→12.5 Precautions for Using Unicode Text File

**■3 Precautions for use**

**(1) Priority when multiple trigger conditions are satisfied simultaneously**

When trigger conditions for writing, reading, and file conversion are satisfied simultaneously, the processes are executed in the following order.

Priority	Trigger device		
<div style="display: flex; flex-direction: column; align-items: center;"> <div style="margin-bottom: 5px;">High</div> <div style="margin-bottom: 10px;">↑</div> <div style="margin-bottom: 10px;">↓</div> <div style="margin-top: 5px;">Low</div> </div>	Trigger device per recipe setting	Recipe No. 1	Read trigger device
		:	Write trigger device
		:	:
		Recipe No. 32767	Read trigger device
	Trigger device per project	Write trigger device	
		Trigger File Conversion device	

If a satisfied trigger condition becomes unsatisfied before the processing order comes, the process is not executed.

Example) When the trigger condition becomes unsatisfied before the writing process of recipe No. 3 is executed

To make sure that the processing for the simultaneously-satisfied triggers are executed, set the trigger devices for each recipe setting as follows.

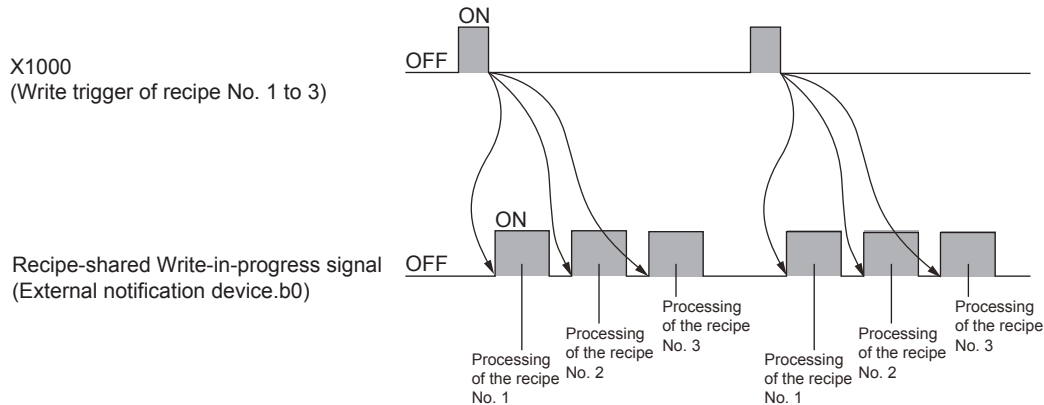

Multiple recipes can be processed sequentially by turning on and off one device.

- Set the conditions to satisfy the trigger devices to "OFF". (A trigger condition is satisfied when a device turns off.)
- Set the same device as the trigger devices of multiple recipe settings.

⇒9.3.7 ■ 1 [Basic] tab

Example) Executing the writing processes of recipe No. 1 to 3 sequentially

- [Write Trigger 1] of recipe No. 1 to 3: X1000
- Trigger condition of [Write Trigger 1] of recipe No. 1 to 3: [OFF]

## (2) When a trigger condition is satisfied while the recipe operation window or the [Recipe information] screen is being displayed

The trigger devices for writing, reading, and file conversion are ignored while the recipe operation window or the [Recipe information] screen is being displayed.

You can check the display status of the recipe operation window or the [Recipe information] screen with the Disable Recipe Trigger signal (External notification device.b14).

⇒9.3.5 ■ 1 [External Control Device]

**(3) Trigger judgment when the same trigger condition is repeatedly satisfied**

A trigger judgment is conducted each and every time a trigger condition is satisfied.

When the state of a trigger condition changes from satisfied to unsatisfied to satisfied, a trigger judgment is conducted again.

When the time while the trigger condition is not satisfied is too short, the trigger cannot be detected as its condition is not satisfied. Therefore, the recipe may not be processed.

**(4) Timing to change the writing or reading target after a trigger condition is satisfied**

Before changing the writing or reading target (such as the recipe number and the record number), confirm that the writing or reading process are complete with the following signals.

- For the writing process: Recipe-shared Write Completed signal (External notification device.b4)
- For the reading process: Recipe-shared Read Completed signal (External notification device.b5)

If you change the target before the corresponding signal turns on, a next writing or reading process may not be executed properly.

**(5) When the writing or reading process cannot be executed**

In the save destination, if a recipe file with the same name is already created for another recipe setting, writing or reading device values cannot be executed.

Remove the recipe file from the save destination, and then write or read device values.

**(6) Changing the recipe setting after its recipe file is created**

When a recipe file is used, device values are written to or read from the recipe file.

In the save destination, if another recipe file already exists, changes made in GT Designer3 are not applied to the recipe file and the writing or reading of device values.

Remove the recipe file from the save destination, and then write or read device values.

**(7) Recipe file created when a recipe process error occurs**

Even if a recipe process error occurs, a recipe file may still be created.

Change the setting in GT Designer3 to remove error causes, and then create a recipe file again.

**(8) Changing the save destination or file name of a recipe file**

If you directly change the save destination or name of a recipe file used, also change its save destination or name in the corresponding recipe setting.

**■ 4 Precautions for using the Character Code for CSV Conversion signal (GS522.b2)****(1) When using a CSV file as a recipe file**

When using a CSV file as a recipe file, observe the following rules.

- If a CSV file has been created while GS522.b2 is on, make sure that GS522.b2 is on when the file is used.
- If a CSV file has been created while GS522.b2 is off, make sure that GS522.b2 is off when the file is used.

Failure to observe the rules renders the relevant file unreadable.

**(2) When converting a CSV file to binary format**

When converting a CSV file to binary format, observe the following rules.

- If a binary file has been converted to a CSV file while GS522.b2 is on, make sure that GS522.b2 is on when the CSV file is converted to a binary file.
- If a binary file has been converted to a CSV file while GS522.b2 is off, make sure that GS522.b2 is off when the CSV file is converted to a binary file.

Failure to observe the rules cannot convert the relevant file.

## ■5 Precautions for using the SRAM user area

### (1) Fields to be imported

If you import a recipe file into the SRAM user area by using a special function switch (Recipe file operation) or external control device, only the following fields are imported.

- Record name
- Record attribute
- Values of the record

To use device comments or other fields, save the recipe data to a recipe file in the data storage.

### (2) Backing up the recipe data stored in the SRAM user area

If you delete the recipe data from the SRAM user area because the data is invalid (system alarm 581 or other errors), back up the data before deletion.

Back up the recipe data and the rest of the data in the SRAM user area by using [SRAM management] in the utility.

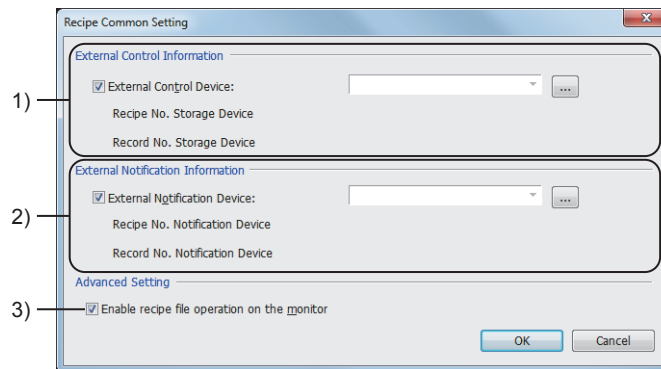

→GOT2000 Series User's Manual (Utility)

## 9.3.5 [Recipe Common Setting] dialog

Set devices for controlling the recipe function.

Select [Common] → [Recipe] → [Recipe Common Setting] from the menu to display the following dialog.

### 1) [External Control Information]

Enable the device setting to control the writing and reading processes. This setting is common to all the recipe settings in a project.

Item	Description
[External Control Device]	Controls the writing and reading of device values, and the file format conversion. The device set in [External Notification Device] cannot be set here. → ■ 1 [External Control Device]
[Recipe No. Storage Device]	Specifies the target recipe number when the device set in [External Control Device] controls the writing and reading of device values and the file conversion. One of the consecutive devices starting from the device set in [External Control Device] is set automatically.
[Record No. Storage Device]	Specifies the target record number when the device set in [External Control Device] controls the writing and reading of device values and the file conversion. One of the consecutive devices starting from the device set in [External Control Device] is set automatically.

### 2) [External Notification Information]

Enable the device setting to output the execution status of a recipe, including a recipe process error.

Item	Description
[External Notification Device]	Notifies the execution status of writing or reading device values. The device set in [External Control Device] cannot be set here. → ■ 2 [External Notification Device]
[Recipe No. Notification Device]	Stores the recipe number of a recipe being processed by the trigger device. One of the consecutive devices starting from the device set in [External Notification Device] is set automatically.
[Record No. Notification Device]	Stores the record number of a recipe being processed by the trigger device. One of the consecutive devices starting from the device set in [External Notification Device] is set automatically.

### 3) [Advanced Setting]

Item	Description
[Enable recipe file operation on the monitor]	<p>GT21 does not support this item.            Incorporates a system application (extended function), which is required for using the recipe operation window, into package data.            To display the recipe operation window on the monitor screen, set a special function switch ([Switch Action]: [Recipe Information]).            →8.2.9 [Special Function Switch] dialog            For the operations of the recipe operation window, refer to the following.            →GOT2000 Series User's Manual (Utility)</p>

## ■1 [External Control Device]

The following table lists the functions of each bit of the device set in [External Control Device].

For the functions of the external notification device, refer to the following.

→ ■2 [External Notification Device]

Bit number	Signal name	Function
b0	Recipe-shared Trigger Write signal	When this signal turns on, values are written to the target devices by using the recipe setting and record specified with [Recipe No. Storage Device] and [Record No. Storage Device].
b1	Recipe-shared Trigger Read signal	When this signal turns on, values are read from the target devices by using the recipe setting and record specified with [Recipe No. Storage Device] and [Record No. Storage Device].
b2 to b7	Use prohibited	-
b8	Convert Recipe File signal	<p>The operation varies depending on the recipe data save destination setting.</p> <ul style="list-style-type: none"> <li>For the data storage (recipe file)</li> </ul> <p>When this bit turns on, the recipe file (*.G2P) corresponding to the recipe data specified with [Recipe No. Storage Device] is converted to CSV or Unicode text format.            Set the file format of the conversion destination file in the [File Save] tab in the [Recipe] dialog.            If a recipe file having the same name exists, the recipe file is overwritten.</p> <ul style="list-style-type: none"> <li>For the SRAM user area</li> </ul> <p>When this bit turns on, the recipe data specified with [Recipe No. Storage Device] is exported to a recipe file.            Set the file format of the export destination file in the [File Save] tab in the [Recipe] dialog.            If a recipe file having the same name exists, the recipe file is overwritten.</p>
b9	Reverse-convert Recipe File signal	<p>The operation varies depending on the recipe data save destination setting.</p> <ul style="list-style-type: none"> <li>For the data storage (recipe file)</li> </ul> <p>When this bit turns on, the recipe file corresponding to the recipe data specified with [Recipe No. Storage Device] is converted from CSV or Unicode text format to binary format (*.G2P).            Set the file format of the conversion source file in the [File Save] tab in the [Recipe] dialog.            If a recipe file having the same name exists, the recipe file is overwritten.</p> <ul style="list-style-type: none"> <li>For the SRAM user area</li> </ul> <p>When this bit turns on, the recipe data specified with [Recipe No. Storage Device] is imported from the relevant recipe file to the SRAM user area.            Set the import source file in the [File Save] tab in the [Recipe] dialog.</p>
b10 to b14	Use prohibited	-
b15	Clear Recipe Processing Error signal	When this signal turns on, the Recipe Processing Error Notification signal (External notification device.b15) turns off.

## ■ 2 [External Notification Device]

The following table lists the functions of each bit of the device set in [External Notification Device].  
For the functions of the external control device, refer to the following.

→ ■ 1 [External Control Device]

Bit number	Signal name	Function
b0	Recipe-shared Write-in-progress signal	Turns on while the Recipe-shared Trigger Write signal (External control device.b0) is on or values are being written with the write trigger device of each recipe setting. Turns off when all of the following conditions are satisfied. <ul style="list-style-type: none"> <li>• The writing process is complete.</li> <li>• The Recipe-shared Trigger Write signal (External control device.b0) is off, or the write trigger condition of each recipe setting is not satisfied.</li> </ul>
b1	Recipe-shared Read-in-progress signal	Turns on when the Recipe-shared Trigger Read signal (External control device.b1) is on or values are being read with the read trigger device of each recipe setting. Turns off when all of the following conditions are satisfied. <ul style="list-style-type: none"> <li>• The reading processing is complete.</li> <li>• The Recipe-shared Trigger Read signal (External control device.b1) is off, or the read trigger condition of each recipe setting is not satisfied.</li> </ul>
b2 to b3	Use prohibited	-
b4	Recipe-shared Write Completed signal	Turns on when the Recipe-shared Trigger Write signal (External control device.b0) is on, or the writing process with the write trigger device of each recipe setting is complete. Turns off when a next writing or reading process starts.
b5	Recipe-shared Read Completed signal	Turns on when the Recipe-shared Trigger Read signal (External control device.b1) is on, or the reading process with the read trigger device of each recipe setting is complete. Turns off when a next writing or reading process starts.
b6 to b7	Use prohibited	-
b8	Recipe File Converting Notification signal	Turns on when the file conversion is started by the Convert Recipe File signal (External control device.b8). Turns off when all of the following conditions are satisfied. <ul style="list-style-type: none"> <li>• The file conversion is complete.</li> <li>• The Convert Recipe File signal (External control device.b8) is off.</li> </ul>
b9	Recipe File Reverse-converting Notification signal	Turns on when the file conversion is started by the Reverse-convert Recipe File signal (External control device.b9). Turns off when all of the following conditions are satisfied. <ul style="list-style-type: none"> <li>• The file reverse conversion is complete.</li> <li>• The Reverse-convert Recipe File signal (External control device.b9) is off.</li> </ul>
b10	Recipe File Conversion Error Notification signal	Turns on at the end of the file conversion started by the Convert Recipe File signal (External control device.b8), if an error occurs during the conversion and the target file is not converted properly. Turns off when a next conversion of a recipe file starts.
b11	Recipe File Reverse-conversion Error Notification signal	Turns on at the end of the file conversion started by the Reverse-convert Recipe File signal (External control device.b9), if an error occurs during the conversion and the target file is not converted properly. Turns off when a next reverse conversion of a recipe file starts.
b12	Use prohibited	-
b13	Recipe File Reverse-conversion Warning Error Notification signal	Turns on at the end of the file conversion started by the Reverse-convert Recipe File signal (External control device.b9), if any of the following mismatches is found between the recipe setting and the target recipe file at the conversion. <ul style="list-style-type: none"> <li>• Recipe setting [Include device comments in conversion target] is not selected in the [Basic] tab in the [Recipe] dialog. → 9.3.7 ■ 1 [Basic] tab</li> <li>• Recipe file [DEVCMT_CNV] (number of characters in the device comment to be converted) is input in the edited recipe file. → 9.3.2 ■ 4 (3) Configuration of the recipe file</li> </ul> Turns off when a next reverse conversion of a recipe file starts.
b14	Disable Recipe Trigger signal	Turns on while the recipe operation window or [Recipe information] screen is being displayed. Notifies that the operations from external control devices cannot be performed while the recipe operation window or [Recipe information] screen is being displayed. Turns off when the recipe operation window or [Recipe information] screen is not displayed.

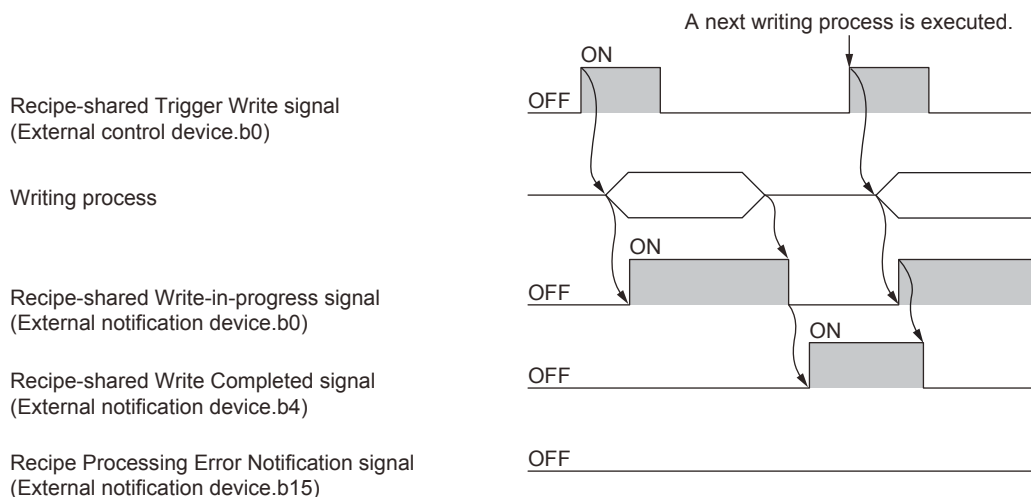

Bit number	Signal name	Function
b15	Recipe Processing Error Notification signal	<p>Turns on if an error occurs during the recipe process (such as writing or reading) started by an external control device and the process is performed improperly. A system alarm occurs when this signal turns on. Check the message and remove error causes.</p> <p>After the error causes are removed, even if this signal is on, the recipe process (such as writing or reading) can be performed.</p> <p>One of the following operations turns off this signal.</p> <ul style="list-style-type: none"> <li>• Turn on the Clear Recipe Processing Error signal (External control device.b15).</li> <li>• Start another process with the external control device.</li> </ul>

**(1) Operation of the external control device and external notification device**

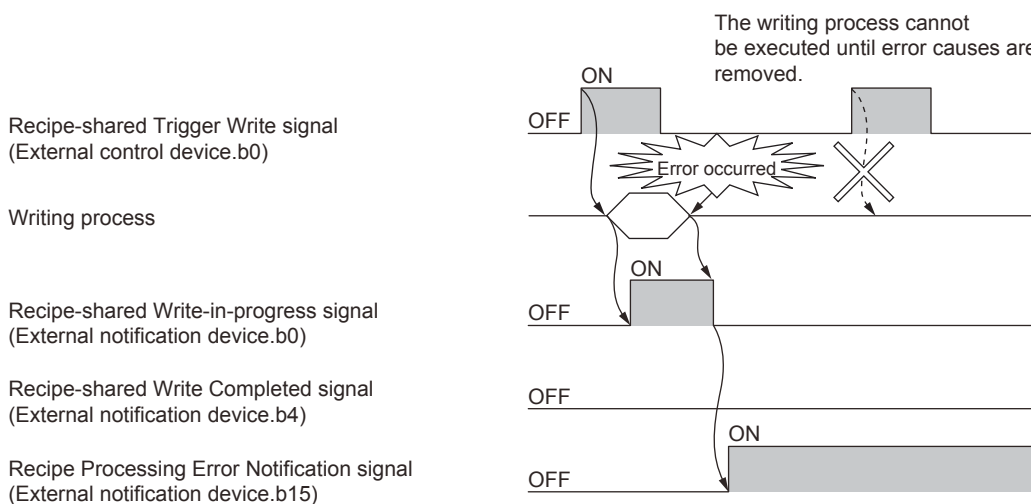

The following shows the ON/OFF timing of each signal.

Example) Behavior of the signal at writing

- When the process ends successfully

- When the process ends abnormally

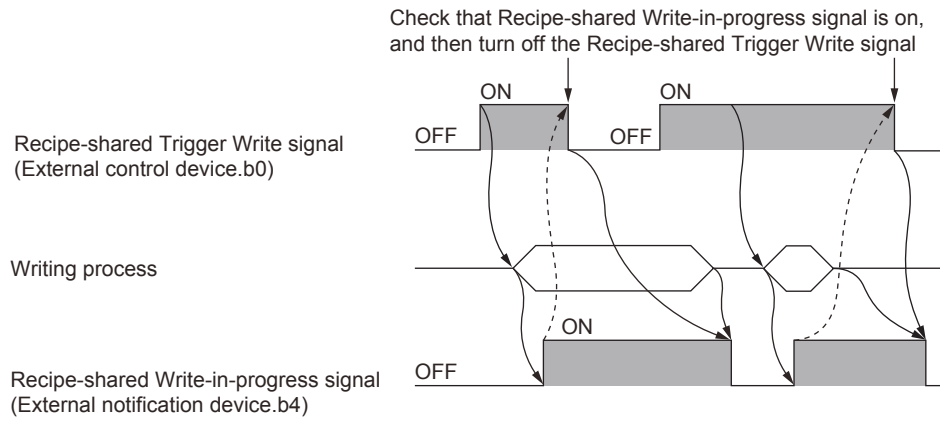

## (2) Handshake by the notification signal

To ensure that a process is performed, use the notification signal to establish a handshake.

Example) Handshake established by the Recipe-shared Write-in-progress signal (External notification device.b0)

Confirm that the Recipe-shared Write-in-progress signal (External notification device.b0) is on. Then, turn off the Recipe-shared Trigger Write signal (External control device.b0) to ensure that the writing process is performed.

## 9.3.6 [Recipe List] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Displays the list of the recipe settings and manages the settings.

Select [Common] → [Recipe] → [Recipe] from the menu to display the following dialog.

### 1) Recipe setting list

List of recipe settings in a project

Item	Description
[No.]	Recipe number of each recipe setting
[Recipe Name]	Recipe name of each recipe setting

### 2) [New] button

Displays the [Recipe] dialog to create a recipe setting.

→ 9.3.7 [Recipe] dialog

### 3) [Edit] button

Displays the [Recipe] dialog to edit a recipe setting selected in the recipe setting list.

→ 9.3.7 [Recipe] dialog

### 4) [Copy] button

Copies a recipe setting selected in the recipe setting list.

### 5) [Paste] button

Displays the [Copy Recipe Setting] dialog to create a recipe setting by using a copied recipe setting.

#### • [Destination No.]

Set the recipe number of a recipe setting, which is created by using a copied recipe setting.  
The setting range is [1] to [32767].

### 6) [Delete] button

Deletes a recipe setting selected in the recipe setting list.

### 7) [Delete All] button

Deletes all the recipe settings.

### 8) [Recipe Common Setting] button

Displays the [Recipe Common Setting] dialog.

## 9.3.7 [Recipe] dialog

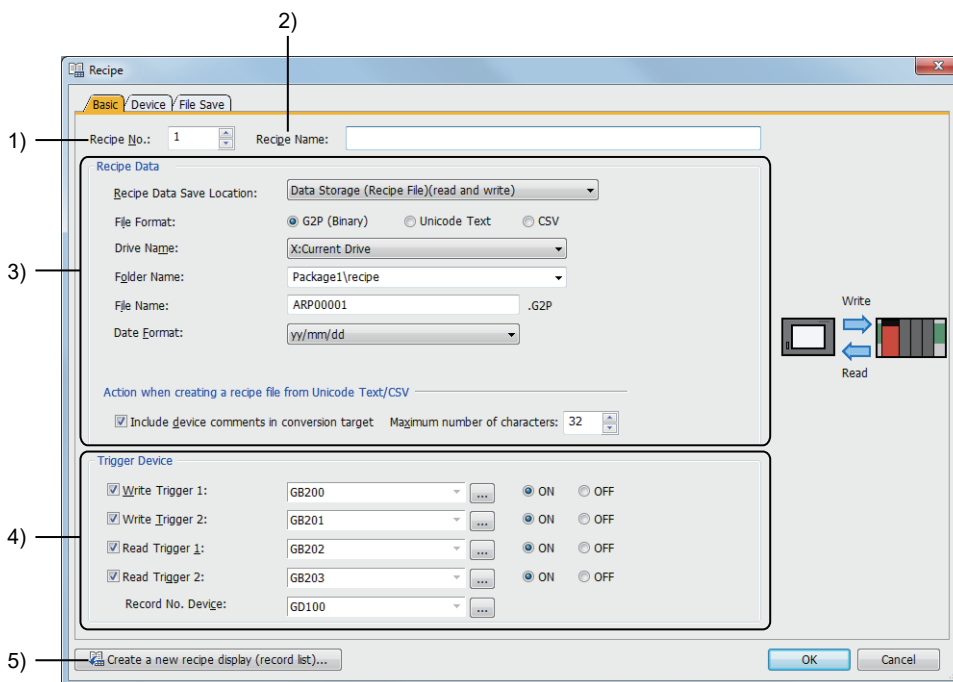

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒ ■ 1 [Basic] tab
- 2 [Device] tab
- 3 [File Save] tab

### ■ 1 [Basic] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Configure the recipe file setting, and set the write and read trigger devices per recipe setting.

#### 1) [Recipe No.]

Set the recipe number of a recipe setting.

The setting range is [1] to [32767].

⇒9.3.2 ■ 1 Contents of a recipe setting

#### 2) [Recipe Name]

Set the name of a recipe setting.

Up to 32 characters can be set.

#### 3) [Recipe Data]

Configure the settings to save recipe data.

⇒9.3.2 ■ 4 Specifications of the recipe file

Item	Description
[Recipe Data Save Location]	<p>Set the destination to save recipe data.</p> <p>The following shows selectable items.</p> <ul style="list-style-type: none"> <li>• [Data Storage (Recipe File)(read and write)] Saves recipe data to a recipe file in the data storage.</li> <li>• [Embedded Memory in GOT (read and write)] Not available to GT21. Saves recipe data to the SRAM user area.</li> <li>• [Not save (record value write only)] No recipe file is created.</li> </ul> <p>Does not save recipe data. No recipe file is created.</p> <p>The recipe data is handled differently depending on the save destination setting. For the details, refer to the following. ⇒9.3.2 ■ 3 Recipe data</p>

Item	Description
[File Format]	<p>Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)].</p> <p>Select a file format of the recipe file.</p> <p>⇒9.3.2 ■ 4 (2) Recipe file format</p> <p>The following shows the items to be selected.</p> <ul style="list-style-type: none"> <li>• [G2P (Binary)] A recipe file is created in binary format (*.G2P).</li> <li>• [Unicode Text] A recipe file is created in Unicode text format (*.TXT).</li> <li>• [CSV] A recipe file is created in CSV format (*.CSV).</li> </ul>
[Drive Name]	<p>Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)].</p> <p>Select a drive at which a recipe file is located on the GOT.</p>
[Folder Name]	<p>Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)].</p> <p>Specify a folder to which a recipe file is saved on the GOT.</p> <p>For the restrictions on the folder name used with the GOT, refer to the following.</p> <p>⇒12.4 Restrictions for Folder Names and File Names used in GOT</p> <p>When [File Format] is set to [Unicode Text] or [CSV], recipe files are created for each record.</p> <p>You are recommended to specify different folders to save each recipe file.</p> <p>When [Drive Name] is set to [C:Built-in Flash Memory] or [D:Built-in SRAM], "\recipe" specified with [Package Folder Name] in the [Type Setting] dialog is applied as the folder name.</p>
[File Name]	<p>Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)].</p> <p>Set the name of a recipe file.</p> <p>For the restrictions of the file name used in the GOT, refer to the following.</p> <p>⇒12.4 Restrictions for Folder Names and File Names used in GOT</p>
[Date Format]	<p>Set this item when [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)] or [Embedded Memory in GOT (read and write)].</p> <p>Select a date format in which the record update date is displayed.</p> <p>The following shows selectable items.</p> <ul style="list-style-type: none"> <li>• [yy/mm/dd]</li> <li>• [mm/dd/yy]</li> <li>• [dd/mm/yy]</li> </ul>
[Include device comments in conversion target]	<p>Set this item when [File Format] is set to [G2P (Binary)].</p> <p>Enables device comments to be edited when a recipe file is converted from binary format (*.G2P) to Unicode text or CSV format.</p> <p>Includes device comments in the conversion target when a recipe file is converted back to binary format (*.G2P).</p>
[Maximum number of characters]	<p>Set this item when [Include device comments in conversion target] is selected.</p> <p>Set the number of characters in a device comment to be converted when a recipe file is converted back to binary format (*.G2P).</p> <p>The setting range is [1] to [32].</p>

#### 4) [Trigger device]

Set the write and read trigger devices.

⇒6.1.1 How to set devices

Item	Description
[Write Trigger 1], [Write Trigger 2]	<p>Set a device to be written and a trigger condition (ON, OFF).</p> <p>Set [Write Trigger 2] to execute the writing when two conditions are satisfied.</p> <p>In that case, device values are written only when the trigger conditions of both the trigger device 1 and 2 are satisfied.</p>
[Read Trigger 1], [Read Trigger 2]	<p>Set a device to be read and a trigger condition (ON, OFF).</p> <p>Set [Read Trigger 2] to execute the reading when two conditions are satisfied.</p> <p>In that case, device values are read only when the trigger conditions of both the trigger device 1 and 2 are satisfied.</p>
[Record No. Device]	<p>Set a device that specifies the target record number when the trigger device of each recipe setting starts the writing or reading process.</p> <p>When the number of records is one, record 1 is always specified, and thus no setting is required.</p>

#### 5) [Create a new recipe display (record list)] button

GT21 does not support this item.

This item is not displayed when the [Recipe] dialog is called up from the [Recipe Display (Record List)] dialog. Displays the [Screen Selection] dialog.

Select a screen to place a recipe display (record list).

Screen title

- **[Screen Type]**  
Select the type of a screen to place a recipe display (record list). The following shows the items to be selected.  
[Base Screen]  
[Window Screen]
- **[Screen No.]**  
Select the screen number of a screen to place a recipe display (record list). The setting range is [0] to [32767]. A target screen is selectable from among screen titles as well. To place a recipe display (record list) on a new screen, select [A new screen will be created.] for the screen title. Click the [Browse] button to select a screen in thumbnail view in the [Screen Image List] dialog.

Screen image list

Jump

- **[Screen Type]**  
Select the type of a screen to be opened.
- **Screen image list**  
Displays screen images.
- **Jump**  
Specify a screen number and click the [Jump] button to select the screen in the screen image list.

## ■ 2 [Device] tab

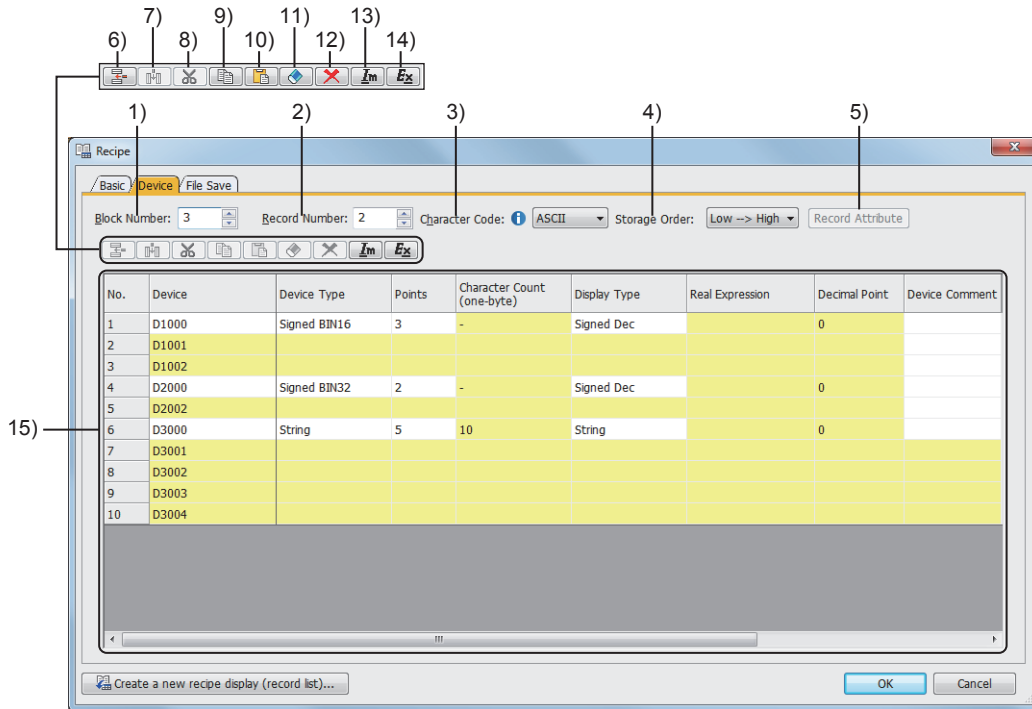

Set the target devices and the initial values of records.

### Point

#### Precautions when using a text display or text input object

When [Character Code] is set to [Unicode] for a recipe target device, if you specify the device for a text display or text input object, configure the settings in the object setting dialog as shown below.

- Select [Unicode] for [Character Code] in the [Device/Style] tab.
- If [Storage Order] is set to [Low-->High] in the recipe setting, select [Display in order of High -> Low] in the [Extended] tab of the object setting.
- If [Storage Order] is set to [High-->Low] in the recipe setting, clear [Display in order of High -> Low] in the [Extended] tab of the object setting.

### 1) [Block Number]

Set the number of blocks of the recipe setting.

The setting range is [1] to [2048].

⇒9.3.2 ■ 1 (1) Block

### 2) [Record Number]

Set the number of records of the recipe setting.

The setting range is [1] to [2000].

⇒9.3.2 ■ 1 (3) Record

### 3) [Character Code]

Set this item when [String] is selected for [Device Type] in a block.

Select the character code to be applied to the value of devices whose [Device Type] is set to [String].

The following shows the items to be selected.

- [ASCII]
- [Unicode]
- [S-JIS]
- [GB]
- [KS] (GT27, GT25, GT23, and GT SoftGOT2000)
- [Big5]

### 4) [Storage Order]

Set this item when [String] is selected for [Device Type] in a block.

Select an order in which data is stored to the devices whose [Device Type] is set to [String].

The following shows the items to be selected.

- [Low->High]
- [High->Low]

### 5) [Record Attribute] button

Displays the [Record Attribute] dialog to set the attribute of a record selected in the target device list.

You can select multiple records by dragging on the record title column.

- **[Record No.]**  
Record number of a selected record  
This item is not displayed when multiple record are selected.
- **[Record Name]**  
Set the record name.  
Up to 32 characters can be set.
- **[Not set the device value]**  
Set no initial value for a record.  
A record without values cannot be used for writing.  
Set a value by reading device values or editing the recipe file.
- **[Not overwrite the device value in recipe data]**  
Protects the record from being overwritten.  
Device values cannot be written to a record, which is protected from being overwritten.

6) **[Insert Block] button**

Inserts a block above the block selected in the target device list.

7) **[Insert Record] button**

Inserts a record in the left of the record selected in the target device list.

8) **[Cut] button**

Cuts an editable cell selected in the target device list.

9) **[Copy] button**

Copies an editable cell selected in the target device list.

10) **[Paste]**

Pastes the cut or copied data in the selected cell.

11) **[Clear]**

Clears data of a cell or record selected in the target device list.

12) **[Delete]**

Deletes a block or record selected in the target device list.

13) **[Import]**

Imports a recipe setting file which is exported with GT Designer3, and overwrites the existing setting in the [Device] tab.

Files of recipe settings or advanced recipe settings exported with the following software can also be imported.

- GT Designer3 Version1 (GOT1000)
- GT Designer2 Version2

Recipe files created on the GOT cannot be imported.

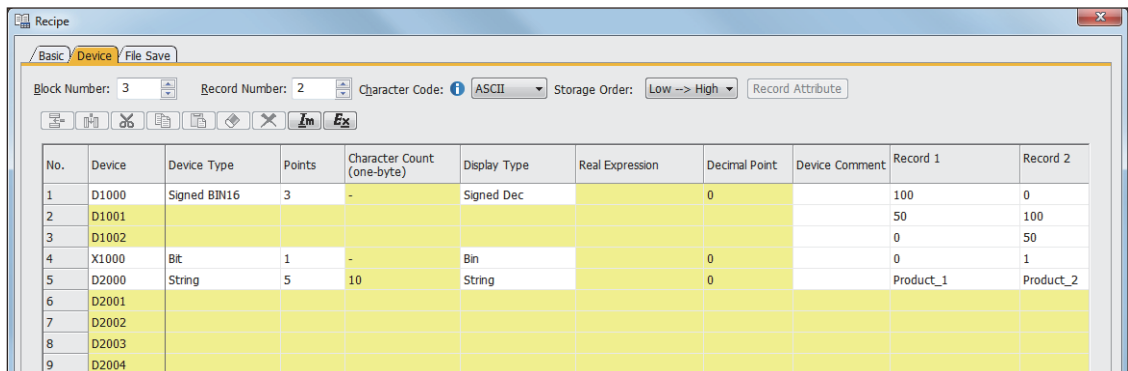

14) **[Export]**

Saves the setting in the [Device] tab with a Unicode text or CSV file.

You can edit the exported file in spreadsheet software and others.

The edited file can be imported with GT Designer3.

The following shows the file format of the exported file.

No.	Device	Device Type	Points	Character Count (one-byte)	Display Type	Real Expression	Decimal Point	Device Comment	Record 1	Record 2
1	D1000	Signed BIN16	3	-	Signed Dec		0		100	0
2	D1001								50	100
3	D1002								0	50
4	X1000	Bit	1	-	Bin		0		0	1
5	D2000	String	5	10	String		0		Product_1	Product_2
6	D2001									
7	D2002									
8	D2003									
9	D2004									

When importing or exporting files in the multiple-language input environment, use Unicode text files.  
 The characters of multiple languages can be imported or exported normally by using Unicode text files.

### 15) Target device list

Lists the target devices and records set in blocks

Item	Description
[Device]	Set the devices from which values are read or to which values are written. →6.1.1 How to set devices
[Device Type]	Select the data type of devices in each block. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Bit]</li> <li>• [Signed BIN16]</li> <li>• [Unsigned BIN16]</li> <li>• [Signed BIN32]</li> <li>• [Unsigned BIN32]</li> <li>• [BCD16]</li> <li>• [BCD32]</li> <li>• [Real]</li> <li>• [String]</li> </ul>
[Points]	Set the number of target devices set in each block. Devices starting from the start device are set sequentially for the set number. The maximum number of devices that can be set depends on the setting of [Device Type]. <ul style="list-style-type: none"> <li>• When [Bit] is selected: [1] device</li> <li>• When [Signed BIN16], [Unsigned BIN16], or [BCD16] is selected:                              256 records or less: [1] to [32768] devices                              257 records or more: [1] to [8192] devices</li> <li>• When [Signed BIN32], [Unsigned BIN32], [BCD32], or [Real] is selected:                              256 records or less: [1] to [16384] devices                              257 records or more: [1] to [4096] devices</li> <li>• When [Text] is selected: [1] to [2048] devices</li> </ul>
[Character Count (one-byte)] ([Character Count] when [Unicode] is selected for [Character Code])	Maximum number of characters to be collected. This item is displayed when [String] is selected for [Device Type]. The settings of [Points] and [Character Code] determine the setting value. <ul style="list-style-type: none"> <li>• When [Unicode] is selected for [Character Code]                              The maximum number of characters equals the value in [Points].</li> <li>• When an item other than [Unicode] is selected                              The maximum number of characters equals the value in [Points] multiplied by 2.                              A two-byte character is counted as two characters.</li> </ul>
[Display Type]	Select the display type of a device when its data is output into a CSV or Unicode text file. The setting range depends on the setting of [Device Type]. →(1) Relationship between the record setting range and [Device Type] and [Display Type]

Item	Description
[Real Expression]	<p>Select the expression type of the real number. Set this item when [Real] is selected for [Display Type]. The following shows the items to be selected.</p> <ul style="list-style-type: none"> <li>• [Exponential Expression]</li> <li>• [Fixed Decimal]</li> </ul> <p>Example) When 12345 is set as the record value and 3 is set in [Decimal Point]</p> <ul style="list-style-type: none"> <li>• Display in [Exponential Expression]: 1.235E+004</li> <li>• Display in [Fixed Decimal]: 12345.000</li> </ul>
[Decimal Point]	<p>Set the number of digits of decimal numbers. Set this item when [Real] is selected for [Display Type]. The setting range is [0] to [32] digits.</p>
[Device Comment]	<p>Set the comment for a target device. Up to 32 characters can be set.</p>
Record	<p>Combinations of device values specified at writing or reading Set values are the initial values of a record. Record columns are created corresponding to the setting of [Record Number]. →9.3.2 ■ 1 (3) Record</p> <p>The setting range of the record initial value depends on [Device Type] and [Display Type]. →(1) Relationship between the record setting range and [Device Type] and [Display Type]</p> <p>Click a column header of the table to display the [Edit] button on the header. Click the [Edit] button to display the [Record Attribute] dialog, and set the attributes of the relevant record.</p> <div data-bbox="732 725 1219 931" data-label="Image"> </div> <ul style="list-style-type: none"> <li>• <b>[Record No.]</b> Record number of a selected record. This item is not displayed when multiple records are selected.</li> <li>• <b>[Record Name]</b> Set the record name. Up to 32 characters can be set.</li> <li>• <b>[Not set the device value]</b> Set no initial value for a record. A record without values cannot be used for writing. Set a value by reading device values or editing the recipe file.</li> <li>• <b>[Not overwrite the device value in recipe data]</b> Protects the record from being overwritten. Device values cannot be written to a record, which is protected from being overwritten.</li> </ul>

### (1) Relationship between the record setting range and [Device Type] and [Display Type]

The setting items of [Display Type] depend on the setting of [Device Type].

The device value range that can be set for records depends on the setting of [Display Type].

[Device Type]	[Display Type]	Range of device values
[Bit]	[Bin]	0, 1
	[Bit]	
[Signed BIN16]	[Signed Dec]	-32768 to 32767
	[Hex]	8000 to 7FFF
	[Octal]	100000 to 077777
	[Bin]	1000000000000000 to 1111111111111111
	[Real]	-32768 to 32767
[Unsigned BIN16]	[Unsigned Dec]	0 to 65535
	[Hex]	0000 to FFFF
	[Octal]	000000 to 177777
	[Bin]	0 to 1111111111111111
	[Real]	0 to 65535

### ■ 3 [File Save] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

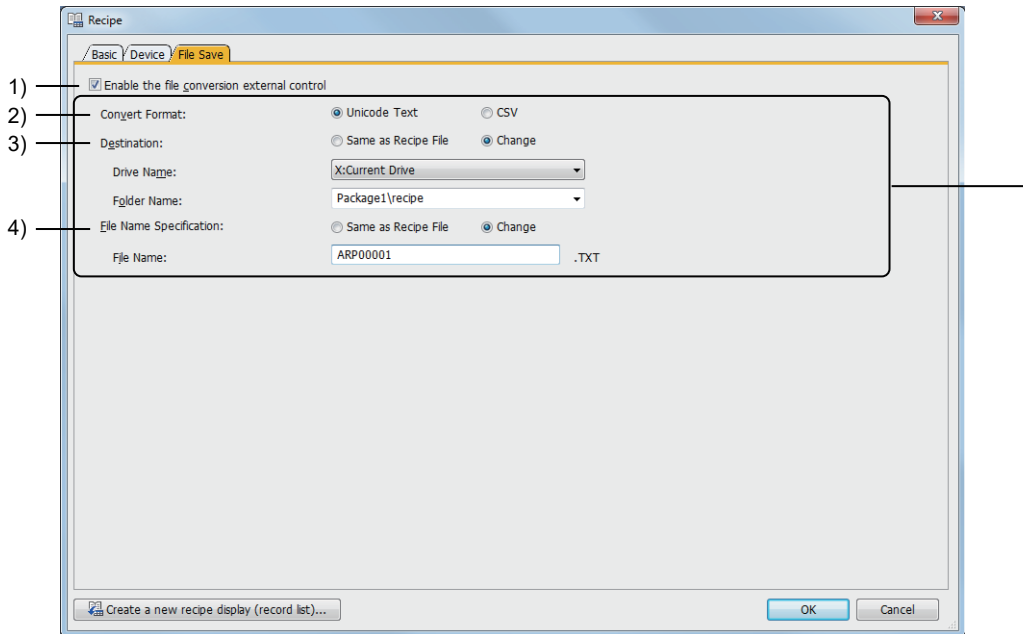

Configure the settings to convert a recipe file (\*.G2P) to a different format, and import/export recipe data to/from the SRAM user area.

For the details, refer to the following.

⇒9.3.3 ■ 4 Converting a recipe file

The [File Save] tab does not appear when the following settings are made in the [Basic] tab.

- [Recipe Data Save Location] is set to [Not save (record value write only)].
- [File Format] is set to [Unicode Text] or [CSV].

When [Recipe Data Save Location] is set to [Data Storage (Recipe File)(read and write)]

When [Recipe Data Save Location] is set to [Embedded Memory in GOT (read and write)]

#### 1) [Enable the file conversion external control]

Allows the file conversion to be controlled by an external control device.

⇒9.3.5 ■ 1 [External Control Device]

#### 2) [Convert Format]

Select the file format after the conversion.

The following shows the items to be selected.

- [Unicode Text]
- [CSV]
- [G2P (Binary)] (only for saving recipe data to the SRAM user area)

#### 3) [Destination]

If the save destination of recipe data is set to the data storage (recipe file), set the destination path of the conversion destination file.

To change the destination from the one where a recipe file is saved, select [Change] and set [Drive Name] and [Folder Name].

If the save destination of recipe data is set to the SRAM user area, set the destination path of the export destination file or import source file.

Set [Drive Name], [Folder Name], and [File Name].

#### 4) [File Name Specification]

If the save destination of recipe data is set to the data storage (recipe file), set the name of the conversion

destination file.

Set a file name of the converted file.

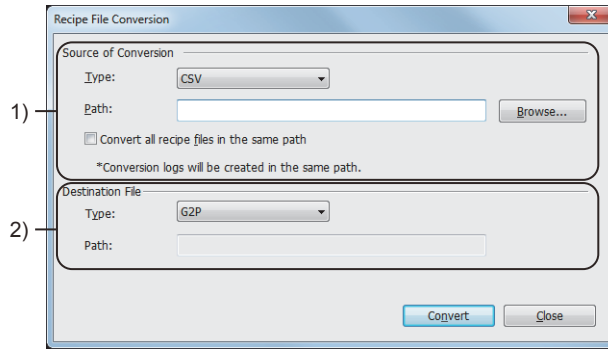

To change the file name from the one of the recipe file, select [Change] and set [File Name].

### 9.3.8 [Recipe File Conversion] dialog

Convert the file format of a recipe file.

Select [Tools] → [Resource Data Conversion] → [Recipe File] from the menu to display the following dialog.

#### 1) [Source of Conversion]

Item	Description									
[Type]	Select a file type of the conversion source file. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [CSV]</li> <li>• [Unicode Text]</li> <li>• [G2P]</li> </ul>									
[Path]	Specify a path of the conversion source file.									
[Convert all recipe files in the same path]	Converts the recipe files, which are in a format selected for [Type], in a specified path. A conversion log is created in the specified path. The full path of the conversion destination files, the conversion results (OK or NG), and the creation date of files are output to the conversion log. <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <table> <tr> <td>C:\recipe\ARP00001.txt</td> <td>OK</td> <td>20141105150551</td> </tr> <tr> <td>C:\recipe\ARP00002.txt</td> <td>OK</td> <td>20141105150551</td> </tr> <tr> <td>C:\recipe\ARP00003.txt</td> <td>OK</td> <td>20141105150551</td> </tr> </table> </div>	C:\recipe\ARP00001.txt	OK	20141105150551	C:\recipe\ARP00002.txt	OK	20141105150551	C:\recipe\ARP00003.txt	OK	20141105150551
C:\recipe\ARP00001.txt	OK	20141105150551								
C:\recipe\ARP00002.txt	OK	20141105150551								
C:\recipe\ARP00003.txt	OK	20141105150551								

#### 2) [Destination File]

Item	Description
[Type]	Select a file type of a file to be created after the conversion. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [CSV]</li> <li>• [Unicode Text]</li> <li>• [G2P]</li> </ul>
[Path]	Displays the path of a file to be saved at the destination, which is the same path as the one of the conversion source file.

## 9.3.9 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the recipe function as required. The following shows the functions that are available by the relevant settings.

### 1 GOT environmental settings (System information)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

→5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Notifying that the recipe process (reading or writing) is being executed (Write device: System signal 2-1.b10)	[System Signal 2-1]

#### Point

#### Difference between the external notification device and system information

The following shows differences between the external notification device and system signal, both of which notify the recipe processing status.

##### (1) External notification device

Signal	Description
Recipe-shared Write-in-progress signal (External notification device.b0)	Turns on while the Recipe-shared Trigger Write signal (External control device.b0) is on or values are being written with the write trigger device of each recipe setting. Turns off when all of the following conditions are satisfied. The writing process is complete. The Recipe-shared Trigger Write signal (External control device.b0) is off, or the write trigger condition of each recipe setting is not satisfied.
Recipe-shared Read-in-progress signal (External notification device.b1)	Turns on when the Recipe-shared Trigger Read signal (External control device.b1) is on or values are being read with the read trigger device of each recipe setting. Turns off when all of the following conditions are satisfied. The reading processing is complete. The Recipe-shared Trigger Read signal (External control device.b1) is off, or the read trigger condition of each recipe setting is not satisfied.

##### (2) System information

Signal	Description
System signal 2-1.b10	Turns on during the writing or reading process started by the following signals. · Recipe-shared Trigger Write signal (External control device.b0) · Recipe-shared Trigger Read signal (External control device.b1) · Write trigger device of each recipe setting · Read trigger device of each recipe setting Turns off when the writing or reading process is complete, regardless of the status of the trigger device.

To establish a handshake, use the external notification device.

→9.3.5 ■ 2 [External Notification Device]

## ■2 GOT Internal Device

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### →12.1.3 GOT special register (GS)

Function	Setting item
Turning on when a recipe file is imported with an applicable special function switch (Write device) (Write device)	GS1010.b0
Turning on when a recipe file is exported with an applicable special function switch (Write device)	GS1010.b1
Turning on when the recipe special control is executed (Write device)	GS1010.b2
Turning on after a recipe file is successfully imported or exported with an applicable special function switch (Write device)	GS1010.b14
Turning on when a recipe file is unsuccessfully imported or exported with an applicable special function switch (Write device)	GS1010.b15
Notifying the result of the recipe special control (Write device)	GS1011
Notifying the search result of the recipe special control (Write device)	GS1012
Changing the character code to Unicode at the following timing <ul style="list-style-type: none"> <li>• When a binary file is converted to CSV format</li> <li>• When data is written to or read from a recipe file in CSV format (Read device)</li> </ul>	GS522.b2
Executing the recipe special control (Read device)	GS1800.b2
Turning off the Touch Switch Operation Completed signal (GS1010.b14) and the Touch Switch Operation Error signal (GS1010.b15) of the Recipe Status device (Read device)	GS1800.b14
Specifying the action of the recipe special control (Read device)	GS1801
Specifying the target of the recipe special control (Read device)	GS1802
Specifying the start device number of the GOT data registers (GD) that are used for the recipe special control (Read device)	GS1803
Specifying the target recipe setting for the recipe special control (Read device)	GS1805
Specifying the target record for the recipe special control (Read device)	GS1806
Specifying the target start row for the recipe special control (Read device)	GS1807
Specifying the number of target rows (starting from the specified start row) for the recipe special control (Read device)	GS1808

## 9.4 Transferring Data between Devices ([Device Data Transfer])

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 9.4.1 Overview of the device data transfer function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

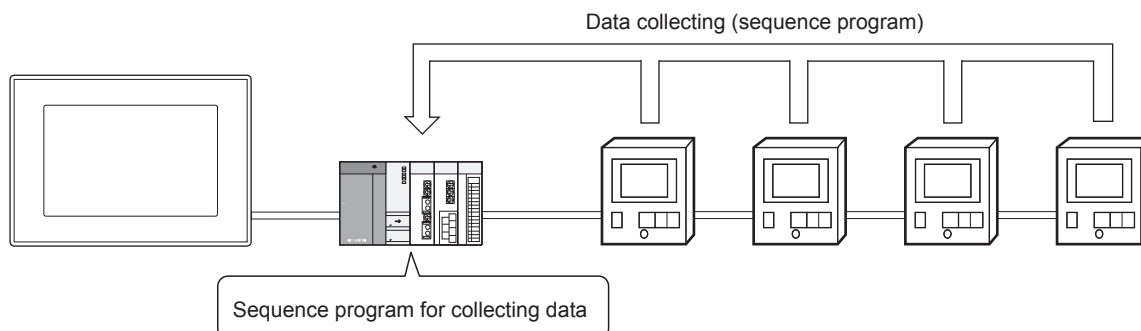

Values can be read from specified devices and written into other devices with a trigger or at intervals.

- Trigger condition : Rising edge of D0.b0
- Source device : D100 of controller 1
- Destination device: R100 of controller 2

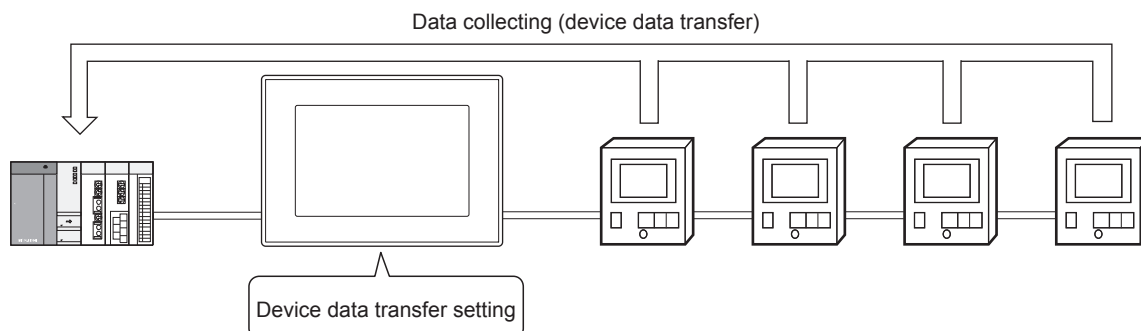

By making device data transfers, the data of controllers can be collected without any sequence program.

- Collecting the data of controllers without making device data transfers  
A sequence program is required to collect the data of controllers. (The GOT only monitors the data.)

- Collecting the data of controllers making device data transfers  
If device data transfers are set, no sequence program is required.

## 9.4.2 Specifications of device data transfer

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 System application (extended function)

To use the device data transfer, a system application (extended function) of [Device Data Transfer] is required. Configuring one or more device data transfer settings incorporates the application into the package data automatically. To use the function on GT SoftGOT2000, the application is not required.

### ■ 2 Number of settings

The setting range depends on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000  
Up to 255 settings can be configured for one project.
- For GT21  
Up to 32 settings can be configured for one project.

→9.4.2 ■ 4 Data structure of device data transfer settings

### ■ 3 Trigger to make device data transfers

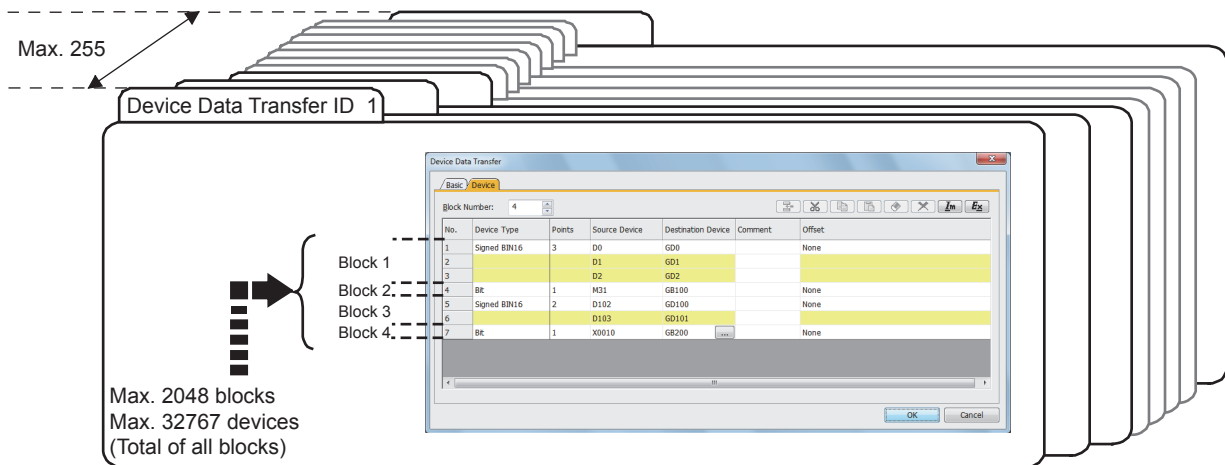

Any one of the following triggers is used as a trigger for device data transfers.

- Rising edge of the trigger device
- Falling edge of the trigger device
- Cycle

### ■ 4 Data structure of device data transfer settings

If multiple settings of the following items are made, multiple device data transfers can be set for one device data transfer setting and device data transfer settings can be set for one project.

- [Device Data Transfer ID]
- [Block Number]

#### (1) Device Data Transfer ID

Device data transfer ID is ID numbers for identifying each device data transfer setting. Set the numbers in the [Basic] tab in the [Device Data Transfer] dialog.

→9.4.6 ■ 1 [Basic] tab

## (2) Block

Blocks are units that divide device numbers and device types into groups. The setting range depends on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000

Up to 2048 blocks can be set for one device data transfer setting (ID).

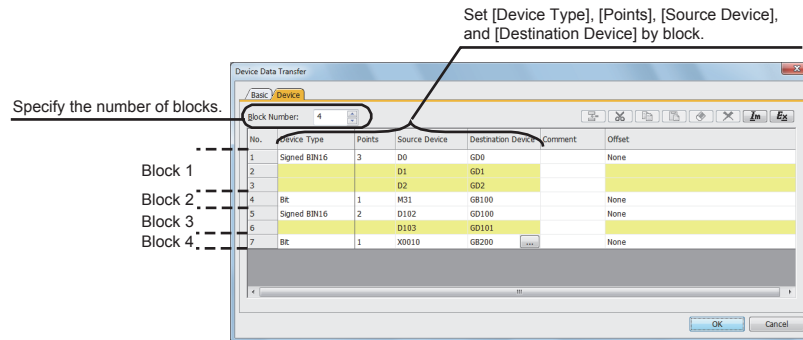

- For GT21

Up to 1000 blocks can be set for one device data transfer setting (ID).

By setting transfers by block, the following settings can be made.

- A device data transfer setting that involves multiple device types (such as bit or word)
- A device data transfer setting that mixes together consecutive devices and random devices

The following shows an example of the mix of bit devices and word devices (signed 16-bit binary data and signed 32-bit binary data) set for one device data transfer setting.

Set blocks in the [Device] tab in the [Device Data Transfer] dialog.

⇒9.4.6 [Device Data Transfer] dialog

### (a) Relation between the number of blocks and transfer processing time

When a large number of blocks are set for a device data transfer setting, transfer processing may take a long time. To shorten the processing time, reduce the number of blocks.

(Reference values)

When QCPU is directly connected to CPU (number of devices: 32767, transmission speed: 115200bps)

- If one block is set: Approximately 15 seconds
- If 2048 blocks are set: Approximately 130 seconds

## (3) Device

### (a) Number of devices that can be set

The setting range depends on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000

Regardless of the device type, up to 32767 devices can be set for one device data transfer ID.

- For GT21

Regardless of the device type, up to 1000 devices can be set for one device data transfer ID.

However, a device that has 32 bit data length is counted as two devices.

### (b) Relation to blocks

A single device number can be set for a single block.

To set consecutive device numbers, set the number of the devices in the same block.

To set device numbers randomly, set the device numbers in different blocks.

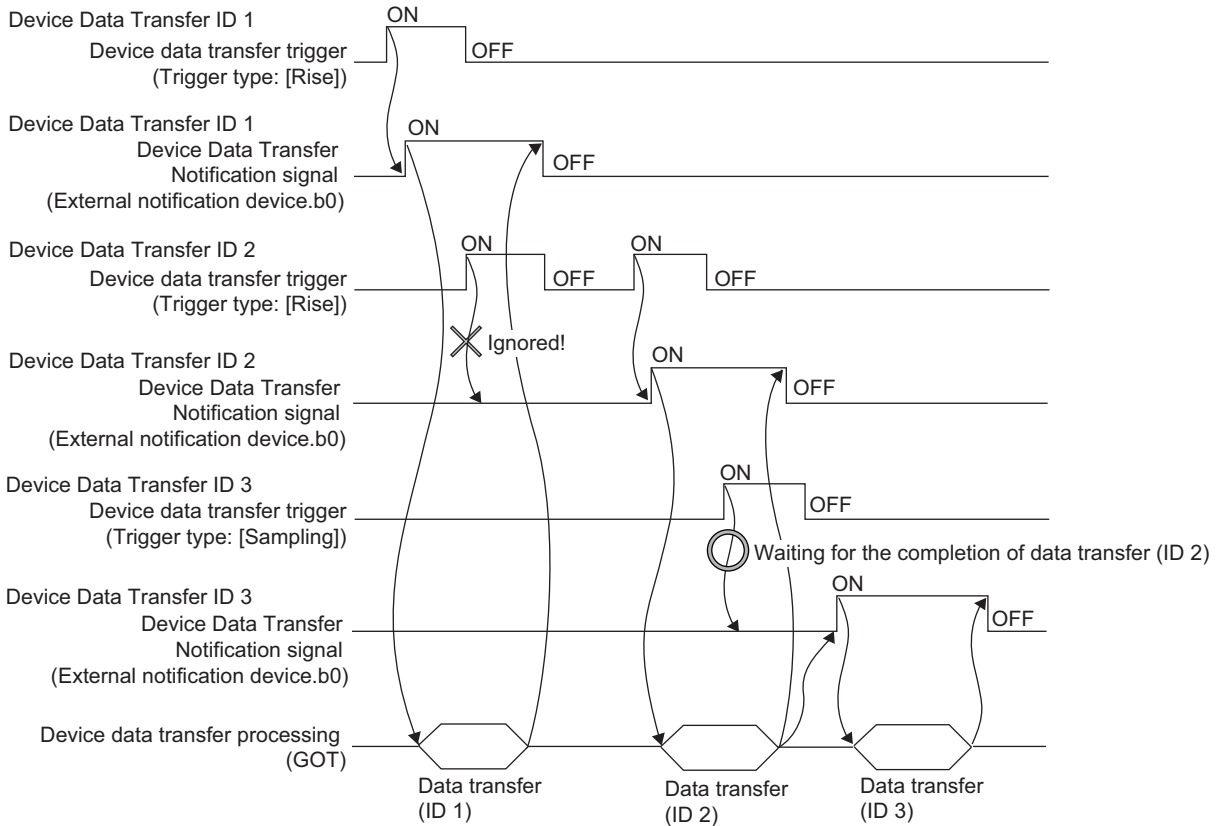

**5 Operations performed when multiple trigger conditions are satisfied simultaneously**

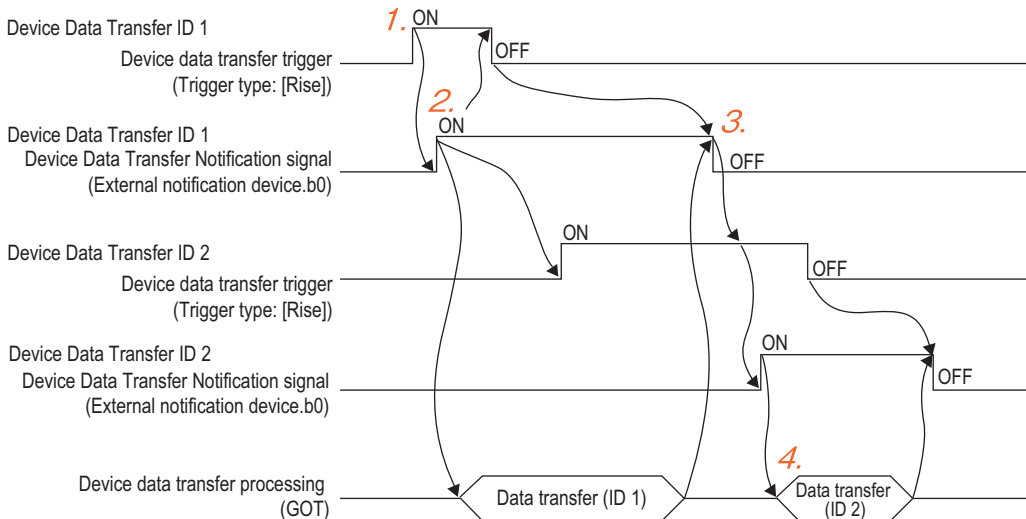

**(1) When the trigger condition for another device data transfer setting is satisfied while a device data transfer is being processed**

If the trigger type is set to [Sampling], the GOT does not ignore the satisfied trigger condition, and executes the device data transfers subsequently.

If the trigger type is not set to [Sampling], the GOT ignores the satisfied trigger condition.

To execute the device data transfer without fail, select [Rise] for [Trigger Type] then time a handshake with the trigger device and Device Data Transfer Notification signal.

**Step 1** The device data transfer trigger (Device Data Transfer ID; 1) turns on.

**Step 2** The Device Data Transfer Notification signal (Device Data Transfer ID: 1) turns on.

The device data transfer trigger (Device Data Transfer ID: 1) turns off and the device data transfer trigger (Device Data Transfer ID: 2) turns on.

**Step 3** Following the completion of the device data transfer processing and the off status of the device data transfer

trigger (Device Data Transfer ID: 1), the Device Data Transfer Notification signal (Device Data Transfer ID: 1) turns off.

**Step 4** The next device data transfer is allowed to be processed and the device data trigger (Device Data Transfer ID: 2) which turned on in step 2 is enabled.

**(2) When trigger conditions for different Device Data Transfer ID numbers are satisfied simultaneously**

The device data transfer that has been given the smallest ID number is prioritized.

However, if trigger conditions for multiple device data transfers are satisfied by the time the device data transfer is completed, the next device data transfer to be executed is the one that has been given the ID number that is the smallest of those larger than the one that has been assigned to the transfer that was already executed.

For example, if the conditions for the device data transfer triggers (Device Data Transfer ID: 1, 3) are satisfied by the time the above device data transfer (Device Data Transfer ID: 1) is completed (device data transfer trigger: OFF → ON), the device data transfer (Device Data Transfer ID: 3) is the next one to be executed.

## 9.4.3 How to use device data transfer

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 Setting procedure

The following shows the procedure for registering a device data transfer setting.

- Step 1** Select [Common] → [Device Data Transfer] from the menu.  
The [Device Data Transfer List] dialog appears.  
→9.4.5 [Device Data Transfer List] dialog
- Step 2** Click the [New] button.  
The [Device Data Transfer] dialog appears. A device data transfer setting can be registered.  
→9.4.6 [Device Data Transfer] dialog
- Step 3** For the [Basic] tab in [Trigger Type], set the timing with which device data transfers are triggered.  
→9.4.6 ■ 1 [Basic] tab
- Step 4** Set [Source Device] and [Destination Device] in the [Device] tab.  
→9.4.6 ■ 2 [Device] tab
- Step 5** Click the [OK] button.  
The [Device Data Transfer] dialog closes.
- Step 6** Click the [Close] button.  
The [Device Data Transfer List] dialog closes and the registration of the device data transfer setting is complete.

#### Point

When setting device data transfers, make sure that the data size does not exceed the available space in the user area for the GOT.

Depending on the settings, not all the set values (such as the number of devices) can be set to their maximum.

For example, if comments are set for each device, the setting size becomes larger.

For details of the capacity of the available user area for the GOT, refer to the following.

→12.6.1 Data transferred to the GOT and capacity of the destination drive

### ■ 2 Operations of device data transfers

#### (1) Transferring device data

When a set trigger condition is satisfied, the values in the source device values are transferred to the destination devices.

#### (2) Reversing the data transfer direction (Switching the relation between the source device and destination device)

By switching the status of the transfer inverting flag device between on and off, the data transfer direction can be reversed accordingly. (The relation between the source and destination is reversed).

Therefore, data transfers in both directions (from the source to the destination and the other way around) can be made with one device data transfer setting.

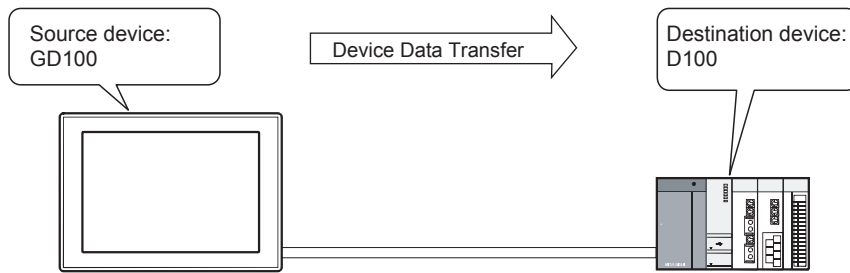

The following shows the procedure for setting the transfer inverting flag device.

- Step 1** Select [Common] → [Device Data Transfer] from the menu.  
The [Device Data Transfer List] dialog appears.  
→9.4.5 [Device Data Transfer List] dialog
- Step 2** Click the [New] button or the [Edit] button.  
The [Device Data Transfer] dialog appears.  
→9.4.6 [Device Data Transfer] dialog
- Step 3** Set a device for [External Control Device] in the [Basic] tab.  
→9.4.6 ■ 1 [Basic] tab  
6.1.1 How to set devices  
Bit 1 of the set device is assigned as the transfer inverting flag device.

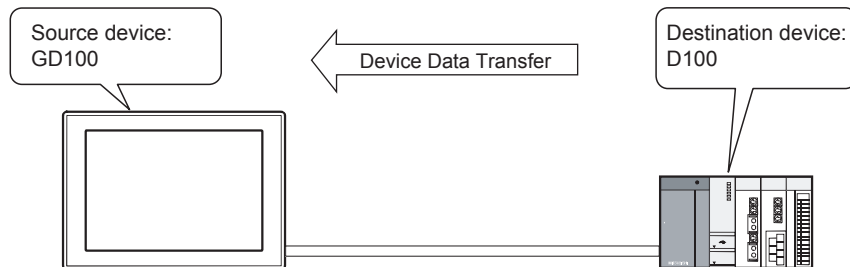

The following shows the relation between the transfer inverting flag device and source/destination.

- When the transfer inverting flag device is off

Device data are transferred from the source device to the destination device.

- When the transfer inverting flag device is on  
Device data are transferred from the destination device to the source device.

Turn on transfer inverting flag device before turning on the trigger device or simultaneously with the trigger device by writing a value to the word device.

### Point

#### Using device data transfers instead of scripts

Instead of bmov, the function of scripts, device data transfers can be used.

The device data transfer communication is established only when the corresponding conditions are satisfied. On the other hand, the devices in a script require continuous communication. Hence, if device data transfers are used, the load due to the continuous communication is not imposed.

For scripts, refer to the following.

⇒9.8 Controlling Operations with Scripts ([Script])

### 3 Outputting the status of device data transfers to a device

When the external notification device is set, the status of device data transfers (such as the status in which a transfer is in the process of being made and presence/absence of an error) can be externally notified.

The following shows the procedure for setting the external notification device.

- Step 1** Select [Common] → [Device Data Transfer] from the menu.  
The [Device Data Transfer List] dialog appears.  
⇒9.4.5 [Device Data Transfer List] dialog
- Step 2** Click the [New] button or the [Edit] button.  
The [Device Data Transfer] dialog appears.  
⇒9.4.6 [Device Data Transfer] dialog
- Step 3** Select [External Notification Device] in the [Basic] tab then set a device.  
⇒9.4.6 ■ 1 [Basic] tab  
6.1.1 How to set devices  
Signals are assigned as shown below.
- Bit 0: Device Data Transfer Notification signal
  - Bit 14: BCD Conversion Error Notification signal
  - Bit 15: Device Data Transfer Error Notification signal

#### (1) Device Data Transfer Notification signal (external notification device.b0)

Notifies that a device data transfer is in the process of being made.

- The device data transfer trigger condition is satisfied → the external notification device.b0 turns on.
- No device data transfer trigger condition is satisfied and the device data transfer is complete → the external notification device.b0 turns off.

Even if this signal is on, a device data transfer can be made as long as the previous device data transfer has been completed.

**(2) BCD Conversion Error Notification signal (external notification device.b14)**

Notifies whether an error has occurred or not during BCD conversion.

- An error occurs during BCD conversion → the external notification device.b14 turns on.

Even if an error occurs, device data are transferred.

However, the device values are not what you intend to transfer. Check the data before restarting the device data transfer.

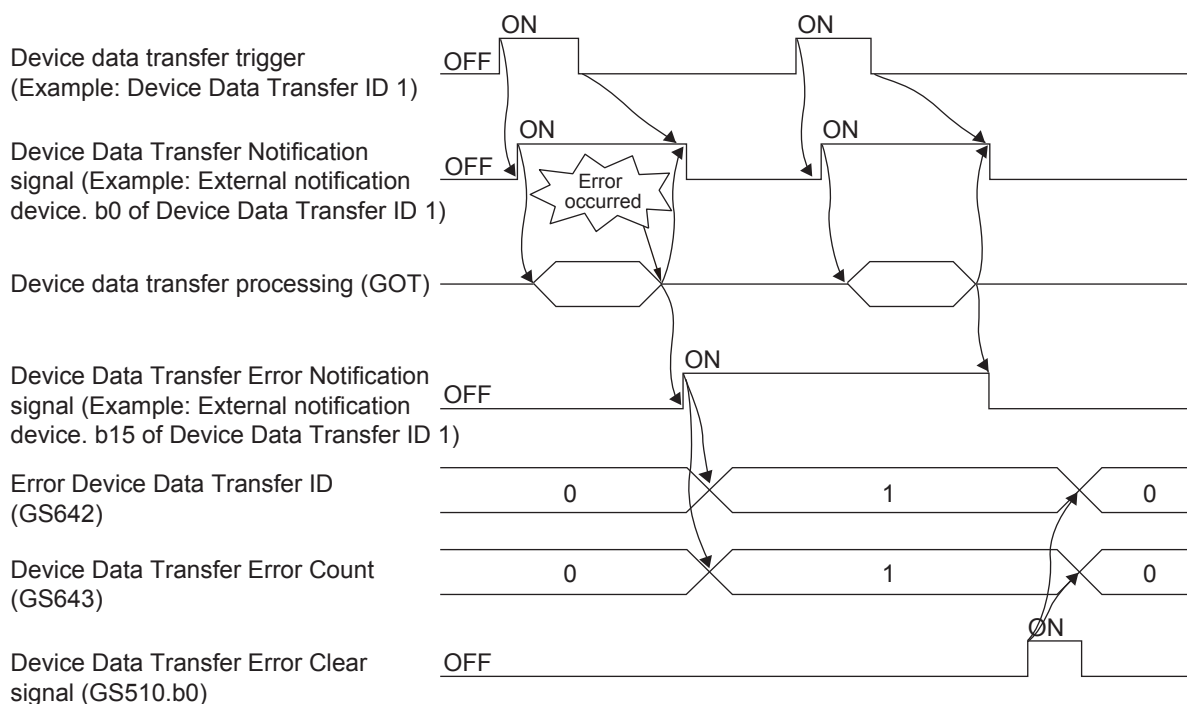

**(3) Device Data Transfer Error Notification signal (external notification device.b15)**

Notifies whether an error has occurred or not during a device data transfer.

- An error occurs during a device data transfer → the external notification device.b15 turns on.
- The device data transfer which was executed after an error occurred is normally completed → the external notification device.b15 turns off.

The following shows the operations performed when an error occurs and corrective actions for the error.

When an error occurs, the following operations are performed.

- Step 1** The Device Data Transfer Error Notification signal (external notification device.b15) turns on.
- Step 2** The ID number that has been assigned to the device data transfer that caused the error is stored in Error Device Data Transfer ID (GS642).
- Step 3** The value in Device Data Transfer Error Count (GS643) is incremented by one every time an error occurs.
- Step 4** A system error occurs.  
After checking the message, identify the cause of the error and eliminate the error.
- Step 5** The device data transfer is restarted.
- Step 6** The device data transfer is successfully made and the Device Data Transfer Error Notification signal (external notification device.b15) turns off.  
To clear Error Device Data Transfer ID (GS642) and Device Data Transfer Error Count (GS643), turn on the Device Data Transfer Error Clear signal (GS510.b0).  
→12.1.3 GOT special register (GS)

**■4 Importing/exporting settings**

You can edit exported Unicode text files and CSV files by using spreadsheet software.

Edited Unicode text files and CSV files can be imported to GT Designer3.

Example) A CSV file

Export to a CSV file.

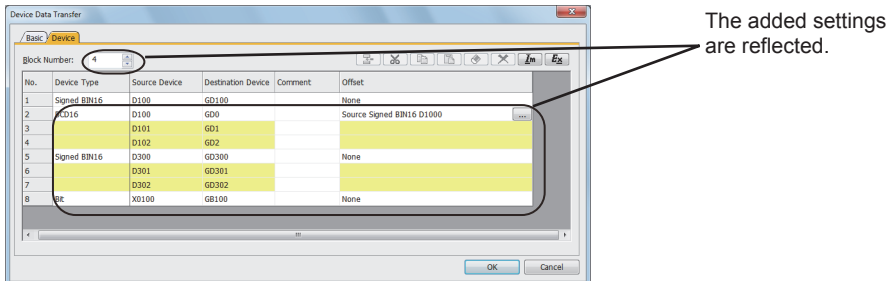

Device Data Transfer						
Block Num	4					
Device Ty	Points	Source De	Destination	Comment	Offset	
Signed BIN	1	D100	GD100	None	None	

Edit the exported file.

Device Data Transfer						
Block Num	4					
Device Ty	Points	Source De	Destination	Comment	Offset	
Signed BIN	1	D100	GD100	None	None	
BCD16	3	D0	GD0	Source Signed BIN16 D1000		
Signed BIN	1	D300	GD300	None	None	
Bit	1	X0100	GB100	None	None	

Add the settings by using applications such as spreadsheet software.

Import from the CSV file to GT Designer3.

### (1) Format of text files for device data transfers

The format of text files for device data transfers is common to both Unicode text files and CSV files. However, use the following delimiters for each item.

- Unicode text file: Tab (\t)
- CSV file: Comma (,)

The following shows the format.

1)	Device Data Transfer						
2)	Block Num	4					
	Device Ty	Points	Source De	Destination	Comment	Offset	
	Signed BIN	1	D100	GD100	None	None	
	BCD16	3	D0	GD0	Source Signed BIN16 D1000		
	Signed BIN	1	D300	GD300	None	None	
	Bit	1	X0100	GB100	None	None	
	3)	4)	5)	6)	7)	8)	

#### 1) Title

Displays "Device Data Transfer".

## 2) Block Number

Set the number of blocks for device data transfers.

The setting range depends on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000

The setting range is [1] to [2048].

- For GT21

The setting range is [1] to [1000].

## 3) Device Type

Set the data type of the device.

The following shows the setting range.

- Bit
- Signed BIN 16
- Unsigned BIN 16
- Signed BIN 32
- Unsigned BIN 32
- [BCD16]
- [BCD32]
- Real number

## 4) Points

Set the number of the target devices for the transfer by block.

When a start device is set, consecutive devices are automatically specified according to the set number. The number of the specified devices including the start device is the same as the number set for this item.

## 5) Source Device

Set a device from which the value is read.

## 6) Destination Device

Set a device to which the value read from the source device is written.

## 7) Comment

Set a comment.

Up to 32 characters can be set.

## 8) Offset

Set the target for an offset and the offset device.

The following shows the targets that can be set.

- None
- Source
- Destination
- Both

When setting the source, destination, or both, input the offset device.

Insert a one-byte space between the offset target and the offset device.

If incorrectly input data are imported, GT Designer3 regards it as [None].

### Point

#### (1) Using characters of multiple languages

When importing or exporting files in the multiple-language input environment, use Unicode text files.

The characters of multiple languages can be imported or exported normally by using Unicode text files.

For the precautions for using Unicode text files, refer to the following.

- ➔ 12.5 Precautions for Using Unicode Text File

#### (2) Editing exported files

If a device in use has a name starting from 0, the 0 may be deleted by a function of applications for editing files (spreadsheet software and others).

If the file is saved after the first 0 is deleted, the file cannot be imported normally.

When using a device that has a name starting from 0, edit the file with a text editor.

## 9.4.4 Precautions

### ■ 1 Device data transfers and the status of the GOT

Depending on the GOT status, no device data transfer is executed.

The following lists the operations with which no device data transfer is executed.

- When writing BootOS, package data
- When restarting the GOT

If a device data transfer is interrupted by the above operations, the value in a source device cannot be synchronized with that in the destination device.

If a device data transfer is interrupted, execute the device data transfer again after the processing of the above operations has been completed.

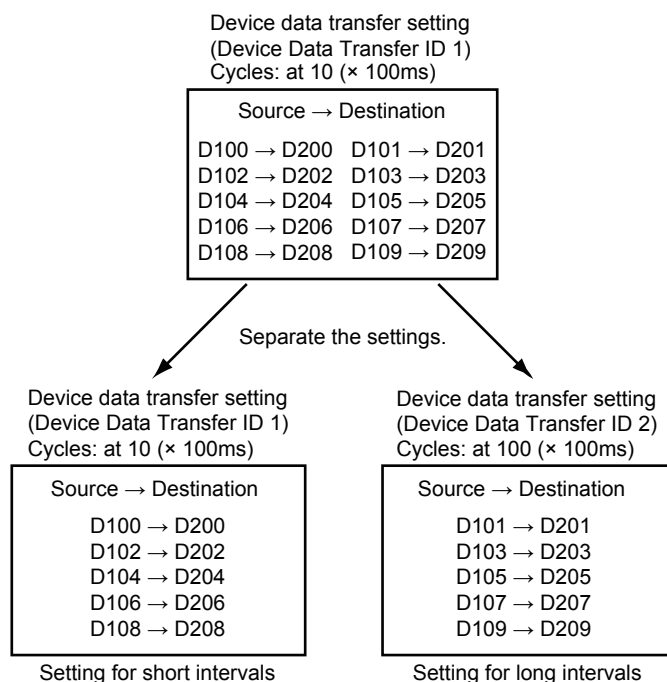

### ■ 2 If device data are not transferred as intended

In the following cases, device data may not be transferred normally.

- The communication between the GOT and controllers takes a long time because a large number of devices have been set.
- The intervals for a device data transfer trigger are short. (In a case where the trigger condition is satisfied while the device data transfer is still in the process of being made)
- Other functions (such as logging and recipe) have also been set.

Take any one of the following countermeasures against the above situations

- When selecting [Sampling] for the trigger type, reduce the number of devices per device data transfer setting of device data transfers made at short intervals (If there are device data transfers that do not require short intervals, set them for another device data transfer setting for which long intervals are set.)

- While the Device Data Transfer Notification signal is off, satisfy the trigger condition.
  - 9.4.3 ■ 3 Outputting the status of device data transfers to a device
- If the baud rate can be changed, increase the baud rate with controller settings.

### ■ 3 Overlap of source and destination devices

If source devices and destination devices overlap in the same device data transfer setting, the device data may not be transferred normally.

If the devices need overlapping, set the overlapping devices for different device data transfer settings.

The following shows an example of settings.

Example) Setting method for transferring the device values of D100, D105, D110 to D110, D115, D120 respectively (D110 overlaps.)

Device Data Transfer ID	Trigger type	Trigger device	Number of blocks	Source device	Destination device
1	Cycle	D1000.b0	1	D110	D120
2	Cycle	D1000.b0	2	D100	D110
				D105	D115

If the same trigger device (D1000.b0) is set for multiple device data transfer settings, the device data transfers of the device data transfer setting that has been given a smaller Device Data Transfer ID number are prioritized.

By transferring D110 prior to D100, the device value in D110 that has yet to be overwritten with the value in D100 can be transferred to D120.

Device Data Transfer ID	Trigger type	Trigger device	Number of blocks	Source device	Destination device
1	Cycle	D1000.b0	3	D110	D120
				D100	D110
				D105	D115

If the device data transfers are set for the same device data transfer setting, the value in D100 is transferred prior to D110 and the device value in D110 is overwritten with that in D100.

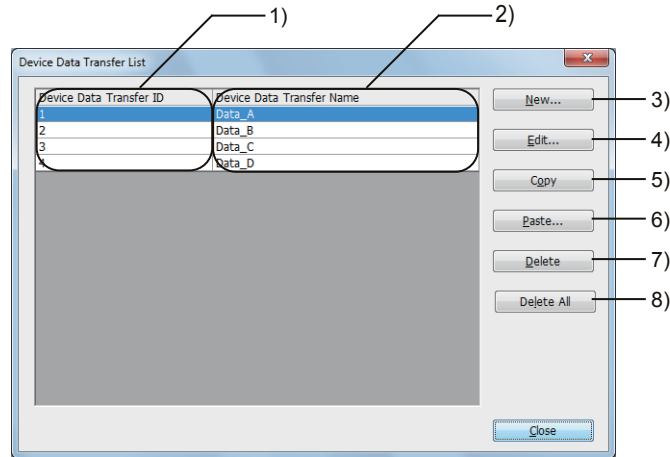

Then the device value in D110 is transferred to D120, which means that the device value in D100 is transferred to D120 as a result.

## 9.4.5 [Device Data Transfer List] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

When device data transfers are made, values are read from specified devices and are written to other devices with a trigger or at intervals.

Select [Common] → [Device Data Transfer] from the menu to display the [Device Data Transfer List] dialog. The dialog displays the settings of device data transfers in a list and manages them.

### 1) [Device Data Transfer ID]

Display the ID numbers for identifying each device data transfer setting.

### 2) [Device Data Transfer Name]

Displays the names of device data transfer settings.

### 3) [New] button

Creates a new device data transfer setting.

⇒9.4.6 [Device Data Transfer] dialog

### 4) [Edit] button

Changes the settings of a selected device data transfer setting.

⇒9.4.6 [Device Data Transfer] dialog

### 5) [Copy] button

Copies a selected device data transfer setting.

### 6) [Paste] button

Pastes a copied device data transfer setting.

### • [Destination ID]

Set a Device Data Transfer ID number.

### 7) [Delete] button

Deletes a selected device data transfer setting.

### 8) [Delete All] button

Deletes all the device data transfer settings.

## 9.4.6 [Device Data Transfer] dialog

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Set device data transfer settings.

- ➔ ■ 1 [Basic] tab
- 2 [Device] tab

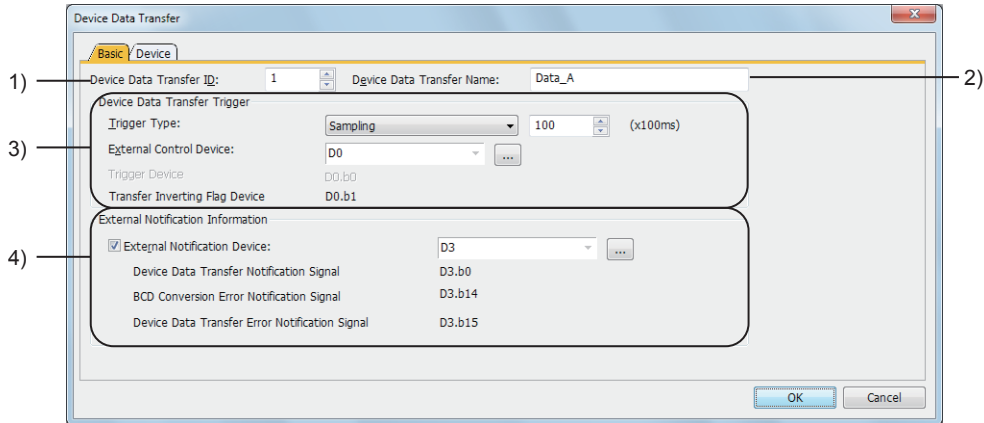

This dialog appears when the [New] button or [Edit] button in the [Device Data Transfer List] dialog is clicked.

➔9.4.5 [Device Data Transfer List] dialog

### ■ 1 [Basic] tab

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Set the device data transfer trigger and external notification information.

#### 1) [Device Data Transfer ID]

Set an ID number to identify the device data transfer setting.

The setting range depends on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000  
The setting range is [1] to [255].
- For GT21  
The setting range is [1] to [32].

➔9.4.2 ■ 4 Data structure of device data transfer settings

#### 2) [Device Data Transfer Name]

Set the name of the device data transfer setting.

Up to 32 characters can be set.

#### 3) [Device Data Transfer Trigger]

Set a condition under which device values are transferred.

➔9.4.3 ■ 2 Operations of device data transfers

Item	Description
[Trigger Type]	Select an operating condition that triggers device value transfers. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Rise]</li> <li>• [Fall]</li> <li>• [Sampling]</li> </ul> When selecting [Sampling], set a cycle in which transfers are executed. The setting range is [1] to [36000].
[External Control Device]	Set the target device for the operating condition of [Trigger Type]. ➔6.1.1 How to set devices In the following cases, set this item. <ul style="list-style-type: none"> <li>• When selecting [Rise] or [Fall]</li> <li>• When selecting [Sampling] and using [Transfer Inverting Flag Device].</li> </ul>
[Trigger Device]	When the value in a set device satisfies a set condition, the values in source devices are transferred to destination devices. Bit 0 of the device set for [External Control Device] is specified. This item is used when [Rise] or [Fall] is selected.

Item	Description
[Transfer Inverting Flag Device]	When a set condition is satisfied, reverses the direction in which device values are transferred. (Device values are transferred from the destination to the source.) Bit 1 of the device set for [External Control Device] is specified.

#### 4) [External Notification Information]

Set a device that notifies the status of transfers.

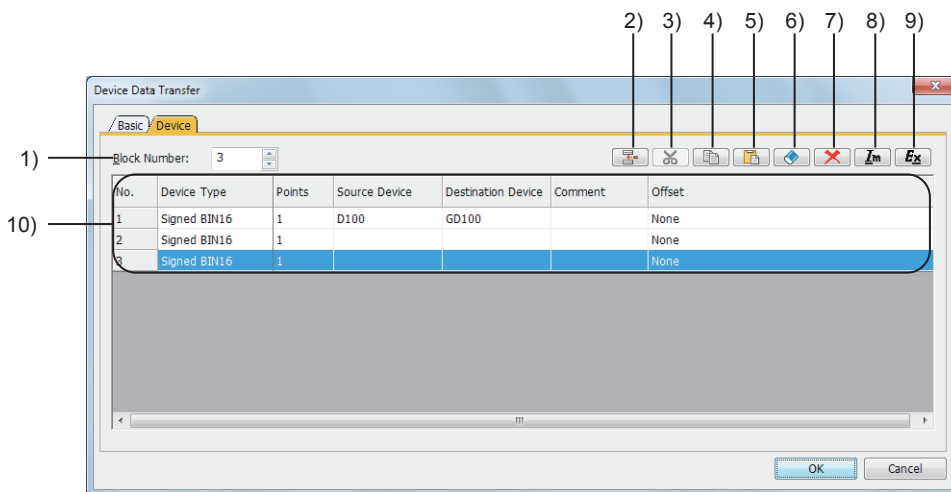

⇒9.4.3 ■ 3 Outputting the status of device data transfers to a device

Item	Description
[External Notification Device]	Set a device that receives notifications of the status of device value transfers. ⇒6.1.1 How to set devices
[Device Data Transfer Notification Signal]	Notifies that device values are in the process of being transferred. Bit 0 of the device set for [External Notification Device] is specified.
[BCD Conversion Error Notification Signal]	When an error occurs while a device value in BCD is being transferred, notifies the error. Bit 14 of the device set for [External Notification Device] is specified.
[Device Data Transfer Error Notification Signal]	When an error occurs during a device value transfer, notifies the error. Bit 15 of the device set for [External Notification Device] is specified.

## ■ 2 [Device] tab

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Displays set source devices and destination devices in a list and manages them.

#### 1) [Block Number]

Set the number of blocks for device data transfers.

The setting range depends on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000

The setting range is [1] to [2048].

- For GT21

The setting range is [1] to [1000].

⇒9.4.2 ■ 4 Data structure of device data transfer settings

#### 2) [Insert Block] button

Inserts a block above a selected block.

#### 3) [Cut] button

Cuts a selected block.

#### 4) [Copy] button

Copies a selected block.

#### 5) [Paste] button

Pastes a copied block.

#### 6) [Clear] button

Clears a comment.

#### 7) [Delete] button

Deletes a selected block.

8) **[Import] button**

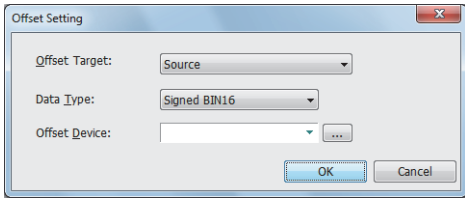

Imports the settings that were edited in a Unicode text file or CSV file to GT Designer3.

9) **[Export] button**

Saves the settings made in this tab as a Unicode text file or CSV file.

10) **Device list**

Lists set devices.

Item	Description
[No.]	Displays the numbers that show the number of set devices.
[Device Type]	<p>Select the data type of the device to be set. The following shows the items to be selected.</p> <ul style="list-style-type: none"> <li>• [Bit]</li> <li>• [Signed BIN16]</li> <li>• [Unsigned BIN16]</li> <li>• [Signed BIN32]</li> <li>• [Unsigned BIN32]</li> <li>• [BCD16]</li> <li>• [BCD32]</li> <li>• [Real]</li> </ul> <p>Set this item prior to the device setting. When the device type is changed to another one that has a different data length after a device is set, the device setting is cleared.*1<sup>2</sup></p>
[Points]	<p>Set the number of the target devices for the transfer by block. When a start device is set, consecutive devices are automatically specified according to the set number. The number of the specified devices including the start device is the same as the number set for this item.</p>
[Source Device]	<p>Set a device from which the value is read. ⇒6.1.1 How to set devices</p>
[Destination Device]	<p>Set a device to which the value read from the source device is written. ⇒6.1.1 How to set devices</p>
[Comment]	<p>Set a comment. A set comment is displayed in Unicode text file and CSV file. Up to 32 characters can be set.</p>
[Offset]	<p>Displays the target for an offset and the offset device. ⇒6.1.9 Offset</p> <div style="text-align: center;">  </div> <ul style="list-style-type: none"> <li>• <b>[Offset Target]</b> Select an offset target. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [None]</li> <li>• [Source]</li> <li>• [Destination]</li> <li>• [Both]</li> </ul> </li> <li>• <b>[Data Type]</b> Select the data type of the device to be set. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Signed BIN16]</li> <li>• [Signed BIN 32]</li> </ul> </li> <li>• <b>[Offset Device]</b> Set an offset device. When selecting [Destination], [Source], or [Both] for [Offset Target], set this item. When [Both] is selected for [Offset Target], a single device can be set for either [Source Device] or [Destination Device].</li> </ul>

\*1 Example 1) When changing the device type to another one that has a different data length

Before	After	Result
Signed BIN 16	Real number	Because the data length changes from 16 to 32 bits, the settings of [Source Device] and [Destination Device] are cleared.

\*2 Example 2) When changing the device type to another one that has the same data length

Before	After	Result
Signed BIN 16	[BCD16]	Because the data lengths are the same, the settings of [Source Device] and [Destination Device] are retained.

## 9.4.7 Relevant settings

Set the relevant settings other than the specific settings for device data transfers as required.

The following shows the functions that are available by the relevant settings.

### ■ 1 GOT Internal Device

→ 12.1.3 GOT special register (GS)

Function	Setting item
Clearing Error Device Data Transfer ID and Device Data Transfer Error Count when turns on (Device Data Transfer Error Clear signal)	GS510.b0
Clearing Device Data Transfer Processing Time, Device Data Transfer Min. Processing Time, and Device Data Transfer Max. Processing Time when turns on (Device Data Transfer Processing Time Clear signal)	GS510.b1
If an error occurs when a device data transfer is made, storing the Device Data Transfer ID number that has been assigned to the device data transfer that has caused the error (Error Device Data Transfer ID)	GS642
Storing the number of the errors that occurs due to device data transfers (Device Data Transfer Error Count)	GS643
Storing the processing time of a device data transfer (Device Data Transfer Processing Time)	GS644
When the processing time is stored in Device Data Transfer Processing Time, storing the Device Data Transfer ID number that has been assigned to the device data transfer that has been completed (Device Data Transfer ID)	GS645
Storing the shortest processing time ever stored in Device Data Transfer Processing Time (Device Data Transfer Min. Processing Time)	GS646
When the shortest processing time is stored in Device Data Transfer Min. Processing Time, storing the Device Data Transfer ID number that has been assigned to the device data transfer that has been completed (Device Data Transfer ID (Min. Processing Time))	GS647
Storing the longest processing time ever stored in Device Data Transfer Processing Time (Device Data Transfer Max. Processing Time)	GS648
When the longest processing time is stored in Device Data Transfer Max. Processing Time, storing the Device Data Transfer ID number that has been assigned to the device data transfer that has been completed (Device Data Transfer ID (Max. Processing Time))	GS649

## 9.5 Operating a Device as a Trigger ([Trigger Action])

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 9.5.1 Overview of the trigger action function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

When set conditions are satisfied, various operations can be performed: bit devices are turned on/off, values are written into word devices, screens are switched, and sounds are output.

### 9.5.2 Specifications of trigger action

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■ 1 Types of trigger actions

The following two types of trigger actions are provided.

##### (1) Trigger actions common in a project

These trigger actions are set globally in a project.

All the devices set globally in a project are monitored.

##### (2) Trigger actions for each screen

These trigger actions are set for each screen.

The screens for which trigger actions are settable depend on the GOT model.

- For GT27, GT25, GT23, and GT SoftGOT2000

Base screens and window screens

- For GT21

Base screens only

Set devices are monitored only while the target screens are displayed by the GOT.

If the set overlay screen function calls the screen for which a trigger action is set, the trigger action is executed on the called screen as well. (Not available to GT21)

#### ■ 2 Number of trigger actions that can be set

Up to 600 trigger actions common in a project can be set. This also applies to trigger actions for each screen.

#### ■ 3 Number of conditions that can be set

Up to two conditions under which trigger actions are executed can be set.

Select the first condition from the following.

- Ordinary
- Rise
- Fall
- Rise/Fall
- ON
- OFF
- ON Sampling
- OFF Sampling
- Sampling
- Range

- Bit Trigger

Select the second condition from the following.

- ON
- OFF
- Sampling
- Bit Trigger

However, if [Ordinary] is set for the first condition, the second condition cannot be set.

#### ■4 Actions that can be executed when set conditions are satisfied

- Making bit devices remain on while set conditions are satisfied.
- Turning on bit devices
- Turning off bit devices
- Switching the status of bit devices between on and off
- Writing values into word devices
- Switching to a specified screen
- Outputting sounds with an external speaker (GT27, GT25, and GT SoftGOT2000 only)

#### ■5 Maximum number of write operations

Bit momentary, bit set, bit reset, bit alternate: 40

Data set (16 bits), data set (32 bits): 20

### 9.5.3 How to use trigger action

#### ■1 Setting procedure

The following shows the procedure for setting a trigger action.

**Step 1** Select [Common] → [Trigger Action] from the menu.

The [Trigger Action] dialog appears.

⇒9.5.5 [Trigger Action] dialog

**Step 2** When setting a trigger action common in the project, display the [Project] tab.

⇒9.5.5 ■ 1 [Project] tab

When setting a trigger action for a screen, display the [Screen] tab and select the target screen.

⇒9.5.5 ■ 2 [Screen] tab

**Step 3** Click the [Add] button.

The [Trigger/Action] dialog appears. A trigger action can be registered.

⇒9.5.6 [Trigger/Action] dialog

**Step 4** In the [Trigger] tab, set a condition (trigger 1) under which the trigger action is executed.

⇒9.5.6 ■ 1 [Trigger] tab

When executing the trigger action when two conditions are satisfied, select [Trigger2] and set one more condition.

**Step 5** In the [Action] tab, set the action to be executed when the conditions are satisfied.

⇒9.5.6 ■ 2 [Action] tab

**Step 6** Click the [OK] button.

The [Trigger/Action] dialog closes.

**Step 7** Click the [OK] button in the [Trigger Action] dialog.

The dialog closes and the registration of the trigger action is complete.

#### ■2 Setting data sets

##### (1) [Fixed] and [Indirect]

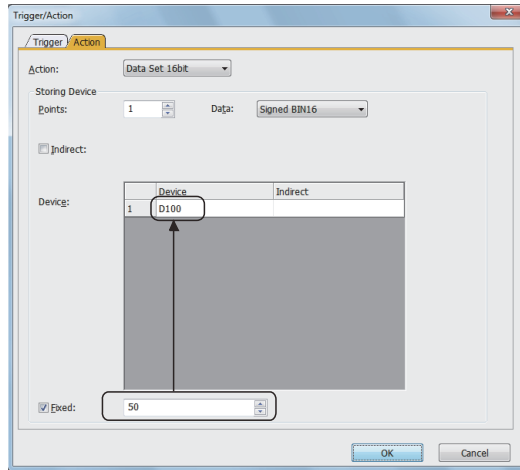

If [Fixed] and [Indirect] are set, a fixed value or the value in a word device is written into the target device.

[Fixed] and [Indirect] can be set together.

(a) **[Fixed]**

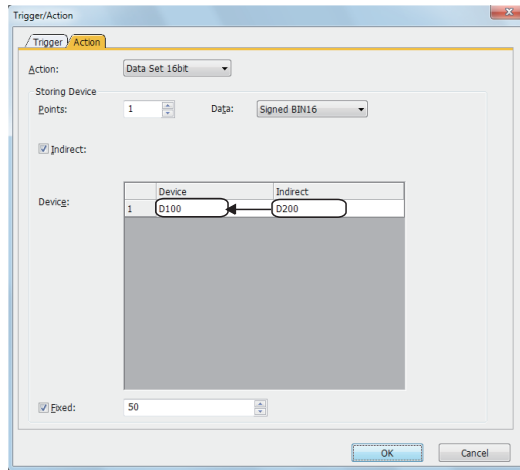

When set conditions are satisfied, the value set for [Fixed] is written into the target device.

When set conditions are satisfied, the fixed value (50) is written into D100.

(b) **[Indirect]**

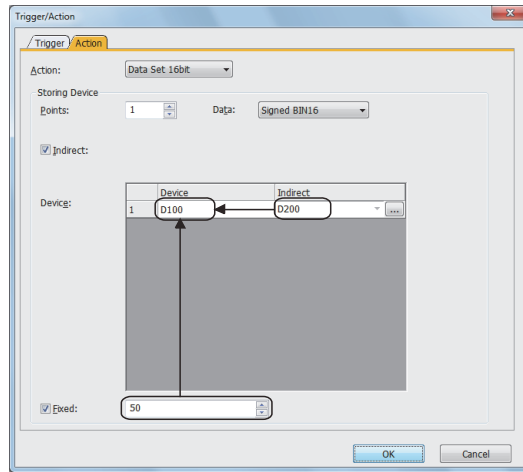

When set conditions are satisfied, the value in the indirect device set for [Indirect] is written into the target device.

When set conditions are satisfied, the value in D200 is written into D100.

(c) **[Fixed] + [Indirect]**

When set conditions are satisfied, the total of the value in the indirect device set for [Indirect] and the value set for [Fixed] is written into the target device.

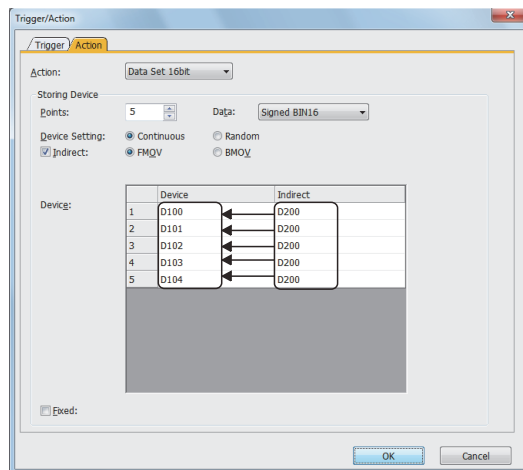

When set conditions are satisfied, the value in D200 + the fixed value (50) is written into D100.

## (2) FMOV and BMOV

When setting two or more devices and selecting [Indirect], select a write operation that writes values to the target devices.

### (a) [FMOV]

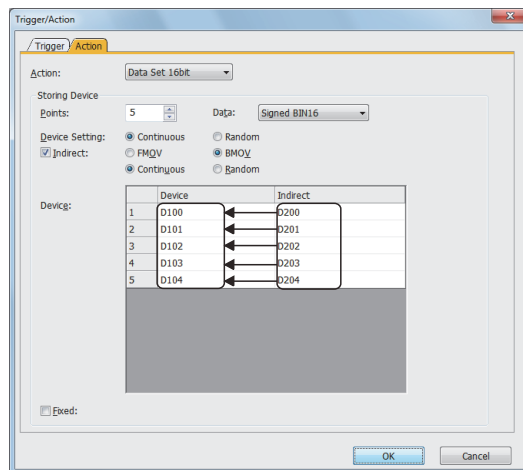

When set conditions are satisfied, the value in the word device set for [Indirect] is written into the target devices.

When set conditions are satisfied, the value in D200 is written into D100 to D104.

### (b) [BMOV]

When set conditions are satisfied, the current values in the word devices individually set for [Indirect] is written into the corresponding target devices.

When set conditions are satisfied, the values in D200 to D204 are written into D100 to D104.

## 9.5.4 Precautions

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

### ■ 1 Setting multiple trigger actions

When setting multiple trigger actions, set [Network No.] and [Station No.], setting items in the [Trigger/Action] dialog, to the same No.

→ 9.5.6 [Trigger/Action] dialog

## 9.5.5 [Trigger Action] dialog

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

When set conditions are satisfied, trigger actions are executed then various operations can be performed: bit devices are turned on/off, values are written into word devices, screens are switched, and sounds are output.

Select [Common] → [Trigger Action] from the menu.

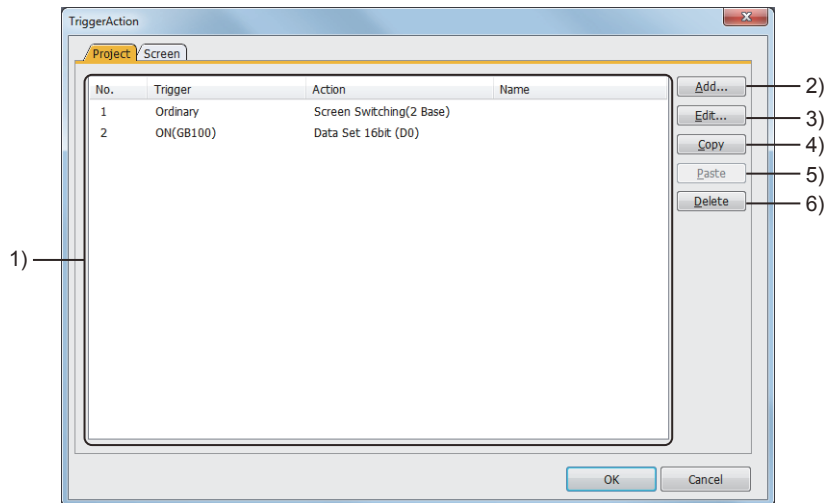

→ ■ 1 [Project] tab

■ 2 [Screen] tab

### ■ 1 [Project] tab

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Displays set trigger actions globally set for the project in a list and manages them.

#### 1) Trigger action list

Lists set trigger actions.

Item	Description
[No.]	Number of a trigger action
[Trigger]	Trigger condition to execute the corresponding action
[Action]	Action to be executed when the trigger condition is satisfied
[Name]	Name of a trigger action

#### 2) [Add] button

Creates a trigger action.

→ 9.5.6 [Trigger/Action] dialog

#### 3) [Edit] button

Changes the settings of a selected trigger action.

→ 9.5.6 [Trigger/Action] dialog

#### 4) [Copy] button

Copies a selected trigger action.

#### 5) [Paste] button

Pastes a copied trigger action.

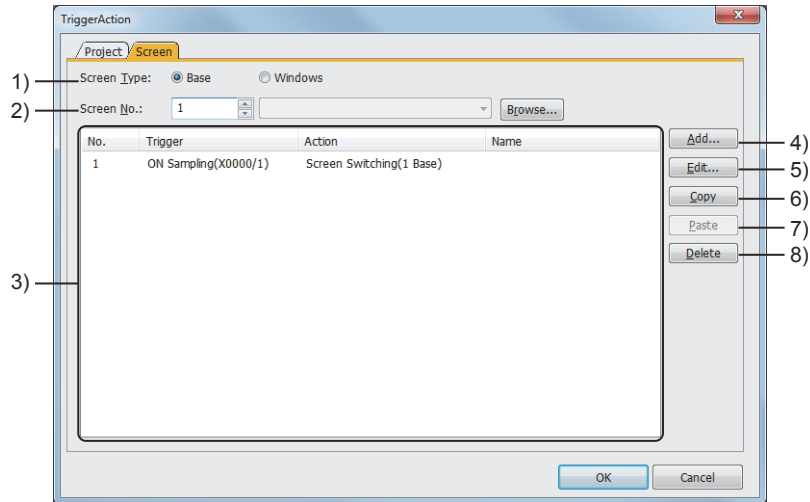

6) **[Delete] button**

Deletes a selected trigger action.

■ 2 **[Screen] tab**

Displays trigger actions set for each screen in a list and manages them.

1) **[Screen Type]**

Set the target screen for set trigger actions.

The following shows selectable items.

- [Base]: Uses a base screen.
- [Windows]: Uses a window screen. (Not available to GT21)

2) **[Screen No.]**

Set the screen No. that has been assigned to the target screen for set trigger actions.

Click the [Browse] button to open the screen image.

3) **Trigger action list**

Lists set trigger actions.

Item	Description
[No.]	Number of a trigger action
[Trigger]	Trigger condition to execute the corresponding action
[Action]	Action to be executed when the trigger condition is satisfied
[Name]	Name of a trigger action

4) **[Add] button**

Creates a trigger action.

⇒9.5.6 [Trigger/Action] dialog

5) **[Edit] button**

Changes the settings of a selected trigger action.

⇒9.5.6 [Trigger/Action] dialog

6) **[Copy] button**

Copies a selected trigger action.

7) **[Paste] button**

Pastes a copied trigger action.

8) **[Delete] button**

Deletes a selected trigger action.

## 9.5.6 [Trigger/Action] dialog

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

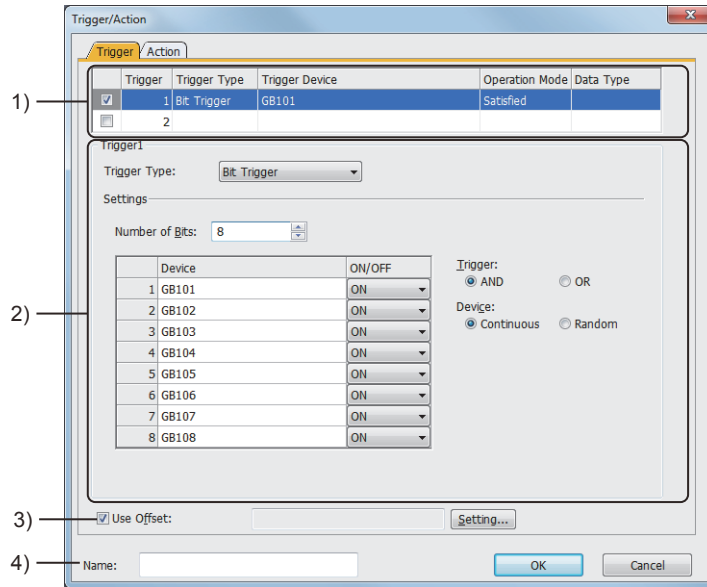

The [Trigger/Action] dialog is displayed when the [Add] button or [Edit] button in the [Trigger Action] dialog is clicked.

- ■ 1 [Trigger] tab
- 2 [Action] tab

### ■ 1 [Trigger] tab

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Set conditions under which set trigger actions are executed.

#### 1) Trigger 1 and trigger 2

Previews set conditions.

Up to two conditions can be set.

In cases where two conditions are set, trigger actions are executed when both of the conditions are satisfied.

When selected, the conditions become valid.

#### 2) [Trigger1], [Trigger2]

Set items for a selected condition.

Item	Description
[Trigger Type]	<p>Set a condition under which trigger actions are executed. The following shows selectable items. Select the first condition from the following.</p> <ul style="list-style-type: none"> <li>• [Ordinary]</li> <li>• [Rise]</li> <li>• [Fall]</li> <li>• [Rise/Fall]</li> <li>• [ON]</li> <li>• [OFF]</li> <li>• [ON Sampling]</li> <li>• [OFF Sampling]</li> <li>• [Sampling]</li> <li>• [Range]</li> <li>• [Bit Trigger]</li> </ul> <p>Select the second condition from the following.</p> <ul style="list-style-type: none"> <li>• [ON]</li> <li>• [OFF]</li> <li>• [Sampling]</li> <li>• [Bit Trigger]</li> </ul> <p>However, if [Ordinary] is selected for the first condition, the second condition cannot be set.</p>
[Settings]	<p>Set necessary items according to the item set for [Trigger Type]. →6.2.2 Setting Trigger Types</p>

### 3) [Use offset]

Displays the target for an offset and the offset device.

This item can be set when trigger actions for each screen are set.

### 4) [Name]

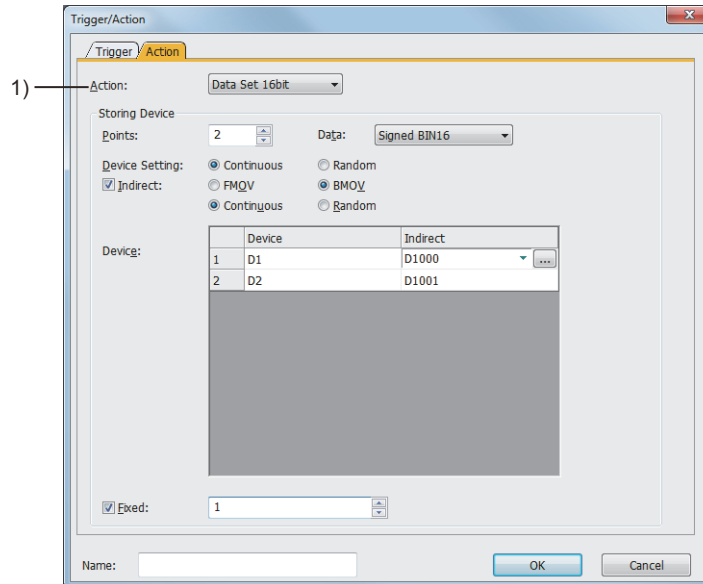

Set the name of a trigger action.

Up to 100 characters can be set.

## ■ 2 [Action] tab

Set actions executed when set conditions are satisfied.

### 1) [Action]

Set actions executed when set conditions are satisfied.

The following shows selectable items.

- [Momentary]: Turns on the target bit devices while the set conditions are satisfied.  
Turns off the target bit devices while the set conditions are not satisfied.  
The target bit devices cannot be turned on or off by other operations.
- [Set]: Turns on the target bit devices.
- [Reset]: Turns off the target bit devices.
- [Alternate]: Switches the status of the target bit devices between on and off.
- [Data Set 16bit]: Writes values into the target 16-bit word devices.
- [Data Set 32bit]: Writes values into the target 32-bit word devices.
- [Screen Switching]: Switches screens
- [Sound Output]: Plays a sound, stops a playback, or mute/unmute the sound. (GT27, GT25 (excluding GT2505-V and GT25HS-V), and GT SoftGOT2000)

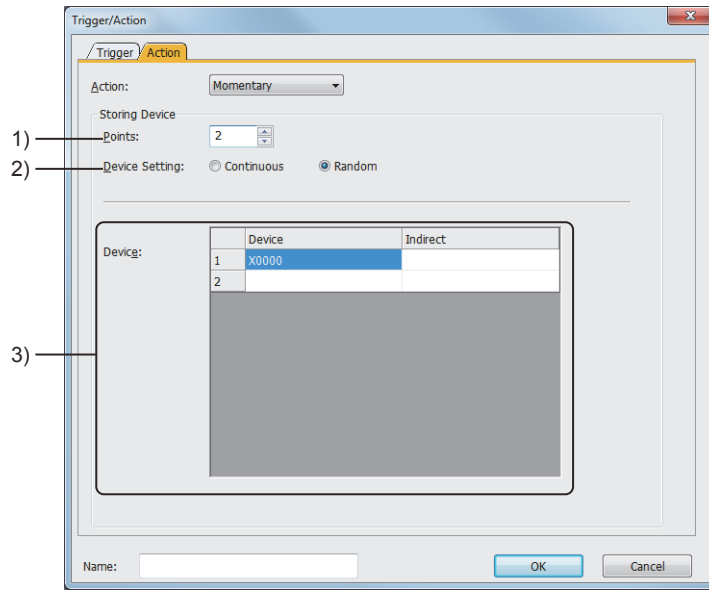

The setting items vary according to the selected action.

For the setting items for each action, refer to the following.

- (1) [Momentary], [Set], [Reset], or [Alternate]
- (2) [Data Set 16bit], [Data Set 32bit]
- (3) [Screen Switching]
- (4) [Sound Output]

(1) [Momentary], [Set], [Reset], or [Alternate]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

1) [Points]

Set the number of devices operated when set conditions are satisfied.  
The setting range is [1] to [40].

2) [Device Setting]

When setting 2 or more for [Points], select the method of setting devices.  
The following shows selectable items.

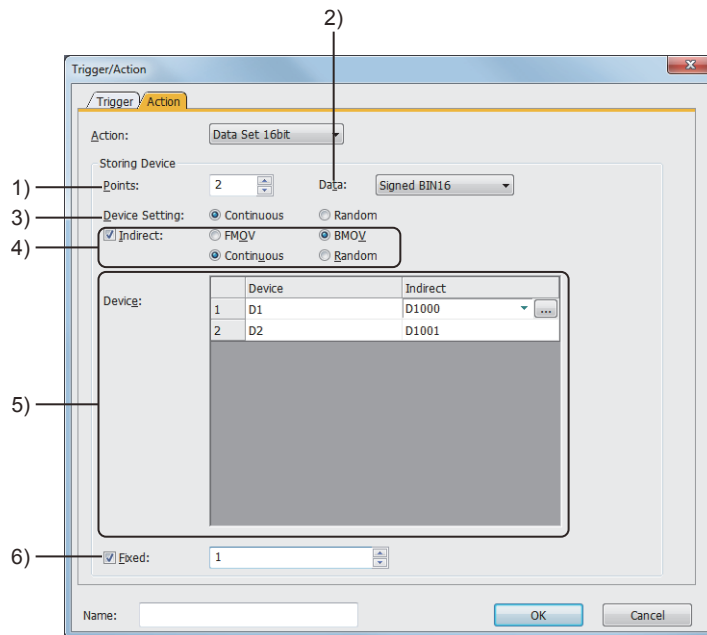

- [Continuous]: Automatically inputs consecutive devices in the table of [Device] when a start device is set.
- [Random]: Sets devices one by one.

3) [Device]

Set the devices operated when set conditions are satisfied.

In the [Device] columns in the table, set the devices operated when set conditions are satisfied.  
The [Indirect] columns are not used.

## (2) [Data Set 16bit], [Data Set 32bit]

### 1) [Points]

Set the number of devices to which values are written when set conditions are satisfied.  
The setting range is [1] to [20].

### 2) [Data]

Select the data type of a value to be written to the target word device.  
The selectable items vary according to the selection for [Action].

- When [Data Set 16bit] is selected
  - [Signed BIN16]
  - [Unsigned BIN16]
  - [BCD16]
- When [Data Set 32bit] is selected
  - [Signed BIN32]
  - [Unsigned BIN32]
  - [BCD32]
  - [Real]

### 3) [Device Setting]

When setting 2 or more for [Points], select the method of setting devices.  
The following shows selectable items.

- [Continuous]: Sets consecutive devices starting from a set device.
- [Random]: Sets devices one by one.

### 4) [Indirect]

Writes the value of an indirect word device to a target word device when the set condition is satisfied.  
When setting 2 or more for [Points], select the method of setting indirect devices.

The following shows selectable items.

- [FMOV]: Set one indirect device.  
⇒9.5.3 ■ 2 (1) [Fixed] and [Indirect]
- [BMOV]: Set indirect devices one by one.  
Select the method of setting indirect devices.

The following shows selectable items.

- [Continuous]: Sets consecutive devices starting from a set device.
- [Random]: Sets devices one by one.  
⇒9.5.3 ■ 2 (2) FMOV and BMOV

### 5) [Device]

Set the devices operated when set conditions are satisfied.

In the [Device] columns in the table, set word devices into which values are written when set conditions are satisfied.

In the [Indirect] columns in the table, set indirect devices.

→6.1.1 How to set devices

### 6) [Fixed]

Set this item when writing a fixed value into the target word devices when set conditions are satisfied.

Set the value to be written.

If [Signed BIN16] is selected for [Data Type], the setting range is [-32768] to [32767].

If [Unsigned BIN16] is selected for [Data Type], the setting range is [0] to [65535].

If [BCD16] is selected for [Data Type], the setting range is [0] to [9999].

If [Signed BIN32] is selected for [Data Type], the setting range is [-2147483648] to [2147483647].

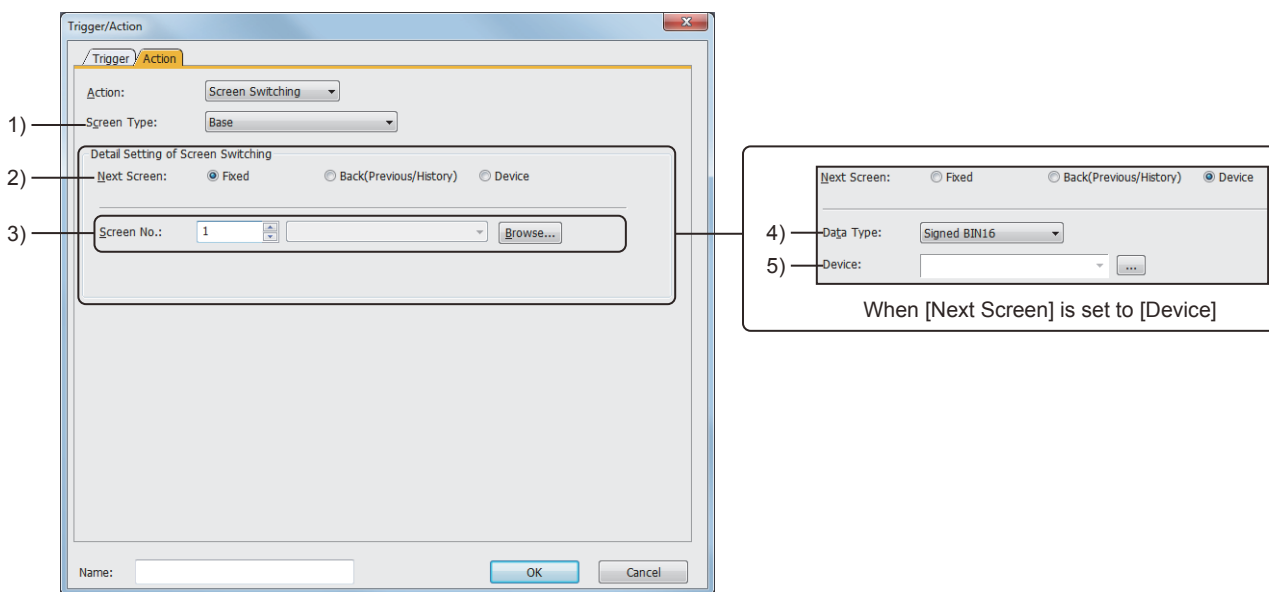

If [Unsigned BIN32] is selected for [Data Type], the setting range is [0] to [4294967295].

If [BCD32] is selected for [Data Type], the setting range is [0] to [99999999].

If [Real] is selected for [Data Type], the setting range is [-999999000000.0] to [999999000000.0].

→9.5.3 ■ 2 (1) [Fixed] and [Indirect]

### (3) [Screen Switching]

When [Next Screen] is set to [Fixed]

#### 1) [Screen Type]

Set the type of the destination screen.

The following shows selectable items.

- [Base]
- [Overlap Window1]
- [Overlap Window2]
- [Overlap Window3] (GT27, GT25, and GT SoftGOT2000)
- [Overlap Window4] (GT27, GT25, and GT SoftGOT2000)
- [Overlap Window5] (GT27, GT25, and GT SoftGOT2000)
- [Superimpose Window1]
- [Superimpose Window2]
- [Dialog Window]

#### 2) [Next Screen]

Set the destination screen for switching.

The following shows selectable items.

- [Fixed]
  - Select this item when switching to the screen that has given a specified screen No.
- [Back(Previous/History)]
  - Select this item when switching to the previously displayed screen.

The hierarchy mode or history mode is settable in the [Environmental Setting] window ([Screen Switching/Window]).

⇒5.2.1 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

- [Device]

Select this item when specifying the destination screen No. with a set device value.

### 3) [Screen No.]

Set the destination screen number.

Click the [Browse] button to open the screen image.

### 4) [Data Type]

Select the data type of the device value.

The following shows selectable items.

- [Signed BIN16]
- [BCD16]

### 5) [Device]

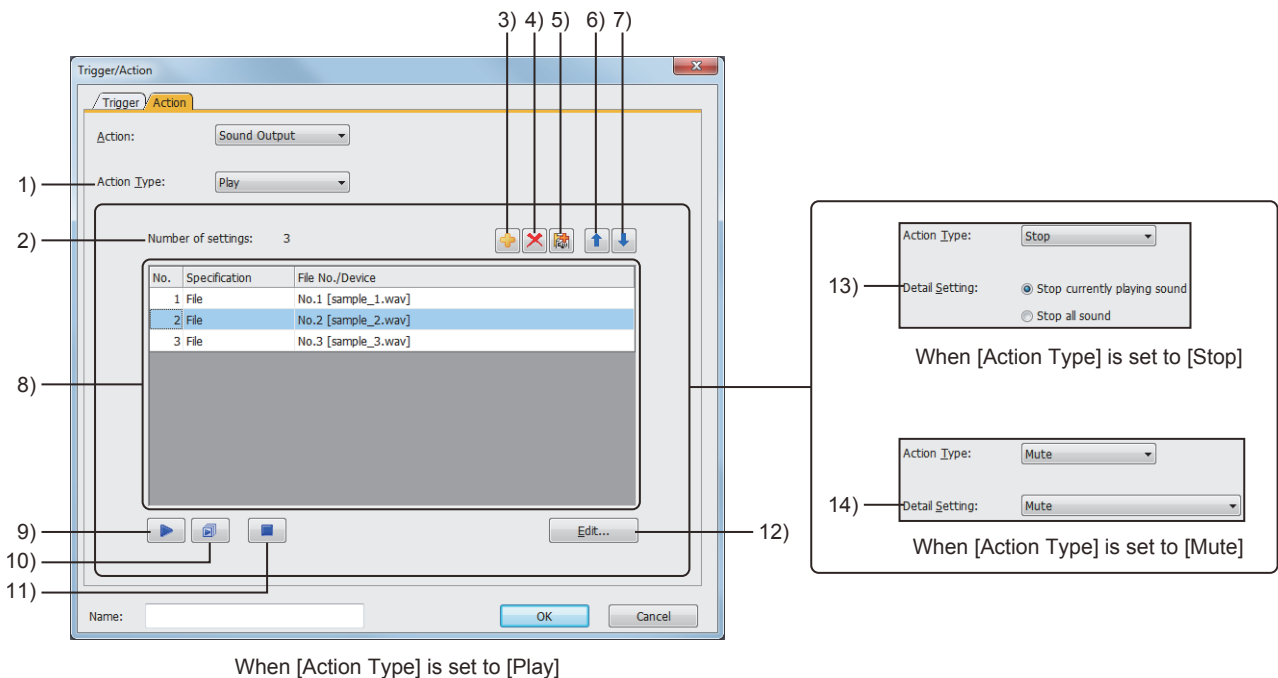

Set a device.

⇒6.1.1 How to set devices

## (4) [Sound Output]

Not available to GT2505-V and GT25HS-V.

### 1) [Action Type]

Select an action of the sound output.

The following shows selectable items.

- [Play]
- [Stop]
- [Mute]

### 2) [Number of settings]

Total number of the play settings in the playlist.

### 3) [Add] button

Adds a new play setting to the playlist.

### 4) [Delete] button

Deletes a selected play setting in the playlist.

### 5) [Duplicate] button

Copies a selected play setting in the playlist.

### 6) [Up] button

Moves the cursor up one row in the playlist.

7) **[Down] button**

Moves the cursor down one row in the playlist.

8) **Playlist**

Lists the play settings of sound files.

Up to 16 play settings can be configured.

When the trigger condition is satisfied, the sound files specified in the playlist play continuously starting from the top of the list.

Item	Description
[No.]	Number of a play setting. The corresponding sound files play in order of increasing number.
[Specification]	Method of specifying a sound file. <ul style="list-style-type: none"> <li>• [File]: Uses a file number to specify a sound file.</li> <li>• [Device]: Uses an indirect device to specify a sound file.</li> </ul>
[File No./Device]	Sound file number or the device to specify a sound file.

9) **[Play] button**

Plays the sound file that corresponds to a selected play setting in the playlist.

10) **[Repeat] button**

Plays the sound files specified in the playlist continuously, starting from the top of the list.

If [Specification] is set to [Device] in a play setting, the corresponding sound file is skipped.

11) **[Stop] button**

Stops the current playback.

12) **[Edit] button**

Displays the [Sound Setting] dialog.

Edit a selected play setting in the playlist.

→9.5.7 [Sound Setting] dialog

13) **[Detail Setting] (when [Action Type] is set to [Stop])**

Select the behavior of the target action.

- [Stop currently playing sound]  
Stops the current playback.  
The standby sound file plays subsequently.
- [Stop all sound]  
Stops the current playback and cancels all standby sound files.

14) **[Detail Setting] (when [Action Type] is set to [Mute])**

Select the behavior of the target action.

- [Mute]
- [Unmute]
- [Mute/unmute]

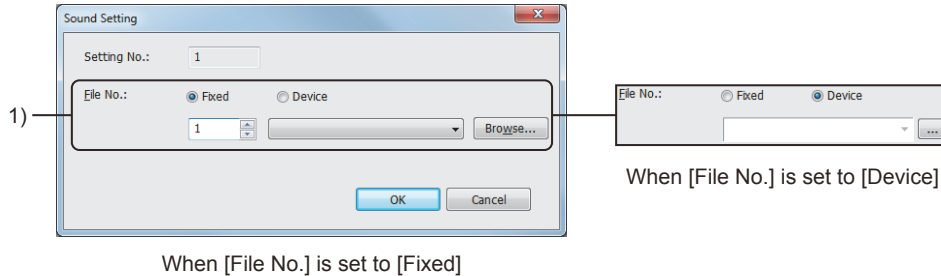

## 9.5.7 [Sound Setting] dialog

Not available to GT2505-V and GT25HS-V.

Set a sound file to play when the trigger condition is satisfied.

To display this dialog, in the [Action] tab of the [Trigger/Action] dialog, set [Action] to [Sound Output] and [Action Type] to [Play], and then click the [Edit] button.

### 1) [File No.]

Select the method of specifying a sound file.

The following shows selectable items.

- [Fixed]
  - Uses a sound file number to specify a sound file.
  - After selecting this item, specify the file number of a registered sound file in the [Sound File List] dialog.
  - The setting range is [1] to [500].
  - Click the [Browse] button to display the [Sound File List] dialog.
  - Register or edit a sound file.
  - ⇒10.12.6 [Sound File List] dialog
- [Device]
  - Uses the value of a specified device to specify a sound file.
  - Select this item, and set a device.
  - ⇒6.1.1 How to set devices

## 9.6 Operating the Set Time as a Trigger ([Time Action])

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 9.6.1 Overview of the time action function

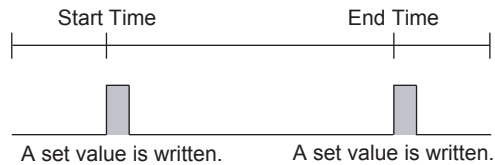

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Devices can be turned on/off and write operations on values can be performed at a specified day of the week and time. This function works based on a day of the week and time the GOT keeps.

#### ■ 1 Turning on and off a bit device of a controller

#### ■ 2 Writing a value into a word device of a controller

#### ■ 3 Outputting sounds with an external speaker (GT27, GT25, and GT SoftGOT2000 only)

### 9.6.2 Specifications of the time action

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■ 1 Number of time actions that can be set

Up to 32 settings can be configured for one project.

#### ■ 2 Actions that can be executed when a set condition is satisfied

- Turning on/off bit devices
- Writing values into word devices
- Outputting sounds with an external speaker (GT27, GT25, and GT SoftGOT2000 only)

## 9.6.3 How to use the time action

### 1 Setting procedure

The following shows the procedure for setting a time action.

**Step 1** Select [Common] → [Time Action] from the menu.

The [Time Action List] dialog appears.

→9.6.5 [Time Action List] dialog

**Step 2** Select a row in the time action list and click the [Edit] button.

The [Time Action Attribute] dialog appears.

→9.6.6 [Time Action Attribute] dialog

**Step 3** In the [Time] tab, set the day of the week and time when the time action starts.

→9.6.6 ■ 1 [Time] tab

**Step 4** In the [Action] tab, set the action executed at the specified day of the week and time.

→9.6.6 ■ 2 [Action] tab

**Step 5** Click the [OK] button.

The [Time Action Attribute] dialog is closed.

**Step 6** Click the [OK] button in the [Time Action List] dialog.

The dialog is closed and the registration of the time action is complete.

### 2 Setting the start and end days of the week and time for time actions

When setting the days of the week and time when time actions start and end, select either of the following items.

#### (1) [Daily]

Select this item when setting the time when time actions start by day of the week.

The same action can be executed multiple times a week.

The start time and end time are required to be set in the same day.

Example) Writing a value into a word device at a specified time every day

#### (2) [Through]

Select this item when the start and end time straddle days.

An action can be executed only once a week.

The start and end time can be set on different days of the week.

Example) Turning on a specified bit device on Monday morning and turning off on Friday morning

### Point

When selecting [Through] for [Mode] and executing the same action twice or more a week, register the time action the number of times that the action is executed.

Example) Setting the same action executed twice a week

- Turning on M0 at a specified time on Monday AM, and turning off M0 at a specified time on Tuesday PM. (the setting of the first action)
- Executing no action on Wednesday
- Turning on M0 at a specified time on Thursday AM, and turning off M0 at a specified time on Friday PM. (the setting of the second action)

### ■ 3 Controlling time actions

Time actions can be controlled with devices.

The settings of time actions can be output and changed.

The following shows the procedure for setting an external control.

**Step 1** Select [Common] → [Time Action] from the menu.

The [Time Action List] dialog appears.

→9.6.5 [Time Action List] dialog

**Step 2** Select [Enable External Control] and set a device.

→6.1.1 How to set devices

**Step 3** When selecting [Separate] for [Device Setting], set an external control device for each time action.

Select a row in the time action list and click the [Edit] button.

The [Time Action Attribute] dialog appears.

→9.6.6 [Time Action Attribute] dialog

**Step 4** Select [External Control Device (8 Points)] in the [Time] tab and set a device.

→9.6.6 ■ 1 [Time] tab

#### (1) External control devices

The settings of a time action can be stored in external control devices.

The setting items assigned to the devices depend on the selection for [Device Setting] in the [Time Action List] dialog.

When [Separate] is selected, the following devices are specified as external control devices.

- Three separate devices set in [External Control] in the [Time Action List] dialog
- Eight consecutive devices set for [External Control Device (8 Points)] in the [Time Action Attribute] dialog

If the device value for the day of the week when the time action starts and ends is 0, the setting of the time action is disabled.

Item	Device		Description
	[Separate]	[Continuous]	
Setting No. device	Set device* <sup>1</sup>	Set device* <sup>1</sup>	Refer to the following. →(2) [Setting No. Device]
External control signal device	Set device* <sup>1</sup>	Set device + 1* <sup>1</sup>	Refer to the following. →(3) [External Control Signal Device]
External control status notification device	Set device* <sup>1</sup>	Set device + 2* <sup>1</sup>	Refer to the following. →(4) [External Control Status Notification Device]
Mode	Set device* <sup>1</sup>	Set device + 3* <sup>1</sup>	Indicates [Mode] of the time action. • b0: 0 [Daily], 1 [Through] • b2 to b15: Use prohibited
Start day of the week, end day of the week	Set device + 1* <sup>2</sup>	Set device + 4* <sup>1</sup>	Indicates the days of the week when the time action starts and ends. When selecting [Daily] for [Mode] of the time action, do not use the device for the end day of the week. Start day of the week • b0: Sunday • b1: Monday • b2: Tuesday • b3: Wednesday • b4: Thursday • b5: Friday • b6: Saturday • b7: Use prohibited End day of the week • b8: Sunday • b9: Monday • b10: Tuesday • b11: Wednesday • b12: Thursday • b13: Friday • b14: Saturday • b15: Use prohibited

Item	Device		Description
	[Separate]	[Continuous]	
Start time (hour)	Set device + 2 <sup>*2</sup>	Set device + 5 <sup>*1</sup>	Indicates the time when the time action starts. (Data type: BCD)
Start time (minute)	Set device + 3 <sup>*2</sup>	Set device + 6 <sup>*1</sup>	
Start time (second)	Set device + 4 <sup>*2</sup>	Set device + 7 <sup>*1</sup>	
End Time (hour)	Set device + 5 <sup>*2</sup>	Set device + 8 <sup>*1</sup>	Indicates the time when the time action ends. (Data type: BCD)
End Time (minute)	Set device + 6 <sup>*2</sup>	Set device + 9 <sup>*1</sup>	
End Time (second)	Set device + 7 <sup>*2</sup>	Set device + 10 <sup>*1</sup>	

\*1 Devices set in [External Control] in the [Time Action List] dialog

→9.6.5 [Time Action List] dialog

\*2 Devices set for [External Control Device (8 Points)] in the [Time Action Attribute] dialog

→9.6.6 ■ 1 [Time] tab

## (2) [Setting No. Device]

Store the setting No. (1 to 32) assigned to the target time action for the external control.

## (3) [External Control Signal Device]

Executes an external control.

Turn on the bit corresponding to the required operation.

If multiple bits are turned on, the rightmost is prioritized.

- b0: Output trigger  
Outputs the data of the time action to the external control devices.
- b1: Change trigger  
Changes the settings of the time action to those of the external control devices.
- b2: Use prohibited
- b3: Time action setting file storage trigger (GT21 only)  
Saves the time settings of all the time actions as the time action setting file.
- b4: Time action setting file deletion trigger (GT21 only)  
Deletes the time action setting file.
- b5 to b15: Use prohibited

### Point

GOT's operations related to the time action setting file

When there is the time action setting file in the GOT at power on or reset, the GOT reads the time action settings from the time action setting file.

## (4) [External Control Status Notification Device]

Notifies the result of the execution of the external control.

After the completion of output or change, this device turns off automatically when the external control signal device is turned off.

- b0: Data were successfully output.
- b1: Data were successfully changed.
- b2: Error  
A system error occurs.
- b3: The time action setting file was successfully saved. (GT21 only)  
Turns on when the time action setting file is successfully saved.
- b4: The time action setting file was successfully read out. (GT21 only)  
Turns on when the time action setting file is successfully deleted.
- b5: The time action setting file was successfully read out. (GT21 only)  
Turns on when the time action setting file in the GOT is successfully read out.
- b6 to b15: Use prohibited

### Disabling the time action setting file

To disable the read operation for reading from the time action setting file, perform either of the following operations then restart the GOT.

- Turn on b4 (time action setting file deletion trigger) of the external control device.
- Write the project in which it has become invalid to write the time action setting file to the GOT.

## (5) Examples of operations in external control

### (a) Output (outputting the settings of a time action to external devices)

- Step 1** Set the setting No. assigned to the target time action for the change of settings.
- Step 2** Turn on b0 of the external control signal device.
- Step 3** The data of the time action are output to the external control devices.

### (b) Change (changing the settings of the time action to those of the external devices)

- Step 1** Set the setting No. assigned to the target time action for the change of settings.
- Step 2** To the external control devices, write the values to replace with.
- Step 3** Turn on b1 of the external control signal device.
- Step 4** The time action is set with the values set above.

## 9.6.4 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■1 When using the same device for multiple time actions

When using the same device for multiple time actions, do not make the executions overlap.

### ■2 When using external control devices

When the following operations are performed after the settings of a time action is changed with external control devices, the settings are reset to the original ones set with GT Designer3.

- Transferring package data
- Installing BootOS
- Powering off and restarting the GOT

### ■3 Operations of time actions

If the GOT's internal clock or the status of the set device is changed, the execution of time actions may be affected. The following lists the operations that affect time actions.

#### (1) Turning on a set bit device before a specified time

Time actions do not start at the specified time.

Example) When the set time when M0 turns on is 9:00

#### (2) When the GOT's internal clock is moved ahead/back

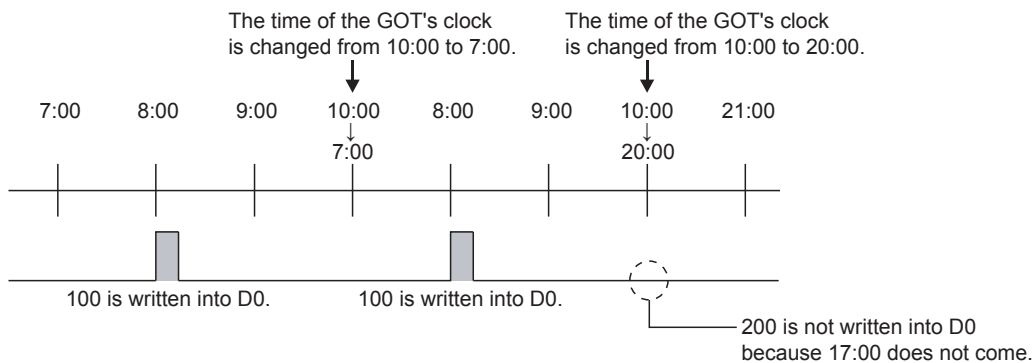

When the specified time when the action starts comes, the action starts.

However, if the current time, obtained after the clock has gone forward/back, is ahead of the specified time, the action does not start.

The following lists the operations that move the GOT's internal clock ahead/back.

- When moving ahead/back the GOT's internal clock with the utility [Time setting] (by the time notification)
- When the time of the controller is moved ahead/back (by the time setting)
- When the clock is moved ahead/back with the GOT internal devices (GS513 to GS516).

Example) To D0, 100 is written at the start time 8:00 and 200 is written at the end time 17:00.

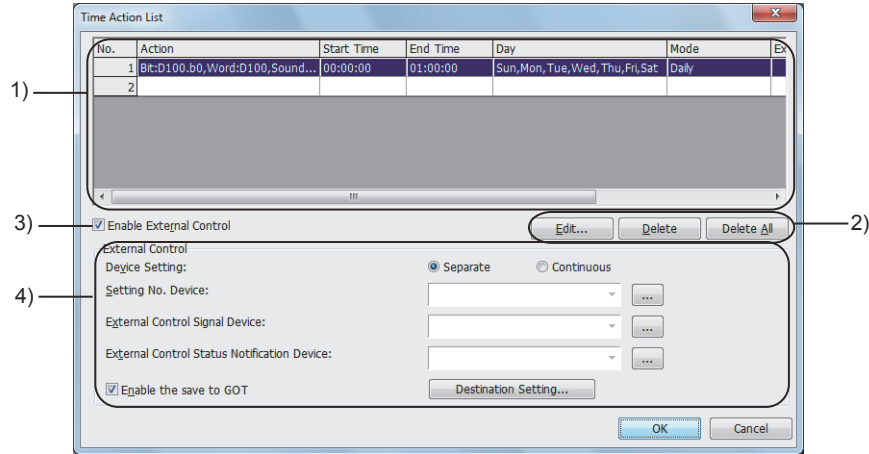

## 9.6.5 [Time Action List] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

By time actions, devices can be turned on/off and write operations on values can be performed at a specified day of the week and time.

Select [Common] → [Time Action] from the menu to display the [Time Action List] dialog.

Set the operations of time actions, start time, and end time.

### 1) Time action list

Lists set time actions.

→ 9.6.6 [Time Action Attribute] dialog

Item	Description
[No.]	Displays the numbers that show the number of time actions.
[Action]	Displays the actions executed when a set conditions is satisfied.
[Start Time]	Displays the time when the time action starts.
[End Time]	Displays the time when the time action ends.
[Day]	Displays the day of the week when the time action is executed.
[Mode]	Displays the mode in which the day of the week and time when the time action starts are specified.
[External Control]	Displays a set external control device.

### 2) [Edit] button

Changes the settings of a selected time action.

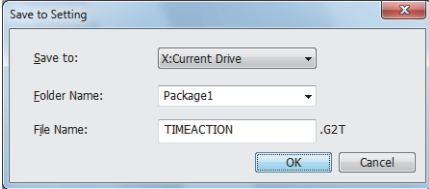

Item	Description
[Edit] button	Changes the settings of a selected time action. → 9.6.6 [Time Action Attribute] dialog
[Delete] button	Deletes a selected time action.
[Delete All] button	Deletes all the set time actions.

### 3) [Enable External Control]

Set this item when controlling time actions with devices.

### 4) [External Control]

Set each item of an external control.

Item	Description
[Device Setting]	<p>Select the manner in which external control devices are set. The following shows selectable items.</p> <ul style="list-style-type: none"> <li>• [Separate]: Set external control devices by time action. Eight word devices are required per time action.</li> </ul>  <ul style="list-style-type: none"> <li>• <b>[Setting No. Device]</b> Set a device that specifies the time actions to be controlled.</li> <li>• <b>[External Control Signal Device]</b> Set a trigger device that executes the control. →9.6.3 ■ 3 (3) [External Control Signal Device]</li> <li>• <b>[External Control Status Notification Device]</b> Set a device that outputs the status of the time action. →9.6.3 ■ 3 (4) [External Control Status Notification Device]</li> <li>• <b>[Continuous]:</b> Uses the same external control devices for all the set time actions. Eleven word devices are required.</li> </ul>  <ul style="list-style-type: none"> <li>• <b>[Setting No. Device(11 points)]</b> Set a device that specifies the time actions to be controlled. Eleven consecutive devices counted from the specified device are set as external control devices.</li> </ul>
[Enable the save to GOT]	<p>Set this item when it is necessary to save the time action setting file in the GOT. Setting this item enables b3 to b4 of the external control signal device and b3 to b5 of the external control status notification device. Setting this item enables the following operations.</p> <ul style="list-style-type: none"> <li>• Changing the settings of time actions with external control devices</li> <li>• Deleting the time action setting file →9.6.3 ■ 3 (4) [External Control Status Notification Device]</li> </ul>
[Destination Setting] button	<p>Displays the [Destination Setting] dialog. Set items required to save the time action setting file in the GOT.</p>  <ul style="list-style-type: none"> <li>• <b>[Save to]</b> Set a destination drive. The following shows selectable items. <ul style="list-style-type: none"> <li>· [A:Standard SD Card]</li> <li>· [B:USB Drive]</li> <li>· [C:Built-in Flash Memory] (for GT2103-P only)</li> <li>· [D:Built-in SRAM]</li> <li>· [E:USB Drive]</li> <li>· [F:USB Drive]</li> <li>· [G:USB Drive]</li> <li>· [X:Current Drive]</li> </ul> For the available drives by GOT model, refer to the following. →1.2.7 Drive configuration of the target GOT for data transfer</li> <li>• <b>[Folder Name]</b> Set the folder name of the folder where the file is stored. For the restrictions on the folder name used with the GOT, refer to the following. →12.4 Restrictions for Folder Names and File Names used in GOT When [C:Built-in Flash Memory] or [D:Built-in SRAM] is selected for [Save to], the name set in [Package Folder Name] in the [Type Setting] dialog is specified as the folder name.</li> <li>• <b>[File Name]</b> Set the name of the files to be saved. For the restrictions of the file name used in the GOT, refer to the following. →12.4 Restrictions for Folder Names and File Names used in GOT When [C:Built-in Flash Memory] or [D:Built-in SRAM] is selected for [Save to], "TIMEACTION" is specified as the file name.</li> </ul>

## 9.6.6 [Time Action Attribute] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

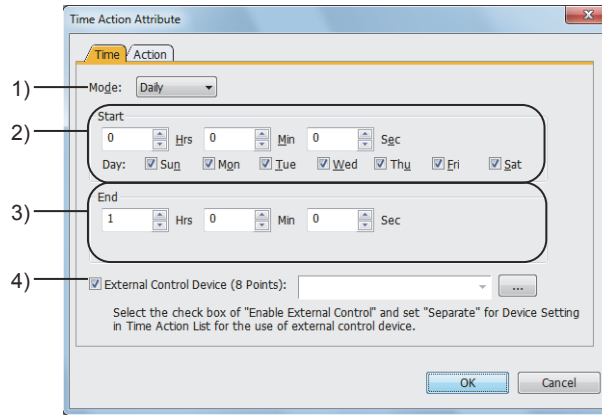

Click the [Edit] button in the [Time Action List] dialog to display the [Time Action Attribute] dialog.

- ■ 1 [Time] tab
- 2 [Action] tab

### ■ 1 [Time] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the day of the week and time when the time action starts.

#### 1) [Mode]

Set the mode in which the day of the week and time when the time action starts are specified. The following shows selectable items.

- [Daily]: Executes the time action on a specified day of the week.
- [Through]: Enables the time action for the period between specified days of the week.

#### 2) [Start]

Set the day of the week and time when the time actions starts.

Item	Description
[Hrs], [Min], [Sec]	Set the time when the time actions starts.
[Day]	When selecting [Daily] for [Mode], set the day of the week when the time action starts. Multiple days of the week can be selected. When selecting [Through] for [Mode], set the day of the week when the time action starts.

#### 3) [End]

Set the day of the week and time when the time action ends.

Item	Description
[Hrs], [Min], [Sec]	Set the time when the time action ends.
[Day]	Set the day of the week when the time action ends. Set this item when selecting [Through] for [Mode].

#### 4) [External Control Device (8 Points)]

Set a device that controls the time action.

- 6.1.1 How to set devices

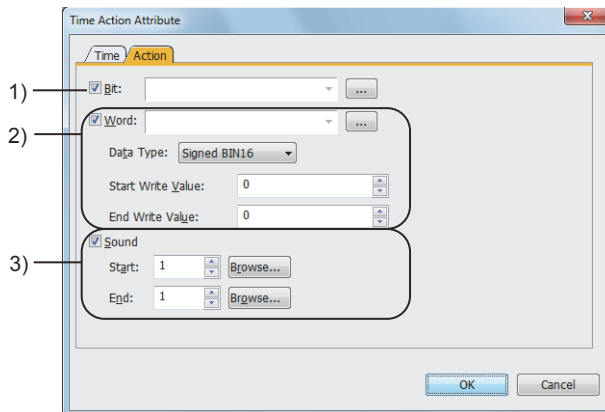

Eight consecutive devices counted from the specified device are set as external control devices.

Set this item when selecting [Separate] for [Device] in [Time Action List].

## 2 [Action] tab

Set the action to execute.

### 1) [Bit]

Set this item to turn on a bit device at the start of the time action and to turn off at the end of the action.  
Set a bit device.

⇒6.1.1 How to set devices

### 2) [Word]

Set this item to write values to a word device at the start and end of the time action.  
Set a word device.

⇒6.1.1 How to set devices

Item	Description
[Data Type]	Set the data type of the word device. The following shows selectable items. <ul style="list-style-type: none"> <li>• [Signed BIN16]</li> <li>• [Unsigned BIN16]</li> <li>• [Signed BIN32]</li> <li>• [Unsigned BIN32]</li> <li>• [BCD 16]</li> <li>• [BCD 32]</li> <li>• [Real]</li> </ul>
[Start Write Value], [End Write Value]	Set values to write to the word device at the start and end of the time action. If [Signed BIN16] is selected for [Data Type], the setting range is [-32768] to [32767]. If [Unsigned BIN16] is selected for [Data Type], the setting range is [0] to [65535]. If [Signed BIN32] is selected for [Data Type], the setting range is [-2147483648] to [2147483647]. If [Unsigned BIN32] is selected for [Data Type], the setting range is [0] to [4294967295]. If [BCD16] is selected for [Data Type], the setting range is [0] to [9999]. If [BCD32] is selected for [Data Type], the setting range is [0] to [99999999]. If [Real] is selected for [Data Type], the setting range is [-999999000000.0] to [999999000000.0].

### 3) [Sound]

Available to GT27, GT25 (excluding GT2505-V and GT25HS-V), and GT SoftGOT2000.  
Set this item to replay a sound at the start and end of the time action.

⇒10.12 Outputting Sound with the GOT (Sound Output Function)

Item	Description
[Start], [End]	Set the numbers assigned to the sound files output at the start and end of the time action. The setting range is [1] to [500]. If the [Browse] button is clicked, a sound can be selected from the list. ⇒10.12.6 [Sound File List] dialog

## 9.7 Capturing the Operating Screen of the GOT ([Hard Copy])

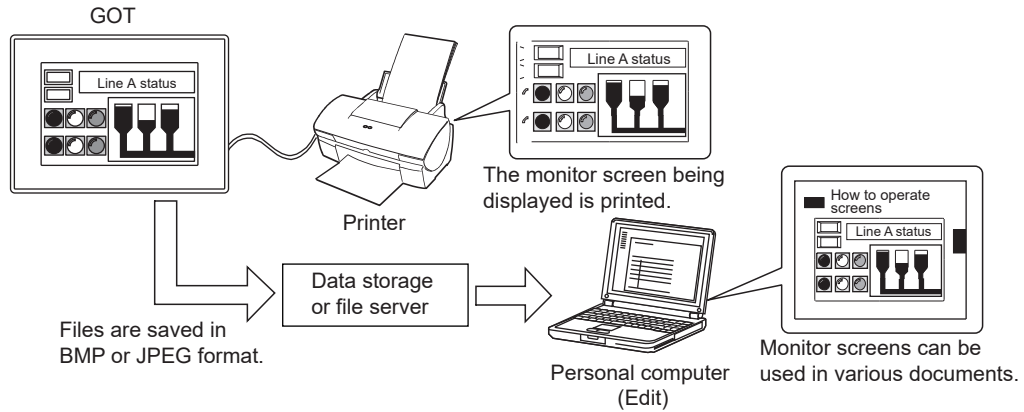

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

### 9.7.1 Overview of the hard copy function

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

The hard copy function captures the screen being displayed on the GOT. The captured screen image is output to one of the following destinations.

- Image file (BMP file or JPEG file)
- Printer

## 9.7.2 Specifications of the hard copy

### ■1 Number of hard copies that can be set

One hard copy setting is available for one project.

### ■2 Output destination

A captured screen image is output to two types of destinations below.

- Image file
- Printer

For the specifications of each output destination, refer to the following.

- ⇒9.7.2 ■3 Specifications of the image file output
- 9.7.2 ■4 Specifications of the printer output

### ■3 Specifications of the image file output

#### (1) File format

The following file formats are supported.

- BMP format
- JPEG format

#### (2) Maximum number of image files to be saved

Up to 9999 files can be saved.

#### (3) File name

The file name of an image file consists of the file name specified on GT Designer3 and a file number.

Example) When [File Name] is set to [SNAP], and [Style] is set to [BMP]

Order in which image files are saved	File name
1st	SNAP0001.BMP
2nd	SNAP0002.BMP
:	:
9998th	SNAP9998.BMP
9999th	SNAP9999.BMP

### ■4 Specifications of the printer output

On GT SoftGOT2000, the captured screen images are output to the printer connected with the personal computer.

For the specifications of the hard copy function on GT SoftGOT2000, refer to the following.

- ⇒GT SoftGOT2000 Version1 Operating Manual

#### (1) Usable printers

The following printers are supported.

- PictBridge-compatible printer (GT27 and GT25 (excluding GT25-W, GT2505-V, and GT25HS-V))
- Serial printer (GT27, GT25 (excluding GT25HS-V), GT23, and GT21)
- Ethernet printer (GT27, GT25, and GT23)

#### (2) System application (extended function)

The following system application (extended function) is required.

- For PictBridge-compatible printers: [Printer(PictBridge)]
- For serial printers: [Printer(Serial)]
- For Ethernet printers: [Printer(ESC/P-R)]

Selecting [Printer] for [Destination] in the [Hard Copy] dialog incorporates the application into the package data automatically.

To use the function on GT SoftGOT2000, the application is not required.

#### (3) Required version of BootOS

To use an Ethernet printer, install version AJ or later of BootOS on the GOT.

- ⇒4.3.2 Transferring data

## 9.7.3 How to use the hard copy function (Image file output)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 Setting procedure

The following shows the procedure for outputting a captured image to an image file.

- Step 1** Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.  
     ⇒9.7.6 [Hard Copy] dialog
- Step 2** Set [Destination] to [File] or [File + Printer].
- Step 3** In the [File] tab, set necessary items and click the [OK] button.  
     ⇒9.7.6 ■ 1 [File] tab  
     When [File + Printer] is selected for [Destination], configure the setting for the printer output as well.  
     ⇒9.7.4 How to use the hard copy function (Printer output)

For the methods of starting a hard copy output, refer to the following.

- ⇒9.7.3 ■ 2 Starting a hard copy output

### ■ 2 Starting a hard copy output

The following shows the procedure for starting a hard copy output.

#### (1) Using a start trigger device

Set the start trigger device for the image file output.

- Step 1** Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.  
     ⇒9.7.6 [Hard Copy] dialog
- Step 2** In the [File] tab, select [Start Trigger Device].
- Step 3** Specify a start trigger device, and click the [OK] button.

To start a hard copy output, use a bit switch or other methods to turn on the start trigger device.

Set the ON and OFF times of the start trigger device to one second or more for each.

If you use the bit switch in which [Action] is set to [Momentary], configure the settings in the [Bit Switch] dialog ([Extended] tab) as shown below.

- Set [Delay] to [OFF].
- Set [Delay Time] to [1] second or more.  
     ⇒8.2.5 [Bit Switch] dialog

#### (2) Using a special function switch

Configure the settings of a special function switch as shown below.

- Set [Switch Action] to [Start Hard Copy].
- Select [Specify the destination to output hard copies].
- Set [Destination] to [File].

Setting a start trigger device is unnecessary.

To start a hard copy output, touch the set special function switch.

- ⇒8.2.9 [Special Function Switch] dialog

## 9.7.4 How to use the hard copy function (Printer output)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

### 1 System configuration

The following shows the system configuration when a printer is used.

For connecting a printer to the GOT, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

On GT SoftGOT2000, the captured screen images are output to the printer connected with the personal computer.

For the specifications of the hard copy function on GT SoftGOT2000, refer to the following.

→GT SoftGOT2000 Version1 Operating Manual

#### (1) PictBridge-compatible printer

Available cables differ depending on the connection type.

Printer	Connection cable	GOT		PLC	Number of connectable printers
Model	Model	Option	GOT model		
For the connectable printers and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	GT09-C30USB-5P(3m) (included in the printer unit)	GT15-PRN*1	GT27 GT25*2	For the system configuration between the GOT and the PLC, refer to each connection manual.	One printer for one GOT

\*1 The unit for the communication between the GOT and the PictBridge-compatible printer.

Some PictBridge-compatible printers may not be able to print data properly. For the precautions of the printer connection, refer to the following Technical News.

→List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)

\*2 GT25-W, GT2505-V, and GT25HS-V are excluded.

#### (2) Serial printer

Available cables differ depending on the connection type.

Printer	Connection cable	GOT		PLC	Number of connectable printers
Model	Model	Option	GOT model		
For the connectable printers and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	RS-232 cable*1	- (Built into GOT)	GT27 GT25*2 GT23 GT21	For the system configuration between the GOT and the PLC, refer to each connection manual.	One printer for one GOT

\*1 Available RS-232 cables differ according to the printer used. Prepare a RS-232 cable that is suitable for the specifications of

the printer to be used.  
 \*2 GT25HS-V is excluded.

## ■2 Ethernet printer

Printer	Connection cable <sup>*1,2</sup> , wireless LAN access point	Maximum segment length <sup>3</sup>	GOT		PLC	Number of connectable personal computers
			Option	GOT model		
Select by each user →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	<ul style="list-style-type: none"> <li>• 100BASE-TX Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher</li> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher</li> </ul>	100m	- (Built into GOT)	GT27 GT25 <sup>*8</sup> GT23	For the system configuration between the GOT and the PLC, refer to each connection manual.	One personal computer for one GOT
			GT25-J71E71-100	GT27 GT25 <sup>*6</sup>		
	-	-	GT25-WLAN	GT27 <sup>*4</sup> GT25 <sup>*4,7</sup>		
	<ul style="list-style-type: none"> <li>• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*5</sup> GT25 <sup>*5,7</sup>		

- \*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard. For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.
- \*2 When a hub is used, use a straight cable.  
 To connect the GOT and the printer directly with an Ethernet cable, use a straight or cross cable.  
 For the cables usable for your printer, check the printer specifications.
- \*3 The length between the hub and node.  
 The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.
- 10BASE-T: Up to 4 personal computers for a cascade connection (500m)
  - 100BASE-TX: Up to 2 personal computers for a cascade connection (205m)
- For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades. For the limit, contact the switching hub manufacturer.
- \*4 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.  
 →5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*5 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.  
 →5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*6 GT25-W, GT2505-V, and GT25HS-V are excluded.
- \*7 GT2505-V and GT25HS-V are excluded.
- \*8 For GT2505HS-V, one built-in interface is usable.  
 An Ethernet printer is connectable only when the GOT is connected to a controller by Ethernet.

### ■3 Setting procedure

#### (1) For GT27, GT25, GT23, and GT21

The following shows the procedure for outputting a captured image to a printer.

- Step 1** Connect a printer to the GOT.
  - ⇒GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1
- Step 2** Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.
  - ⇒9.7.6 [Hard Copy] dialog
- Step 3** Set [Destination] to [Printer] or [File + Printer].
- Step 4** In the [Printer] tab, set necessary items and click the [OK] button.
  - ⇒9.7.6 ■ 2 [Printer] tab
  - When [File + Printer] is selected for [Destination], configure the setting for the image file output as well.
  - ⇒9.7.3 How to use the hard copy function (Image file output)

For the methods of starting a hard copy output, refer to the following.

- ⇒9.7.4 ■ 4 Starting a hard copy output

If you start a hard copy output while the printer is powered off, a captured screen image cannot be printed.

Make sure to power on the printer.

Printing starts upon power-on of the printer.

#### (2) For GT SoftGOT2000

The following shows the procedure for outputting a captured image to a printer.

- Step 1** Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.
  - ⇒9.7.6 [Hard Copy] dialog
- Step 2** Set [Destination] to [Printer] or [File + Printer].
- Step 3** In the [Printer] tab, set necessary items and click the [OK] button.
  - ⇒9.7.6 ■ 2 [Printer] tab
  - When [File + Printer] is selected for [Destination], configure the setting for the image file output as well.
  - ⇒9.7.3 How to use the hard copy function (Image file output)
- Step 4** On GT SoftGOT2000, select the [Project] menu and configure the print settings.
  - ⇒9.7.6 [Hard Copy] dialog

For the methods of starting a hard copy output, refer to the following.

- ⇒9.7.4 ■ 4 Starting a hard copy output

If you start a hard copy output while the printer is powered off, a captured screen image cannot be printed.

Make sure to power on the printer.

Printing starts upon power-on of the printer.

### ■4 Starting a hard copy output

The following shows the procedure for starting a hard copy output.

#### (1) Using a start trigger device

Set the start trigger device for the printer output.

- Step 1** Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.
  - ⇒9.7.6 [Hard Copy] dialog
- Step 2** In the [Printer] tab, select [Start Trigger Device].
- Step 3** Specify a start trigger device, and click the [OK] button.

To start a hard copy output, use a bit switch or other methods to turn on the start trigger device.

Set the ON and OFF times of the start trigger device to one second or more for each.

If you use the bit switch in which [Action] is set to [Momentary], configure the settings in the [Bit Switch] dialog ([Extended] tab) as shown below.

- Set [Delay] to [OFF].
- Set [Delay Time] to [1] second or more.

⇒8.2.5 [Bit Switch] dialog

**(2) Using a special function switch**

Configure the settings of a special function switch as shown below.

- Set [Switch Action] to [Start Hard Copy].
- Select [Specify the destination to output hard copies].
- Set [Destination] to [Printer].

Setting a start trigger device is unnecessary.

To start a hard copy output, touch the set special function switch.

⇒8.2.9 [Special Function Switch] dialog

**■5 Aborting a hard copy output**

The following shows the procedure for aborting a hard copy output.  
GT SoftGOT2000 does not support aborting a hard copy output.

**(1) Using an abort trigger device**

Set the abort trigger device for the printer output.

**Step 1** Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.

⇒9.7.6 [Hard Copy] dialog

**Step 2** In the [Printer] tab, select [Abort Trigger Device].

**Step 3** Specify an abort trigger device, and click the [OK] button.

To abort a hard copy output, use a bit switch or other methods to turn on the abort trigger device.

Set the ON and OFF times of the abort trigger device to one second or more for each.

If you use the bit switch in which [Action] is set to [Momentary], configure the settings in the [Bit Switch] dialog ([Extended] tab) as shown below.

- Set [Delay] to [OFF].
- Set [Delay Time] to [1] second or more.

⇒8.2.5 [Bit Switch] dialog

**(2) Using a special function switch**

In the setting of a special function switch, set [Switch Action] to [Abort Hard Copy].

Setting an abort trigger device is unnecessary.

To abort a hard copy output, touch the set special function switch.

⇒8.2.9 [Special Function Switch] dialog

**■6 Printing a captured image with inverted black and white colors**

A captured screen image is printable with inverted black and white colors.

The black and white areas are inverted.

Any other color areas (including gray and red) are printed as-is.

The black and white inversion is useful for the following purposes.

- To use less ink of the printer when a screen image to be printed has many black areas
- To improve visibility when a screen image to be printed has many black areas

The following shows how to enable or disable the black and white inversion.

### (1) Configuring the setting on GT Designer3

To enable the black and white inversion, select [Invert] in the [Hard Copy] dialog ([Printer] tab).

→9.7.6 [Hard Copy] dialog

This setting is not applied to GT SoftGOT2000.

Configure the print settings on GT SoftGOT2000.

→GT SoftGOT2000 Version1 Operating Manual

### (2) Using the system signals

To enable the black and white inversion on the GOT, use the following system signals.

Not available to GT SoftGOT2000.

- Hard Copy Setting Validate signal (System signal 1-1.b10)

Turning on this signal enables the setting change of the hard copy function.

Turn on the signal before executing a hard copy output.

Turn on this signal before the GOT recognizes its internal processing (it takes approximately 300 ms).

- Hard Copy White/Black Reverse signal (System signal 1-1.b12)

When this signal is on, the black and white inversion is enabled.

When this signal is off, the black and white inversion is disabled.

## 9.7.5 Precautions

### 1 Precautions for use

#### (1) When using the image file output and the printer output together

If the trigger condition for printer output is satisfied while a captured image is being saved to a file, the printer output is executed upon completion of the image file output.

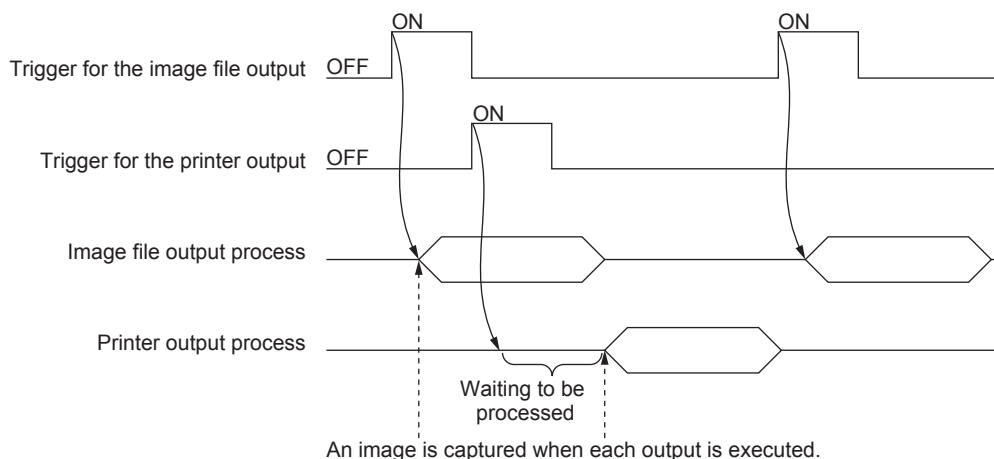

If the trigger condition for image file output is satisfied while a captured image is being printed, the image file output is executed upon completion of the printer output.

An image is not captured when the trigger condition for a target output is satisfied, but captured when the target output is executed.

If the trigger condition for image file output and the one for printer output are satisfied simultaneously, the GOT captures the image displayed when each output is executed.

Thus, the captured images may be different between the outputs.

Example) When the trigger condition for printer output is satisfied while a captured image is being saved to a file  
Upon completion of the image file output, the printer output is executed.

#### (2) Utilizing a GOT1000 project

If you convert a GOT1000 project to a GOT2000 project, check the printer setting of the project.

When the output destination is set to a printer in a GOT1000 project, the destination interface for the printer is set to [Not connected] automatically in the printer setting.

After the project conversion, change the destination interface for the printer.

## ■2 Precautions for use (Image file output only)

### (1) GOT status during a hard copy

While a hard copy operation is being performed, the GOT interrupts its processing of screens being displayed. The screen processing restarts after the completion of the hard copy.

### (2) State of a new trigger while an image file output is being executed

Even if the trigger condition for an image file output is satisfied while another image file output is being executed, the new trigger is invalid.

Make sure that the trigger condition for a new image file output is satisfied after the ongoing file output is complete. Check the Writing Notification device for completion of an image file output.

→9.7.6 ■ 1 [File] tab

## ■3 Precautions for use (Printer output only)

### (1) Some areas of the screen on the GOT cannot be copied

Depending on the printer used, some areas of the screen may not be copied properly.

If it happens, disable the trimming in the setting of the printer used. (Some printers may not have the trimming setting.)

### (2) Printer's error

When an error occurs in the printer at the printing or the printer fed a blank sheet of paper but it can print the data properly when the restart button is pressed, set [A4] for [Print Image Size] of the hard copy and supply A4-size papers into the printer in the portrait direction.

An error may occur depending on the printer used when the sheet size and print image size are different.

Even though you use the printer in which an error occurs when [Print Image Size] is set for any size other than [A4], it may print the data properly with the set size.

- Set any size other than [A4] to [Print Image Size] of the hard copy.
- Supply A4-size papers into the printer in the portrait direction.
- An error (such as the printer feeds a blank sheet of paper) may occur. However, the printer may be able to print data properly when the restart button is pressed.

For the details of the operations and settings of the printer, refer to the following.

→Manual of the printer used

### (3) State of a new trigger while a printer output is being executed

Even if the trigger condition for a printer output is satisfied while another printer output is being executed, the new trigger is invalid.

Make sure that the trigger condition for a new printer output is satisfied after the ongoing printer output is complete.

Check the Hard Copy Output signal (System signal 2-1.b7) for completion of a printer output.

→5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

## ■4 Precautions for hardware (Printer output only)

### (1) Setting of the system signal 2-2 when a serial printer is used

The printer may not print data and a system alarm may not occur even if the Print Output signal (System signal 2-2.b15) is turned off from on.

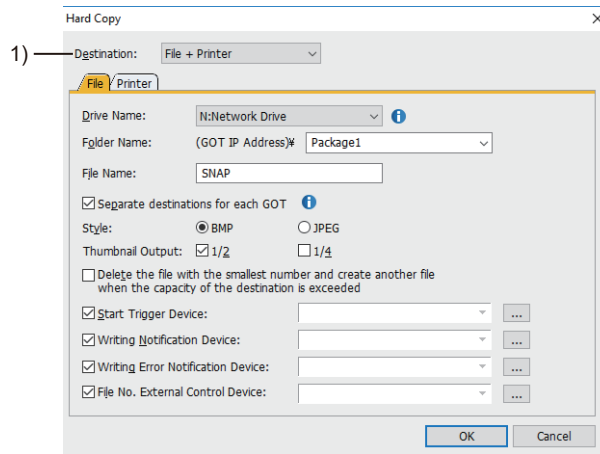

In this case, check if the printer is powered off and cables are disconnected.

## 9.7.6 [Hard Copy] dialog

The hard copy function captures the screen being displayed on the GOT and outputs the captured image to an image file or a printer.

Select [Common] → [Hard Copy] from the menu to display the [Hard Copy] dialog.

### 1) [Destination]

Select the output destination of a captured image.

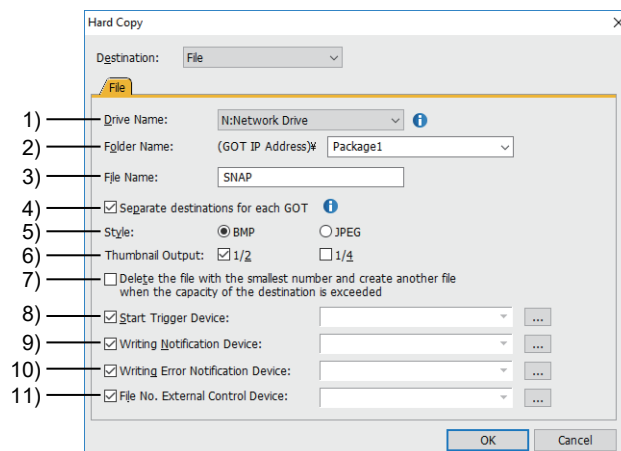

The following shows selectable items.

- [File]  
Outputs a captured image to an image file.  
Displays the [File] tab.
- [Printer]  
Outputs a captured image to a printer.  
Displays the [Printer] tab.
- [File + Printer]  
Outputs a captured image to an image file or a printer.  
Displays the [File] tab and the [Printer] tab.

For the setting items on each tab, refer to the following.

- ■ 1 [File] tab
- 2 [Printer] tab

### ■ 1 [File] tab

### 1) [Drive Name]

Set the destination drive.

The following shows selectable items.

- [A:Standard SD Card]
- [B:USB Drive]
- [E:USB Drive]
- [F:USB Drive]
- [G:USB Drive]
- [N:Network Drive]
- [X:Current Drive]

For the available drives by GOT model, refer to the following.

⇒ 1.2.7 Drive configuration of the target GOT for data transfer

**2) [Folder Name]**

Set the name of the folder to which an image file is saved.

Up to 65 characters can be set.

When [1/2] or [1/4] is selected for [Thumbnail Output], up to 63 characters can be set.

For the restrictions on the folder name, refer to the following.

⇒ 12.4 Restrictions for Folder Names and File Names used in GOT

**3) [File Name]**

Set the name of the files to be saved.

Up to 67 characters can be set.

When [1/2] or [1/4] is selected for [Thumbnail Output], up to 65 characters can be set.

For the restrictions on the file name, refer to the following.

⇒ 12.4 Restrictions for Folder Names and File Names used in GOT

**4) [Separate destinations for each GOT]**

Available to GT27 and GT25.

This item appears when [Drive Name] is set to [N:Network Drive].

Automatically creates a folder for each GOT to save image files.

Each folder is named as the IP address of each GOT.

⇒ 5.3.15 ■ 4 Creating a folder for each GOT

**5) [Style]**

Set the file format of a file to be saved.

The following shows selectable items.

- [BMP]
- [JPEG]

**6) [Thumbnail Output]**

Set this item to create a thumbnail of a captured image when the image is saved to a file.

Example) [1/2] in size

Item	Description
[1/2]	Creates a thumbnail that is half of normal screen size. The following shows the destination folder. • Folder name: Folder set with [Folder Name]\M • File name: Name set for [File Name]
[1/4]	Creates a thumbnail that is a quarter of normal screen size. The following shows the destination folder. • Folder name: Folder set with [Folder Name]\S • File name: Name set for [File Name] To use the vertically installed GT27-S or GT27-V, install the version E or later of BootOS on the GOT.

**7) [Delete the file with the smallest number and create another file when the capacity of the destination is exceeded]**

Deletes an existing file and saves a new file when the save destination drive has insufficient free space.

Operation varies depending on the amount of free space of the destination drive and the file number of each file in the

destination folder.

File number of a file in the destination folder	If the destination drive has enough free space	If the destination drive has insufficient free space
File No. 9999 nonexistent	A new file is saved with the largest file number in the destination folder.	The existing files are deleted, starting from the one with the smallest file number in the destination folder, until a new file is saved. A new file is saved with the largest file number in the destination folder.
File No. 9999 existent	All existing image files in the destination folder are deleted, and a new file is saved with file No. 1.	

When the number of files in the destination folder reaches 9899, the System signal 2-1.b12 turns on.  
If you deselect this item, a new file is not created when the destination drive has insufficient free space or file No. 9999 exists in the destination folder.

### 8) [Start Trigger Device]

Set the device to start an image file output.  
For the setting procedure, refer to the following.  
⇒6.1.1 How to set devices

### 9) [Writing Notification Device]

Set the device to notify that a captured image is being saved to a file.  
For the setting procedure, refer to the following.  
⇒6.1.1 How to set devices

This device is on during an image file output.

### 10) [Writing Error Notification Device]

Set the device to notify that saving a captured image to a file has failed.  
For the setting procedure, refer to the following.  
⇒6.1.1 How to set devices

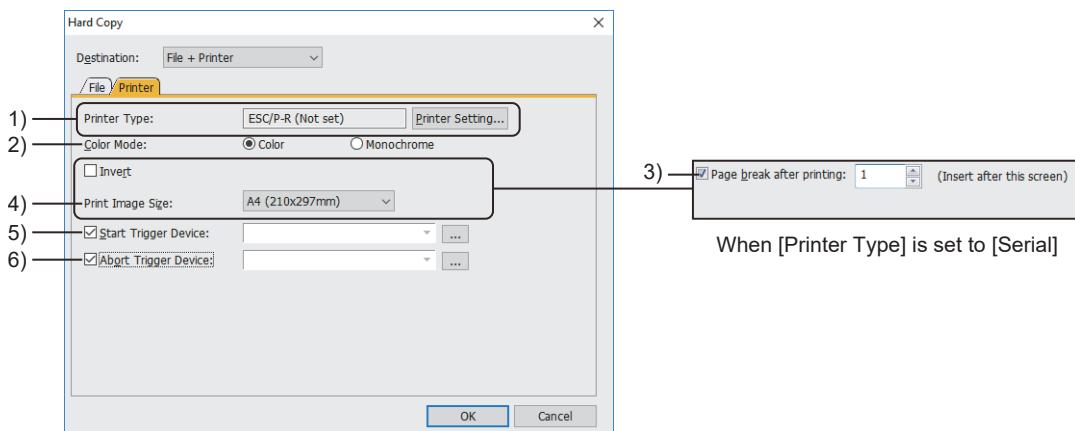

This device turns on when an error occurs during an image file output.  
The device does not turn off automatically even after error recovery.  
You need to turn off the device.

### 11) [File No. External Control Device]

Set the device that specifies the file number of a file to be saved.  
The data type of the device is unsigned 16-bit binary.  
For the setting procedure, refer to the following.  
⇒6.1.1 How to set devices  
The valid range of the file number is 1 to 9999.  
If a specified file number exists, the corresponding file is overwritten.  
If a specified file number is outside the valid range, the file is not saved.  
This setting overrides the setting of [Delete the file with the smallest number and create another file when the capacity of the destination is exceeded]. (The GOT performs the operation with the latter item deselected.)

## ■ 2 [Printer] tab

Not available to GT25HS-V.

When [Printer Type] is set to [ESC/P-R]

### 1) [Printer Type]

Not available to GT SoftGOT2000.

Type of a selected printer.

To select a printer type, click the [Printer Setting] button.

→10.11.8 [Printer] dialog

## 2) [Color Mode]

Not available to GT SoftGOT2000.

When [Printer Type] is set to [ESC/P-R]

The following shows selectable items.

- [Color]
- [Monochrome]

## 3) [Invert]

Prints a captured screen image with inverted black and white colors.

For the black and white inversion, refer to the following.

→9.7.4 ■ 6 Printing a captured image with inverted black and white colors

This setting is not applied to GT SoftGOT2000.

Configure the print settings on GT SoftGOT2000.

→GT SoftGOT2000 Version1 Operating Manual

## 4) [Page break after printing]

Not available to GT SoftGOT2000.

This item can be set only when [Serial] is selected for [Printer Type].

Set the number of screens to print without page break.

The setting range is [1] to [4]

## 5) [Print Image Size]

This item is settable when [Printer Type] is set to [PictBridge] or [ESC/P-R].

The following shows selectable items.

- [L(89x127mm)]
- [Postcard(100x148mm)]
- [2L(127x178mm)]
- [A4(210x297mm)]
- [Letter (8.5"x11")] (When [ESC/P-R] is selected)

This setting is not applied to GT SoftGOT2000.

Configure the print settings on GT SoftGOT2000.

→GT SoftGOT2000 Version1 Operating Manual

## 6) [Start Trigger Device]

Set the device to start a printer output.

For the setting procedure, refer to the following.

→6.1.1 How to set devices

## 7) [Abort Trigger Device]

Set the device to abort a printer output.

For the setting procedure, refer to the following.

→6.1.1 How to set devices

This setting is not applied to GT SoftGOT2000.

## 9.7.7 Relevant settings

Set the relevant settings other than the specific settings for the hard copy as required.  
The following shows the functions that are available by the relevant settings.

### 1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Allowing the output setting of the hard copy to be changed with the system information (Read device: System signal 1-1.b10)	[System Signal 1-1]
Specifying the invert printing of the hard copy. (Read device: System signal 1-1.b12)	[System Signal 1-1]
Notifying that the hard copy is being executed. (Write device: System signal 2-1.b7)	[System Signal 2-1]
Aborting the printing process. (Read device: System signal 1-2.b15)	[System Signal 1-2]
Notifying an error of printer while the printing process is being executed. (Write device: System signal 2-1.b15)	[System Signal 2-1]
Notifying that the printing process is being executed. (Write device: System signal 2-2.b15)	[System Signal 2-2]
Notifying that the number of files in the save destination folder approaches the upper limit (9999) (Write device: System signal 2-1.b12)	[System Signal 2-1]

### 2 GOT Internal Device

⇒12.1.3 GOT special register (GS)

Function	Setting item
Notifying the connection status between the GOT and a printer. (Write device) The following printers are supported: PictBridge-compatible printers.	GS258.b0 (Not available to GT25-W, GT2505-V, GT25HS-V, GT23, GT21, and GT SoftGOT2000.)
Notifying the occurrence of a warning-level error. (Write device) The following printers are supported: PictBridge-compatible printers.	GS258.b1 (Not available to GT25-W, GT2505-V, GT25HS-V, GT23, GT21, and GT SoftGOT2000.)
Notifying the occurrence of a fatal-level error. (Write device) The following printers are supported: PictBridge-compatible printers.	GS258.b2 (Not available to GT25-W, GT2505-V, GT25HS-V, GT23, GT21, and GT SoftGOT2000.)
Notifying that the printer is ready or not. (Write device) The following printers are supported: PictBridge-compatible printers, serial printers, and Ethernet printers.	GS258.b3 (Not available to GT SoftGOT2000.)
Notifying the error code of the latest error that has occurred in the printer. (Write device) The following printers are supported: Ethernet printers.	GS259 (Not available to GT21 and GT SoftGOT2000.)
Outputting page numbers with a numerical print. (Write device)	GS278
Disabling automatic page breaks when the number of printed lines reaches the number of lines specified in the [Report Setting] dialog. (Read device)	GS524.b0
Inserting a page break when GS524.b0 is on. (Read device)	GS524.b1

## 9.8 Controlling Operations with Scripts ([Script])

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 9.8.1 Overview of the script function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Scripts allow you to control the GOT display with the GOT's original programs.

By controlling the GOT display with scripts in the GOT, you can significantly reduce the load for the display of the system (controllers).

### 9.8.2 Features of the script function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■1 Easy system maintenance

With scripts, the controllers can be programmed to handle machine control only, so the system maintenance becomes much easier.

#### ■2 Various screen controls available together with the GOT

Using scripts enables the following operations that could not be achieved by the GOT alone.

##### (1) Operations together with other object functions

- The status of multiple bit devices can be indicated by one lamp.
- A specific part can be displayed if any of the bit devices is on, and hidden if all of them are off.
- When a numerical value is input, the part which indicates that it has already been input is pasted next to the then input numerical display frame.
- One touch switch can perform multiple operations corresponding to the status in multiple situations.
- The error handling screen appears automatically upon the detection of a GOT error. (The GOT Error Code device of the system information stores the error code upon its detection.)

##### (2) Processing complicated arithmetic operations

- Polynomial operations can be expressed simply in a line, which are difficult for ladder programs to express.

- In addition to four arithmetic operations, scripts can be used for various application arithmetic operation functions such as trigonometric and exponential functions.

##### (3) No limit on application

- You can obtain a target date using an entered date and interval (number of days in between).  
What is the date after 345 days from May 20th, 2012? → April 30th, 2013.
- You can obtain the corresponding day of the week from an entered date.  
What day of the week was February 21st, 1961? → Tuesday.

#### ■3 Simple programming language

Scripts are in a language similar to C language, so you can easily make a program with elementary programming knowledge.

#### ■4 Programming using a commercially available text editor

Commercially-available text editors (such as the Microsoft Windows standard memo pad and Wordpad) which you may use every day can be used for programming, so you can improve program productivity.

## ■5 Operating conditions settable for each script

Various conditions can be set as triggers for a script, so script execution can be scheduled.

In addition to the above conditions, the execution of an object script can be tied to an input to the object, display on the object, or a touch on a touch switch.

GT21 does not support the object script function.

## ■6 A wide variety of the debug functions

Since scripts and C language are similar, you can simulate the scripts by making minor corrections using a general C language compiler or debugger.

Complicated scripts including many control statements can be debugged easily by using them.

The device monitor is useful for debugging controllers using the GOT.

The test function and device monitor are available to check conditional branches in a script.

By monitoring the GOT special register (GS), error information and scripts in execution can be easily checked.

## ■7 Syntax check of the created scripts

You can check the syntax of a created script on GT Designer3 before running the script on the GOT, improving programming efficiency.

## ■8 Converting the script language of Digital Electronics Corporation software

You can convert the D-Scripts or Global D-Scripts of Digital Electronics Corporation software so that the scripts run on the GOT.

To convert the script language, use GT Converter2.

For the details of the data to be converted and the conversion method, refer to the following.

⇒GT Converter2 Version3 Operating Manual for GT Works3

### 9.8.3 Script types

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following four types of scripts are supported.

Type	Description	Supported models
Project script	Project scripts are set and operate for the whole project. For the details of project scripts, refer to the following. →9.9 Project Script, Screen Script, and Script Part	GT27 GT25 GT23 GT21 GS
Screen script	Screen scripts are set and operate for each base screen and window screen (superimpose windows and overlap windows). For the details of screen scripts, refer to the following. →9.9 Project Script, Screen Script, and Script Part	SoftGOT2000
Script part	A script parts object is placed on a base screen or a window screen (superimpose window or overlap window), and the script set for the object runs. For the details of script parts, refer to the following. →9.9 Project Script, Screen Script, and Script Part	
Object script	Object scripts are set and operate for the following objects. <ul style="list-style-type: none"> <li>• Touch switch ([Switch] only)</li> <li>• [Bit Lamp]</li> <li>• [Word Lamp]</li> <li>• [Numerical Display]</li> <li>• [Numerical Input]</li> <li>• [Text Display]</li> <li>• [Text Input]</li> <li>• [Date Display]</li> <li>• [Time Display]</li> <li>• [Bit Comment]</li> <li>• [Word Comment]</li> <li>• [Parts Display]</li> <li>• [Parts Movement]</li> <li>• [Line Graph]</li> <li>• [Trend Graph]</li> <li>• [Bar Graph]</li> <li>• [Statistics Bar Graph]</li> <li>• [Statistics Pie Graph]</li> <li>• [Scatter Graph]</li> <li>• [Historical Trend Graph]</li> <li>• [Graphical Meter]</li> <li>• [Level]</li> <li>• [Panelmeter]</li> </ul> For the details of object scripts, refer to the following. →9.10 Object Script	GT27 GT25 GT23 GT21 GS SoftGOT2000

## 9.9 Project Script, Screen Script, and Script Part

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 9.9.1 Overview of a project script, screen script, and script part

GT27 GT25 GT23 GT21 SoftGOT2000 GS

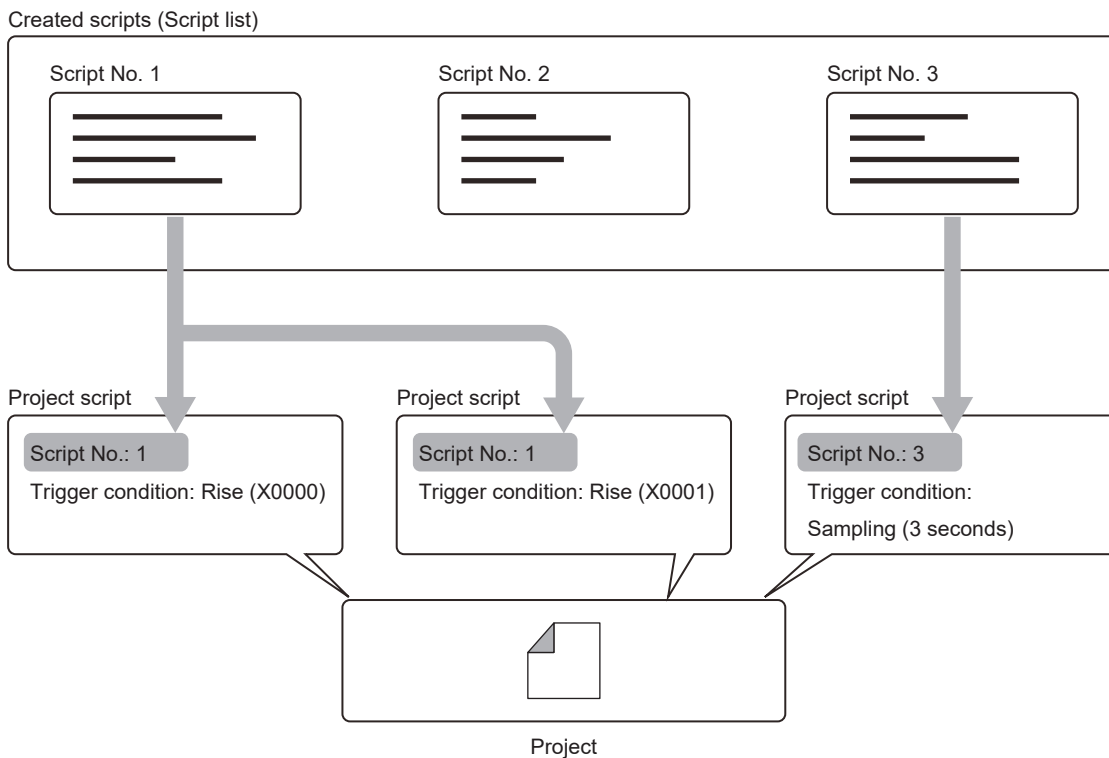

#### ■ 1 Overview of a project script

Set a project script for the current project.

If the trigger condition of the script is satisfied, the script runs.

A created script can be specified in a project script setting or a screen script setting.

If you edit the script, the edit will affect the project script setting or screen script setting.

#### ■ 2 Overview of a screen script

Set a screen script for the user-specified screen.

While the GOT displays the screen, if the trigger condition of the script is satisfied, the script runs.

A created script can be specified in a project script setting or a screen script setting.

If you edit the script, the edit will affect the project script setting or screen script setting.

### ■3 Overview of a script part

Place a script parts object on a screen to create a script.

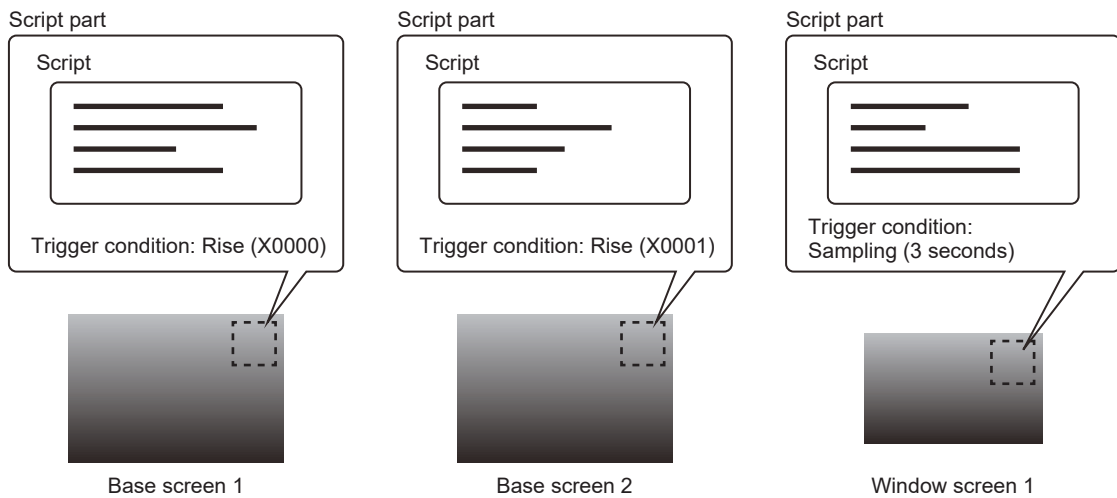

While the GOT displays the screen having a script parts object, if the trigger condition of the created script is satisfied, the script runs.

Each script parts object has its own scripts.

If you edit a script of a script parts object, the edit will not affect the other script parts objects.

The following object manipulations are supported.

- Copying to another screen
- Grouping
- Registering to the library
- Adding to a template

A script parts object is visible only on the screen editor of GT Designer3.

The object is invisible on the GOT screen.

## 9.9.2 Specifications of a project script, screen script, and script part

### ■ 1 Specifications related to a script setting

A script setting consists of a script trigger condition and a script.

The setting target, and the maximum numbers of script settings and scripts vary depending on the script type.

Script type	Setting target	Maximum number of script settings	Maximum number of scripts
Project script	Project	256	32767 (in both the project script settings and the screen script settings)
Screen script	<ul style="list-style-type: none"> <li>Base screen</li> <li>Window screen (superimpose window or overlap window) *1</li> </ul>	256 per screen (The script settings for called screens are included.)	
Script part			Maximum number of script parts objects: 32 per screen Maximum number of script settings: 16 per object

\*1 For GT21, screen scripts are not settable for window screens.

### ■ 2 Specifications related to the behavior of a script

The following shows the specifications related to the behavior of a script.

Script type	Execution condition	Number of executable scripts
Project script	The trigger condition of a script is satisfied. (Except under conditions where the GOT stops monitoring for reasons including receiving package data.)	256
Screen script	The trigger condition of a script is satisfied while the GOT displays the screen for which the script is set. (Except under conditions where the GOT stops monitoring for reasons including receiving package data.)	256 per screen (in both the screen script settings and the script settings of script parts objects)
Script part		

#### (1) Specifications of a screen script and script part

The following shows the behavior of a script when the set overlay screen function or a parts display object displays the screen for which the script is set.

Function	Behavior
Set overlay screen	<ul style="list-style-type: none"> <li>For GT27, GT25, GT23, and GT SoftGOT2000 If a calling screen calls a called screen for which a screen script or a script part is set, the script runs.</li> <li>GT21 If a calling screen calls a called screen for which a screen script or a script part is set, the script does not run.</li> </ul>
Parts display	If a parts display object displays a screen for which a screen script or a script part is set, the script does not run.

### ■ 3 Control structures for a project script, screen script, and script part

The following explains the control structures for scripts.

Program scripts using the following commands (including control statements, operators, and functions).

You can describe nests (hierarchy) for if, while, and switch statements.

End a script using a return statement.

## (1) Control statement

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Control statement	Description	
if	Syntax	if (conditional expression) {statements}
	Function	Performs a conditional control. The if statement evaluates (conditional expression). If the expression is true (other than 0), {statements} is executed. The if statement is a fundamental conditional control and used to execute specified processing when a value satisfies a condition or to alter the flow of program execution.
if to else	Syntax	if (conditional expression) {statements 1} else {statements 2}
	Function	Performs a conditional control. The if statement evaluates (conditional expression). If the expression is true (other than 0), {statements 1} is executed. If the expression is false (0), {statements 2} is executed. The if statement is a fundamental conditional control and used to execute specified processing when a value satisfies a condition or to alter the flow of program execution.
while break	Syntax	while (continuous conditional expression) {statements}
	Function	Evaluates (continuous conditional expression). As long as the expression is true (other than 0), {statements} is repeatedly executed. In the following cases, the iterative loop is terminated. <ul style="list-style-type: none"> <li>• When (continuous conditional expression) is false (0)</li> <li>• When {statements} includes the break statement</li> </ul> The while statement is used to execute processing repeatedly until a target condition is satisfied. (For example, repeating the processing until a device value becomes 0) If a condition is always evaluated to true (other than 0), an infinite loop is created. Use the temporary device area or a GOT internal device as the write destination.
switch case default break	Syntax	switch (target) { case constant: statements; break; case constant: statements; break; default: statements; }
	Function	Create a control statement using the combination of four reserved words (switch, case, break, and default). In the following cases, the statements that follow a case statement and the default statement are executed. <ul style="list-style-type: none"> <li>• When (target) matches a specified constant</li> <li>• When (target) does not match any constant that case statements have and when there is the default statement</li> </ul> In the following cases, the switch body {} is terminated. <ul style="list-style-type: none"> <li>• When there is a break statement in the script</li> <li>• When there is no case statement or default statement that has the constant that matches (target)</li> </ul> The break statement and default statement are not required in the control statement. The switch statement is used when various processing are required according to the value of a variable.
return	Syntax	return;
	Function	Terminates the script. A single script can have multiple return statements.
;	Syntax	;
	Function	Indicates the end of a line. It must be put at the end of each line.

## (2) Operator (logic)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Operator	Description	
&&	Syntax	if ((relevant expression) && (relevant expression)) {……}
	Function	If both of (relevant expression) are true, the result has 1. If either of (relevant expression) is false, the result has 0. (Logical AND operator)
	Syntax	if ((relevant expression)    (relevant expression)) {……}
	Function	If either of (relevant expression) is true, the result has 1. If both (relevant expression) are false, the result has 0. (Logical OR operator)
!	Syntax	if (!(relevant expression)) {……}
	Function	If (relevant expression) is 0, the result has 1. Otherwise the result has 0. (Logical NOT operator)

### (3) Operator (relation)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Operator	Description	
<	Syntax	<target 1> < <target 2>
	Function	<target 1> is less than <target 2>. (Left-inequality operator)
<=	Syntax	<target 1> <= <target 2>
	Function	<target 1> is less than or equal to <target 2>. (Equivalence left-inequality operator)
>	Syntax	<target 1> > <target 2>
	Function	<target 1> is greater than <target 2>. (Right-inequality operator)
>=	Syntax	<target 1> >= <target 2>
	Function	<target 1> is greater than or equal to <target 2>. (Equivalence right-inequality operator)
!=	Syntax	<target 1> != <target 2>
	Function	<target 1> and <target 2> are not equal. (Inequality operator)
==	Syntax	<target 1> == <target 2>
	Function	<target 1> and <target 2> are equal. (Equality operator)

### (4) Operator (arithmetic)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Operator	Description	
+	Syntax	<target> + <factor>
	Function	Adds <factor> to <target>. (Addition operator)
-	Syntax	<target> - <factor>
	Function	Subtracts <factor> from <target>. (Subtraction operator)
*	Syntax	<target> * <factor>
	Function	Multiplies <target> by <factor>. (Multiplication operator)
/	Syntax	<target> / <factor>
	Function	Divides <target> by <factor>. (Division operator) When <factor> is 0, the script operation stops.
%	Syntax	<target> % <factor>
	Function	Finds the remainder dividing <target> by <factor>. (Remainder operator) When <factor> is 0, the script operation stops.

### (5) Operator (bit device)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Operator	Description	
&	Syntax	<target> & <factor>
	Function	Finds the logical product (AND) of <target> and <factor>. (Bit accumulation operator)
	Syntax	<target>   <factor>
	Function	Finds the logical add (OR) of <target> and <factor>. (Bit addition operator)
~	Syntax	~<bit>
	Function	Negates (inverts) <bit>. (Complement operator)
^	Syntax	<target> ^ <factor>
	Function	Finds the exclusive logical add (XOR) of <target> and <factor>. (Bit difference operator)
<<	Syntax	<target> << <factor>
	Function	Shifts <target> left by the number of bits specified by <factor>. (Left-shift operator)
>>	Syntax	<target> >> <factor>
	Function	Shifts <target> right by the number of bits specified by <factor>. (Right-shift operator)

### (6) Operator (assignment)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Operator	Description	
=	Syntax	<device> = <target>
	Function	Stores <target> in <device>. (Assignment operator)

### (7) Variables

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Variable	Description	
Device and temporary device area	Syntax	[w:GD150]
	Function	Indicates a PLC CPU device, a GOT internal device, or a temporary device area. For devices and temporary device areas, refer to the following. → ■ 4 Available data and how to express the data

### (8) Functions (device operation)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Function	Description	
set	Syntax	set (<bit device>)
	Function	Sets <bit device>.
	Example	set([b:M0001]);
rst	Syntax	rst (<bit device>)
	Function	Resets <bit device>.
	Example	rst([b:M0001]);
alt	Syntax	alt (<bit device>)
	Function	Inverts <bit device>.
	Example	alt([b:M0001]);

### (9) Functions (consecutive device operation)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Function	Description	
bmov	Syntax	bmov (<word device 1>, (word device 2>, <integer>)
	Function	Batch-transfers the data in the devices in the contiguous sequence, the first area of which is <word device 1>, to the devices in the contiguous sequence, the first area of which is <word device 2>. The number of the devices in the contiguous sequence is specified by <integer>.
	Example	bmov([w:D100],[w:D500],10);
fmov	Syntax	fmov (<word device 1>, (word device 2>, <integer>)
	Function	Transfers the data in <word device 1> to the devices in the contiguous sequence, the first area of which is <word device 2>. The number of the devices in the contiguous sequence is specified by <integer>.
	Example	fmov([w:D100],[w:D500],10);

## (10) Functions (application arithmetic operation)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Function	Description	
sin	Syntax	sin (<word device or constant>)
	Function	Calculates the sine of a specified <word device or constant>. (Sine) Specify <word device or constant> in radian.
	Example	sin([w:D100]);
cos	Syntax	cos (<word device or constant>)
	Function	Calculates the cosine of a specified <word device or constant>. (Cosine) Specify <word device or constant> in radian.
	Example	cos([w:D100]);
tan	Syntax	tan (<word device or constant>)
	Function	Calculates the tangent of a specified <word device or constant>. (Tangent) Specify <word device or constant> in radian.
	Example	tan([w:D100]);
asin	Syntax	asin (<word device or constant>)
	Function	Calculates the arc sine of <word device or constant>. (Arc sine) Specify <word device or constant> in radian.
	Example	asin([w:D100]);
acos	Syntax	acos (<word device or constant>)
	Function	Calculates the arc cosine of <word device or constant>. (Arc cosine) Specify <word device or constant> in radian.
	Example	acos([w:D100]);
atan	Syntax	atan (<word device or constant>)
	Function	Calculates the arc tangent of <word device or constant>. (Arc tangent) Specify <word device or constant> in radian.
	Example	atan([w:D100]);
abs	Syntax	abs (<word device or constant>)
	Function	Calculates the absolute value of <word device or constant>. (Absolute value)
	Example	abs([w:D100]);
log	Syntax	log (<word device or constant>)
	Function	Calculates the base-e logarithm <natural logarithm> of <word device or constant>.
	Example	log([w:D100]);
log10	Syntax	log10 (<word device or constant>)
	Function	Calculates the base-10 logarithm (common logarithm) of <word device or constant>. (Common logarithm)
	Example	log10([w:D100]);
exp	Syntax	exp (<word device or constant>)
	Function	Calculates the value of e raised to the power of <word device or constant>. (Exponent)
	Example	exp([w:D100]);
Idexp	Syntax	Idexp (<word device 1 or constant 1>, <word device 2 or constant 2>)
	Function	Calculates <word device 1 or constant 1> multiplied by 2 raised to the power of <word device 2 or constant 2>. (Exponent of product)
	Example	Idexp([w:D100]);
sqrt	Syntax	sqrt (<word device or constant>)
	Function	Calculates the square root of <word device or constant>. (Square root)
	Example	sqrt([w:D100]);

(11)Functions (file operation)

Function	Description	
file_getlist	Syntax	file_getlist (<folder name>, <file name>, <storage device>, <offset>, <number of files>, <maximum number of characters>)
	Function	Extracts file names equivalent to the number of characters specified by <maximum number of characters>, and stores the file names in <storage device> and the following devices in the contiguous sequence. The number of files specified by <number of files> is read from the xth file (x is specified by <offset>) counted from the first specified by <folder name> and <file name>.
	Return value	Normal: Number of obtained files When a specified file is nonexistent or the value of <offset> is larger than the number of existing files: 0 Error: -1
	Example	[s16:D500] = file_getlist("X:\\Package1\\", "*.DAT", [w:D100], 3, 2, 8);
file_getfolderlist	Syntax	file_getfolderlist (<folder name 1>, <folder name 2>, <storage device>, <offset>, <number of folders>, <maximum number of characters>)
	Function	In a folder specified by <folder name 1> and <folder name 2>, obtains characters of the name of the <offset>th and subsequent folders. Then, stores the obtained characters in <storage device> and subsequent devices. The number of obtained characters is specified by the <maximum number of characters>, and that of target folders is specified by <number of folders>.
	Return value	Normal: Number of obtained folders When a specified folder is nonexistent or the value of <offset> is larger than the number of existing folders: 0 Error: -1
	Example	[s16:D500] = file_getfolderlist("X:\\Package1\\", "", [w:D100], 6, 2, 8);
file_read <sup>*2</sup>	Syntax	file_read (<folder name>, <file name>, <storage device>, <offset>, <number of read bytes>)
	Function	Reads data of the file specified by <folder name> and <file name>, and stores the data in <storage device> and the following devices in the contiguous sequence. The number of bytes specified by <number of read bytes> is read from the xth byte (x is specified by <offset>).
	Return value	Normal: Size of read data (bytes) When <number of read bytes> is 0 or <offset> is greater than the file size: 0 Error: -1
	Example	[s16:D500] = file_read("X:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16);
file_lineread <sup>*2</sup>	Syntax	file_lineread (<folder name>, <file name>, <storage device>, <offset>, <maximum number of read bytes>)
	Function	This function is for an ASCII or Shift-JIS file. Reads 1-line data starting from the <offset>th byte from a file specified by <folder name> and <file name>, and stores the data in <storage device> and subsequent devices. Data size that can be read at a time is within <maximum number of read bytes>.
	Return value	Normal: Size of read data (bytes) <sup>*1</sup> When <number of read bytes> is 0 or <offset> is greater than the file size: 0 Error: -1
	Example	[s16:D200] = file_lineread("X:\\Package1\\", "ARP00001.CSV", [w:D300], 0, 32);
file_unilineread <sup>*2</sup>	Syntax	file_unilineread (<folder name>, <file name>, <storage device>, <offset>, <maximum number of read bytes>)
	Function	This function is for a Unicode file. Reads 1-line data starting from the <offset>th byte from a file specified by <folder name> and <file name>, and stores the data in <storage device> and subsequent devices. Data size that can be read at a time is within <maximum number of read bytes>.
	Return value	Normal: Size of read data (bytes) <sup>*1</sup> When <number of read bytes> is 0 or <offset> is greater than the file size: 0 Error: -1
	Example	[s16:D200] = file_unilineread("X:\\Package1\\", "ARP00001.txt", [w:D300], 0, 32);

Function	Description	
file_write *2	Syntax	file_write (<folder name>, <file name>, <storage device>, <offset>, <number of write bytes>, <mode>)
	Function	Writes data in a manner specified by <mode>. <ul style="list-style-type: none"> <li>• New: 0 Creates the file specified by &lt;folder name&gt; and &lt;file name&gt; to which device data is written. The number of bytes specified by &lt;number of write bytes&gt; of the device data in &lt;storage device&gt; and the following devices in the contiguous sequence is written. When the file that &lt;file name&gt; specifies already exists, the file is deleted and a new file is created.</li> <li>• Addition: 1 Adds data equivalent to the number of bytes specified by &lt;number of write bytes&gt; in &lt;storage device&gt; and the following devices in the contiguous sequence to the end of the file specified by &lt;folder name&gt; and &lt;file name&gt;. When &lt;file name&gt; specifies a file that does not exist, a new file is created.</li> <li>• Overwrite: 2 Overwrites a position in the file specified by &lt;folder name&gt; and &lt;file name&gt; with the device data equivalent to the number of bytes specified by &lt;number of write bytes&gt; in &lt;storage device&gt; and the following devices in the contiguous sequence. The position in the file is specified by &lt;offset&gt;.</li> </ul>
	Return value	Normal: Size of written data (bytes) Error: -1
	Example	[s16:D500] = file_write("X:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16, 2);
file_rename	Syntax	file_rename (<folder name>, <file name>, <new file name>)
	Function	Changes <file name> of the file specified by <folder name> and the <file name> to <new file name>.
	Return value	Normal: 0 Error: -1
	Example	[s16:D500] = file_rename("X:\\Package1\\", "ARP00001.DAT", "DATA1201.DAT");
file_delete	Syntax	file_delete (<folder name>, <file name>)
	Function	Deletes a specified <file name> in <folder name>.
	Return value	Normal: 0 Error: -1
	Example	[s16:D500] = file_delete("X:\\Package1\\", "ARP00001.DAT");
file_copy	Syntax	file_copy (<copy source folder name>, <copy source file name>, <copy destination folder name>, <copy destination file name>, <copy mode>)
	Function	Copies the file specified by <copy source folder name> and <copy source file name> into the folder specified by <copy destination folder name> changing the file name to <copy destination file name>. With <copy mode>, whether or not write protection is imposed can be specified. When <copy destination folder name> specifies a folder that does not exist, a new folder is created and the file is pasted. A file with the length of 0 byte is copied.
	Return value	Normal: 0 Error: -1
	Example	[s16:D500] = file_copy("X:\\Package1\\", "ARP00001.DAT", "B:\\backup\\", "", 1);
file_xcopy	Syntax	file_xcopy (<copy source folder name 1>, <copy source folder name 2>, <copy destination folder name 1>, <copy destination folder name 2>, <copy mode>)
	Function	Copies the folders specified by <copy source folder name 1> and <copy source folder name 2> to the folders specified by <copy destination folder name 1> and <copy destination folder name 2>. With <copy mode>, whether or not write protection is imposed and sub folders are set as the target for a copy can be specified.
	Return value	Normal: 0 Error: -1
	Example	[s16:D500] = file_xcopy("X:\\Package1\\", "sample1", "B:\\backup\\", "sample1", 1);
#pragma folder_name_length	Syntax	#pragma folder_name_length (<maximum number of folder name characters>)
	Function	Declare this function at the top of a script. Sets <maximum number of folder name characters> when a device is specified as the folder name.
	Example	#pragma folder_name_length(14)
#pragma file_name_length	Syntax	#pragma file_name_length (<maximum number of file name characters>)
	Function	Declare this function at the top of a script. Sets <maximum number of file name characters> when a device is specified as the file name.
	Example	#pragma file_name_length(12)
#pragma use_character_r_code unicode	Syntax	#pragma use_character_code unicode
	Function	Declare this function at the top of a script. Uses the characters of the folder name and file name specified in a file operation function as Unicode characters. The characters of the folder name and file name, which are obtained using "file_getlist" or "file_getfolderlist", are encoded in Unicode.
	Example	#pragma use_character_code unicode

\*1 The data which is read does not contain line feed codes but the return value contains the number of bytes containing line feed

codes.

\*2 Specify a data storage order (from higher-order bytes or from lower-order bytes) on GT Designer3 or with GS390.

Setting method	Description
Setting on GT Designer3	Set [File/Text Handling Function Storage Order] on the [Option] tab in the [Script] dialog. →9.9.5 ■ 4 [Option] tab
Setting with GS390	Specify a data storage order with the value of GS390. • 0 or 3 or more: Data is stored in the order specified on GT Designer3. • 1: Data is stored from lower-order bytes. • 2: Data is stored from higher-order bytes.

For the argument used for the file operation function, refer to the following.

→ ■ 4 Available data and how to express the data

(a) **Folder and file name character number specification functions (#pragma folder\_name\_length, #pragma file\_name\_ength)**

• Scope

The folder and file name character number specification functions are used to specify a folder name or file name with a device.

If a folder name or file name is directly specified by character strings, this function is invalid.

• Maximum number of characters per folder name or file name (when these function are not used)

Up to 12 characters can be used for a folder name and file name when the folder and file name character number specification functions are not used.

(b) **Use Unicode declare function (#pragma use\_character\_code unicode)**

• Scope

The use Unicode declare function is used to specify the folder name and file name in a file operation function in Unicode.

• Character code specified without this function

The characters of the folder name and file name are encoded in ASCII.

(c) **Devices used for arguments**

If a controller device is used for any of the following arguments, a function using the argument takes a long time to execute. Therefore, using a GOT internal device is recommended.

- <folder name>
- <folder name 1>
- <folder name 2>
- <file name>
- <storage device>
- <new file name>
- <copy source folder name>
- <copy source folder name 1>
- <copy source folder name 2>
- <copy source file name>
- <copy destination folder name>
- <copy destination folder name 1>
- <copy destination folder name 2>
- <copy destination file name>

(12)Functions (string operation)

Function	Description	
str_scanf	Syntax	str_scanf (<input string storage device>, <input byte count>, <offset>, <format>, <input value storage device>, <input value storage device>, ...)
	Function	Use this function to read data from an ASCII or Shift JIS string. Stores the character string equivalent to <input byte count> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <input value storage device> in the format specified by <format>. Up to 10 pieces of data can be read.
	Return value	Normal: Number of the pieces of read data Error: -1
	Example	[s16:D500] = str_scanf([w:D100], 32, 0, "%d,%4x", [w:D200], [w:D204]);
str_printf	Syntax	str_printf (<output string storage device>, <output byte count>, <format>, <output value storage device>, <output value storage device>, ...)
	Function	Use this function to write a device value in ASCII or Shift JIS code. Writes the value of <output value storage device> equivalent to <output byte count>, starting from the first byte of <output string storage device> in <format>. A null is appended to a string, and therefore specify "the number of characters + 1" for <output byte count>. Up to 10 pieces of data can be written.
	Return value	Normal: Size of the written character string (bytes) Error: -1
	Example	[s16:D500] = str_printf([w:D100], 18, "%04d,%4x,%4.2f\r\n", [s16:D200], [s16:D300], [f16:D400]);
str_strlen	Syntax	str_strlen (<input string storage device>, <input byte count>)
	Function	Use this function to obtain the data length of an ASCII or Shift JIS string. Obtains the data length of characters from the first byte of <input string storage device> to the byte specified by <input byte count>.
	Return value	Normal: Data length of the character string (bytes) Error: -1
	Example	[s16:D500] = str_strlen([w:D100], 10);
str_strmid	Syntax	str_strmid (<input string storage device>, <output string storage device>, <offset>, <string length>)
	Function	Use this function to read a part of an ASCII or Shift JIS string and write the read data to a device. Stores the character string equivalent to <string length> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <output string storage device>.
	Return value	Normal: Data length of the read string (bytes) Error: -1
	Example	[s16:D500] = str_strmid([w:D100], [w:D200], 5, 7);
str_uniscanf	Syntax	str_uniscanf (<input string storage device>, <input byte count>, <offset>, <format>, <input value storage device>, <input value storage device>, ...)
	Function	Use this function to read data from a Unicode string. Stores the character string equivalent to <input byte count> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <input value storage device> in the format specified by <format>. Up to 10 pieces of data can be read.
	Return value	Normal: Number of the pieces of read data Error: -1
	Example	[s16:D500] = str_uniscanf([w:D100], 32, 0, "%d%5s", [s16:D200], [w:D300]);
str_uniprintf	Syntax	str_uniprintf (<output string storage device>, <output byte count>, <format>, <output value storage device>, <output value storage device>, ...)
	Function	Use this function to write a device value in Unicode. Writes the value of <output value storage device> equivalent to <output byte count>, starting from the first byte of <output string storage device> in <format>. A null is appended to a string, and therefore specify "the number of characters + 2" for <output byte count>. Up to 10 pieces of data can be written.
	Return value	Normal: Size of the written character string (bytes) Error: -1
	Example	[s16:GD400] = str_uniprintf([w:GD100], 32, "%04d ¥t%5s\r\n", [s16:GD200], [w:GD300]);
str_unistrlen	Syntax	str_unistrlen (<input string storage device>, <input byte count>)
	Function	Use this function to obtain the data length of a Unicode string. Obtains the data length of the character string stored from the first byte of <input string storage device> to the xth byte (x is specified by <input byte count>).
	Return value	Normal: Data length of the character string (bytes) Error: -1
	Example	[s16:GD200] = str_unistrlen([w:GD100], 20);

Function	Description	
str_unistrmid	Syntax	str_unistrmid (<input string storage device>, <output string storage device>, <offset>, <string length>)
	Function	Use this function to read a part of a Unicode string and write it to a device. Stores the character string equivalent to <string length> extending from the xth byte (x is specified by <offset>) of <input string storage device> in <output string storage device>.
	Return value	Normal: Data length of the read string (bytes) Error: -1
	Example	[s16:GD400] = str_unistrmid([w:GD100], [w:GD200], 10, 5);
str_lc2uni	Syntax	str_lc2uni (<local code type>, <original string storage device>, <destination string storage device>, <input byte count>, <output byte count>)
	Function	Reads characters from a string in <local code type> in <original string storage device> and subsequent devices. The number of read characters is specified by <input byte count>. Encodes the read characters to Unicode, and writes the Unicode characters to <destination string storage device> and subsequent devices. The number of written characters is specified by <output byte count>. A character that cannot be encoded is replaced with a space.
	Return value	Normal: Size of the written character string (bytes) Error: -1
	Example	[s16:GD300] = str_lc2uni(1, [w:GD100], [w:GD200], 6, 12);
str_uni2lc	Syntax	str_uni2lc (<local code type>, <original string storage device>, <destination string storage device>, <input byte count>, <output byte count>)
	Function	Reads characters from a Unicode string in <original string storage device> and subsequent devices. The number of read characters is specified by <input byte count>. Encodes the read characters to <local code type>, and writes the encoded characters to <destination string storage device> and subsequent devices. The number of written characters is specified by <output byte count>. A character that cannot be encoded is replaced with a space.
	Return value	Normal: Size of the written character string (bytes) Error: -1
	Example	[s16:GD300] = str_uni2lc(3, [w:GD100], [w:GD200], 12, 6);

For the arguments available to the string operation functions, refer to the following.

→ ■ 4 Available data and how to express the data

**(a) Combination with the file operation function**

By using a file operation function together with a string operation function, you can read data from a CSV file or Unicode text file, or edit the file.

**(b) Devices used for arguments**

If a controller device is used for any of the following arguments, a function using the argument takes a long time to execute. Therefore, using a GOT internal device is recommended.

- <input string storage device>
- <output string storage device>
- <input value storage device>
- <output value storage device>
- <original string storage device>
- <destination string storage device>

**(13)Others**

Item	Description	
Constant	Syntax	1234
	Function	Constant (decimal number, hexadecimal number, BCD, real number, character string) For the details of the constants, refer to the following. → ■ 4 Available data and how to express the data

Item	Description	
#pragma use_ptmp_length	Syntax	#pragma use_ptmp_length (<points to be used>)
	Function	This function is usable in the scripts of a script parts object only. Declare this function at the top of a script. Specifies the maximum number of script parts temporary device areas (PTMP) ranging from 1 to 32768. If this function is not declared, the maximum number of PTMPs is specified as shown below. <ul style="list-style-type: none"> <li>For GT27, GT25, GT23, and GT SoftGOT2000 1024 (PTMP0 to PTMP1023)</li> <li>For GT21 256 (PTMP0 to PTMP255)</li> </ul>
	Example	#pragma use_ptmp_length (32768)
Local Symbol Definition	Syntax	#defsymb <symbol name> <symbol definition>
	Function	Defines <symbol name>. Replaces the contents of <symbol name> in a script with those of <symbol definition> while the script is running. Even if a same-name symbol of the following types already exists in the script, the symbol name will be replaced with the symbol definition by #defsymb. <ul style="list-style-type: none"> <li>Script symbol</li> <li>Script parts symbol</li> <li>Object script symbol</li> </ul> The set symbol definition is effective from the definition line to the end of the script.
	Example	#defsymb XYZ 10
Comment	Syntax	// (comment)
	Function	A comment can be described in (comment).

#### ■ 4 Available data and how to express the data

The following describes available data used for project scripts and screen scripts and how to express them.

##### (1) Data type of scripts

The following seven data types are provided for scripts.

However, the data type is fixed for each script.

Select a data type when creating a monitor screen with GT Designer3.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [BCD16]
- [BCD32]
- [Real]

To operate different types of data, using the integer  $\leftarrow$   $\rightarrow$  real number conversion function enables you to handle integral device values as real numbers for each script.

→(16) Integer  $\leftarrow$   $\rightarrow$  real number conversion function

##### (2) Available constants and how to express the constants

The following four constants are provided for scripts.

Constant	Expression example
Decimal number	124
Hexadecimal number	0xFF12, 0x14AC67F1
Real number	32.124, 3.2124e + 10
BCD	344

However, available constants and the data range are determined according to the data type of each script as shown below.

Data type	Available constant	Available data range
Signed BIN 16	Decimal number	-32768 to 32767
	Hexadecimal number	0 to FFFF
Unsigned BIN 16	Decimal number	0 to 65535
	Hexadecimal number	0 to FFFF

Data type	Available constant	Available data range
Signed BIN 32	Decimal number	-2147483648 to 2147483647
	Hexadecimal number	0 to FFFFFFFF
Unsigned BIN 32	Decimal number	0 to 4294967295
	Hexadecimal number	0 to FFFFFFFF
[BCD16]	BCD	0 to 9999
	Hexadecimal number	0 to 270F
[BCD32]	BCD	0 to 99999999
	Hexadecimal number	0 to 5F5E0FF
Real number	Real number	Signed 13 digits representation (Decimal point format only)*1
	Hexadecimal number	0 to FFFFFFFF

\*1 The real number precision is given up to the sixth decimal place.

The accuracy of the 7th and later decimal places cannot be guaranteed.

When a number having 7th or later digits is displayed on the GOT, the displayed value may differ from the value displayed on the programming tool for the controller.

Example) When the value of a real number (floating point data) of the controller is 4.123

- Value displayed on the programming tool of the controller: 4.123000
- Value displayed on the GOT (if displayed up to 6th digit): 4.123000
- Value displayed on the GOT (if displayed up to 13th digit): 4.1230001449585

For the details of the real number (floating point), refer to the following manual.

→QnUCPU User's Manual (Function Explanation, Program Fundamentals)

### (3) Available devices and how to express the devices

Scripts use the same devices as the ones used by other monitor functions.

Expressions of devices differ according to the device type and whether a station is specified or not.

Devices which can be monitored by the GOT depend on the PLC CPU to be monitored.

→12.2 Device Range and Settings of Each Controller

To readily specify a device in the device setting screen, use the input navigation in the [Edit Script (script name)] dialog.

→9.9.7 [Edit Script(script name)] dialog

Device type	Statement example	Expression example	Supported models
Word device	[w: Device No.] *1	[w:D100]	
Word device (offset) *6	[w: Device No.[w: Offset device No.]] *1*2*3	[w:D100[w:D0]]	
Bit device	[b: Device No.] *1	[b:X100]	
Bit device (offset) *6	[b: Device No.[w: Offset device No.]] *1*2*3	[b:X100[w:D0]]	
Word device specified as bit device	[b: Device No.. Bit location] *1	[b:D100.b1]	
Bit device specified as word device	[w: Device No.] *1	[w:X100]	

Device type		Statement example	Expression example	Supported models
Station number-specified device *4		[Network No.-station number:w: device No.] *1	[0-FF:w:D100]	
Multiple CPU No. specification *5		[Network No.-station number/CPU No.:w: device No.]	[0-FF/1:w:D100]	
Block No. specification for extension file register *7		[w: ER block No.-device No.]	[w:ER255-100]	
Specifying the start I/O No. of the buffer memory (BM) *8		[w: BM buffer memory start I/O No.-device No.]	[w:BM1E-100]	
Specifying the unit No. of the buffer memory (G) *9		[w: U Unit No.-G device No.]	[w:U2F-G100]	
Specifying the SFC block No. of the step relay (block) (BLS) *10		[b: BL SFC block No.-S device No.]	[b:BL2-S100]	
Specifying the axis No. for the servo amplifier device *11		[w: A Axis No.-device No.]	[w:A1-PA3]	
		[w: U Unit No.-A Axis No.-device No.]	[w:U2F-A1-PA3]	
Channel specification *12*13		[@Channel No.:w: device No.]	[@3:w:D100]	
System label *14		[<t:System Label Name>]	[<t:Label>]	
Global Label *15	Bit	[gl_b::<Global Label Name>]	[4-5:gl_b::Global label]	
	Word	[gl_w::<Global Label Name>]	[4-5:gl_w::Global label]	
	Signed BIN16	[gl_s16::<Global Label Name>]	[4-5:gl_s16::Global label]	
	Unsigned BIN16	[gl_u16::<Global Label Name>]	[4-5:gl_u16::Global label]	
	Signed BIN32	[gl_s32::<Global Label Name>]	[4-5:gl_s32::Global label]	
	Unsigned BIN32	[gl_u32::<Global Label Name>]	[4-5:gl_u32::Global label]	
	Real	[gl_ftt::<Global Label Name>]	[4-5:gl_ftt::Global label]	
Label (GT Designer3) *16		[<\$:Group Name:Label Name>]	[<\$:Group:Label>]	

Device type	Statement example	Expression example	Supported models
OMRON NJ/NX tag *17	Bit	[gl_b::(Tag Name)]	[4-5:gl_b::Tag name]
	Word	[gl_w::(Tag Name)]	[4-5:gl_w::Tag name]
	Signed BIN16	[gl_s16::(Tag Name)]	[4-5:gl_s16::Tag name]
	Unsigned BIN16	[gl_u16::(Tag Name)]	[4-5:gl_u16::Tag name]
	Signed BIN32	[gl_s32::(Tag Name)]	[4-5:gl_s32::Tag name]
	Unsigned BIN32	[gl_u32::(Tag Name)]	[4-5:gl_u32::Tag name]
	Real	[glflt::(Tag Name)]	[4-5:glflt::Tag name]
AB native tag *18	Bit	[gl_b::(Tag Name)]	[4-5:gl_b::Tag name]
	Word	[gl_w::(Tag Name)]	[4-5:gl_w::Tag name]
	Signed BIN16	[gl_s16::(Tag Name)]	[4-5:gl_s16::Tag name]
	Unsigned BIN16	[gl_u16::(Tag Name)]	[4-5:gl_u16::Tag name]
	Signed BIN32	[gl_s32::(Tag Name)]	[4-5:gl_s32::Tag name]
	Unsigned BIN32	[gl_u32::(Tag Name)]	[4-5:gl_u32::Tag name]
	Real	[glflt::(Tag Name)]	[4-5:glflt::Tag name]

\*1 Depending on the PLC CPU device to be monitored, the device number may need to be expressed with the number of digits shown in the following table.

PLC CPU	Device name	Number of digits		Expression example	Remarks
		Word specification	Bit specification		
OMRON PLC	..	-	2	[b::2303]	Since the form is Channel + Relay, specify the relay part with a two-digit number.
	LR, AR, HR, WR	-	2	[b:HR207]	
ALLEN-BRADLEY PLC	B	6	7	[w:B000003] [b:MB02343]	Specify the file No. and element No. with a three-digit number, and the bit location with a single-digit number.
	N, TP, TA, CP, CA	6	-	[w:N007255]	Specify the file No. and element No. with a three-digit number.
	TT, TN, CU, CD, CN	-	6	[b:TT004255]	
SIEMENS PLC	D	-	9	[w:D000100000]	Specify Data Block (DB) with a four-digit number and DataWord (DW) with a five-digit number.

\*2 Available data range is 16 bits (-32768 to 32767).

\*3 If a data type other than [w:] is specified for the offset device No., the offset can be used within the range appropriate for the data type.

\*4 If QCPU, LCPU, QnACPU, or ACPUCPU is used and the network No. and station number are omitted, the device of the host station (0-FF) is monitored.

\*5 Even if the target PLC is the host station (0-FF), station specification must be performed.

\*6 For the details of the offset devices, refer to the following.

⇒(15) Offset device specification

\*7 Can be set only when an ER device is used.

\*8 The start I/O No. can be specified only when a BM device is used.

\*9 The unit No. can be specified only when a G device is used.

\*10 The SFC block No. can be specified only when a BLS device is used.

\*11 The axis No. can be specified only when a device of the servo amplifier is used.

The unit No. can be specified only when the target device is monitored through a simple motion module.

\*12 When specifying both a channel No. and a station number, specify the channel No. first. (Example: [@3:0-FF:w:D100])

\*13 When specifying a device of channel No.1, specification of the channel No. (@channel No.) can be omitted.

([@1:w:D100] can also be expressed as [w:D100] by omitting "@1." part.)

\*14 Can be set only when [Use system labels in conjunction with MELSOFT Navigator] is checked in the [Type Setting] dialog.

⇒5.1.4 [Type Setting] dialog

\*15 Settable only when an RCPUCPU model is set in the [Controller Setting] window.

⇒5.5 Configuring the Communication Method between the GOT and the Controller ([Controller Setting])

\*16 Settable only when a label (GT Designer3) is registered.

⇒6.1.4 How to set labels (GT Designer3)

\*17 Settable only when [OMRON NJ/NX] is set for the controller type in the [Controller Setting] window.

- 5.5 Configuring the Communication Method between the GOT and the Controller ([Controller Setting])
- \*18 Settable only when [AB Control/CompactLogix(Tag)] is set for the controller type in the [Controller Setting] window.
- 5.5 Configuring the Communication Method between the GOT and the Controller ([Controller Setting])

#### (4) Available arguments and how to express the arguments

GT21 does not support the file operation functions.

The following shows available arguments for the file operation function of scripts.

Argument	Expression example	Available data range
Folder name Folder name 1 Folder name 2 Copy source folder name Copy source folder name 1 Copy source folder name 2 Copy destination folder name Copy destination folder name 1 Copy destination folder name 2	For specifying with character strings: "X:\Package1\ For specifying with devices: [w:D0001]	The following drives can be specified. A, B, E, F, G, X The total number of the characters of a folder name and a file name must be 78 or less. This specification is also applied to a case where multiple arguments are used to specify a folder name or file name. →(6) Folder names and file names An argument can be specified using a device. →(3) Available devices and how to express the devices
File name Copy source file name Copy destination file name	For specifying with character strings: "FILE00001.CSV" For specifying with devices: [w:D0001]	An argument can be specified using a device. →(3) Available devices and how to express the devices
New file name	For specifying with character strings: "FILE00001.BAK" For specifying with devices: [w:D0001]	
Storage device	[w:GD200]	For applicable devices, refer to the following. →(3) Available devices and how to express the devices Bit devices and the word specification of bit devices cannot be used.
Number of folders Number of files	1	The setting range is 1 to 32. An argument can be specified using a device. →(3) Available devices and how to express the devices
Offset	0	<ul style="list-style-type: none"> <li>• For the file operation function 16 bits: 0 to 65535 32 bits: 0 to 2147483647 When the offset is used for the file name obtaining function (file_getlist), only 16 bits can be specified. When the file write function (file_write) is used, the offset is available only when &lt;mode&gt; is 2 (overwrite). For a mode other than overwrite, set 0 for the offset.</li> <li>• For the string operation function (str_scanf, str_strmid) 0 to 255</li> <li>• For the string operation function (str_uniscanf, str_unistrmid) 0 to 510 Make sure to set an even number.</li> </ul> An argument can be specified using a device. →(3) Available devices and how to express the devices For the details of the offset, refer to the following. →(5) How to use the offset
Maximum number of characters	8	The setting range is 1 to 78. An argument can be specified using a device. →(3) Available devices and how to express the devices
Number of read bytes	For specifying with character strings: 32 For specifying with devices: [w:GD200]	The setting range is 1 to 2048. An argument can be specified using a device. →(3) Available devices and how to express the devices
Number of write bytes		
Input byte count	For specifying with character strings: 32 For specifying with devices: [w:GD200]	<ul style="list-style-type: none"> <li>• For str_scanf, str_printf, str_strlen, str_strmid, and str_lc2uni 1 to 256</li> <li>• For str_uniscanf, str_uniprintf, str_unistrlen, str_unistrmid, and str_uni2lc 2 to 512</li> </ul> An argument can be specified using a device. →(3) Available devices and how to express the devices
String length		
Output byte count		
Maximum number of read bytes	256	The setting range is 1 to 256. Set an even number in "file_unilinear". An argument can be specified using a device. →(3) Available devices and how to express the devices

Argument	Expression example	Available data range
Mode	0	<p>The following shows the setting range.</p> <ul style="list-style-type: none"> <li>• 0: New</li> <li>• 1: Addition</li> <li>• 2: Overwrite</li> </ul> <p>For operations of the file write function (file_write) for each mode, refer to the following.</p> <p>→ ■ 3 Control structures for a project script, screen script, and script part</p> <p>An argument can be specified using a device.</p> <p>→(3) Available devices and how to express the devices</p>
Copy mode	For specifying with character strings: 3 For specifying with devices: [w:D0001]	<p>The setting range is 0 to 3.</p> <p>Each bit of the setting value determines the copy mode.</p> <ul style="list-style-type: none"> <li>• Bit 0 <ul style="list-style-type: none"> <li>0: Prohibits overwriting a file.</li> <li>1: Allows overwriting a file.</li> </ul> </li> <li>• Bit 1 <ul style="list-style-type: none"> <li>0: Does not copy subfolders.</li> <li>1: Copies subfolders.</li> </ul> </li> <li>• Bit 2 to 15: Use prohibited</li> </ul> <p>An argument can be specified using a device.</p> <p>→(3) Available devices and how to express the devices</p>
Maximum number of folder name characters	12	The setting range is 1 to 78.
Maximum number of file name characters	12	The setting range is 1 to 78.
Input string storage device	[w:GD200]	<p>For applicable devices, refer to the following.</p> <p>→(3) Available devices and how to express the devices</p>
Output string storage device		
Format	For specifying with character strings: "%d,%5s" For specifying with comments: cmt(1, 3)	<ul style="list-style-type: none"> <li>• For specifying with character strings: <ul style="list-style-type: none"> <li>Number of characters: 256 characters or less</li> <li>Number of format specifiers: 10 or less</li> <li>Enclose a format specifier in double quotation marks.</li> </ul> </li> <li>→(7) How to specify a format</li> <li>• For specifying with comments: <ul style="list-style-type: none"> <li>cmt (comment group, comment No.)</li> <li>Comment group: 1 to 255</li> <li>Comment No.: 1 to 32767</li> <li>Only the comments registered in the comment group can be used.</li> </ul> </li> </ul>
Input value storage device	[w:GD200]	<p>For applicable devices, refer to the following.</p> <p>→(3) Available devices and how to express the devices</p>
Output value storage device		
Local code type	1	<p>The following shows the setting range.</p> <ul style="list-style-type: none"> <li>• 0: Depends on the system language. (ASCII for English, Shift JIS for other languages)</li> <li>• 1: Shift JIS</li> <li>• 2: ASCII</li> <li>• 3: GB</li> <li>• 4: KS</li> <li>• 5: Big5</li> </ul>

### (5) How to use the offset

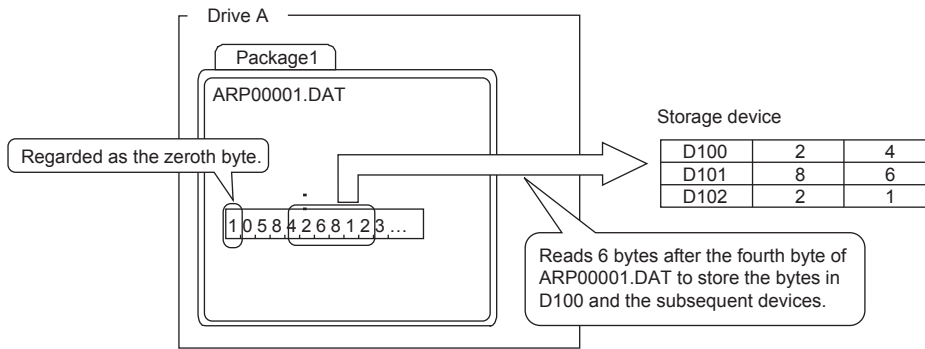

The offset is the argument which represents the storage location of the target data in a folder or file. To express the storage location of the target data with the offset, a start folder or file is regarded as zeroth one (or zeroth byte).

The following shows an application example of the offset using the file read function (file\_read).

Example) Offset of the file name ARP00001.DAT:

If the data starting from the forth byte is read for six bytes (for number of read bytes) and stored to storage device D100 and later devices

```
[s16:D500] = file_read("A:\Package1\\", "ARP00001.DAT", [w:D100], 4, 6); //Reads file
```

## (6) Folder names and file names

GT21 does not support this item.

### (a) How to use the delimiter (\)

To specify a folder name with character strings, use \\ in a path as a delimiter.

In the file operation function, the first \ is recognized as a control character.

Therefore, unless the delimiter is used as \\, the path is not correctly specified and an error occurs.

Example) A:\Package\ (actual path) → A:\\Package\\ (path used as an argument)

To specify a folder name with devices, do not use \\ as a delimiter.

The path is not correctly specified and an error occurs.

### (b) Restrictions for folder names and file names

For the character strings available and unavailable for folder names and file names, refer to the following.

→ 12.4 Restrictions for Folder Names and File Names used in GOT

### (c) Specifying with wild cards

Only when the file name obtaining function (file\_getlist) is used, you can use wild cards to specify a file name.

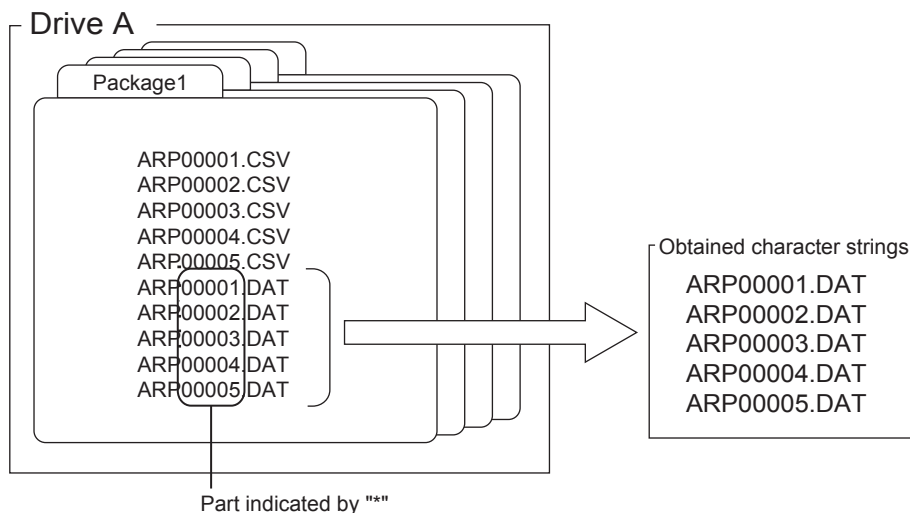

Wild cards handle an unknown part of the name as character strings.

The part specified by wild cards can be any character strings.

The following shows application examples of wild cards.

Example) For obtaining the file stored in the folder A:\\Package1\\ and the name starts with ARP and ends with DAT  
`[s16:D500] = file_getlist("A:\\Package1\\", "ARP*.DAT", [w:GD100], 0, 5, 12); //Obtains file name`

ARP \*.DAT  
 ↳ Wild card (character strings)

Use wild cards under the following conditions.

- Only [\*] can be used as the wild card.

Example of valid use: ARP\*.DAT

Example of invalid use: ARP?????.DAT

- Only one [\*] can be used in an argument.

However, you can use [\*.\*] as an exception.

Example of valid use: \*.DAT

Example of invalid use: ARP\*.\*

- When [\*] is used in the file name of the script, [\*] can be placed only right before [.] (period).

Example of valid use: ARP\*.DAT

Example of invalid use: ARP\*01.DAT

- When [\*] is used in the extension part of the file name of the script, the extension must consist of the wild card only.

Example of valid use: ARP00001.\*

Example of invalid use: ARP00001.\*AT

### (7) How to specify a format

Specify a format using format specifiers and escape sequences.

#### (a) Specifying a format with comments

Only the comments registered in the comment group can be used.

Do not enter a line feed in the format.

The description after a line feed is not reflected in the format.

#### (b) Format specifier

Determines the data type for reading and writing.

The form of a format specifier differs according to the function used.

Describe one format specifier for one data.

The number of format specifiers must be the same as the number of devices, which are the storage locations of read or written data.

#### (c) Escape sequence

Skips or writes control symbols.

Available format specifiers and escape sequences differ according to the functions used.

→(8) String input function (str\_scanf, str\_uniscanf)

(9) String output function (str\_printf, str\_uniprintf)

### (8) String input function (str\_scanf, str\_uniscanf)

GT21 does not support this item.

#### (a) Format specifier

Describe format specifiers in the following formats.

% + flag + field width + type specifier

Description example)

For skipping one character and reading the data (field width: 5) in decimal number :%\*c%5d

- Flag

The flag is the processing to be executed when the data is read.

Add a flag after % as required.

Flag	Expression	Description example	Description
Skip	*	%*d	Skips the specified type data. The number of the skipped data is not added to the number of the read data (return value). (Description example: when decimal data is skipped)

- Field width

The field width is the maximum number of characters which can be read from character strings.

When the read data is larger than the field width, the excess portion of the data which is larger than the number of bytes specified with the field width cannot be read.

Describe the field width in nonnegative integers.

Add a field width before a type specifier as required.

- Type specifier

Specifies the type of the data to be read from character strings.

A format specifier must be used with a type specifier.

Type specifier	Description
c	Reads one character.
s	Reads character strings.
d	Reads integers in decimal numbers.
u	Reads unsigned integers in decimal numbers.
o	Reads integers in octal numbers.

Type specifier	Description
x	Reads integers in hexadecimal numbers.
f	Reads real numbers.
[...]	Reads the characters specified with square brackets. Reading is stopped at the time of reading characters which are not specified with the brackets. Example) If %[ABC] is set for a format specifier and the character string CBAGAB is read, the result is CBA. If ^ is added to the character string in square brackets, characters other than the specified ones are read. Reading is stopped at the time of reading the character string specified with square brackets. Example) If %[ ^ABC] is set for a format specifier and the character string DEFADE is read, the result is DEF.
%	Skips a percent sign (%).

## (b) Escape sequence

Escape sequence	Description
\n	Skips a line feed (LF).
\t	Skips a tab.
\\	Skips a backslash (\).
\?	Skips a question mark (?).
\'	Skips a single quotation mark (').
\"	Skips a double quotation mark (").

## (9) String output function (str\_printf, str\_uniprintf)

GT21 does not support this item.

### (a) Format specifier

Describe format specifiers in the following formats.

% + flag + field width + precision specification + type specifier

Description example)

For writing the data (field width: 5) in fixed-point numbers of four digits after the decimal point and left-aligning the numbers:

%-5.4f

- Flag

The flag is the processing to be executed when the data is written. Add a flag after % as required.

Flag	Expression	Description example	Description
Left alignment	-	%-d	Left-aligns character strings when a field width is specified. (Description example: when decimal data is written and left-aligned)
Plus sign (+) addition	+	%+d	Adds a plus sign before a numerical value and writes the data. (Description example: when decimal data is written after a plus sign is added to the data)
Blank addition	Blank	%d	Adds a blank before a numerical value and writes the data. (Description example: when decimal data is written after a blank is added to the data)
Zero padding	0	%05d	Adds a zero to blank spaces and writes the data when a field width is specified. (Description example: when decimal data is written after a zero is added to the data)
Prefix addition	#	%#5x	Adds 0, 0x, or 0X as a prefix when octal or hexadecimal numbers are written. (Description example: when hexadecimal data is written after 0x is added as a prefix to the data)

- Field width

The field width is the maximum number of characters which can be written in a field.

If the number of characters of written data exceeds the field width, a value of -1 (error) is returned.

If the written number of characters in the data is smaller than the field width, blanks are added to the remaining digits.

Describe the field width in nonnegative integers.

Add a field width before a type specifier as required.

- Precision specification

Specify a period (.) and nonnegative integers.

Every type specifier has different meanings of precision specification.

If precision specification is not added, the default value is applied.

Add a precision specification after the field width as required.

Type specifier	Description	Default value
c	The precision specification is invalid.	-
s	Specifies the maximum number of characters to be output. The characters which exceed the value of precision specification are not output.	8
d, u, o, x, X	Specifies the minimum value of the number of digits to be written. If the number of digits in an argument is smaller than the specified value, Null or zero is input into the remaining digits. (Whether either one is input into the digits differs according to a flag to be specified.) If the number of digits exceeds the value of precision specification, the value is not rounded down.	1
f <sup>*1</sup>	Specifies the number of digits after the decimal point of decimal numbers. When the decimal point is displayed, integers are displayed. The value is rounded down until the value becomes an appropriate number of digits.	6
e, E <sup>*1</sup>	Specifies the number of digits to be output after the decimal point of decimal numbers. Up to 39 digits can be specified for precision. The last number of the data to be output is rounded down.	
g, G	Specifies the maximum value of the number of significant digits to be written. Up to 14 digits can be specified for precision.	

\*1 The values after the decimal point are not output in the following cases.

When 0 is set for the precision specification

When a period (.) is set without specifying subsequent numerical values

• Type specifier

Specifies the type of the data to be written into character strings.

A format specifier must be used with a type specifier.

Type specifier	Description
c	Writes one character.
s	Writes character strings.
d	Writes integers in signed decimal numbers.
u	Writes integers in unsigned decimal numbers.
o	Writes integers in octal numbers.
x, X	Writes integers in hexadecimal numbers. When X is used, alphabets in the data are capitalized.
f	Writes real numbers in real number form. Example) 123.456
e, E	Writes real numbers in exponential form. The exponents are displayed with three digits. Example) 12345.6e-002 When E is used, alphabets in the data are capitalized.
g, G	Writes real numbers in an optimal form. If an exponent is either of the following, real numbers are written in exponential form. • Value less than -4 • Value larger than the precision value specified with the precision specification For an exponent other than the above, real numbers are written in real number form. When G is used, alphabets in the data are capitalized.
%	Writes a percent sign (%). Specifying the corresponding device is not required. Even though a field width and a flag are specified, they are invalid.

(b) Escape sequence

Escape sequence	Description
\n	Writes a line feed (LF).
\r	Writes a carriage return (CR).
\t	Writes a tab.
\\	Writes a backslash (\).
\?	Writes a question mark (?).
\'	Writes a single quotation mark (').
\"	Writes a double quotation mark (").

## (10) Temporary device areas and their uses

Temporary device areas are usable in a script in addition to controller devices.

Data is written to the specified temporary device areas in real time during script execution.

The GOT does not need to communicate with a controller when using temporary device areas, reducing communication load.

The following types of temporary device areas are supported.

Type	Specifications
Temporary device area (TMP)	<p>A TMP is a global variable that is accessible by multiple scripts.            TMPs can be specified in the following scripts.</p> <ul style="list-style-type: none"> <li>• Project script</li> <li>• Screen script</li> <li>• Script part</li> <li>• Object script</li> </ul> <p>For the details, refer to the following.            →(11) Specifications of a temporary device area (TMP)</p>
Script parts temporary device area (PTMP)	<p>A PTMP is a local variable that is accessible by the scripts of each script parts object.            PTMPs can be specified in the scripts of the object or as the trigger devices to run the scripts.            For the details, refer to the following.            →(12) Specifications of a script parts temporary device area (PTMP)</p>

The following shows the uses of these temporary device areas.

Use	Description
To prevent an assignment delay	<p>If a controller device is specified as the write destination in a script, the operation result will be written to the device when the script ends, resulting in an assignment delay.            If a temporary device area is specified instead, the result will be written to the area in real time without delay.            Example) If you manipulate a bit device, and then use the bit device in a conditional formula</p> <hr/> <pre> if(...) {     alt([b:TMP0001.03]); //Invert TMP0001.03. } if([b:TMP0001.03] == ON) { //A branch is executed based on the status of TMP0001.03.     ... } else {     ... }           </pre> <hr/> <p>For the details of the assignment delay, refer to the following.            →9.9.12 ■ 1 Precautions for use</p>
As the write destination device of a while statement	<p>A device causing an assignment delay cannot be used as the write destination device of a while statement.            Use a temporary device area or a GOT internal device accordingly.</p>

## (11) Specifications of a temporary device area (TMP)

The following shows the specifications of a temporary device area (TMP).

Item	Specifications
Size	<p>One TMP is 32 bits long.            If a TMP is used as a bit device, it is handled as 16 bits long.            The settable bit range is 0 to 15.</p>
Initial value	<p>A TMP stores 0 when the GOT is powered on.</p>
Maximum number of the areas	<ul style="list-style-type: none"> <li>• For GT27, GT25, GT23, and GT SoftGOT2000                1024 (TMP0 to TMP1023)</li> <li>• For GT21                256 (TMP0 to TMP255)</li> </ul>
Example of a representation	<ul style="list-style-type: none"> <li>• To handle TMP0001 as a word device                [w:TMP0001]</li> <li>• To handle bit 1 of TMP1023 as a bit device                [b:TMP1023.01]</li> </ul>

Project scripts, screen scripts, and script parts use common TMPs.

Object scripts use different TMPs.

Accordingly, object scripts and the other types of scripts cannot exchange data using their TMPs.

To exchange data, use the GOT internal devices (GD or GB).

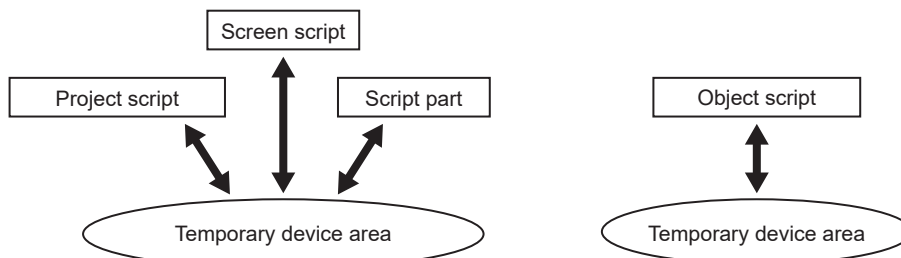

Figure conceptualizing the access to each TMP with the same number

To access the same TMP from multiple scripts, set the same data type for the scripts and the same representation for the TMP in the scripts.

Otherwise, the stored value may be rendered invalid in the following uses.

Invalid use	Example
Scripts with different data types access the same TMP.	Script A (unsigned BIN16) writes a value to TMP0000, and then script B (unsigned BIN32) reads the value from TMP0000. Script A ([Data Type]: [Unsigned BIN16]) <hr/> <pre>[w:TMP0000] = 0x1234;           //Write a value to TMP0000 as unsigned 16-bit binary data.</pre> <hr/> Script B ([Data Type]: [Unsigned BIN32]) <hr/> <pre>[w:GD0000] = [w:TMP0000])      //Read the value from TMP0000 as unsigned 32-bit binary data.</pre>
The representation of a TMP at reading differs from the one at writing.	Script A writes a hexadecimal value to TMP0000 represented as a word device, and then script B reads the value from TMP0000 represented as a bit device. <hr/> <pre>[w:TMP0000] = 0x3;           //Write a value to TMP0000 represented as a word device.</pre> <pre>if([b:TMP0000.b0] == ON) {... //Read the value from TMP0000 represented as a bit device.</pre>

### (12) Specifications of a script parts temporary device area (PTMP)

The following shows the specifications of a script parts temporary device area (PTMP).

Item	Specifications
Size	One PTMP is 32 bits long. If a PTMP is used as a bit device, it is handled as 16 bits long. The settable bit range is 0 to 15.
Initial value	A PTMP is reset to 0 at screen switching. The value stored during script execution is retained until the next screen switching.
Maximum number of the areas	Using #pragma use_ptmp_length, you can specify the maximum number of PTMPs ranging from 1 to 32768. The default is set as shown below. <ul style="list-style-type: none"> <li>For GT27, GT25, GT23, and GT SoftGOT2000 1024 (PTMP0 to PTMP1023)</li> <li>For GT21 256 (PTMP0 to PTMP255)</li> </ul>
Example of a representation	<ul style="list-style-type: none"> <li>To handle PTMP0001 as a word device [w:PTMP0001]</li> <li>To handle bit 1 of PTMP1023 as a bit device [b:PTMP1023.01]</li> </ul>

Each script parts object uses its own PTMPs.

The scripts of a script parts object can exchange data each other using their common PTMPs.

Script parts objects cannot exchange data each other using their PTMPs.

To exchange data, use the GOT internal devices (GD or GB) or temporary device areas (TMPs).

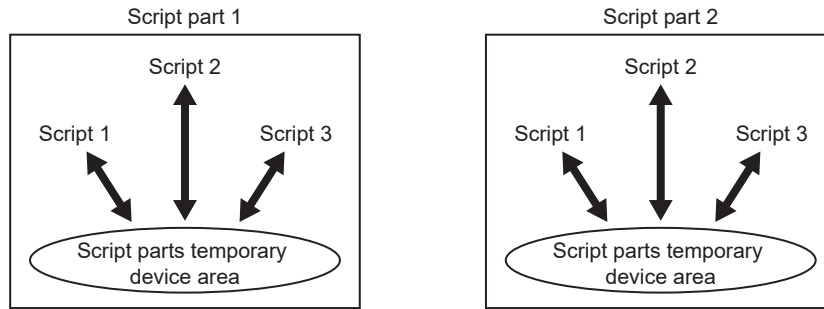

Figure conceptualizing the access to each PTMP with the same number

### (13) How to express bit devices (system define)

The following expressions can be used for bit devices.

#### (a) If a relevant expression for bit devices is processed

Device values which are normally expressed with 1 or 0 can be expressed with on and off.

```
if([b:X100]==1){[w:D0]=100;} //If X100 is on, D0 is 100.
```

↓

```
if([b:X100]==ON){[w:D0]=100;} //If X100 is on, D0 is 100.
```

#### (b) If assignment processing of bit devices is processed

Device values which are normally expressed with the set statement, the rst statement, 1, or 0 can be expressed with on or off.

```
set([b:X100]); //X100 turns on.
```

```
[b:X100]=1; //X100 turns on.
```

↓

```
[b:X100]=ON; //X100 turns on.
```

### (14) Substituting devices and constants by the user-defined character strings

The devices and constants in a script are substitutable by the user-defined character strings.

Define character strings as symbols for devices and constants. You can check for duplicate devices and constants, and apply changes of devices and constants to the script without editing the script directly.

Example) Substituting the device [b:X1000] by the character string "ERROR\_CHECK"

```
if(ERROR_CHECK == 1) {[w:D0] = 100;} // Write 100 to D0 if ERROR_CHECK ([b:X1000]) turns on.
```

The following types of symbols are supported.

Symbol	Description
Script symbol	Script symbols are usable in the following scripts. <ul style="list-style-type: none"> <li>• Project script</li> <li>• Screen script</li> </ul> For information on how to set a script symbol, refer to the following. <p>→9.9.5 ■ 3 [Script Symbol] tab</p>
Script parts symbol	Script parts symbols are usable in the scripts of a script parts object. Each script parts object has its own script parts symbols. For information on how to set a script parts symbol, refer to the following. <p>→9.9.10 ■ 2 [Script Parts Symbol] tab</p>
Object script symbol	Object script symbols are usable in object scripts only. For information on how to set an object script symbol, refer to the following. <p>→9.9.9 [Script Symbol] dialog</p>
Local symbol	Local symbols are usable in all types of scripts. Local symbols are valid only in the script where they are defined. For the local symbols, refer to the following. <p>→ ■ 3 Control structures for a project script, screen script, and script part</p>

**(15) Offset device specification**

The offset device can be specified.

**(a) Format**

Example) When D200 is 5, 48 is stored in D105.

**(b) Available devices**

- Base device  
Controller devices, GOT internal devices, gateway devices, and temporary device areas can be specified. Word devices and bit devices can be used.
- Offset device  
Controller devices, GOT internal devices, gateway devices, and temporary device areas can be specified. Only word devices can be used. (Bit devices can be specified as word devices. Specify a device with a multiple of 16.)

**(c) Application examples**

Changing parameters according to the operation mode

- D10: For switching the operation mode
- D100 to D109: For storing parameter values
- GD500: Base device
- TMP100: Offset device

Script 1 (specifies a parameter value.)

```
[w:GD500]=10; //Parameter value of operation mode 1
[w:GD501]=11;
[w:GD502]=12;
:
[w:GD600]=20; //Parameter value of operation mode 2
[w:GD601]=21;
[w:GD602]=22;
:
[w:GD700]=30; //Parameter value of operation mode 3
[w:GD701]=31;
[w:GD702]=32;
```

Script 2 (determines an offset value according to the device value for switching the operation mode.)

```
switch( [w: D10] ){
case1: //If D10 is 1, the offset value is 0.
[w:TMP100]=0;
break;
case2: //If D10 is 2, the offset value is 100.
[w:TMP100]=100;
break;
case3: //If D10 is 3, the offset value is 200.
[w:TMP100]=200;
break;
}
```

Scripts 3 (writes parameters according to the offset value.)

```
bmov([w:GD500[w:TMP100]],[w:D100],10); //Writes the device value of [GD500 + value of TMP100] to the devices from D100 to D109.
```

If script 2 and 3 are processed simultaneously or as one script, the scripts do not operate properly due to the switching delay of offsets.

**(d) Data type of offset devices**

The data type of offset devices is converted into signed BIN 16 data regardless of [Data Type] set in [Edit Script].

Example) [w:GD100] = [w:D1000[s32:GD1000]];

- 1) If 65535 is set to GD1000 (signed BIN 32), the equation "65535 (signed BIN 32) = -1 (signed BIN 16)" is satisfied and the value in D999 is assigned to GD100.
- 2) If 65537 is set to GD1000 (signed BIN 32), the equation "65537 (signed BIN 32) = 1 (signed BIN 16)" is satisfied and the

value in D1001 is assigned to GD100.

Example) [w:GD100] = [w:D1000[d32:GD1000]];

If 10 is set to GD1000 (signed BIN 32), the equation "10 (signed BIN 32) = 16 (signed BIN 16)" is satisfied and the value in D1016 is assigned to GD100.

Example) [w:GD100] = [w:D1000[ft:GD1000]];

1) If 65535.0 is set to GD1000 (real number), the equation "65535.0 (real number) = -1 (signed BIN 16)" is satisfied and the value in D999 is assigned to GD100.

2) If 65537.0 is set to GD1000 (real number), the equation "65537.0 (real number) = 1 (signed BIN 16)" is satisfied and the value in D1001 is assigned to GD100.

#### (e) Delay at assignment of offset devices

If a controller device is used as a base device, delay may occur and the offset may not operate properly even though the offset device value is changed.

If the offset does not operate properly, use temporary device areas or GOT internal devices.

⇒9.9.12 ■ 1 Precautions for use

### (16)Integer ← → real number conversion function

GT21 does not support this item.

For scripts, the data type is selected for each script. However, using the integer ← → real number conversion function enables you to use integral device values as real numbers for operation.

The integer ← → real number conversion function is available only for GOT internal devices (GD).

To convert the value of a controller device, transfer the value to the GOT internal device using a script (bmov instruction).

When real numbers are converted into integers, the value after the decimal point is rounded down. (1.53 → 1)

If the real number is out of the range, an error occurs before the value after the decimal point is rounded down and the real number is not converted.

#### (a) Conversion method

The integer ← → real number conversion is executed using the GOT internal device (GD) as the target to be converted.

Execute the integer ← → real number conversion by specifying the following devices by scripts.

Up to 4096 points can be converted at once.

For the details of the GOT internal devices, refer to the following.

⇒12.1.3 GOT special register (GS)

##### • Read device

Device	Function	Description
GS460	Conversion Start Indication	Specifies the conversion start and the conversion method with each bit. b0: Unsigned BIN 16 data is converted into real numbers. b1: Signed BIN 16 data is converted into real numbers. b2 and b3: Use prohibited b4: Real numbers are converted into unsigned BIN 16 data. b5: Real numbers are converted into signed BIN 16 data. b6 to b14: Use prohibited b15: This bit is turned on when conversion is executed.
GS461	Number of Conversion Devices	Specifies the number of devices to be converted.
GS462	Conversion Source Head Device No.	Specifies the start device No. of the GOT internal device (GD) where the value before conversion is stored.
GS463	Conversion Destination Head Device No.	Specifies the start device No. of the GOT internal device (GD) where the conversion result is to be stored.
GS464	Storage Error Value	Specifies the device value to be stored in the conversion destination device when a conversion error occurs. (Using this device for error recognition may be useful.)

Turn off the Conversion Start Indication (GS460) after completion of conversion.

If the Conversion Start Indication is executed when it is on, the device value is not converted.

##### • Write device

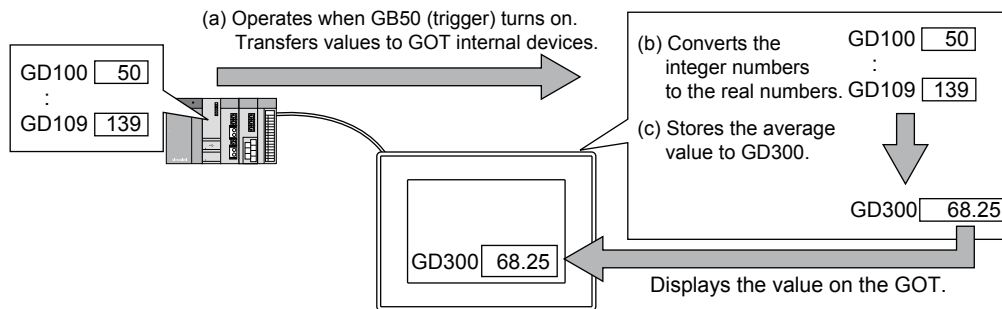

Device	Function	Description
GS260	Status	Stores the conversion completion notification and an error occurrence in each bit. If the Conversion Start Indication (GS460.b15) is turned off (0), each bit becomes 0. b0 to b13: Use prohibited b14: This bit turns on when an error occurs during conversion in the GOT. (An error code is stored in GS261.) b15: This bit turns on when conversion is finished in the GOT.
GS261	Error code <sup>*1</sup>	Stores an error which has occurred at conversion. When conversion is finished properly, 0 is stored in this device.

\*1 The following shows the error codes to be stored in GS261.

Error code	Description	Remarks
1	The Conversion Start Indication is not initialized.	Conversion processing is not executed.
2	The setting of the Conversion Start Indication is incorrectly configured.	
3	The number of devices is out of range.	
4	The device is out of range.	
5	The conversion source and destination are the same.	
6	Not used	-
7	Conversion error (such as an overflow)	Conversion processing continues.

## (b) Application examples

The average value of the data (signed BIN 16) stored in controller devices is displayed on the GOT in real numbers.

- Script 1 (conversion start processing)

Transfers the values of the controller devices (D100 to D109) to the GOT internal devices (GD100 to GD109) and converts integer numbers to real numbers.

Script 2 is started after the conversion is started.

- Data type: Signed BIN 16

- Trigger: Rise of GB50

```
bmov([w:D100],[w:GD100],10);
[w:GS461]=10; //Number of devices to be converted
[w:GS462]=100; //Conversion source head device No.
[w:GS463]=200; //Conversion destination head device No.
[w:GS460]=0x8002; //Starts conversion.
set([b:GB100]); //Launches script 2.
```

- Script 2 (conversion completion monitor processing)

Waits completion of the conversion from integral numbers to real numbers. When no error occurs after completion of the conversion, the Conversion Start Indication device is cleared at the same time of starting script 3.

- Data type: Signed BIN 16

- Trigger: While GB100 is on

```
if([b:GS260.15]==1)
{ //Conversion is complete.
if([b:GS260.14]==0)
{
set([b:GB101]); //Conversion is complete and the status is normal. (Launches script 3.)
}
}
[w:GS460]=0; //Clears the conversion start trigger.
rst([b:GB100]); //Clears the script 2 trigger.
}
```

- Script 3 (Average calculation processing)

Calculates the average value of the GOT internal device values converted into real numbers and stores the average value in GD300.

- Data type: Real number

- Trigger: Rise of GB101

```
[w:TMP001]=0;
[w:TMP001]=[w:TMP001]+[w:GD200];
[w:TMP001]=[w:TMP001]+[w:GD202];
```

```

[w:TMP001]=[w:TMP001]+[w:GD204];
[w:TMP001]=[w:TMP001]+[w:GD206];
[w:TMP001]=[w:TMP001]+[w:GD208];
[w:TMP001]=[w:TMP001]+[w:GD210];
[w:TMP001]=[w:TMP001]+[w:GD212];
[w:TMP001]=[w:TMP001]+[w:GD214];
[w:TMP001]=[w:TMP001]+[w:GD216];
[w:TMP001]=[w:TMP001]+[w:GD218];
[w:GD300]=[w:TMP001]/10; //Stores the average in GD300 (real number).
rst([b:GB101]); //Clears the script 3 trigger.

```

### (17)Data type conversion function

Using this function enables you to calculate integral device values as real numbers much easier than using the integer ← → real number conversion function.

The values of word devices can be converted into a specified data type for reading or writing.

Specify the data type when reading or writing the device values.

The following shows the list of the data types which can be specified with the data type conversion function.

Data type after conversion	Statement example	Expression example	
Signed BIN 16	[s16:device]	[s16:D0]=[w:GD0];	Refers to the value in GD0 as the data type set in [Data Type], converts the value into the signed BIN 16 data, and assigns the data to D0.
Unsigned BIN 16	[u16:device]	[w:GD0]=[u16:D0];	Refers to the value in D0 as the unsigned BIN 16 data, converts the value into the data type set in [Data Type], and assigns the data to GD0.
Signed BIN 32	[s32:device]	if([s32:D0]<0){	Refers to the values in D0 and D1 as the signed BIN 32 data and compares the data with 0.
Unsigned BIN 32	[u32:device]	[u32:GD10]=[w:GD0]*[w:GD1];	Refers to the values in GD0 and GD1 as the data type set in [Data Type], converts the operation results into the unsigned BIN 32 data, and assigns the results to GD10 and GD11.
[BCD16]	[d16:device]	[d16:GD0]=[w:D0]&0x000F;	Refers to the value in D0 as the data type set in [Data Type], converts the operation result into BCD16 data, and assigns the result to GD0.
[BCD32]	[d32:device]	[w:GD0]=[d32:D0];	Refers to the value in D0 and D1 as the BCD32 data, converts the values into the data type set in [Data Type], and assigns the values to GD0.
Real number	[flt:device]	[flt:D100]=log([w:D200]);	Refers to the value in D200 as the data type set in [Data Type], converts the operation result into real numbers, and assigns the result to D100 and D101.

Example 1) If signed BIN 16 is set for [Data Type] and the average value of the device values is assigned in real numbers

```
[flt:D10]=([w:D20]+[w:D30]+[w:D40]+[w:D50]+[w:D60])/5;
```

Example 2) If the device value in real number is rounded down and written to the signed BIN 32 data

```
[s32:D100]=[flt:D200];
```

Example 3) If the device value in real number is rounded off and written to the signed BIN 32 data

```
[s32:D100]=[flt:D200]+0.5;
```

## 9.9.3 How to use a project script, screen script, or script part

This section explains how to use a project script, screen script, or script part.

### ■1 Setting procedure

The following shows the procedure for setting a script.

#### (1) Procedure for setting a project script or screen script

- Step 1** Configure the script settings with GT Designer3, such as the data type and trigger type.
  - ⇒9.9.5 [Script] dialog
- Step 2** Create or edit a script with the script editor or a commercially available text editor.
  - ⇒9.9.7 [Edit Script(script name)] dialog
- Step 3** When you have created or edited a script with a commercially available text editor, read the script with GT Designer3.
- Step 4** Check the syntax of the script with GT Designer3.
  - ⇒9.9.7 [Edit Script(script name)] dialog
  - If an error is detected, return to step 1 to correct the script.
  - A general C language compiler is also usable to simulate the operation.
  - ⇒9.9.14 ■ 1 Simulation using a general C language compiler or debugger
- Step 5** Write the project from the personal computer to the GOT with GT Designer3.
  - ⇒4. COMMUNICATING WITH GOT
- Step 6** Start monitoring and check the script operation using the device monitor.
  - ⇒GOT2000 Series User's Manual (Monitor)
  - If the script runs properly, the creation of the script is complete.
  - If the script runs improperly, return to step 1 to correct the script.

#### (2) Procedure for setting a script part

When you place a script parts object on the screen editor, make sure that the object overlaps the screen display area 1 dot or more.

Otherwise, the script set for the object does not run.

- Step 1** Select [Object] → [Script Parts] from the menu.
- Step 2** Click the position to place a script parts object.
- Step 3** Double-click the script parts object to display the [Script Parts] dialog.
  - ⇒9.9.10 [Script Parts] dialog
- Step 4** On the [Script Setting] tab, set a trigger type and a script.
- Step 5** Check the syntax of the script with GT Designer3.
  - ⇒9.9.7 [Edit Script(script name)] dialog
  - 9.9.11 [Script Edit] dialog (for script parts)
  - If an error is detected, return to step 4 to correct the script.
  - A general C language compiler is also usable to simulate the operation.
  - ⇒9.9.14 ■ 1 Simulation using a general C language compiler or debugger
- Step 6** Write the project from the personal computer to the GOT with GT Designer3.
  - ⇒4. COMMUNICATING WITH GOT
- Step 7** Start monitoring and check the script operation using the device monitor.
  - ⇒GOT2000 Series User's Manual (Monitor)
  - If the script runs properly, the creation of the script is complete.
  - If the script runs improperly, return to step 4 to correct the script.

### ■2 Operation

The following shows the operation of a project script, screen script, or script part.

### (1) Trigger condition

A project script, a screen script, or the script of a script parts object runs when its trigger condition is satisfied, and the result is written to a target PLC CPU.

The following shows the selectable trigger types.

- [Ordinary]
- [ON]
- [OFF]
- [Rise]
- [Fall]
- [Rise/Fall]
- [ON Sampling]
- [OFF Sampling]
- [Sampling] (Unit: second)
- [When closing a screen] (for screen scripts and script parts)

### (2) Execution unit

Project scripts, screen scripts, and the scripts of a script parts object run one by one.

Even if the trigger conditions of multiple scripts are satisfied, the scripts do not run simultaneously.

### (3) Execution order

The GOT check whether the trigger conditions of project scripts, screen scripts, and scripts of script parts objects are satisfied in top-to-bottom order as shown in the table below.

Depending on when the trigger device status is refreshed, the scripts may not run in the specified order even though the same trigger device is set for the scripts.

To control the execution order of scripts, establish a handshake between the scripts.

Priority order of screens	Priority order of scripts	Hierarchical order of the set overlay screen function	Execution order specified on GT Designer3	Number of executable scripts
-	Project script	-	1 → 2 → ...	256
Base screen	Screen script	Basic screen	1 → 2 → ...	256
		Called screen of the 1st layer	1 → 2 → ...	
		:	:	
		Called screen of the 16th layer	1 → 2 → ...	
	Script part	32 script parts objects on the basic screen	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		32 script parts objects on a called screen of the 1st layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		:	:	
		32 script parts objects on the called screens of the 16th layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
Superimpose window 1	Screen script	Basic screen	1 → 2 → ...	256
		Called screen of the 1st layer	1 → 2 → ...	
		:	:	
		Called screen of the 16th layer	1 → 2 → ...	
	Script part	32 script parts objects on the basic screen	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		32 script parts objects on a called screen of the 1st layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		:	:	
		32 script parts objects on the called screens of the 16th layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	

Priority order of screens	Priority order of scripts	Hierarchical order of the set overlay screen function	Execution order specified on GT Designer3	Number of executable scripts
Superimpose window 2	Screen script	Basic screen	1 → 2 → ...	256
		Called screen of the 1st layer	1 → 2 → ...	
		:	:	
		Called screen of the 16th layer	1 → 2 → ...	
	Script part	32 script parts objects on the basic screen	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		32 script parts objects on a called screen of the 1st layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		:	:	
Overlap window 1	Screen script	Basic screen	1 → 2 → ...	256
		Called screen of the 1st layer	1 → 2 → ...	
		:	:	
		Called screen of the 16th layer	1 → 2 → ...	
	Script part	32 script parts objects on the basic screen	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		32 script parts objects on a called screen of the 1st layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		:	:	
:	:	:	:	:
Overlap window 5	Screen script	Basic screen	1 → 2 → ...	256
		Called screen of the 1st layer	1 → 2 → ...	
		:	:	
		Called screen of the 16th layer	1 → 2 → ...	
	Script part	32 script parts objects on the basic screen	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		32 script parts objects on a called screen of the 1st layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	
		:	:	
		32 script parts objects on the called screens of the 16th layer	Script parts object 1: 1 → 2 → ... : Script parts object 32: 1 → 2 → ...	

#### (4) Execution status

A project script, a screen script, or the script of a script parts object is processed according to the script execution status.

Script execution status	Processing
Waiting for turn	<ul style="list-style-type: none"> <li>• Waits for the processing turn according to the execution order.</li> <li>• When the turn has come, the script enters the "Waiting for execution" status.</li> </ul>
Waiting for execution	<ul style="list-style-type: none"> <li>• The processing differs depending on the operating condition.</li> </ul> <p>Satisfied: The script enters the "Execution" status. Not satisfied: The script enters the "Waiting for turn" status, and the next script enters the "Waiting for execution" status.</p>

Script execution status	Processing
Execution	<ul style="list-style-type: none"> <li>When the script has ended, the processing result is written to the PLC CPU and the script enters the "Waiting for turn" status.</li> <li>The next script enters the "Waiting for execution" status.</li> <li>If an error occurs, the script enters the "Stop" status and the next script enters the "Waiting for execution" status.</li> <li>When a screen is switched while screen scripts are used, the next script does not enter the "Waiting for execution" status until all the scripts set in the screen have been executed.</li> </ul>
Stop	<ul style="list-style-type: none"> <li>The "Stop" status is held until the error history is cleared.</li> </ul>

### ■ 3 Monitoring time for a project script, screen script, or script part

Specify the monitoring time of a script with GS385.

If a script does not end after a lapse of the specified monitoring time, the script is aborted.

The setting range is 1 second to 300 seconds. (Units of 1 second)

If the set value falls outside this range, 10 seconds are assumed.

If error code 15 is output during script execution, specify a longer monitoring time with GS385.

### ■ 4 Running a project script, screen script, or script of a script parts object upon an applicable process

Use GS386 to set whether to run a script upon screen switching or other applicable processes.

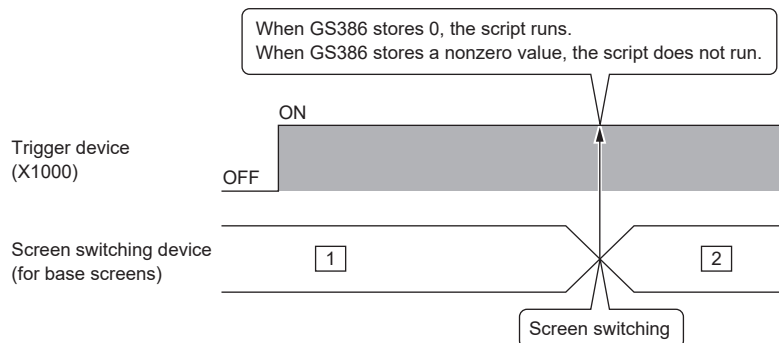

When GS386 stores 0: Runs the script upon an applicable process.

When GS386 stores a nonzero value: Does not run the script upon an applicable process.

This setting is applied to the project scripts, screen scripts, and script parts where the following trigger types are set.

Trigger type	When running a script upon an applicable process
[Rise]	When the trigger device is on, the script runs upon screen switching or other applicable processes.
[Fall]	When the trigger device is off, the script runs upon screen switching or other applicable processes.
[Rise/Fall]	When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Example) When a screen script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for base screen 2

The following shows the processes upon which a script runs.

Script type	Process	Remarks
Project script	When the GOT is powered on or when the GOT returns from offline	-
Screen script Script part	Screen switching	The scripts, which are set for the screen displayed after screen switching, are executed.
	Security switching *1	-
	Language switching *1	-
	System language switching *1	-
	Station No. switching *1	When the station No. switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.
	Offset switching *1	On a screen having a script setting, when offset switching occurs in any device of the screen, the script is executed.

\*1 When [Perform script initial operation (screen/object) only when switching screens] is deselected on the [Option] tab in the [Script] dialog, the script runs upon the process.

⇒ 9.9.5 ■ 4 [Option] tab

## 9.9.4 Examples of project scripts, screen scripts, and the scripts of script parts objects

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the examples of project scripts, screen scripts, and the scripts of script parts objects.

### 1 Switches with the interlock function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### (1) Operation

When the ready switch and the run/stop switch turn on, the running lamp turns on.  
The system operation is controlled associating with the running lamp.

Screen image	Operation of each object
	<p>Running lamp: Displays the operation status of the system.</p> <p>Ready switch: Operates as an interlock of the run/stop switch.</p> <p>Run/Stop switch: Switches the operation status of the system (running or stop).</p>

#### (2) Monitor screen setting

Object name	Type	Setting item	Setting
Running lamp	Bit lamp	Monitor device	M0003 (System operation control device)
Ready switch	Bit switch	Monitor device	M0001
		Operation setting	Bit set
Run/Stop switch	Bit switch	Monitor device	M0002
		Operation setting	Bit set

#### (3) Program example

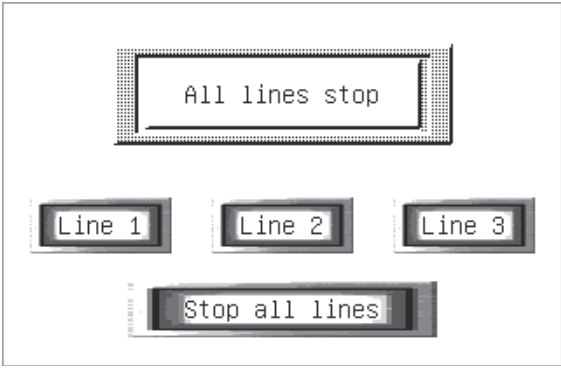

Item	Description
Data type	Signed BIN 16
Trigger type	Always
Script	<pre>if ([b:M0001]&amp;&amp;[b:M0002]){   set([b:M0003]); }else{   rst([b:M0003]);   rst([b:M0002]); }</pre> <p>//When both the ready switch and the run/stop switch turn on, //the running lamp turns on and the system operation starts. //If not, //the running lamp turns off and the system stops and //the run/stop switch is reset.</p>

### 2 Lamps which change display objects according to multiple conditions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### (1) Operation

The operations of three lines are controlled by the switches, and the control statuses of each line are indicated by one lamp.

Screen image	Operation of each object
	<p>Control status lamp: The lamp color and the comment change according to the operation status of each line.</p> <p>Line 1 to Line 3 switch: Control the operations of line 1 to line 3.</p> <p>Stop all lines switch: Stops all the lines.</p>

### (2) Monitor screen setting

Object name	Type	Setting item	Setting
Control status lamp	Word lamp	Monitor device	D10
Control status lamp	Word lamp	Style, text	Display range: \$V==0 Lamp color: 182 Text: All lines stop
			Display range: \$V==1 Lamp color: 3 Text: Line 1 running
			Display range: \$V==2 Lamp color: 224 Text: Line 2 running
			Display range: \$V==3 Lamp color: 227 Text: Line 3 running
			Display range: \$V==4 Lamp color: 28 Text: Line1 and 2 running
			Display range: \$V==5 Lamp color: 31 Text: Line1 and 3 running
			Display range: \$V==6 Lamp color: 252 Text: Line2 and 3 running
Line 1 switch	Bit switch	Monitor device	X1
		Operation setting	Bit alternate
Line 2 switch	Bit switch	Monitor device	X2
		Operation setting	Bit alternate
Line 3 switch	Bit switch	Monitor device	X3
		Operation setting	Bit alternate
Stop all lines switch	Bit switch	Monitor device	X0
		Operation setting	Bit set

### (3) Program example

Item	Description
Data type	Signed BIN 16
Trigger type	Always

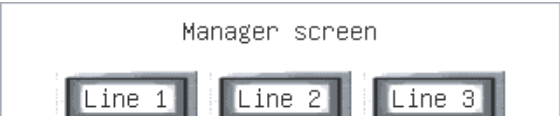

Item	Description
Script	<pre> if(((b:X1)==OFF)&amp;&amp;((b:X2)==OFF)&amp;&amp;((b:X3)==OFF)){ [w:D10]=0; } if(((b:X1)==ON)&amp;&amp;((b:X2)==OFF)&amp;&amp;((b:X3)==OFF)){ [w:D10]=1; } if(((b:X1)==OFF)&amp;&amp;((b:X2)==ON)&amp;&amp;((b:X3)==OFF)){ [w:D10]=2; } if(((b:X1)==OFF)&amp;&amp;((b:X2)==OFF)&amp;&amp;((b:X3)==ON)){ [w:D10]=3; } if(((b:X1)==ON)&amp;&amp;((b:X2)==ON)&amp;&amp;((b:X3)==OFF)){ [w:D10]=4; } if(((b:X1)==ON)&amp;&amp;((b:X2)==OFF)&amp;&amp;((b:X3)==ON)){ [w:D10]=5; } if(((b:X1)==OFF)&amp;&amp;((b:X2)==ON)&amp;&amp;((b:X3)==ON)){ [w:D10]=6; } if(((b:X1)==ON)&amp;&amp;((b:X2)==ON)&amp;&amp;((b:X3)==ON)){ [w:D10]=7; } if ((b:X0)==ON){ rst((b:X1)); rst((b:X2)); rst((b:X3)); rst((b:X0)); } </pre>

### ■ 3 Password entry screen with time limit function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### (1) Operation

The password entry screen is displayed. If the correct password is not entered within 10 seconds, the screen returns to the previous screen.

Screen image	Operation of each object
<p>Screen with the <input type="checkbox"/> Manager switch (base screen 3)</p>  <p>Screen change ↓ ↑ Returns in 10 seconds</p> <p>Enter the manager password</p>  <p>↓ Password match</p> <p>Manager screen</p>  <p>Manager screen (base screen 5) appears.</p>	<p>Manager button: Displays the password entry screen (base screen 4).</p> <p>Password entry: Displays the password entered using 0 to 9 switches.</p> <p>0 to 9 switch: Inputs a value.</p> <p>Clear switch: Clears the input value.</p> <p>Confirm switch: Confirms the input value.</p>

#### (2) Monitor screen setting

Object name	Type	Setting item	Setting
Manager button	Go To Screen switch	Operation setting	Base screen switching 4

Object name	Type	Setting item	Setting
Password entry	Numerical input	Monitor device	D10
1 switch	Key code switch	Operation setting	Key code [0031h]
2 switch	Key code switch	Operation setting	Key code [0032h]
3 switch	Key code switch	Operation setting	Key code [0033h]
4 switch	Key code switch	Operation setting	Key code [0034h]
5 switch	Key code switch	Operation setting	Key code [0035h]
6 switch	Key code switch	Operation setting	Key code [0036h]
7 switch	Key code switch	Operation setting	Key code [0037h]
8 switch	Key code switch	Operation setting	Key code [0038h]
9 switch	Key code switch	Operation setting	Key code [0039h]
0 switch	Key code switch	Operation setting	Key code [0030h]
Clear switch	Key code switch	Operation setting	Key code [0088h]
Confirm switch	Key code switch	Operation setting	Key code [000Dh]

### (3) Program example

This program example uses the GOT special registers (GS devices).

In the GOT special registers, the GOT internal information, the communication status, and the error information of the scripts are stored.

Associating the GOT special registers with scripts enables various operations.

For the details of the GOT special register, refer to the following.

→ 12.1.3 GOT special register (GS)

Item	Description
Data type	Signed BIN 16
Trigger type	Always
Script	<pre> if([b:GS1.01]==ON){ [w:TMP0001]=[w:GS7]; } if([w:D10]==3238){ [w:D0]=5; [w:D10]=0; }if([w:GS7]-[w:TMP0001]&gt;=10){ [w:D0]=3; } </pre>

## ■ 4 Application examples of the file operation function

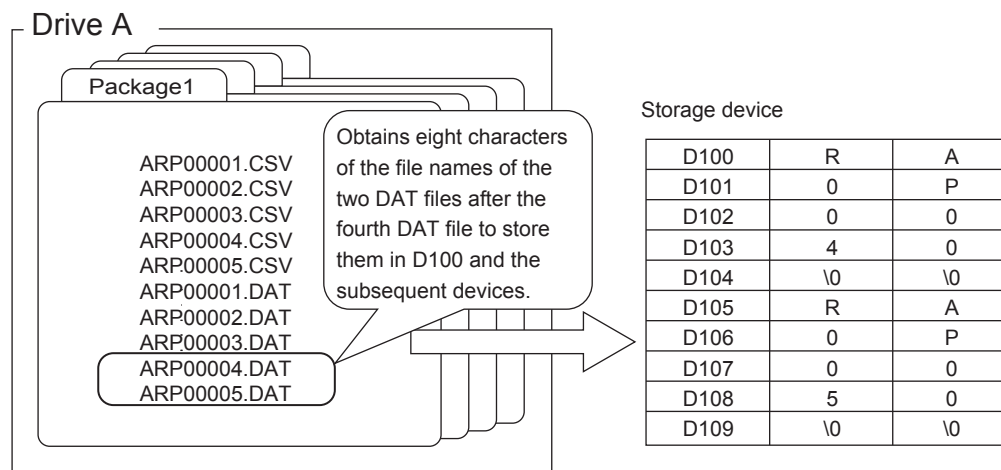

The following shows application examples of the file operation function.

### (1) File name obtaining function (file\_getlist)

Example) To obtain the file names of the two DAT files after the fourth DAT file in the folder Package 1 of drive A and to store eight characters of each file name in D100 and the subsequent devices

(Without using the declare function, #pragma use\_character\_code unicode)

[s16:D500] = file\_getlist("A:\\Package1\\", "\*.DAT", [w:D100], 3, 2, 8); //Obtain a file name

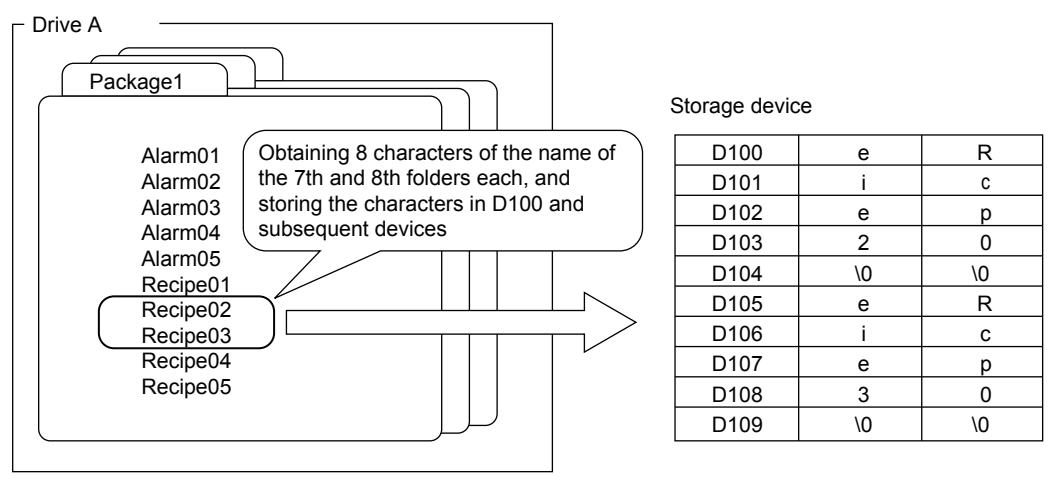

**(2) Obtain folder name function (file\_getfolderlist)**

Example) To obtain 8 characters of the name of the 7th and 8th folders each in the Package1 folder in drive A, and store the characters in D100 and subsequent devices

(Without using the declare function, #pragma use\_character\_code unicode)

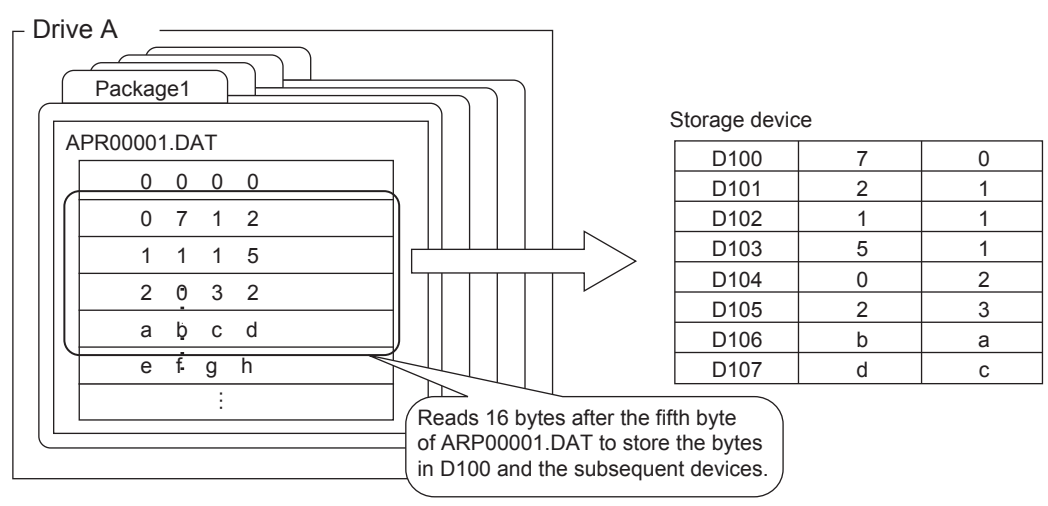

```
[s16:D500] = file_getfolderlist("A:\\Package1\\", "", [w:D100], 6, 2, 8); // Obtain a folder name.
```

**(3) File read function (file\_read)**

Example) To read 16 bytes after the fifth byte of ARP00001.DAT in the folder Package 1 of drive A and to store the bytes in D100 and the subsequent devices

```
[s16:D500] = file_read("A:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16); //Reads file
```

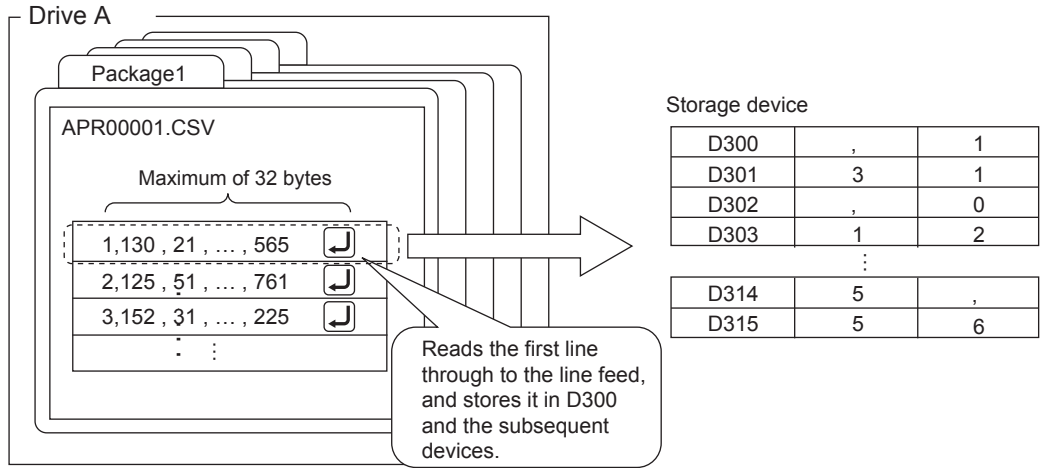

**(4) File line read function (file\_lineread, file\_unilineread)**

Example) To read the first line of ARP00001.CSV in the folder Package 1 of drive A and to store it in D300 and the subsequent devices

- Length of one line: Up to 32 bytes
- D200: Return value (number of read bytes)
- D300: Device storing the read data

```
[s16:D200] = file_lineread("A:\\Package1\\", "ARP00001.CSV", [w:D300], 0, 32); //Read one line
```

By adding the number of read bytes stored in the return value to the offset, the second or later lines can be read consecutively.

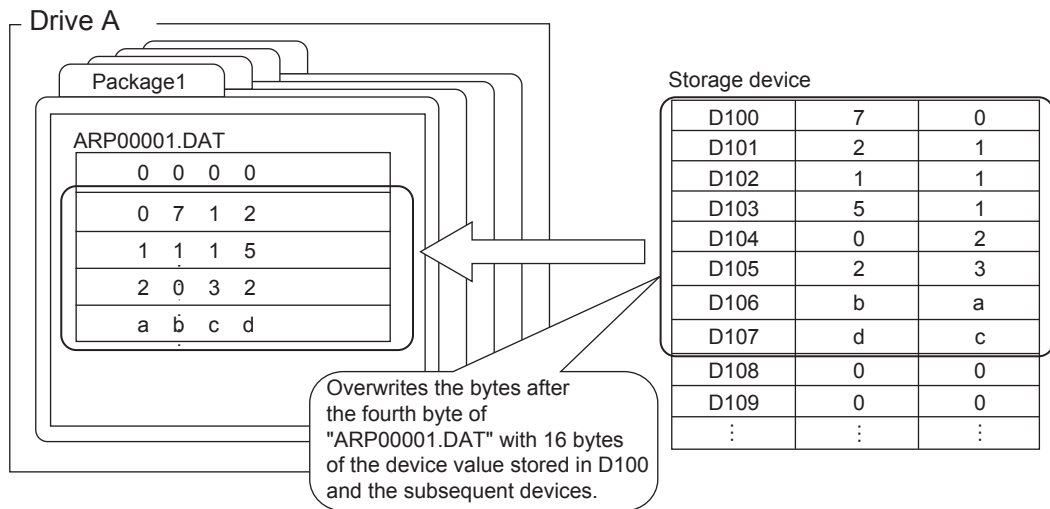

Example)

```
[s16:D400] = [s16:D400] + [s16:D200]; //Add the number of read bytes to the offset
[s16:D200] = file_lineread("A:\\Package1\\", "ARP00001.CSV", [w:D300], [s16:D400], 256);
```

**(5) File write function (file\_write)**

Example) To overwrite the bytes after the fourth byte of ARP00001.DAT in the folder Package 1 of drive A with 16 bytes of the device value stored in D100 and the subsequent devices

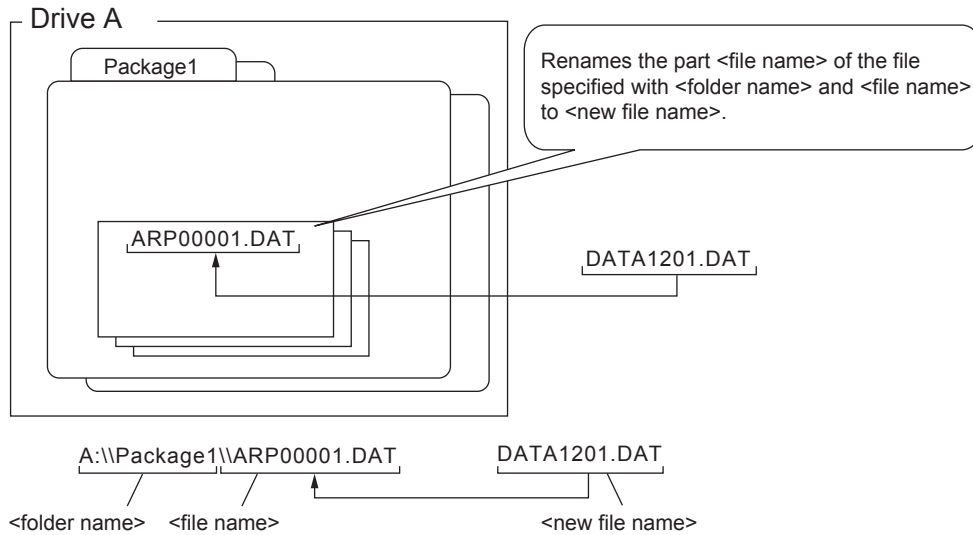

```
[s16:D500] = file_write("A:\\Package1\\", "ARP00001.DAT", [w:D100], 4, 16, 2); //Write file
```

**(6) File rename function (file\_rename)**

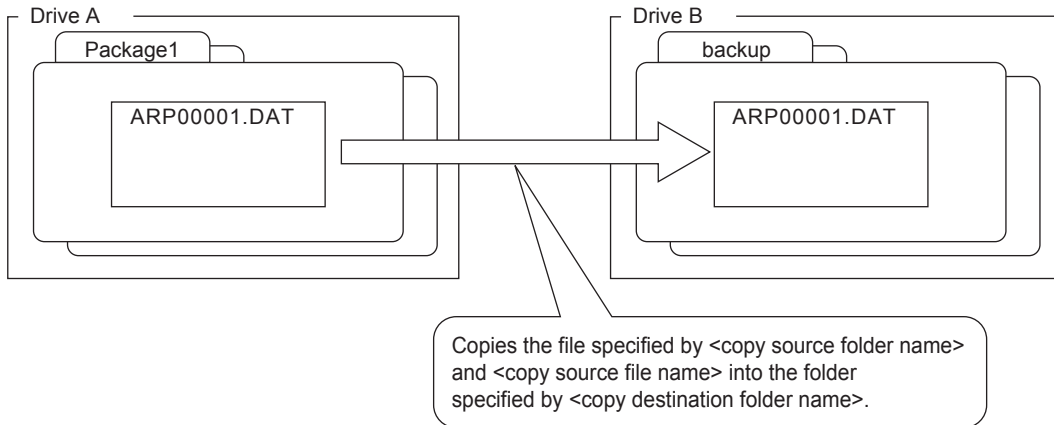

Example) To rename ARP00001.DAT in the folder Package 1 of drive A to DATA1201.DAT

```
[s16:D500] = file_rename("A:\\Package1\\", "ARP00001.DAT", "DATA1201.DAT"); //Rename file
```

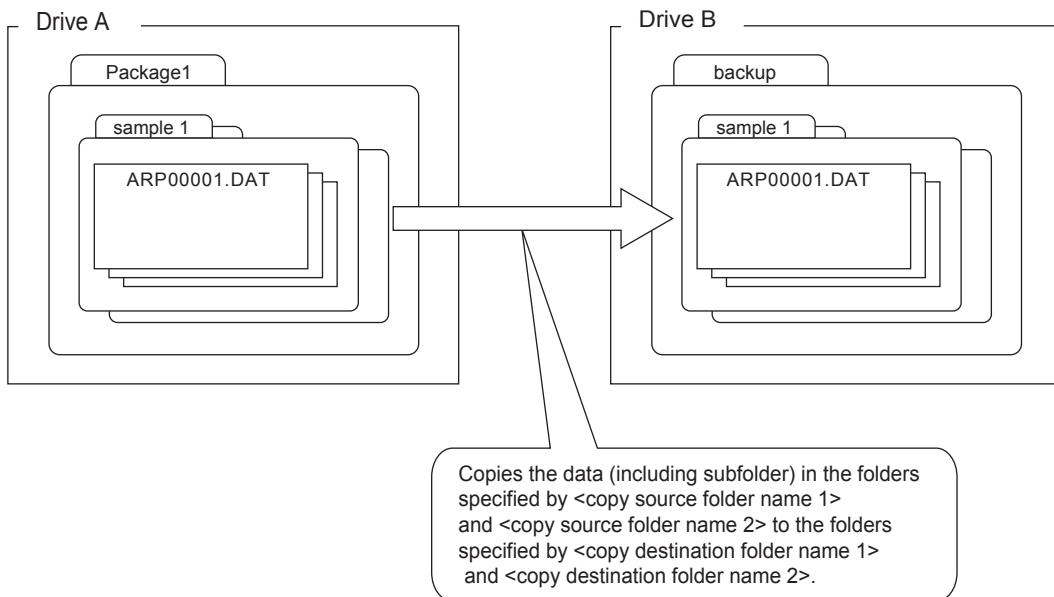

**(7) File copy function (file\_copy)**

Example) To copy ARP00001.DAT in the folder Package1 of drive A to the backup folder of drive B  
 [s16:D500] = file\_copy("A:\\Package1\\", "ARP00001.DAT", "B:\\backup\\", "", 1); //Copy file.

**(8) Folder copy function (file\_xcopy)**

Example) To copy the data (including subfolder) in the folder Package 1 of drive A to the backup folder of drive B  
 [s16:D500] = file\_xcopy("A:\\Package1\\", "sample1", "B:\\backup\\", "sample1", 1); //Copy folder.

**(9) Folder and file name character number specification functions (#pragma folder\_name\_length, #pragma file\_name\_length)**

Example) To limit the folder name to 14 characters and file name to 12 characters at file reading

GD2000 to GD2006: Store folder name A: \FOLDER0001\.

GD2100 to GD2105: Store file name ARP00001.DAT.

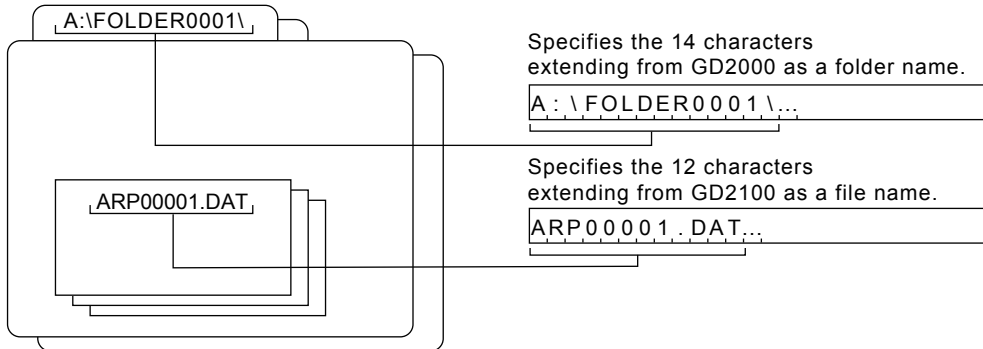

GD3000 to GD3015: Store the data read from a file.

```
#pragma folder_name_length(14) //Limit the folder name length to 14 characters
```

```
#pragma file_name_length(12) //Limit the file name length to 12 characters
```

```
[s16:D500]=file_read([w:GD2000],[w:GD2100],[w:GD3000],0,32);
```

```
//Read 32 characters from the start of file name GD2100
```

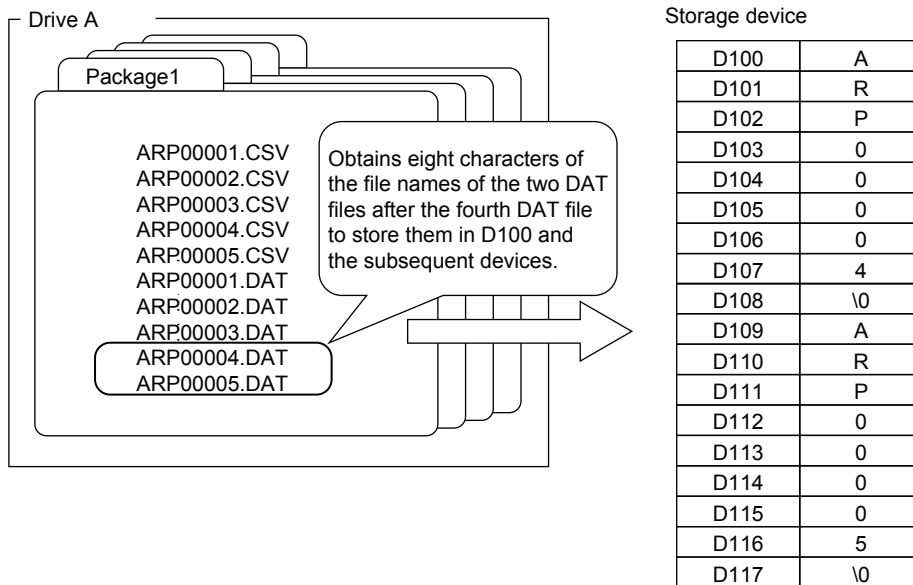

**(10) Use Unicode declare function (#pragma use\_character\_code unicode)**

Example) To specify a folder name and a file name in Unicode at file reading

```
#pragma use_character_code unicode
```

```
[s16:D500] = file_getlist("A:\\Package1\\", "*.DAT", [w:D100], 3, 2, 8); //Obtain a file name
```

## ■5 Application examples of the string operation function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

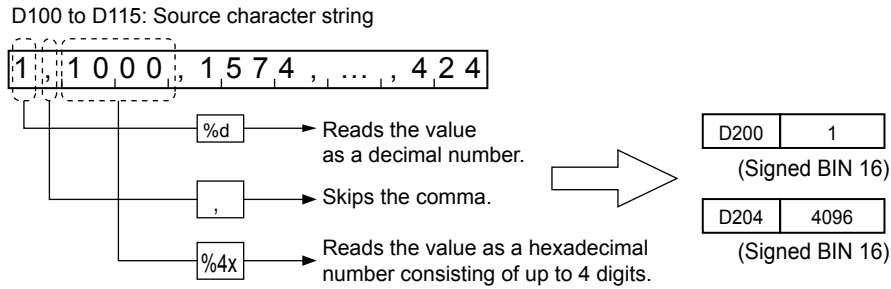

The following shows application examples of the string operation function.

### (1) String input function (str\_scanf, str\_uniscanf)

Example) To read the first two fields from one line stored in D100 and the subsequent devices

- D500: Return value
- D100: Input string storage device (read one-line data)
- D200: Input value storage device (first field)
- D204: Input value storage device (second field)

```
[s16:D500] = str_scanf([w:D100],32,0,"%d,%4x",[w:D200],[w:D204]); //Obtain two data sets
```

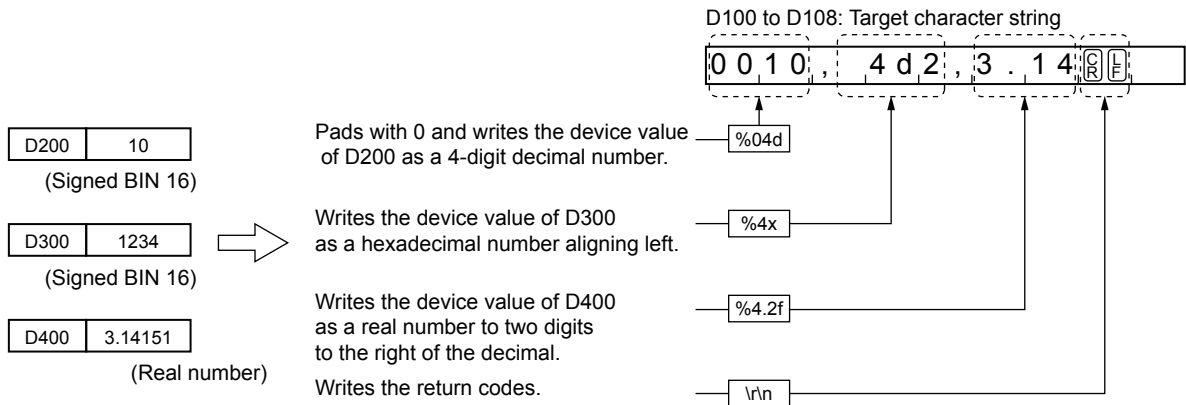

### (2) String output function (str\_printf, str\_uniprintf)

Example) To write three data sets stored in D200, D300, and D400 to one character string stored in D100 and the subsequent devices

- D500: Return value
- D100: Output string storage device (target character string)
- D200: Output value storage device (data to be written to the first field)
- D300: Output value storage device (data to be written to the second field)
- D400: Output value storage device (data to be written to the third field)

```
[s16:D500] = str_printf([w:D100],18,"%04d,%4x,%4.2f\r\n",[s16:D200],[s16:D300],[f1t:D400]);  
//Write three data sets
```

### (3) String length acquisition function (str\_strlen, str\_unistrlen)

Example) To obtain the data length of characters from the 1st byte of D100 to the 10th byte

- D500: Return value (data length)
- D100: Input string storage device

```
[s16:D500] = str_strlen([w:D100],10); //Obtain data length of D100
```

**(4) Partial string acquisition function (str\_strmid, str\_unistrmid)**

Example) To read 7 bytes after the fifth character of the string stored in D100 and the subsequent devices and to store the bytes in D200

- D500: Return value (read data amount)
- D100: Input string storage device (source character string)
- D200: Output string storage device (read data)

```
[s16:D500] = str_strmid([w:D100], [w:D200], 5, 7); //Obtain a part of the string of D100.
```

**(5) Convert character code function (Local code to Unicode) (str\_lc2uni)**

Example) To read 6 characters (6-byte data) from an ASCII string in D100 and subsequent devices, encode the characters to Unicode, and write the 6 Unicode characters (12-byte data) to D200 and subsequent devices

- Order of storing data: Lower to higher

```
[s16:D500] = str_lc2uni(2, [w:D100], [w:D200], 6, 12); // Convert a character code.
```

**(6) Convert character code function (Unicode to local code) (str\_uni2lc)**

Example) To read 6 characters (12-byte data) from a Unicode string in D100 and subsequent devices, encode the characters to ASCII, and writes the 6 ASCII characters (6-byte data) to D200 and subsequent devices

- Order of storing data: Lower to higher

```
[s16:D500] = str_uni2lc(2, [w:D100], [w:D200], 12, 6); // Convert a character code.
```

## 9.9.5 [Script] dialog

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

This dialog is used for setting a project script or screen script.

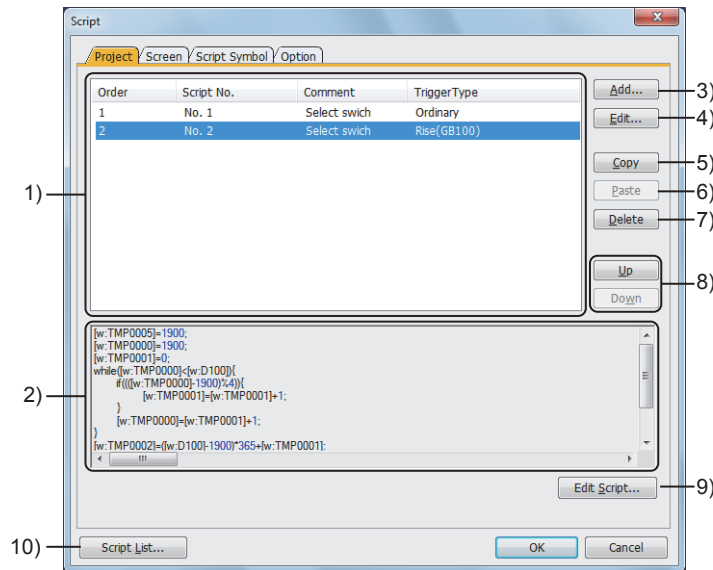

To display this dialog, select [Common] → [Script] → [Script] from the menu.

- ■ 1 [Project] tab
- 2 [Screen] tab
- 3 [Script Symbol] tab
- 4 [Option] tab

### ■ 1 [Project] tab

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Set the project scripts which operate to the whole project.

#### 1) Script setting list

Displays the list of script settings.

The script of the selected script No. is displayed in the space below the script setting list.

#### 2) Script preview

Displays the content of the script selected in the script setting list.

#### 3) [Add] button

Add a new script setting to the list.

Click this button to display the [Script Edit] dialog.

→ 9.9.6 [Script Edit] dialog (for project scripts and screen scripts)

The execution order of the scripts is set according to the order in which the scripts are added.

#### 4) [Edit] button

Edit the selected script setting.

Click this button to display the [Script Edit] dialog.

→ 9.9.6 [Script Edit] dialog (for project scripts and screen scripts)

#### 5) [Copy] button

Copies the selected script setting.

#### 6) [Paste] button

Pastes the copied script setting to the last line of the list.

Click the [Paste] button to display the dialog for selecting the method to paste the script.

The pasting method differs depending on the [Yes] or [No] button.

[Yes] button: Copies the source script.

Select the [Yes] button to display the following dialog.

When [External File (External Data)] is selected in the [Option] tab

When [Project Data (Internal Data)] is selected in the [Option] tab

• **[Script No.]**

Set the script No. for the script to be registered. (Default: The minimum number of the non-registered script No.) After registered, the script is reflected to the script list.

→9.9.8 [Script File List] dialog

• **[File Name]**

This item is displayed when [External File (External Data)] is selected in the [Option] tab.

Click the [Browse] button to set the path name and file name of the script to be registered.

• **[Script Name]**

This item is displayed when [Project Data (Internal Data)] is selected in the [Option] tab.

Set the name of the script to be registered.

The setting range is 1 character to 32 characters.

[No] button: Refers to the same script as that of the copy source.

7) **[Delete] button**

Deletes the selected script setting.

8) **[Up] button, [Down] button**

Changes the execution order of the selected script setting.

9) **[Edit Script] button**

Edit the selected project script with the editor selected in [Script Editor Selection] in the [Option] tab.

→[Option] tab: ■ 4 [Option] tab

Script editor: 9.9.7 [Edit Script(script name)] dialog

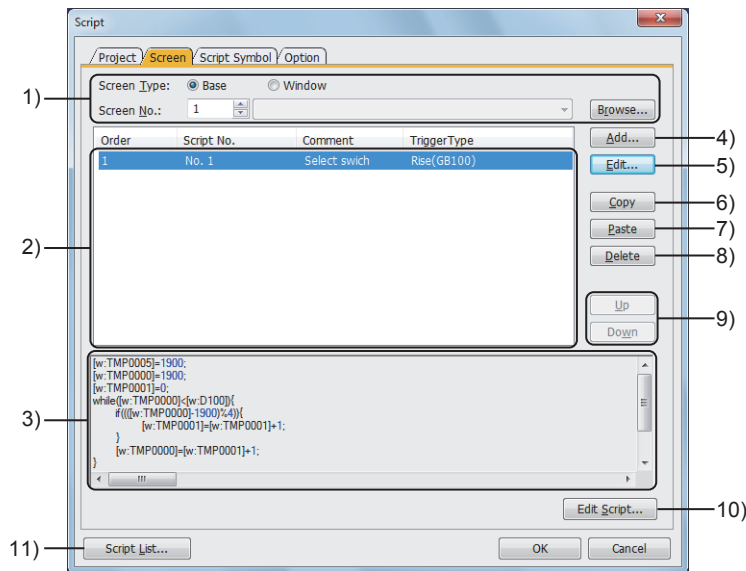

10) **[Script List] button**

Displays the list of the registered scripts.

You can register scripts additionally and edit the scripts in the list.

→9.9.8 [Script File List] dialog

■ 2 **[Screen] tab**

1) **[Screen Type]**

Select the screen ([Base] or [Windows]) in which the script setting operates and the screen number.

The setting range is [0] to [32767].

The screen number can be selected with the screen title.

Click the [Browse] button to display the [Screen Image List] dialog.

→2.5 Creating, Opening, and Closing a Screen

2) **Script setting list**

Displays the list of script settings.

The script of the selected script No. is displayed in the space below the script setting list.

**3) Script preview**

Displays the content of the script selected in the script setting list.

**4) [Add] button**

Add a new script setting to the list.

Click this button to display the [Script Edit] dialog.

→9.9.6 [Script Edit] dialog (for project scripts and screen scripts)

The execution order of the scripts is set according to the order in which the scripts are added.

**5) [Edit] button**

Edit the selected script setting.

Click this button to display the [Script Edit] dialog.

→9.9.6 [Script Edit] dialog (for project scripts and screen scripts)

**6) [Copy] button**

Copies the selected script setting.

**7) [Paste] button**

Pastes the copied script setting to the last line of the list.

Click the [Paste] button to display the dialog for selecting the method to paste the script.

The pasting method differs depending on the [Yes] or [No] button.

[Yes] button: Copies the source script.

Select the [Yes] button to display the following dialog.

When [External File (External Data)] is selected in the [Option] tab

When [Project Data (Internal Data)] is selected in the [Option] tab

• **[Script No.]**

Set the script No. for the script to be registered. (Default: The minimum number of the non-registered script No.) After registered, the script is reflected to the script list.

→9.9.8 [Script File List] dialog

• **[File Name]**

This item is displayed when [External File (External Data)] is selected in the [Option] tab.

Click the [Browse] button to set the path name and file name of the script to be registered.

• **[Script Name]**

This item is displayed when [Project Data (Internal Data)] is selected in the [Option] tab.

Set the name of the script to be registered.

The setting range is 1 character to 32 characters.

[No] button: Refers to the same script as that of the copy source.

**8) [Delete] button**

Deletes the selected script setting.

**9) [Up] button, [Down] button**

Changes the execution order of the selected script setting.

**10) [Edit Script] button**

Edit the selected project script with the editor selected in [Script Editor Selection] in the [Option] tab.

→[Option] tab: ■ 4 [Option] tab

Script editor: 9.9.7 [Edit Script(script name)] dialog

**11) [Script List] button**

Displays the list of the registered scripts.

You can register scripts additionally and edit the scripts in the list.

→9.9.8 [Script File List] dialog

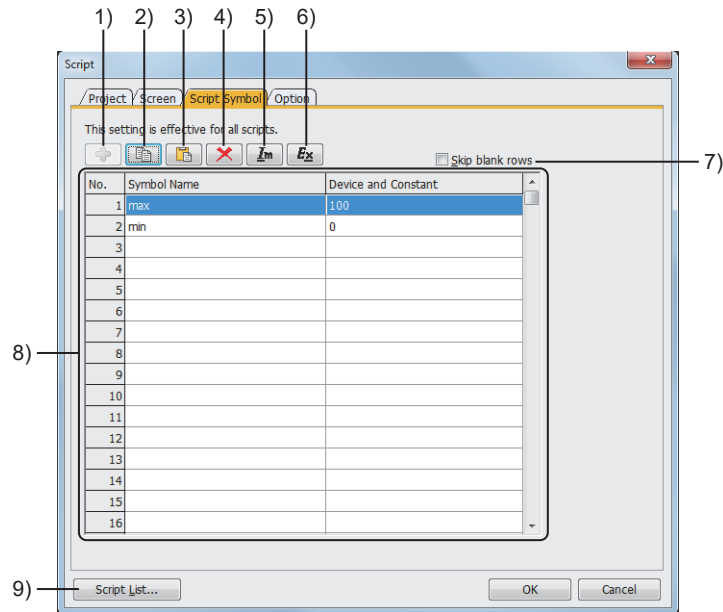

### ■ 3 [Script Symbol] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Register character strings as script symbols.

Devices and constants in a script can be substituted by the registered character strings.

The set script symbols are usable in project scripts and screen scripts.

#### 1) [Add] button

This button is available when [Skip blank rows] is selected.

Displays the [Add Script Symbol] dialog.

- [No.]

Set a number for the script symbol to be added.  
The setting range is [1] to [10000].

- [Symbol Name]

Set a character string to be described in a script.  
Up to 32 alphanumeric characters and symbols can be entered.  
However, the symbol # is not usable.

- [Device and Constant]

Set a device or constant for the symbol name.  
Up to 32 alphanumeric characters and symbols can be entered.

#### 2) [Copy] button

Copies the setting from the row selected in the script symbol list.

You can copy the settings from multiple rows at one time.

When [Skip blank rows] is selected, the settings in the hidden rows are also copied.

The copied settings can be pasted to another script symbol setting dialog.

#### 3) [Paste] button

Pastes the copied setting to the selected row.

When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.

When pasting a setting to one row

When pasting settings to multiple rows

- [Symbol No.]  
Set a symbol number for the destination row.  
The setting range is [1] to [10000].
- [First Symbol No.]  
Set a symbol number for the first destination row.  
The setting range is [1] to [10000].

**4) [Delete] button**

Deletes the setting from the selected row.  
You can delete the settings from multiple rows at one time.

**5) [Import] button**

Displays the [Open] dialog.  
Read the script symbol settings from a Unicode text file or CSV file.

**6) [Export] button**

Displays the [Save As] dialog.  
Save the script symbol settings to a Unicode text file or CSV file.  
If multi-language characters are used in the settings, use the Unicode text file format.  
For the precautions for using a Unicode text file, refer to the following.  
→12.5 Precautions for Using Unicode Text File

**7) [Skip blank rows]**

Displays only the rows in which script symbols have been registered.

**8) Script symbol list**

Lists the registered script symbols.  
[Symbol Name] and [Device and Constant] are editable.

Item	Description
[No.]	Row number. Clicking a row number selects the relevant row.
[Symbol Name]	Set a character string to be described in a script. Up to 32 alphanumeric characters and symbols can be entered. However, the symbol # is not usable.
[Device and Constant]	Set a device or constant for the symbol name. Up to 32 alphanumeric characters and symbols can be entered.

**9) [Script List] button**

Displays the [Script List] dialog.  
The [Script List] dialog lists the registered scripts.  
You can register scripts additionally and edit the scripts in the list.  
→9.9.8 [Script File List] dialog

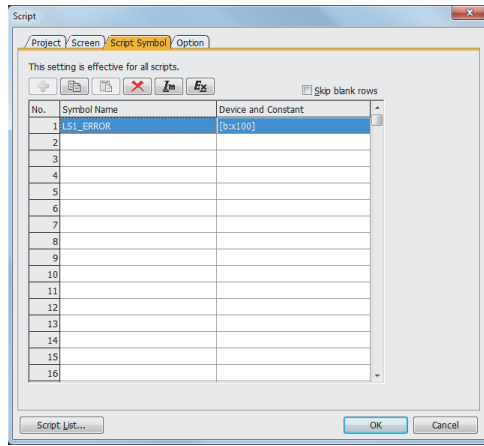

**Point**

**(1) Editing method of scripts**

You can edit scripts in the exported Unicode text file or CSV file using spreadsheet software and other software.  
The edited Unicode text file or CSV file can be imported and read to GT Designer3.

**(2) Editing the exported file**

Example) When script settings are exported into and imported from a CSV file

Export the set script symbols to a CSV file.

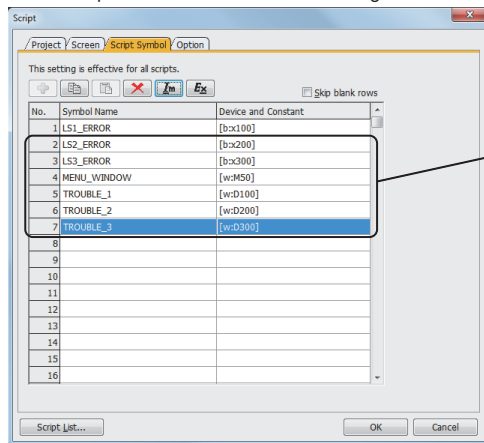

No.	Symbol Name	Device and Constant
1	LS1_ERROR	[b:x100]
2		
3		
4		
5		
6		
7		
8		
9		
10		
11		
12		
13		
14		
15		
16		

Edit the exported file.

No.	Symbol Name	Device and Constant
1	LS1_ERROR	[b:x100]
2	LS2_ERROR	[b:x200]
3	LS3_ERROR	[b:x300]
4	MENU_WINDOW	[w:M50]
5	TROUBLE_1	[w:D100]
6	TROUBLE_2	[w:D200]
7	TROUBLE_3	[w:D300]

Add settings using applications such as spreadsheet software.

Import from the CSV file to GT Designer3.

The added settings are reflected.

When 0 is set at the beginning of the symbol name, device, or constant, 0 at the beginning may be deleted depending on the function of the application for editing files (spreadsheet software and other software).

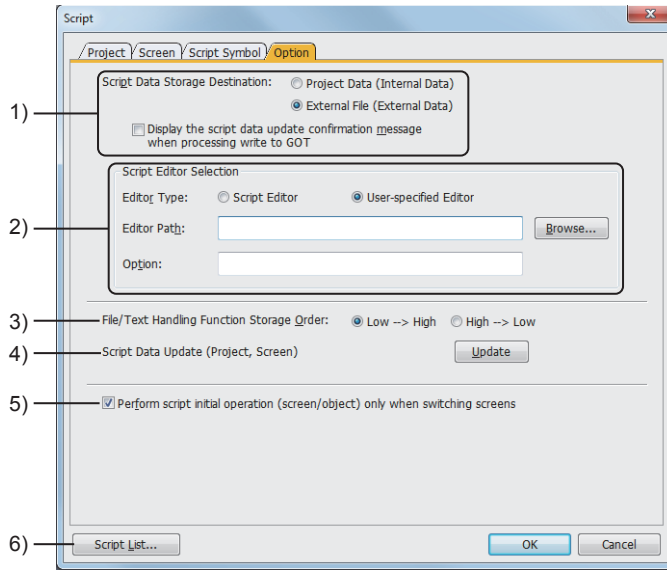

Pay attention to the above for editing exported files.

■ 4 [Option] tab

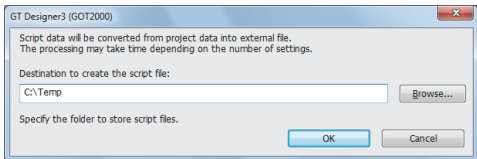

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the storage location of script data, editor used for editing scripts, and processing when an internal device is used.

1) [Script Data Storage Destination]

Select the location to store the script data of project scripts and screen scripts.

Item	Description
[Project Data (Internal Data)]	Select this item to store the script data in the project data. When the setting is changed from [External File (External Data)] to [Project Data (Internal Data)], the script data is converted from the script file to the project data.
[External File (External Data)]	Select this item to store the script data in the script file. When the setting is changed from [Project Data (Internal Data)] to [External File (External Data)], the script data is converted from the project data to the script file. Select [External File (External Data)] in [Script Data Storage Destination] to display the following dialog.  • [Destination to create the script file]*1 Specify the folder to save the script file in. Click the [OK] button to convert the script data to a script file.
[Display the script data update confirmation message when processing write to GOT]	This item can be selected when [Script Data Storage Destination] is set to [External File (External Data)]. Select this item to display the message to check whether to update the script data for communication with the GOT (when [Communication] is selected from the menu).

\*1 Up to 32 alphanumeric characters or symbols can be set for the script file name in the project data.

When the setting is changed from [External File (External Data)] to [Project Data (Internal Data)], the 33rd and later characters in the script file name are deleted.

2) [Script Editor Selection]

Set the editor for editing project scripts and screen scripts.

Item	Description
[Editor Type]	[Script Editor]: Select this item to use the script editor built in GT Designer3. [User-specified Editor]: Select this item to use the text editor specified by the user. This item can be selected only when [Script Data Storage Destination] is set to [External File (External Data)]. When selecting [User-specified Editor], set [Editor Path] and [Option] below.
[Editor Path]	Set the start-up file of the text editor (such as Notepad (NOTEPAD.EXE) or WordPad (WORDPAD.EXE) of Windows).

Item	Description
[Option]	Specify the option for the text editor.

### 3) [File/Text Handling Function Storage Order]

Select the order of data storage when file\_read or file\_write is used.

- [Low-->High]: Select this item to store data in the order of lower to upper data.
- [High-->Low]: Select this item to store data in the order of upper to lower data.

### 4) [Script Data Update (Project, Screen)]

Click the [Update] button to update the setting of the script data read to GT Designer3.

### 5) [Perform script initial operation (screen/object) only when switching screens]

Enables the initial operation of the screen script or the object script upon screen switching only.

The screen scripts and object scripts, which the following trigger type is set in, are executed upon screen switching.

- [Rise]
 

Executes the script when the trigger device turns on after screen switching or other processes.
- [Fall]
 

Executes the script when the trigger device turns off after screen switching or other processes.
- [Rise/Fall]
 

Executes the script when the trigger device turns on or off after screen switching or other processes.

When the screen script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for base screen 2

After base screen 1 is switched to base screen 2, if the trigger device (X1000) turns on, the screen script set for base screen 2 is executed.

The setting determines the process that triggers the initial operation of the script as shown below.

Setting	Process
Selected	<ul style="list-style-type: none"> <li>• Screen switching</li> </ul> <p>The scripts, which are set for the screen displayed after screen switching, are executed.</p>
Cleared	<ul style="list-style-type: none"> <li>• Screen switching</li> <li>• Security switching</li> <li>• Language switching</li> <li>• System language switching</li> <li>• Station No. switching</li> <li>• Offset switching</li> </ul> <p>When the station No. switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.</p> <p>Only the screen scripts are executed.</p> <p>On a screen having a script setting, when offset switching occurs in any device of the screen, the script is executed.</p>

You can disable the initial operation of the scripts by using the GOT internal devices.

- Project script and screen script: GS386
- Object script: GS389
  - ⇒12.1.3 ■ 4 Read device list

### 6) [Script List] button

Displays the [Script List] dialog.

Displays the list of the registered scripts.

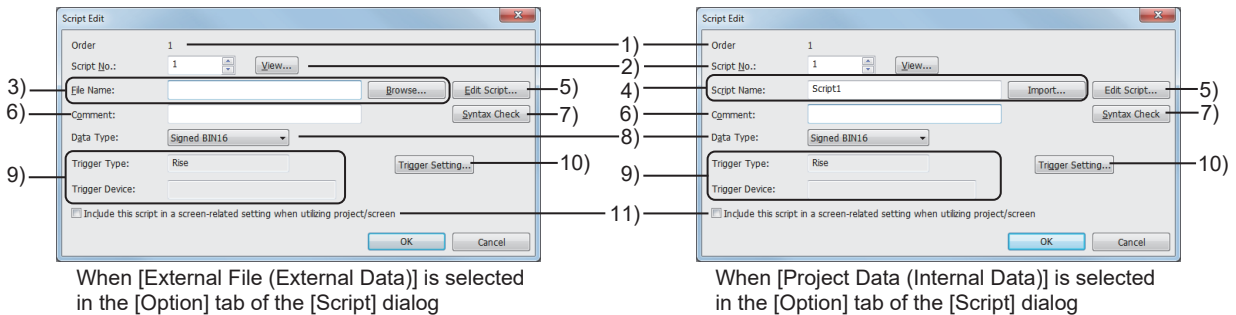

You can register scripts additionally and edit the scripts in the list.

⇒9.9.8 [Script File List] dialog

## 9.9.6 [Script Edit] dialog (for project scripts and screen scripts)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

This dialog is used for setting a project script or screen script.  
For each script setting, set a trigger condition and a script.

### 1) [Order]

Displays the execution order of the script being edited.

### 2) [Script No.]

Set the registration number of the script that is to be executed by the script being edited.

Click the [View] button to check the registration number of other scripts.

⇒ 9.9.8 [Script File List] dialog

### 3) [File Name]

Displays the drive and folder where the script file to be executed is stored when [External File (External Data)] is selected in the [Option] tab.

When no script file is registered, click the [Browse] button to set the script file to be executed.

Up to 32 characters can be set for the file name of the script file (excluding the extension.TXT).

When [Project Data (Internal Data)] is selected in the [Option] tab and the script data is converted, the file name is used for [Script Name].

When 32 or more characters are used for a file name, only the 32 characters are used for [Script Name] and the 33rd or later characters are not used.

### 4) [Script Name]

When [Project Data (Internal Data)] is selected in the [Option] tab, set the script name to be executed.

The following symbols cannot be entered into [Script Name].

/ \ ? \* : | " < >

Click the [Import] button to read the script edited in the text file format to GT Designer3.

When a script file is imported, the file name excluding the extension (.TXT) is displayed at [Script Name].

Set [Script Name] which is different from that of other scripts.

When [External File (External Data)] is selected in the [Option] tab and the script data is converted, [Script Name] is used for the file name of the script file.

Therefore, when [Script Name] is duplicated, take a measure such as changing the file name.

### 5) [Edit Script] button

Edit the script selected in [File Name] or [Script Name] with the editor which is selected in [Script Editor Selection] in the [Option] tab.

⇒ [Option] tab: 9.9.5 ■ 4 [Option] tab

Script editor: 9.9.7 [Edit Script(script name)] dialog

### 6) [Comment]

Set the comment (note) of the script being edited.

Up to 32 characters can be set.

### 7) [Syntax Check] button

Checks the syntax of the script selected in [File Name] or [Script Name].

The available device type and device range are also checked.

⇒ 9.9.14 ■ 2 Messages to be displayed at the syntax check

### 8) [Data Type]

Select the data type of the script to be executed.

The following shows the items to be selected.

- [Signed BIN16]

- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [BCD16]
- [BCD32]
- [Real]

### 9) [Trigger Type], [Trigger Device]

Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

### 10) [Trigger Setting] button

Click the [Trigger Setting] button to display the [Trigger Setting] dialog.

#### ⇒6.2.2 Setting Trigger Types

When [Trigger Type] is set to [Rise]

When [Trigger Type] is set to [Sampling]  
[Sampling]

When [Trigger Type] is set to [ON Sampling]

#### • [Trigger Type]

Select the operating condition of the script. The following shows the items to be selected.

- [Ordinary]
- [ON]
- [OFF]
- [Rise]
- [Fall]
- [Rise/Fall]
- [Sampling]
- [ON Sampling]
- [OFF Sampling]
- [When closing a screen] (Available to the screen script only)

#### • [Trigger Device]

Set this item when [Trigger Type] is set to [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling]. Set a trigger device to execute the script.

#### • [Unit]

Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling].

Select the unit of the cycle time to execute the script. The following shows the items to be selected.

- [Second]
- [Millisecond (x100ms)]

#### • [Sampling]

Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling].

Set the cycle time to execute the script.

The setting range depends on the setting of [Unit].

When [Unit] is set to [Second], the setting range is [1] second to [3600] seconds.

When [Unit] is set to [Millisecond (x100ms)], the setting range is [1] × 100 ms to [600] × 100 ms.

The counting of the cycle time starts when the trigger condition is satisfied.

When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset.

Example) When [Trigger Type] is set to [ON Sampling] and the cycle time is set to 10 seconds

After the trigger device has been on for 10 seconds, the script runs. If the trigger device turns off before a lapse of 10 seconds, the script does not run.

### 11) [Include this script in a screen-related setting when utilizing project/screen]

This item is displayed only when this dialog has been brought up from the [Project] tab of the [Script] dialog.

Utilizes this script as a screen-related setting when the project or screen utilization is executed.

#### ■ 1 Behavior of the script for which [Trigger Type] is set to [When closing a screen]

Such a script runs immediately before the relevant screen is switched or closed.

The screen will not be switched until the script execution is complete.

If an error or a timeout occurs during script execution, the screen is switched upon the occurrence of the event.

When [Trigger Type] is set to [When closing a screen], take the following precautions.

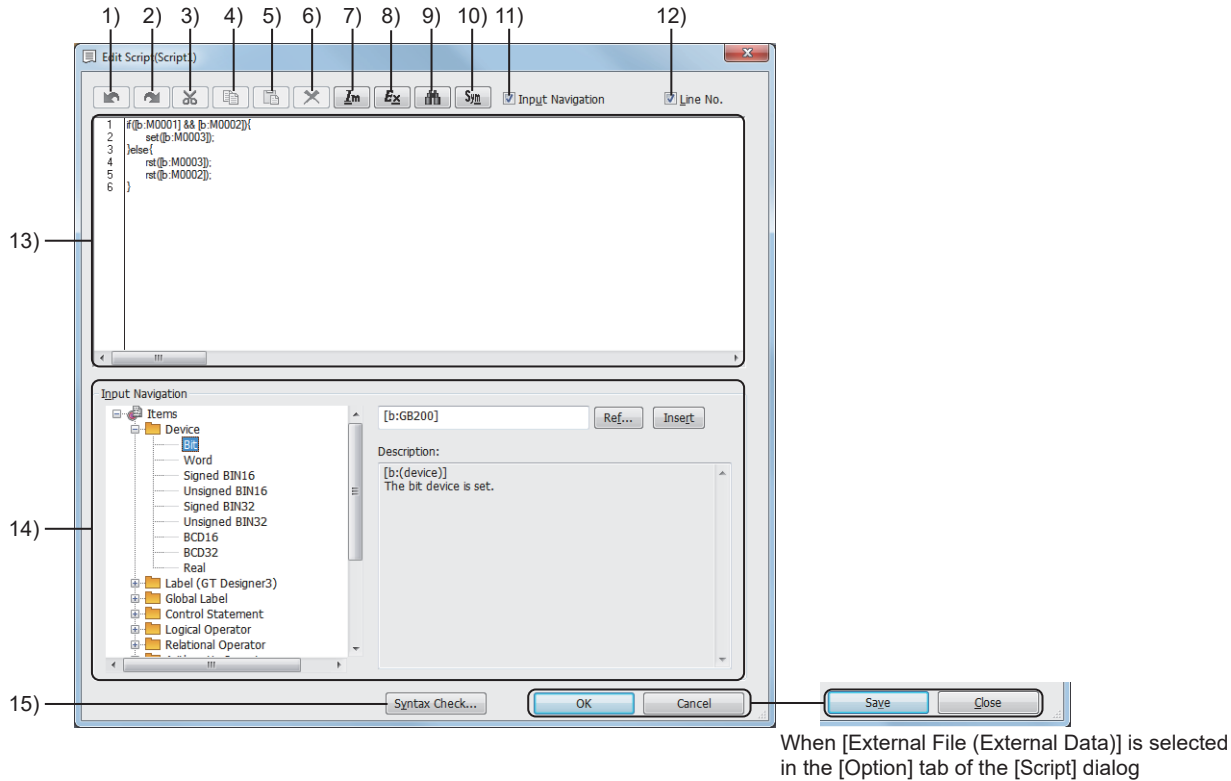

Item	Description
Response speed for screen switching	Depending on the controller device used in the script, there may be a delay in response when switching screens.
Restrictions during script execution	When a trigger type other than [When closing a screen] is set for a script, the script does not run if its trigger condition is satisfied during the execution of another script whose trigger type is [When closing a screen]. The GOT can accept inputs from a touch switch or others.

Item	Description
State of not notifying of an error	An error is not notified in the state where the communication is unestablished for reasons including a cable disconnection or screen switching.

## 9.9.7 [Edit Script(script name)] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

This dialog is used for setting a project script, screen script, script part, or object script. Edit, import, or export a script.

- 1) **[Undo] button**  
Returns the editing operation of the script to the previous step.
- 2) **[Redo] button**  
Redoes the returned operation.
- 3) **[Cut] button**  
Cuts the selected character strings.
- 4) **[Copy] button**  
Copies the selected character strings.
- 5) **[Paste] button**  
Pastes the copied or cut character strings.
- 6) **[Delete] button**  
Deletes the selected character strings.
- 7) **[Import] button**  
Displays the [Open] dialog.  
Read a script from a text file.
- 8) **[Export] button**  
Displays the [Save As] dialog.  
Save the script in the script edit area to a text file.  
If the script contains multi-language characters, use the Unicode text file format.  
For the precautions for using a Unicode text file, refer to the following.  
→ 12.5 Precautions for Using Unicode Text File
- 9) **[Search] button**  
Displays the [Search] dialog.

Input the text to be searched and select the search direction ([Up], [Down]). Then click the [Search Next] button to search the input text.

#### 10) [Symbol] button

Displays the dialog for selecting a script symbol to be inserted.

The script symbol is inserted into the cursor position in the script edit area.

The dialog to appear varies depending on the type of the script being edited.

Script	Reference
Project script	
Screen script	→9.9.9 [Script Symbol] dialog
Script part	→9.9.10 ■ 2 [Script Parts Symbol] tab
Object script	→9.10.5 [Object Script Symbol] dialog

#### 11) [Input Navigation]

Displays [Input Navigation] in the dialog.

#### 12) [Line No.]

Displays line numbers in the script edit area.

#### 13) Script edit area

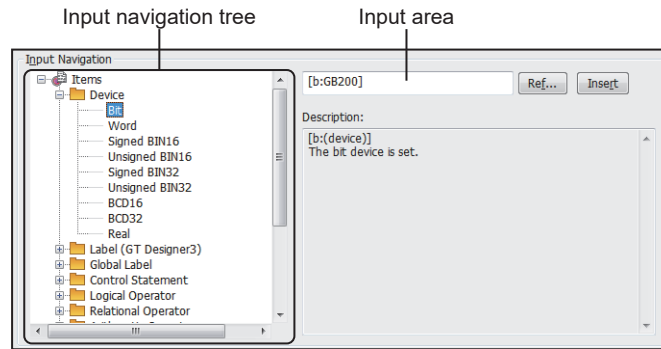

Area to edit a script.

#### 14) [Input Navigation]

Insert a device or function to the script.

Select an item from the input navigation tree to display its expression in the input area.

Click the [Insert] button to insert the entry in the input area into the cursor position in the script edit area.

Item	Description
Input navigation tree	Select a device or function to be inserted. The expression of the selected item appears in the input area.
Input area	Make an entry to be inserted to the script.
[Ref] button	This item appears when a device, label, or tag is selected in the input navigation tree. Displays the setting dialog of the selected device, label, or tag. The settings made in the dialog is reflected to the input area. To display the [Select CH No.] dialog, hold down the [Shift] key and click the [Ref] button. To specify a channel, label, or tag, bring up the relevant setting dialog from the [Select CH No.] dialog. →6.1.1 ■ 1 Setting devices in the device setting dialog
[Insert] button	Inserts the entry in the input area into the cursor position in the script edit area.
[Description]	Describes the expression and function of the item selected in the input navigation tree.

#### 15) [Syntax Check] button

Checks the syntax of the script being edited.

The available device type and device range are also checked.

→9.9.14 ■ 2 Messages to be displayed at the syntax check

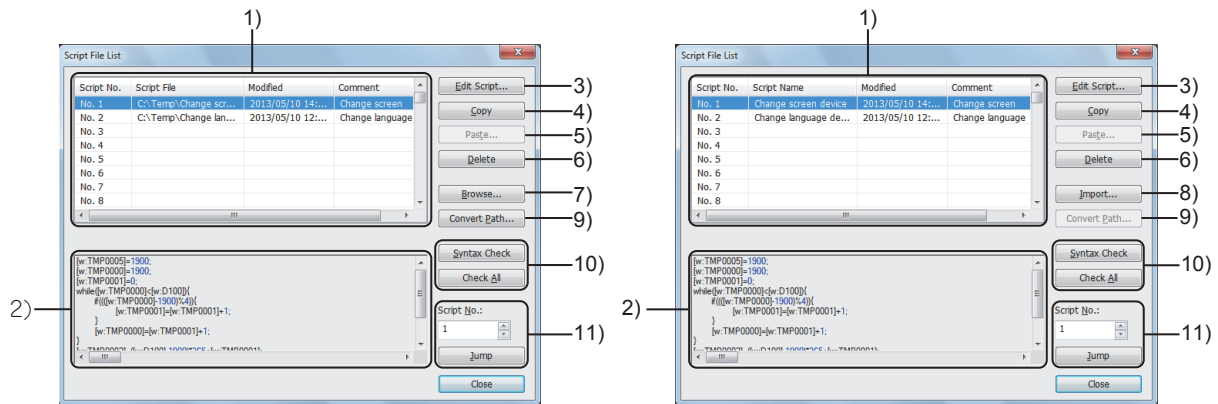

## 9.9.8 [Script File List] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

This dialog is used for setting a project script or screen script.

Select [Common] → [Script] → [Script File List] from the menu to display the setting dialog.

Register scripts additionally and edit the scripts in the list of the registered scripts.

When [External File (External Data)] is selected in the [Option] tab of the [Script] dialog

When [Project Data (Internal Data)] is selected in the [Option] tab of the [Script] dialog

### 1) Script list

Displays the list of the registered scripts (script file or script name, modified date, and comment).

For script files and script names, the path name is displayed when [External File (External Data)] is selected in the [Option] tab and the script name is displayed when [Project Data (Internal Data)] is selected in the [Option] tab.

Even if a script is set in the [Edit Script] dialog, the setting is applied to this dialog.

You can input the comment directly in the comment column in the list.

The content of the selected script is displayed in the space below the script setting list.

### 2) Script preview

Displays the content of the script selected in the script setting list.

### 3) [Edit Script] button

Edit the selected script with the script editor which is selected in [Script Editor Selection] in the [Option] tab or the editor specified by the user.

For the details of the [Option] tab and script editors, refer to the following.

⇒ [Option] tab: 9.9.5 ■ 4 [Option] tab

Script editor: 9.9.7 [Edit Script(script name)] dialog

### 4) [Copy] button

Copies the selected script.

### 5) [Paste] button

Pastes the copied script to the selected script No.

### 6) [Delete] button

Deletes the selected script.

### 7) [Browse] button

Register the script file to be referred to in the script list when [External File (External Data)] is selected in the [Option] tab.

### 8) [Import] button

Reads the script edited in the text file to GT Designer3 when [Project Data (Internal Data)] is selected in the [Option] tab.

### 9) [Convert Path] button

Changes the path name of the script file when [External File (External Data)] is selected in the [Option] tab.

Select the row to be changed and click the [Convert Path] button to display the [Convert File Path] dialog.

- **[Script No.]**  
Script No. selected in the script list
- **Previous value**  
Old path name of the script file
- **[Before]**  
Click the [Browse] button to set a new path name of ;othe script file.
- **[Convert the same path]**  
Select this item to convert all the files in the same path name as the file to be converted.

When the script file is saved in the folder of the project data of GT Designer3, the path name of the script file is updated automatically even if the folder in the project data is moved to a different drive or path.

Thus, the path name does not have to be set again.

10) **[Syntax Check] button, [Check All] button**

Checks the script syntax of the selected script or all the registered scripts.  
When an error occurs, the row number with an error and error details are displayed.  
The available device type and device range are also checked.

→9.9.14 ■ 2 Messages to be displayed at the syntax check

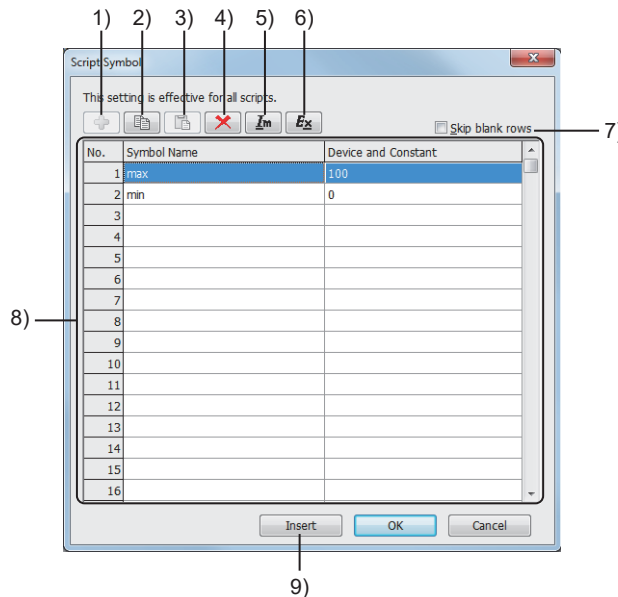

11) **[Jump] button**

Selects the script set in [Script No.].

### 9.9.9 [Script Symbol] dialog

This dialog is used for setting a project script or screen script.  
Select [Common] → [Script] → [Script Symbol] from the menu to display the setting dialog.  
Register character strings as script symbols.  
Devices and constants in a script can be substituted by the registered character strings.  
The set script symbols are usable in project scripts and screen scripts.

1) **[Add] button**

This button is available when [Skip blank rows] is selected.  
Displays the [Add Script Symbol] dialog.

- **[No.]**  
Set a number for the script symbol to be added.  
The setting range is [1] to [10000].
- **[Symbol Name]**  
Set a character string to be described in a script.  
Up to 32 alphanumeric characters and symbols can be entered.  
However, the symbol # is not usable.
- **[Device and Constant]**  
Set a device or constant for the symbol name.  
Up to 32 alphanumeric characters and symbols can be entered.

2) **[Copy] button**

Copies the setting from the row selected in the script symbol list.  
 You can copy the settings from multiple rows at one time.  
 When [Skip blank rows] is selected, the settings in the hidden rows are also copied.  
 The copied settings can be pasted to another script symbol setting dialog.

3) **[Paste] button**

Pastes the copied setting to the selected row.  
 When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.

When pasting a setting to one row

When pasting settings to multiple rows

- [Symbol No.]  
Set a symbol number for the destination row.  
The setting range is [1] to [10000].
- [First Symbol No.]  
Set a symbol number for the first destination row.  
The setting range is [1] to [10000].

4) **[Delete] button**

Deletes the setting from the selected row.  
 You can delete the settings from multiple rows at one time.

5) **[Import] button**

Displays the [Open] dialog.  
 Read the script symbol settings from a Unicode text file or CSV file.

6) **[Export] button**

Displays the [Save As] dialog.  
 Save the script symbol settings to a Unicode text file or CSV file.  
 If multi-language characters are used in the settings, use the Unicode text file format.  
 For the precautions for using a Unicode text file, refer to the following.  
 → 12.5 Precautions for Using Unicode Text File

7) **[Skip blank rows]**

Displays only the rows in which script symbols have been registered.

8) **Script symbol list**

Lists the registered script symbols.  
 [Symbol Name] and [Device and Constant] are editable.

Item	Description
[No.]	Row number. Clicking a row number selects the relevant row.
[Symbol Name]	Set a character string to be described in a script. Up to 32 alphanumeric characters and symbols can be entered. However, the symbol # is not usable.
[Device and Constant]	Set a device or constant for the symbol name. Up to 32 alphanumeric characters and symbols can be entered.

9) **[Insert] button**

This item appears when this dialog is brought up from the [Edit Script(script name)] dialog.  
 Inserts the selected script symbol into the script edit area in the [Edit Script(script name)] dialog.

**(1) Editing method of scripts**

You can edit scripts in the exported Unicode text file or CSV file using spreadsheet software and other software.

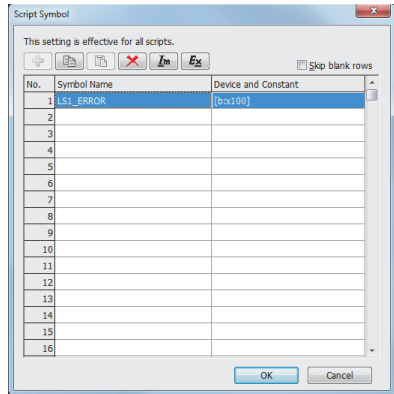

The edited Unicode text file or CSV file can be imported and read to GT Designer3.

**(2) Editing the exported file**

When 0 is set at the beginning of the symbol name, device, or constant, 0 at the beginning may be deleted depending on the function of the application for editing files (spreadsheet software and other software).

Pay attention to the above for editing exported files.

Example) When script settings are exported into and imported from a CSV file

Export the set script symbols to a CSV file.

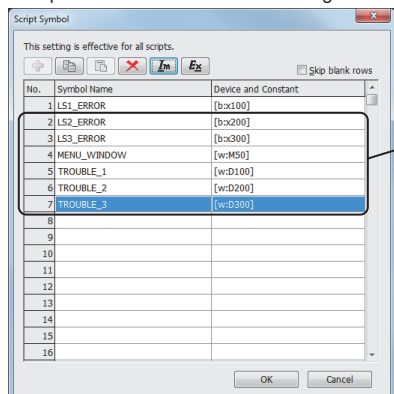

1	LS1_ERROR	[b;x100]

Edit the exported file.

1	LS1_ERROR	[b;x100]
2	LS2_ERROR	[b;x200]
3	LS3_ERROR	[b;x300]
4	MENU_WINDOW	[w;M50]
5	TROUBLE_1	[w;D100]
6	TROUBLE_2	[w;D200]
7	TROUBLE_3	[w;D300]

Add settings using applications such as spreadsheet software.

Import from the CSV file to GT Designer3.

The added settings are reflected.

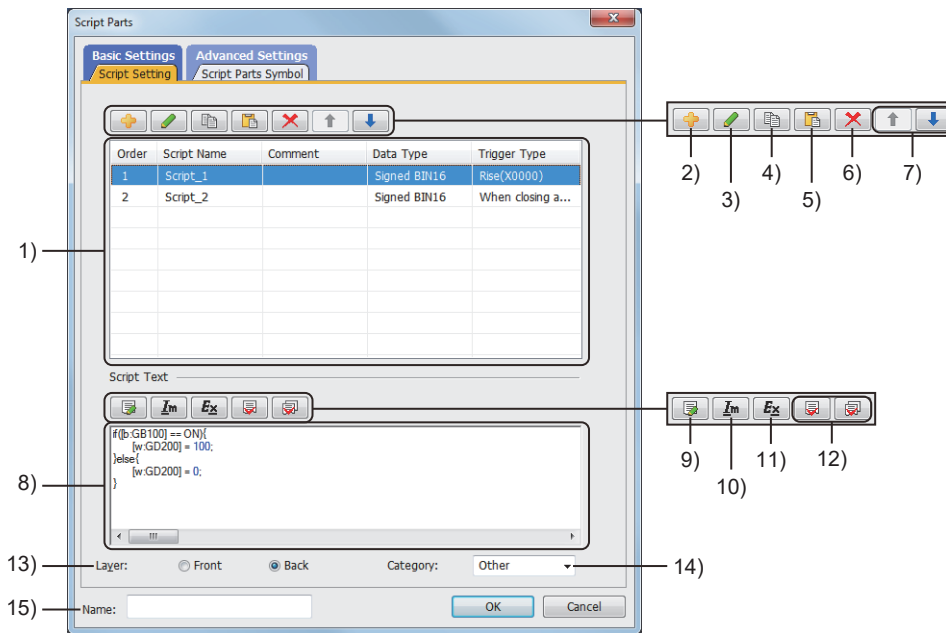

## 9.9.10 [Script Parts] dialog

This dialog is used for setting a script part.

- Step 1** Select [Object] → [Script Parts] from the menu.
- Step 2** Click the position to place a script parts object.
- Step 3** Double-click the script parts object to display the setting dialog.
  - ■ 1 [Script Setting] tab
  - 2 [Script Parts Symbol] tab

### ■ 1 [Script Setting] tab

Set a script trigger condition and a script.

- 1) Script setting list**  
Lists the scripts set for the current script parts object.
- 2) [Add] button**  
Displays the [Script Edit] dialog.  
Add a new script setting to the list.  
→ 9.9.11 [Script Edit] dialog (for script parts)
- 3) [Edit] button**  
Displays the [Script Edit] dialog.  
Edit the selected script setting.  
→ 9.9.11 [Script Edit] dialog (for script parts)
- 4) [Copy] button**  
Copies the selected script setting.
- 5) [Paste] button**  
Pastes the copied script setting to the last line of the list.
- 6) [Delete] button**  
Deletes the selected script setting.
- 7) [Up] button or [Down] button**  
Changes the execution order of the selected script setting.
- 8) Script preview**  
Displays a preview of the script set for the selected script setting.
- 9) [Edit Script] button**  
Displays the [Edit Script(script name)] dialog.  
Edit the script.  
→ 9.9.7 [Edit Script(script name)] dialog
- 10) [Import] button**

Displays the [Open] dialog.  
 Read a script from a text file.  
 The name of the read text file is set as the script name.

11) **[Export] button**

Displays the [Save As] dialog.  
 Save the previewed script to a text file.

12) **[Syntax Check] button or [Check All] button**

Performs a syntax check on the previewed script or all the scripts set for the script parts object.  
 If an error is detected, the relevant line number and error details are displayed.  
 The available device type and device range are also checked.  
 ⇒9.9.14 ■ 2 Messages to be displayed at the syntax check

13) **[Layer]**

Not available to GT21.  
 Select the layer to arrange the object on.  
 The following shows the items to be selected.

- [Front]
- [Back]

14) **[Category]**

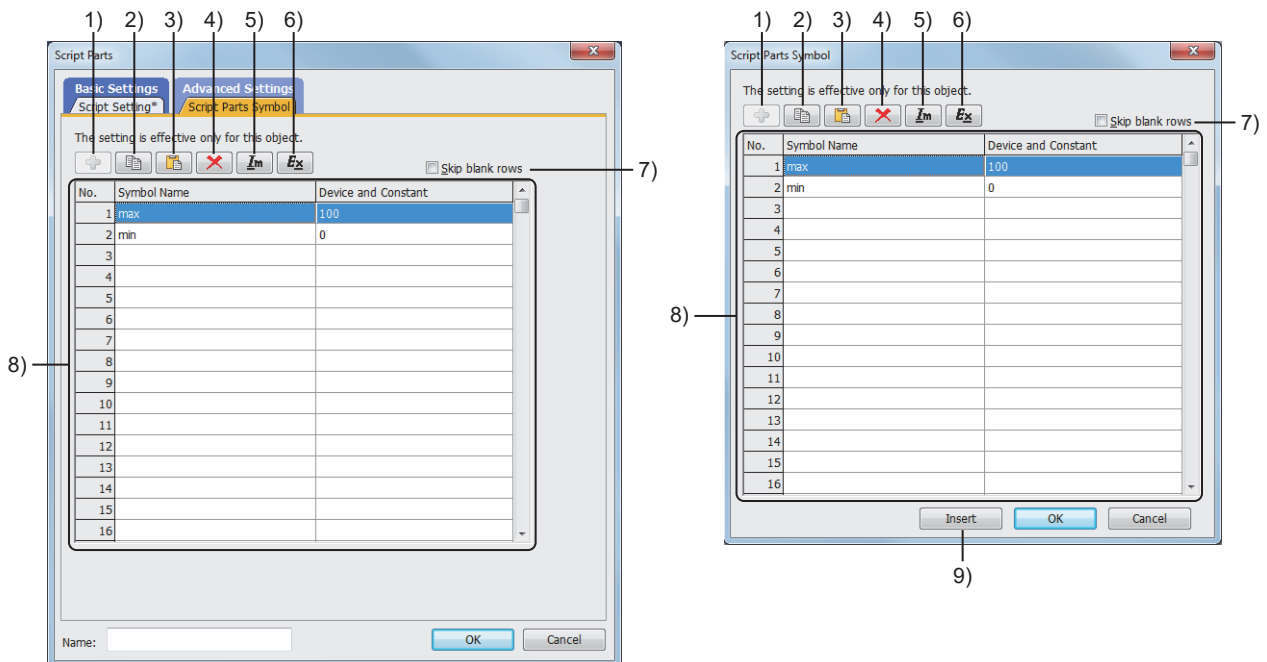

Select the category to assign the object.  
 ⇒11.7 Managing figures and objects by category

15) **[Name]**

Set the object name.  
 The name is displayed in the [Data View] window, property sheet, and others.  
 The name is changeable on the other tabs as well.  
 Up to 100 characters can be set.

■2 **[Script Parts Symbol] tab**

Register character strings as script parts symbols.  
 Devices and constants in a script can be substituted by the registered character strings.  
 The set script parts symbols are usable only in the scripts of the current script parts object.  
 Display the [Script Parts Symbol] dialog from the [Edit Script(script name)] dialog.

1) **[Add] button**

This button is available when [Skip blank rows] is selected.

Displays the [Add Script Parts Symbol] dialog.

- [No.]  
Set a number for the script symbol to be added.  
The setting range is [1] to [10000].
- [Symbol Name]  
Set a character string to be described in a script.  
Up to 32 alphanumeric characters and symbols can be entered.  
However, the symbol # is not usable.
- [Device and Constant]  
Set a device or constant for the symbol name.  
Up to 32 alphanumeric characters and symbols can be entered.

## 2) [Copy] button

Copies the setting from the row selected in the script symbol list.  
You can copy the settings from multiple rows at one time.  
When [Skip blank rows] is selected, the settings in the hidden rows are also copied.  
The copied settings can be pasted to another script symbol setting dialog.

## 3) [Paste] button

Pastes the copied setting to the selected row.  
When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.

When pasting a setting to one row

When pasting settings to multiple rows

- [Symbol No.]  
Set a symbol number for the destination row.  
The setting range is [1] to [10000].
- [First Symbol No.]  
Set a symbol number for the first destination row.  
The setting range is [1] to [10000].

## 4) [Delete] button

Deletes the setting from the selected row.  
You can delete the settings from multiple rows at one time.

## 5) [Import] button

Displays the [Open] dialog.  
Read the script symbol settings from a Unicode text file or CSV file.

## 6) [Export] button

Displays the [Save As] dialog.  
Save the script symbol settings to a Unicode text file or CSV file.  
If multi-language characters are used in the settings, use the Unicode text file format.  
For the precautions for using a Unicode text file, refer to the following.

→ 12.5 Precautions for Using Unicode Text File

## 7) [Skip blank rows]

Displays only the rows in which script symbols have been registered.

## 8) Script symbol list

Lists the registered script symbols.  
[Symbol Name] and [Device and Constant] are editable.

Item	Description
[No.]	Row number. Clicking a row number selects the relevant row.
[Symbol Name]	Set a character string to be described in a script. Up to 32 alphanumeric characters and symbols can be entered. However, the symbol # is not usable.

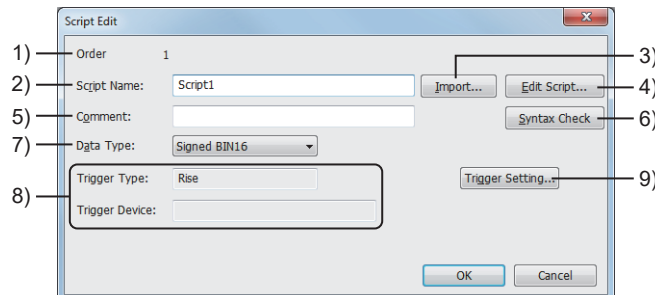

Item	Description
[Device and Constant]	Set a device or constant for the symbol name. Up to 32 alphanumeric characters and symbols can be entered.

### 9) [Insert] button

Inserts the selected script symbol into the script edit area in the [Edit Script(script name)] dialog.

## 9.9.11 [Script Edit] dialog (for script parts)

This dialog is used for setting a script part.

### 1) [Order]

Execution order of the current script.

### 2) [Script Name]

Name of the current script.

The following symbols cannot be entered into [Script Name].

/ \ ? \* : | " < >

### 3) [Import] button

Displays the [Open] dialog.

Read a script from a text file.

The name of the read text file is set as the script name.

### 4) [Edit Script] button

Displays the [Edit Script(script name)] dialog.

Edit the script.

⇒9.9.7 [Edit Script(script name)] dialog

### 5) [Comment]

Set the comment (note) of the script being edited.

Up to 32 characters can be set.

### 6) [Syntax Check] button

Checks the syntax of the script for possible errors.

The available device type and device range are also checked.

⇒9.9.14 ■ 2 Messages to be displayed at the syntax check

### 7) [Data Type]

Select the data type of the script to be executed.

The following shows the items to be selected.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [BCD16]
- [BCD32]
- [Real]

### 8) [Trigger Type] or [Trigger Device]

Displays the script trigger type or trigger device set in the [Trigger Setting] dialog.

### 9) [Trigger Setting] button

Displays the [Trigger Setting] dialog.

Set a script trigger condition.

When [Trigger Type] is set to [Rise]

When [Trigger Type] is set to [Sampling]

When [Trigger Type] is set to [ON Sampling]

- **[Trigger Type]**  
Select the operating condition of the script. The following shows the items to be selected.
  - [Ordinary]
  - [ON]
  - [OFF]
  - [Rise]
  - [Fall]
  - [Rise/Fall]
  - [Sampling]
  - [ON Sampling]
  - [OFF Sampling]
  - [When closing a screen]
- **[Trigger Device]**  
Set this item when [Trigger Type] is set to [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling]. Set a trigger device to execute the script.
- **[Unit]**  
Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling]. Select the unit of the cycle time to execute the script. The following shows the items to be selected.
  - [Second]
  - [Millisecond (x100ms)]
- **[Sampling]**  
Set this item when [Trigger Type] is set to [Sampling], [ON Sampling], or [OFF Sampling]. Set the cycle time to execute the script. The setting range depends on the setting of [Unit]. When [Unit] is set to [Second], the setting range is [1] second to [3600] seconds. When [Unit] is set to [Millisecond (x100ms)], the setting range is [1] × 100 ms to [600] × 100 ms. The counting of the cycle time starts when the trigger condition is satisfied. When the satisfied trigger condition becomes unsatisfied, the count of the cycle time is reset. Example) When [Trigger Type] is set to [ON Sampling] and the cycle time is set to 10 seconds. After the trigger device has been on for 10 seconds, the script runs. If the trigger device turns off before a lapse of 10 seconds, the script does not run.

■1 Behavior of the script for which [Trigger Type] is set to [When closing a screen]

Such a script runs immediately before the relevant screen is switched or closed.

The screen will not be switched until the script execution is complete.

If an error or a timeout occurs during script execution, the screen is switched upon the occurrence of the event.

When [Trigger Type] is set to [When closing a screen], take the following precautions.

Item	Description
Response speed for screen switching	Depending on the controller device used in the script, there may be a delay in response when switching screens.
Restrictions during script execution	When a trigger type other than [When closing a screen] is set for a script, the script does not run if its trigger condition is satisfied during the execution of another script whose trigger type is [When closing a screen]. The GOT can accept inputs from a touch switch or others.
State of not notifying of an error	An error is not notified in the state where the communication is unestablished for reasons including a cable disconnection or screen switching.

### ■ 1 Precautions for use

#### (1) Applicable range of the scripts

Since this function is designed to control the GOT display, do not use it for machine control that requires precise time management.

When changing the data in PLC through the GOT, create an interlock circuit using a sequence program to ensure the whole system can always operate safely.

The following periods may vary depending on projects.

- The period between when the trigger device condition of the script is satisfied and when the script is actually executed
- Processing time of the script

#### (2) Stop of the script processing

In any of the following cases, the corresponding script being processed stops and an error occurs.

- In division, when the divisor becomes 0 and the calculation becomes zero division
- When [BCD16] or [BCD32] is selected as a script data format but a value of the monitor device cannot be handled as BCD

Example) [w:D0] = [w:D1]: Current value of D1 is 0x991A

- When [BCD16] or [BCD32] is selected as a script data format but the operation result is out of the BCD range

Example) 16-bit: Other than 0 to 9999, 32-bit: Other than 0 to 99999999

- When a device of the controller is specified as the write destination device of a while statement

For the available data type and data range, refer to the following.

⇒9.9.2 ■ 4 Available data and how to express the data

For the details of the while statement, refer to the following.

⇒9.9.2 ■ 3 Control structures for a project script, screen script, and script part

For troubleshooting the script processing stop, refer to the following.

⇒9.9.14 Troubleshooting

#### (3) Variation of the result of processing depending on data types

In the following cases, you may get an unexpected result of processing.

- When a format other than [BCD16] or [BCD32] is selected as the script data type but a constant out of the selected format range is included
- When [Unsigned BIN16] or [Unsigned BIN32] is selected as the script data type but a negative constant is included
- When a format other than [Real] is selected as the script data type but a decimal is used as a constant

For the details of data types, refer to the following.

⇒9.9.2 ■ 4 Available data and how to express the data

#### (4) Bitwise operation and data type

If you perform a bitwise operation on the device with a signed data type, an unexpected value may result.

Set an unsigned data type for the target device of a bitwise operation.

#### (5) Digit limitation when describing monitor devices

Depending on controllers to be monitored, the device number for them must be described in specific digits.

Otherwise, malfunction may result.

For the details of how to describe the device number, refer to the following.

⇒9.9.2 ■ 4 Available data and how to express the data

#### (6) Writing the project in the GOT after editing the script

If you edit a screen script or an object script, write the project being edited in the GOT.

Otherwise, the change you made is not reflected to the GOT.

#### (7) Operation while a script is being edited

When you click the [Edit Script] button and edit a script using a script editor or a text editor, you cannot operate GT Designer3.

GT Designer3 reacts as if it freezes up then, but once you close the script editor or the text editor, you can operate GT Designer3 again.

**(8) Precautions for assignment delay**

**(a) Assignment delay**

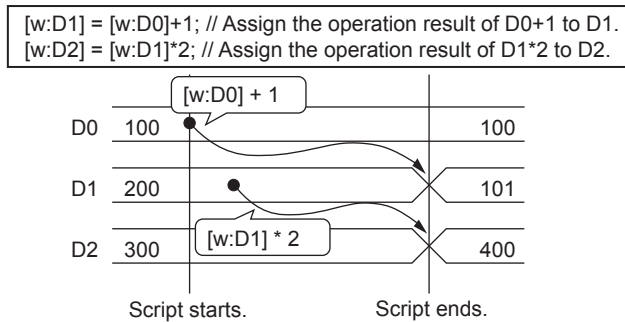

Depending on devices where you write the operation result of scripts, some time (called assignment delay) is needed for writing the result to the device when the operation of a script is complete. The following shows whether each device needs assignment delay or not.

Synchronized: The result is written in synchronization with the script. Delay: Assignment delay occurs.

Device and temporary device area	Script
Controller device	Delay
GB	Synchronized
GD	
GS	
TMP	

If you perform an assignment as shown in example 1, an assignment delay leads to an unexpected operation result. To reduce the frequency of communication with the PLC CPU to lower the influence on the monitoring process, describe the script as shown in example 2 or 3.

Example 1) Assignment using PLC CPU devices

In this example, due to an assignment delay, after the script ends, the operation result of the first line (D0+1) is reflected to D1.

Therefore, the operation result of the first line is not reflected to that of the second line (D1\*2).

Example 2) Assignment using a temporary device area

Using a temporary device area for the script avoids an assignment delay.

For the details of temporary device areas, refer to the following.

→9.9.2 ■ 4 Available data and how to express the data

Example 3) Assignment processing using GOT internal devices (GD, GB)

```
[w:GD1] = [w:D0]+1; // Assign the operation result of D0+1 to GD1.
[w:D1] = [w:GD1]; // Assign GD1 to D1.
[w:D2] = [w:GD1]*2; // Assign the operation result of GD1*2 to D2.
```

The processing timing with GOT internal devices (GD and GB) is the same as one with temporary device areas. Therefore,

you can avoid assignment delays.

**Point**

**(1) LS devices described within the script language that is created using Digital package**

The LS devices described in the script language of Digital Electronics Corporation (D-script) are designed to be free from assignment delays.

Therefore, when D-script including LS devices shown in example 1 is converted, the operation on the GOT may not be as intended.

To prevent an assignment delay, use temporary device areas for D-script including LS devices as shown in example 2.

**(b) Assignment delay when an offset is specified**

- When reading values from devices

If you specify an offset in a script when devices of controllers are used as base devices, assignment delays may occur and the script may not operate correctly even if the values of offset devices are changed.

Example 1) Specifying a target device for reading with an offset device does not work correctly (when R200 = 10)

```
[w:TMP0000]=[w:R200];
[w:TMP0001]=[w:R100[w:TMP0000]]; The value of R110 cannot be referred at this timing.
Base device ─┘ ┌─ Offset device
```

In the above example, the value of the offset device (TMP0000) remains the same as that before the assignment. If the device numbers are out of the range of the base device (R), an error occurs.

If no assignment delays occur, use the temporary device area or GOT internal devices for both base devices and offset devices.

Example 2) Measure to avoid the assignment delay using temporary device areas (when R200 = 10)

```
bmov([w:R100],[w:TMP0100],11)
[w:TMP0000]=[w:R200];
[w:TMP0001]=[w:TMP0100[w:TMP0000]]; The value of R110 can be referred at this timing.
```

By assigning the values of R devices to the temporary device areas using bmov in advance, the operation that cannot be done in example 1 becomes available.

Notes on example 2

In example 2, the range of the offset device (R200) is 0 to 10, and the values of 11 devices counted from the base device (R100) are assigned to the temporary device areas.

Therefore, the number of devices to be assigned to the temporary device areas must be changed according to the range of offset devices.

- When writing values to devices

When writing values to devices, there are no specific restrictions applied when reading values from devices. (Refer to the following example 1.) However, when controller devices are used as base devices, you cannot assign values repeatedly by switching values of offset devices in a while statement as shown in example 2.

Even in this case, it becomes available by using the temporary device area or GOT internal devices (GB and GD) for both base devices and offset devices in the same way as mentioned earlier for reading values from devices.

Example 1) Specifying a target device for writing with an offset device (Enabled)

```
[w:TMP0000]=10;
[w:R100[w:TMP0000]]=[w:TMP0001]; The value can be assigned to R110 at this timing.
Base device ─┘ ┌─ Offset device
```

Example 2) Specifying a target device for writing with an offset device in a while statement (Disabled)

```
[w:TMP0000]=10;
while([w:TMP0000]<20){
[w:R100[w:TMP0000]]=[w:TMP0001]; An error occurs.
[w:TMP0000]=[w:TMP0000]+2;
}
```

Example 3) Measure to avoid the error in example 2

---

```

bmov([w:R110],[w:TMP0110],10);
[w:TMP0000]=10;
while([w:TMP0000]<20){
[w:TMP0100[w:TMP0000]]=[w:TMP0001];    No error occurs.
[w:TMP0000]=[w:TMP0000]+2;
}
bmov([w:TMP0110],[w:R110],10);

```

---

By assigning the values last assigned in the temporary device areas with R devices using bmov, the operation that cannot be done in example 2 becomes available.

### (9) Simulating using a general C language compiler or debugger

- If [BCD32] or [BCD16] is selected as the script data type, you cannot perform a simulation using a general C language compiler or debugger.
- Since the set, rst, alt, bmov, and fmov statements are dedicated for scripts, you cannot perform a simulation using a general C language compiler or debugger.  
Use assignment of 1 or 0 instead of the set or rst statement.
- When you use the system define (ON, OFF description) of the GOT as they are, the define for it must be added to the C language source file.
- The assignment delay which occurs when a script is executed on the GOT does not occur during a simulation using a general C language compiler or debugger.  
Therefore, when performing a simulation, take a possibility of occurrence of assignment delays into consideration.
- By applying the measures above, a new program created using C language then debugged can be used as a GOT script.
- Offset device specification cannot be made in the above debugging process.  
If you debug the offset specified device, it is necessary to set the corresponding device in advance.

### (10) Character code applicable to a file name

#### (a) Character code applicable to the utility

Only ASCII code is applicable to the screens for file manipulations in the utility.  
A file name, which is not encoded in ASCII, is displayed incorrectly in the utility.

#### (b) Character code applicable to the file transfer (FTP client) function

When a transfer file name is indirectly specified in the file transfer (FTP client) function, only ASCII code is applicable to the file name.

The file transfer (FTP client) function cannot transfer a file whose name is not encoded in ASCII.

### (11) Script error control and GOT status

While the GOT displays a screen in which no script is set, the following operations are not available.

- Clearing script error data or executing a script stopped due to an error by using the Script Common Control (GS384)  
    ⇒ 12.1.3 ■ 5 (1) Script Common Control (GS384)
- Resetting script error data in the [GOT Diagnostics] dialog  
    ⇒ 11.14.5 [GOT Diagnostics] dialog

Perform the above operations while the GOT displays a screen in which a script is set.

**(12)Precautions for setting [Sampling], [ON Sampling], or [OFF Sampling] for the trigger type**

**(a) If a script does not complete within the set cycle time**

If a script does not complete within the set cycle time, its subsequent execution is delayed until the current execution completes.

After the set cycle time elapses from the start of the delayed execution, the script starts its new execution.

Example) Executing a project script for which [Trigger Type] is set to [Sampling] and [Sampling] is set to [1] (x 100 ms)

**(b) If the trigger condition for a script is satisfied while any processing other than the script is in progress**

If the trigger condition for a script is satisfied while any processing other than the script (including reading or writing a file and updating a screen) is in progress, the script execution is delayed until the processing completes.

After the set cycle time elapses from the start of the delayed execution, the script starts its new execution.

Example) Executing a project script for which [Trigger Type] is set to [Sampling] and [Sampling] is set to [1] (x 100 ms)

**(c) If the scripts running periodically are set for multiple screens to be displayed simultaneously**

When these screens are displayed simultaneously, the scripts may fail to run at short time intervals, such as every 100 ms. In such a case, set a longer cycle time.

**■ 2 Precautions for drawing**

**(1) Restoring a script file**

When opening a project for which [External File (External Data)] is set in the [Option] tab, GT Designer3 restores the script file if the script file does not exist in the set path.

In such a case, specify a folder in which the script file should be restored in the dialog shown below.

**(2) When [Use system labels in conjunction with MELSOFT Navigator] is disabled**

When [Use system labels in conjunction with MELSOFT Navigator] is disabled, system labels used in scripts are not converted to devices.

Set the devices for project data.

**■ 3 Precautions when writing a script****(1) Operations that exceed the allowable range of a device value**

Do not write a script that causes an operation result which exceeds the allowable range of a device value.

Script operation is processed internally in double-precision real numbers.

Therefore, when a judgment is made using an if statement and others, the result of the judgment may differ depending on the operation methods.

Example) Judgment for the difference between GD100 and D100 using an if statement (in the case of 16-bit signed binary)

When GD100 = -32758 and D100 = 32767

**(a) When operation is executed in an evaluation expression**

```
if(([w:GD100]-[w:D100])>=10){ //If the difference between GD100 and D100 is 10 or larger,
[w:D200]=0; //Writes 0 to D200.
}
```

The calculation result of "GD100 - D100" (-32758 - 32767) is -65525, thus the condition is not satisfied.

**(b) When processing the script after assignment**

```
[w:GD200]=[w:GD100]-[w:D100]; //Assigns the value of "GD100 - D100" to GD200.
if([w:GD200]>=10){ //When the value of GD200 is 10 or larger,
[w:D200]=0; //Writes 0 to D200.
}
```

When -65525; the calculation result of "GD100 - D100" (-32758 - 32767), is assigned to GD200 in 16-bit signed binary, GD200 becomes 10, so the condition is satisfied.

(Since a value out of the range that can be handled by a variable (device) is assigned as the result of an operation, the result differs from the result obtained in (a).)

**(2) When using bmov and fmov****(a) Data type**

When using bmov or fmov, use the same data type for the word device 1 and the word device 2.

Otherwise, an error occurs during the syntax check.

→9.9.5 [Script] dialog

**(b) Data type for [w:device]**

The data type for [w:device] is set to the one specified in the [Edit Script] dialog.

The following example shows an error that occurs in the syntax check when using [w:device].

Example) When setting [Signed BIN16] for the data type in the [Edit Script] dialog

```
bmov([w:GD200],[flt:GD201],10);
```

Since the data type for GD200 is the signed 16-bit binary data while the data type for GD201 is the real number, an error occurs in the syntax check.

→9.9.2 ■ 4 (17) Data type conversion function

**(c) Syntax check**

When a syntax check is done from the [Script File List] dialog, the data type is regarded as [Signed BIN16].

When executing a syntax check using a data type other than [Signed BIN16], first set a desired data type in the [Edit Script] dialog, then execute the syntax check from the script editor.

**(3) When using file operation functions**

GT21 does not support the file operation functions.

**(a) Data type**

When using the file operation functions, do not specify BCD for the data type of the storage devices.

Doing so may disable detection of abnormality in the script.

→9.9.5 [Script] dialog

**(b) Data type for [w:device]**

The data type for [w:device] is set to the one specified in the [Edit Script] dialog.

When using [w:device] for the file operation functions, do not specify BCD for the data type of the storage devices.

**(c) Syntax check**

When a syntax check is done from the [Script File List] dialog, the data type is regarded as [Signed BIN16].

When executing a syntax check using a data type other than [Signed BIN16], first set a desired data type in the [Edit Script] dialog, then execute the syntax check from the script editor.

#### (d) Operations while files are read or written

The following file operation functions cannot be executed while the target file is accessed by other functions.

Execute the functions after the access to the target file from the other functions is complete.

- While reading: file\_read, file\_write, file\_lineread, file\_unilineread, file\_delete
- While writing: file\_read, file\_write, file\_lineread, file\_unilineread, file\_rename, file\_delete

#### (e) When using the file rename function (file\_rename)

When the full path to a file to be renamed is specified in <folder name>, do not leave <file name> blank.

Otherwise, the file name is not renamed correctly.

Example) When specifying the full path to a file in <folder name> without setting <file name>

```
[s16:D500] = file_rename("A:\Package1\ARP00001.DAT", "", "DATA-15-JAN-08.DAT"); //Renames file name.
```

The file name with the folder name is renamed from "A:\Package1\ARP00001.DAT" to

```
"A:\Package1\ARP00001.DATDATA-15-JAN-08.DAT".
```

When specifying the full path to a file in <file name>, specify the full path to the file in <renamed file name> also.

Otherwise, the path is changed together with the change of the file name.

Therefore, the file is not moved in the intended location.

Example) When specifying the full path to a file in <file name> without setting <folder name>

```
[s16:D500] = file_rename("", "A:\Package1\ARP00001.DAT", "DATA-15-JAN-08.DAT"); //Renames file name.
```

The file name is renamed from "A:\Package1\ARP00001.DAT" to "A:\DATA-15-JAN-08.DAT".

#### (f) When using the file copy function (file\_copy)

If there is no folder specified in <copy destination folder name>, create a folder when copying the file.

Make sure to add "\\" at the end of <copy destination folder name>.

Otherwise, the file is renamed to the folder name specified in <copy destination folder name> and copied.

Example) When there is no folder specified in <copy destination folder name> and "\\" is not added at the end of <copy destination folder name>

```
[s16:D200] = file_copy("A:\Package1\ARP00001.DAT", "B:\backup", "", 1); //Copies file.
```

If no backup folder exists in the drive B, "ARP00001.DAT" is renamed to backup and copied in "B:\\".

Do not create any folder in the same name as that of the file specified in <copy source file name> in the copy destination drive.

Otherwise, the file cannot be copied correctly.

#### (g) When using the folder copy function (file\_xcopy)

If an error occurs during the copying process, copying files stops.

The files copied before interruption are correctly copied.

Do not create any folder in the same name as that of the file specified in <copy source file name> in the copy destination drive.

Otherwise, the file cannot be copied correctly.

#### (h) How to use the folder and file name character number specification functions (#pragma folder\_name\_length, #pragma file\_name length) and the use Unicode declare function (#pragma use\_character\_code unicode)

Use the folder and file name character number specification function and the use Unicode declare function only one time at the start of a script.

Otherwise, the folder name and file name cannot be specified correctly.

#### (i) When specifying the folder and file names using devices

When specifying the folder and file names using devices, keep the values that are specified by the folder and file name character number specification functions (#pragma folder\_name\_length, #pragma file\_name length) to a minimum.

When specifying the folder and file names with devices, the GOT reads as many devices as the number of the characters specified in the folder and file name character number specification functions.

If the values specified in the functions exceed the actual number of the file and folder name characters, the GOT reads unnecessary devices.

Reading unnecessary data results in an excessive load on the communication process, so such an operation as updating a screen or executing a script may take longer time.

Example) When the maximum number of file name characters is set to 22 and the number of actual file name characters is 16

D100 to D110: Holds the folder name "A:\folder-00001\".

D200 to D210: Holds the file name "DATA-15-JAN-2008".

GD100: Storage device

```
#pragma folder_name_length(22) //Limits the maximum folder name length to 22 characters.
#pragma file_name_length(22) //Limits the maximum folder name length to 22 characters.
[s16:D500]=file_read([w:D100],[w:D200],[w:GD100],0,16); //Reads the 16-byte data from the specified file.
```

D100	:	A		D200	A	D
D101	f	\		D201	A	T
D102	l	o		D202	1	-
D103	e	d		D203	-	5
D104	-	r		D204	A	J
D105	0	0		D205	-	N
D106	0	0		D206	0	2
D107	\	1		D207	8	0
D108				D208		
D109				D209		
D110				D210		

Unnecessary 12 characters of devices are read.

**(4) When using the string operation function**

GT21 does not support the string operation functions.

**(a) Available character strings**

The string operation function handles ASCII and Shift JIS strings.

If a target string contains any character other than ASCII and Shift JIS characters, a script error occurs.

**(b) Return value when an error occurs**

If an error occurs when data in a device set as an argument is being read or written, execution of the script is aborted.

Therefore, no return value is stored in the device for storing the return value.

**(c) Order of storing data**

The order of storing data in the following processes is selectable from between [Low-->High] and [High-->Low].

- Reading data to the input value storage device
- Writing data to the output string storage device

⇒9.9.5 ■ 4 [Option] tab

**(5) Precautions for format specification**

**(a) Field width of the format specifier**

When the string input function (ASCII code) is used, the values skipped due to their skip flags (\*) are not counted as the number of read data (return value).

**(b) Count of the skipped data**

When the string input function (ASCII code) is used, the values skipped due to their skip flags (\*) are not counted as the number of read data (return value).

**(c) Characters that cannot be specified with the format specifier "%[...]"**

With the format specifier "%[...]", the following symbols cannot be specified.

Doing so may result in a format error.

-.]

**(d) Specifying a format with comments**

Comments consist of the Unicode text.

When specifying the format with a comment, do not use a character that cannot be converted from the Unicode text to the ASCII characters.

If such characters are used, they are replaced with blanks.

**(e) Data delimiter of a CSV file**

When reading data obtained from a CSV file, or writing data in character strings to be written to the CSV file, indicate a delimiter with the format specifier.

Example) When reading obtained numerical values from a CSV file

- If delimited by a blank: 123 456 can be read with the syntax %d%d.
- If delimited by a comma: 123,456 can be read with the syntax %d,%d can read.

**(f) Character string delimiters**

When a character string is read using "%s", a comma is not recognized as a delimiter but as a part of the string.

Therefore, the string with a comma for a delimiter is read as one data including the comma.

To read the character string as the data that is delimited by a comma, use "%[^,]" to read characters other than the comma, and then skip the delimiter with the comma.

Example) When reading the character string ABC,DEF with "%s"

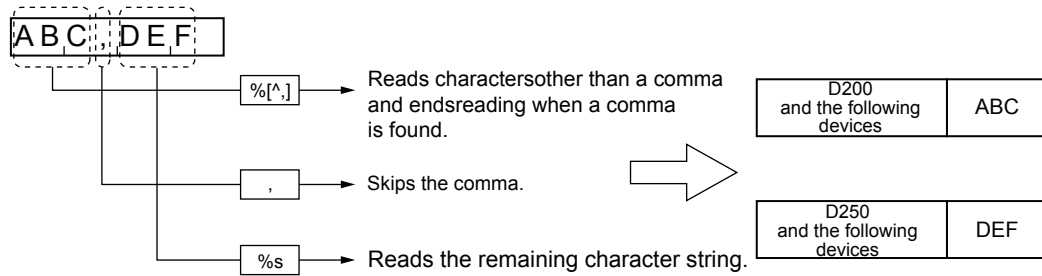

GD100 to D108: Holds the character string ABC,DEF.

GD200: Input value storage device 1

GD250: Input value storage device 2

[s16:GD500]=str\_scanf([w:GD100],7,0,"%[^,],%s",GD200,GD250); //Reads the 7-byte character string.

D100 to D104: Source character string

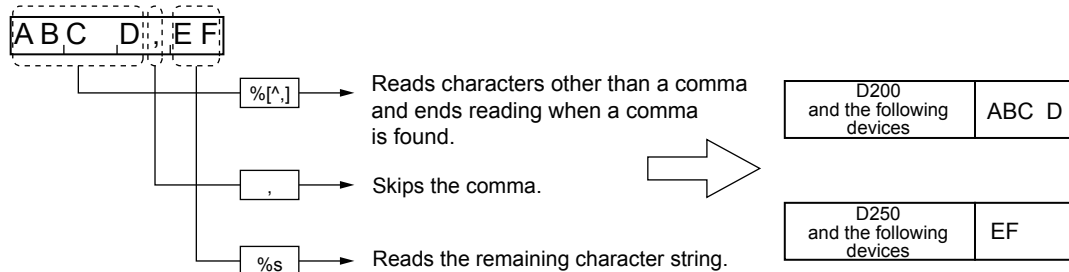

Blanks are recognized as delimiters. Therefore, if a character string including blanks is read, it is read as multiple data.

To read a character string with blanks as one data, use "%[^,]" to read characters other than a comma, then skip a delimiter with the comma.

Example) When reading the character string ABC D, EFG by using the above script

D100 to D104: Source character string

#### (g) Number of significant digits for the single precision real number

The maximum number of significant digits for the single precision real number is six.

If the precision with six digits or more is set for the format specifier, the result may be incorrect.

#### (h) Differences in the written result between the GOT and GT SoftGOT2000 or GT Simulator3

Some of the processing differs between the GOT and GT SoftGOT2000 or GT Simulator3.

If real numbers with the precision of more than six are written, the results may differ between the GOT and GT SoftGOT2000/GT Simulator3.

#### (i) When writing a character string with "%s"

Starting from the device to be written, a number of devices corresponding to that of characters are used.

Reserve the writable device area in advance.

### ■ 4 Precautions when setting a project script

The monitor device of a project script is always operating.

Note that displaying the monitor screen may take long when the number of monitor devices is large.

### ■ 5 Precautions when switching the screen

If screen switching is executed while a screen script or the script of a script parts object is running, the target screen will not be switched until the script ends.

If screen switching is executed while a project script is running, the script will temporarily stop running until the target screen is switched.

### ■ 6 Precautions for script parts

#### (1) Behavior of a script parts object on the screen displayed in multiple locations

If an overlap window, superimpose window, and the set overlay screen function call a screen having a script parts object, the script of the script parts object runs only when the screen is called up for the first time.

The script does not run in the other locations even after you close the screen where the script has run.

In the above state, if the screen is called up again in any of these locations, the script will run on the newly displayed screen.

**(2) User area to be used when script parts temporary device areas (PTMP) are used**

When you use PTMPs, the size of the user area to be used depends on the number of the PTMPs.  
Set a minimum number of PTMPs.

**(3) Syntax check on PTMPs**

In a syntax check, whether the number of PTMPs falls within the following range is checked regardless of the settings of the GOT type and #pragma use\_ptmp\_length.

- 32768 (PTMP0 to PTMP32767)

Even if the number of PTMPs is invalid according to the above settings, no error will occur during the syntax check.  
You must check that the number of PTMPs is within the valid range.

**■7 Precautions when using bmov**

For project scripts or screen scripts, using many bmov commands to read device values from the controller and to store them in the GOT internal devices may slow the performance of the GOT display refresh or the reaction of the touch switch input.

This section explains how to make the GOT monitor operate at a higher speed by reducing the frequency of the communication with controllers by bmov.

**(1) How to read device values from controllers without bmov**

The GOT can read device values with device data transfer instead of bmov.

With device data transfer, the GOT communicates with controllers only when trigger conditions are satisfied. Therefore, the GOT has no communication loads by always monitoring the device used for the script function.

For the details of device data transfer, refer to the following.

⇒9.4 Transferring Data between Devices ([Device Data Transfer])

**(2) How to reduce the communication time when using bmov**

If the following read operations are performed by the screen script, the script applies only to the currently displayed screen on the GOT.

With project scripts or screen scripts, the GOT only reads a batch of device values from the controller direct addresses all the time, regardless of execution condition of each script, or conditional branches using if or switch statements.

When the offset is specified in the device, the offset device is the device described in the direct address.

Also, when using bmov to read device values from controllers, the GOT only reads the values of source devices all the time by communicating with the controllers one or more times by bmov.

To reduce the communication time, it is recommended that you read a batch of values from the source devices temporarily into a temporary device area.

Perform the following remedies.

**(a) If device values are read from controllers in divided blocks, change the script into the one that reads a batch of values temporarily into the temporary device area, then divides them again, and then transfers them to the GOT internal devices.**

⇒(3) Script solution examples

**(b) If the GOT reads device values according to each execution condition of an if or switch statement, read the values temporarily into the temporary device area before the if or switch statement is executed.**

Then, change the script into the one that transfers the values from the temporary device area to the GOT internal devices by dividing the values into groups according to the condition of if or switch statement.

⇒9.9.12 ■ 7 (3) (b) Reading bmov commands in a script at a time

When reading a batch of devices from the controller to the temporary device area, refer to the number of words (size) shown in the table below as a guide.

If the number of words is larger than the guide, the number is automatically divided in controllers before they are transferred.

Controller type	Approximate number of words transferred by bmov at a time
QCPU (bus connection only)	960 words
Motion controller CPU (Q mode)	
QCPU (other than bus connection)	480 words
LCPU	
QnACPU	
Motion controller CPU (A mode)	
ACPU	64 words
FXCPU	

### (3) Script solution examples

#### (a) Reading a batch of device values into a temporary device area

This solution saves the communication time by reducing the frequency of communication between the GOT internal memory and the controller from three times to once.

When data are transferred from a temporary device area to GOT internal devices (such as GD), the internal memory does not communicate with controllers.

The internal memory is used for communication processing.

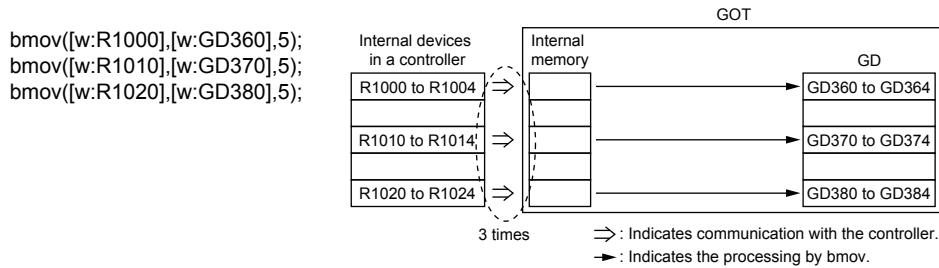

It is a system area, and the user is not permitted to access to the area.

Before applying remedy

- Processing outline

Device values are transferred from R1000 to R1004, R1010 to R1014 and R1020 to R1024 into GD360 to GD364, GD370 to GD374 and GD380 to GD384 respectively.

- Script description

- Processing outline

Device values are transferred from R1000 to R1024 into TMP0 to TMP24 in the GOT first, then transferred again from TMP0 to TMP24 into GD360 to GD364, GD370 to GD374 and GD380 to GD384 respectively.

- Script description

#### (b) Reading bmov commands in a script at a time

This solution saves the communication time by reducing the frequency of communication between the GOT internal memory and the controller from ten times to once.

(When internal devices in a controller are read in an if or switch statement, the internal memory communicates with the controller regardless of the operating condition. When data are transferred from a temporary device area to GOT internal devices (such as GD), the internal memory does not communicate with controllers.)

Before applying remedy

- Processing outline

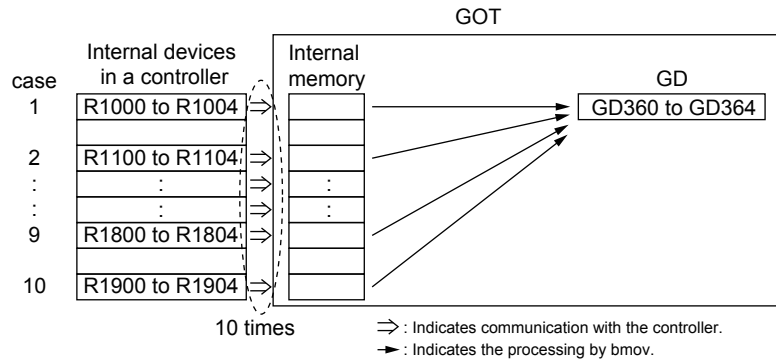

Device values are transferred from R1000 to R1004, ... and R1900 to R1904 into GD360 to GD364 according to the case statements.

- Script description

```

switch([w:D1000]){
case 1:
bmov([w:R1000],[w:GD360],5);
break;
case 2:
bmov([w:R1100],[w:GD360],5);
break;
:
case 9:
bmov([w:R1800],[w:GD360],5);
break;
case 10:
bmov([w:R1900],[w:GD360],5);
break;
}
rst([b:GB1000]);

```

After the remedy is applied

- Processing outline

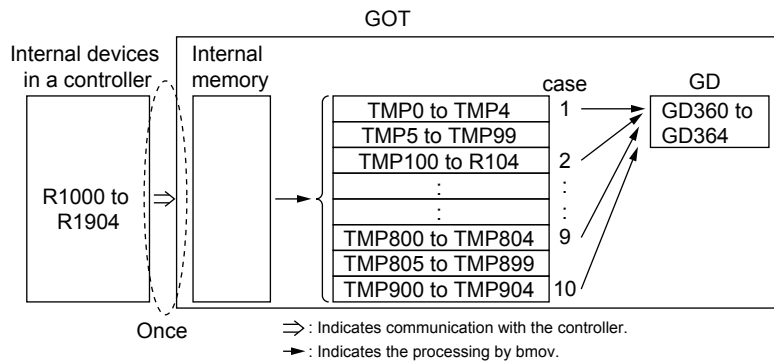

Device values are transferred from R1000 to R1904 into TMP0 to TMP904 in the GOT at a time, then transferred again from TMP0 to TMP904 into GD360 to GD364 according to the case statements.

- Script description

```

bmov([w:R1000],[w:TMP0],905);
switch([w:D1000]){
case 1:
bmov([w:TMP0],[w:GD360],5);
break;
case 2:
bmov([w:TMP100],[w:GD360],5);
break;
:
case 9:
bmov([w:TMP800],[w:GD360],5);
break;
case 10:
bmov([w:TMP900],[w:GD360],5);
break;
}
rst([b:GB1000]);

```

## 9.9.13 Relevant settings

Set the relevant settings other than the specific settings for project scripts, screen scripts, and script parts as required. The following shows the functions that are available by the relevant settings.

### 1 GOT internal device

⇒ 12.1.3 GOT special register (GS)

○ : Applicable, - : Not applicable

Function	Setting item	Project script	Screen script	Script part
Notifying that a script error has occurred.	GS14.b0	○	○	○
Notifying that a BCD error has occurred.	GS14.b7	○	○	○
Notifying that a zero division error has occurred.	GS14.b8	○	○	○
Notifying that a communication error (including access to an invalid device) has occurred.	GS14.b12	○	○	○
Storing the start device number of the devices where the latest error record is stored. The devices range from GS16 to GS47.	GS15	○	○	-
Storing the script error records (including script numbers and error codes).	GS16 to GS47	○	○	-
Storing the device number of the device where the latest script execution record is stored. The device is in the range of GS49 to GS79.	GS48	○	○	-
Storing the script numbers of the executed scripts.	GS49 to GS79	○	○	-
Notifying that a file operation function is being executed.	GS154.b0	○	○	○
Notifying that a file operation function error has occurred.	GS154.b15	○	○	○
Storing a number showing the GOT data registers (GD) where the latest error record is stored. The GD devices are specified with GS392 and GS394.	GS157	○	○	○
Storing a number showing the GOT data registers (GD) where the latest script execution record is stored. The GD devices are specified with GS396 and GS398.	GS158	○	○	○
Notifying occurrence of an error which occurs while the integer $\leftrightarrow$ real number conversion is processed. *1	GS260.b14	○	○	○
Notifying the completion of the integer $\leftrightarrow$ real number conversion. *1	GS260.b15	○	○	○
Storing the error code of an error which occurs while the integer $\leftrightarrow$ real number conversion is processed. *1	GS261	○	○	○
Clearing script error records as shown below. • GS14.b0, b7, b8, and b12 store 0. • GS15 stores -1. • GS16 to GS47 store 0.	GS384.b0	○	○	○
Re-executing the script aborted due to an error.	GS384.b1	○	○	○
Setting the monitoring time for one script.	GS385	○	○	○
Controlling whether to run a script upon screen switching or other applicable processes. The applicable script trigger types are as follows. • [Rise] • [Fall] • [Rise/Fall]	GS386	○	○	○
Specifying a data storage order when a file operation function is used. *1	GS390	○	○	○
Storing the detailed script error records.	GS392 GS394 GS395	○	○	○
Storing the detailed script execution records.	GS396 GS398 GS399	○	○	○

	GS464			

\*1 GT21 does not support this item.

## 9.9.14 Troubleshooting

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

Scripts do not display error messages when an error occurs. Stopping the script where an error has occurred prevents other scripts and monitor functions from stopping. Therefore, every script must be debugged following the procedures as shown below.

### ■ 1 Simulation using a general C language compiler or debugger

Since scripts and C language are similar, you can simulate the scripts by making minor corrections using a general C language compiler or debugger.

Complicated scripts including many control statements can be debugged easily by using them.

The following shows the procedure to simulate scripts using a general C language compiler or debugger.

**Step 1** Change a script file for GOTs (extension.txt) into a C language source file (extension.c).

- Change of the file extension: text1.txt → text1.c

**Step 2** Open the C language source file in a commercially-available text editor and create a frame with "main(){ }".

Describe "#include<stdio.h>" at the beginning.

- Additional description of "main" and "include"

Additional description→	#include<stdio.h>
Additional description→	main(){
	[w:TMP0001]=0;
	while([w:TMP0000]<[w:D100]){
	if(!([w:TMP0000]-1900)%4){
	[w:TMP0001]=[w:TMP0001]+1;
	... ( Omitted ) ...
	[w:TMP0010]=[w:TMP0002]+[w:TMP0003]+[w:TMP0004]-1;
	[w:D200] = [w:TMP0010]%7;
Additional description→	}

**Step 3** Change the description method of devices (variables) from the one for scripts to the one for C language.

Using the following definitions to change the variables into the one for C language enables you to smoothly restore them into the GOT scripts.

Using the batch replacement function of a commercially-available text editor may be useful for the change as well.

Definition 1 [w: → \_w

Definition 2 [b: → \_b

Definition 3 ] → \_\_

- Change of the description method of devices (variables)

	#include<stdio.h>
	main(){
Description change→	_wTMP0001__=0;
Description change→	while(_wTMP0000__<_wD100__){
Description change→	if(!((_wTMP0000__-1900)%4){
Description change→	_wTMP0001__=_wTMP0001__+1;
	... ( Omitted ) ...
Description change→	_wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;
Description change→	_wD200__ = _wTMP0010__%7;
	}

**Step 4** For C language, variables to be used must be defined in advance.

Since only one data type can be set for one script, the same variable type of C language must be set for all the

variables.

The following shows the data type of scripts.

If [BCD32] or [BCD16] is selected as the script data type, you cannot perform a simulation using the general C language compiler or debugger.

Data type of scripts	Variable type
Signed BIN 16	short
Unsigned BIN 16	unsigned short
Signed BIN 32	long
Unsigned BIN 32	unsigned long
Real number	float
BCD32, BCD16	-

- Variable definition (auto variable declaration)

Description change → Addition → Addition → Addition → Addition →	<pre> #include&lt;stdio.h&gt; void main(void){   unsigned short _wTMP0000__;   unsigned short _wTMP0001__;   unsigned short _wTMP0002__;   unsigned short _wD100__;   ... ( Omitted) ...   _wTMP0001__=0;   while(_wTMP0000__&lt;_wD100__){     if(!((_wTMP0000__-1900)%4)){       _wTMP0001__=_wTMP0001__+1;       ... ( Omitted) ...       _wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;       _wD200__=_wTMP0010__%7;     }   } </pre>
--	--

**Step 5** Perform a simulation with the general C language compiler or debugger.

The step run, variable watch, and other functions specific to the debugger can be used.

After completion of debugging, perform Step 1 to 4 in reverse order to restore the data into the GOT script file.

## ■ 2 Messages to be displayed at the syntax check

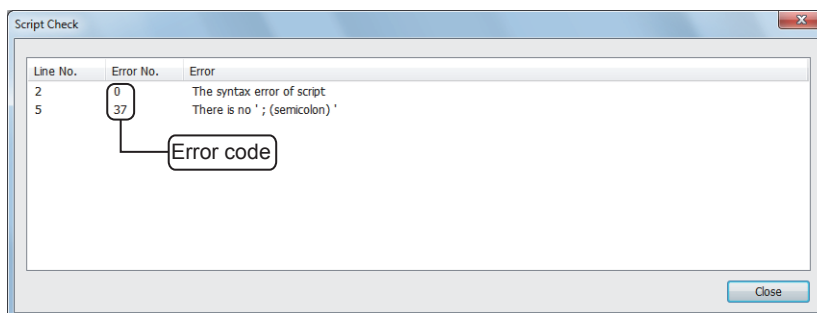

### (1) Dialog to be displayed at the syntax check

When you execute a syntax check, the [Script Check] dialog appears to display the error codes of the errors detected in a script.

For the details of the error codes, refer to the following.

- ⇒ (2) List of syntax error codes

Example) When executing a syntax check on a project script

Some errors cannot be detected by the syntax check.

If any error which cannot be detected by the syntax check exists in the script, the error is detected when the script is executed on the GOT.

For the errors for the execution of a script and the corrective action on the GOT, refer to the following.

- ⇒ ■ 3 Script execution errors and their corrective actions on the GOT

## (2) List of syntax error codes

The [Script Check] dialog displays the error codes listed below.

Error code <sup>*1</sup>	Description
0	The syntax error of script
1	The odd number address is set to the address
2	Extended file register (ER) setting error (inter-block settings)
3	Address is only a multiple of 16
4 <sup>*2</sup>	Out of the range of device No. (displayed in HEX. Number)
5 <sup>*2</sup>	Out of the range of device No. (displayed in DEC. Number)
6	Out of the range of device No. (displayed in OCT. Number address)
7	The setting is not executed with the multiple of 16 when specifying the bit device word
8	The setting is not within the range of 0 to 15 when specifying word device bit
9	The set device is out of the range or does not exist
11	Illegal address
14	Access to the device disabling word accessibility by using bit
15	Access to the device disabling bit accessibility by using bit
16	Octal device are set with odd number
17	The setting is not executed with the multiple of 16 when specifying the bit device word
20	The specified CPU does not exist
21	The specified Word type does not exist
22	A CPU not included with network settings has been specified
24	2 byte code cannot be used
25	No expression exist between {and}
26	There are a lot of expression or control structure
27	There are a lot of expression or control structure
28	case outside of switch
29	"Default" exist although there is no switch statement
30	There are multiple "default" settings in switch
31	There are too many switch "case" statements
32	There are too many "switch break" statements
33	Too many nest of switch
34	System memory is insufficient
35	Parenthesis nest is deep
36	Syntax error
37	There is no ' ; (semicolon) '
38	There are invalid characters
39	File input is not specified
40	The specified input file does not exist
41	The nest of if/while is deep
45	The CPU incompatible with multi-CPU is specified as multi-CPU
46	The multi-specified station No. is incorrect
47	Network in GOT internal devices
48	Set network in GOT internal devices
101	No closed parenthesis
111	The bit device is specified for the device with indirect specification
112	Controller Type of channel n is not specified or does not exist <sup>*3</sup>
113	Channel number error
114	Common device cannot use channel

Error code *1	Description
115	The read only variable is written
116	The write only variable is read
117	The read only property is written
118	The write only property is read
119	Unterminated string
120	There is EOF in string
121	The string is too long
122	Unicode translation error
123	Cannot use EG in object script
124	Cannot use word type cast
125	There are invalid variables
126	There are invalid properties
127	There are invalid functions
128	There are invalid device type
129	Unterminated label
130	There is EOF in label
131	The label is too long
132	An unavailable label is set
133	The device of label is invalid
134	The device of label is not set
135	Label conversion error
136	Data types of the 1st argument and 2nd one are not equal in bmov/fmov
137	value out of range
138	can't use #pragma except in script head
139	#pragma folder_name_length redeclared
140	#pragma file_name_length redeclared
141	Bit device word cannot be used
142	Word device bit cannot be used
143	The format is invalid
144	The number of format designators is out of the valid range
145	The argument count is wrong
147	#pragma use_ptmp_length redeclared
148	PTMP cannot be used except for script parts
201	The device code is unknown
202	The device No. is beyond the valid range
203	Device No. + Device Points are beyond the valid range
204	The network No./Station No./CPU No. are beyond the valid range
205	The device name is invalid
206	The device No. notation is invalid
207	The address No. is invalid (not in even number or multiples of 8/16)
208	The device type is invalid
209	The GOT series is unknown
301	The GOT type does not support global labels/tags
302	Global labels/tags cannot be used for the controller of channel n*3
303	The global label/tag is too long
304	An invalid character is used for the global label/tag
305	Global label/tag syntax error

Error code *1	Description
306	The global label/tag that is not array type is used for the continuous device setting

\*1 If the station number setting of the device is incorrect, the same error may be displayed twice.

\*2 For devices in which decimal numbers and hexadecimal numbers are used for device numbers (including a coil (MB) of YASKAWA PLC CP-9200SH), error code 4 occurs if a number outside the address range is specified.

\*3 The letter "n" indicates a channel number.

### ■ 3 Script execution errors and their corrective actions on the GOT

The following shows how to check the errors and their error codes on the GOT.

Item	Description
Checking for the occurrence of an error	<p>Check for the occurrence of the following errors.</p> <ul style="list-style-type: none"> <li>• Script error</li> <li>• BCD error</li> <li>• Zero division error</li> <li>• Communication error (including access to an invalid device)</li> <li>• File operation function error</li> </ul> <p>The following script types are supported: project script, screen script, and script part.                      ⇒(1) Checking for the occurrence of an error</p>
Checking an error record	<p>Check the following information of an error.</p> <ul style="list-style-type: none"> <li>• Script number</li> <li>• Error code</li> </ul> <p>The following script types are supported: project script and screen script.                      ⇒(2) Checking an error record</p>
Checking a detailed error record	<p>Check the following information of an error.</p> <ul style="list-style-type: none"> <li>• Error code</li> <li>• Script type</li> <li>• Screen number</li> <li>• Script number or object ID number</li> <li>• Execution order number</li> <li>• Screen type</li> <li>• Number of the displayed base screen</li> </ul> <p>The following script types are supported: project script, screen script, and script part.                      ⇒(3) Checking a detailed error record</p>
Clearing error records	<p>Turning on GS384.b0 clears the script error records as shown below.</p> <ul style="list-style-type: none"> <li>• GS14.b0, b7, b8, and b12 store 0.</li> <li>• GS15 stores -1.</li> <li>• GS16 to GS47 store 0.</li> </ul> <p>The following script types are supported: project script, screen script, and script part.</p>
Re-executing the script aborted due to an error	<p>Turn on GS384.b1 to re-execute the script aborted due to an error.</p> <p>The following script types are supported: project script, screen script, and script part.</p>

To check device values, use the device monitor function or objects (including a numerical display and lamp).

#### (1) Checking for the occurrence of an error

The following script types are supported: project script, screen script, and script part.

The following GOT internal devices notify the occurrence of errors.

GOT internal device	Description	
GS14	b0	Turns on when a script error occurs.
	b7	Turns on when a BCD error occurs.
	b8	Turns on when a zero division error occurs.
	b12	Turns on when a communication error (including access to an invalid device) occurs.
GS154	b15	Turns on when a file operation function error occurs. Turns off when the subsequent file operation function is properly completed.

To reset each bit of GS14, turn on GS384.b0.

## (2) Checking an error record

The following script types are supported: project script and screen script.

When an error occurs, the error record is stored into the devices ranging from GS16 to GS47.

GS15 stores the start device number of the devices where the latest error record is stored.

To clear error records, turn on GS384.b0.

The following shows the operation of the relevant GOT internal devices.

GOT internal device	Description																		
GS15	<p>Stores the start device number of the devices where the latest error record is stored. The devices range from GS16 to GS47.</p> <p>The value of GS15 changes as follows each time an error occurs.            -1 → 16 → 18 → 20 → 22 → ... → 46 (The next loop will start from 16.)</p> <p>Example) Relationship between the value of GS15 and the storage location of the latest error record</p> <ul style="list-style-type: none"> <li>• When GS15 stores 16, the latest error record is stored in GS16 and GS17.</li> <li>• When GS15 stores 46, the latest error record is stored in GS46 and GS47.</li> </ul> <p>Turning on GS384.b0 resets GS15 to -1.</p>																		
GS82 to GS113	<p>Stores the following information when a script error occurs.</p> <ul style="list-style-type: none"> <li>• Script number</li> <li>• Error code</li> </ul> <p>Two word devices are used for one error.</p> <table border="1" style="margin-left: 40px;"> <tr> <td>GS16</td> <td>Script number</td> <td rowspan="2">} 1st error record</td> </tr> <tr> <td>GS17</td> <td>Error code</td> </tr> <tr> <td>GS18</td> <td>Script number</td> <td rowspan="2">} 2nd error record</td> </tr> <tr> <td>GS19</td> <td>Error code</td> </tr> <tr> <td>⋮</td> <td>⋮</td> <td></td> </tr> <tr> <td>GS46</td> <td>Script number</td> <td rowspan="2">} 15th error record</td> </tr> <tr> <td>GS47</td> <td>Error code</td> </tr> </table> <p>If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.</p>	GS16	Script number	} 1st error record	GS17	Error code	GS18	Script number	} 2nd error record	GS19	Error code	⋮	⋮		GS46	Script number	} 15th error record	GS47	Error code
GS16	Script number	} 1st error record																	
GS17	Error code																		
GS18	Script number	} 2nd error record																	
GS19	Error code																		
⋮	⋮																		
GS46	Script number	} 15th error record																	
GS47	Error code																		

## (3) Checking a detailed error record

The following script types are supported: project script, screen script, and script part.

The specified GOT data registers (GD) store error records.

These GD devices are specified with the following GOT special registers (GS).

- GS392: Specify the start device number of the GD devices to store error records.
- GS394: Specify the maximum number of error records.

Example) When GS392 stores 1000, and GS394 stores 5

GD1000 to GD1007	⋯ 1st error record
GD1008 to GD1015	⋯ 2nd error record
GD1016 to GD1023	⋯ 3rd error record
GD1024 to GD1031	⋯ 4th error record
GD1032 to GD1039	⋯ 5th error record

Eight word devices are used for one error.

For the details of an error record, refer to the following.

⇒(4) Details of an error record

To start storing error records, turn on GS395.b0.

You can identify the devices storing the latest error record based on the values of GS392 and GS157.

The following shows the operation of the relevant GOT internal devices.

- Write device

GOT internal device	Description
GS157	<p>Stores a number showing the devices where the latest error record is stored.</p> <p>Data type: Signed binary</p> <p>Initial value: -1</p> <p>Calculate the start device number of the devices storing the latest error record by using the following expression.</p> <ul style="list-style-type: none"> <li>• <math>GS392 + (GS157 \times 8)</math></li> </ul> <p>Example) When GS392 stores 1000, and GS157 stores 5</p> $1000 + (5 \times 8) = 1040$ <p>In this case, GD1040 to GD1047 (eight GD devices) store the latest error record.</p>

• Read device

GOT internal device		Description
GS392		Specify the start device number of the GD devices to store error records. Data type: Unsigned binary
GS394		Specify the maximum number of error records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no error record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS395.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.
GS395	b0	When this bit is turned on, storing error records starts. When this bit is turned off, storing error records ends.
	b1	Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS394. When this bit is turned on, storing error records stops. When this bit is turned off, storing error records continues by overwriting the oldest record.
	b8	When this bit is turned on, the project script error records are not stored.
	b9	When this bit is turned on, the screen script error records are not stored.
	b10	When this bit is turned on, the script error records of script parts objects are not stored.
	b11	When this bit is turned on, the records of warnings (that do not abort a script) are not stored.

**(4) Details of an error record**

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. →(5) List of script execution error codes
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• 1: Project script</li> <li>• 2: Screen script (set for a base screen)</li> <li>• 3: Screen script (set for a window screen)</li> <li>• 4: Script part</li> </ul>
GD1002	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1003	Script number or object ID number	The device stores a script number or object ID number according to the script type. <ul style="list-style-type: none"> <li>• For project scripts and screen scripts: script number</li> <li>• For script parts: object ID number</li> </ul>
GD1004	Execution order number	Script execution order number specified on GT Designer3 The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• For project scripts: 1 to 256</li> <li>• For screen scripts: 1 to 256 (per screen)</li> <li>• For script parts: 1 to 16 (per script parts object)</li> </ul>
GD1005	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"> <li>• 200: Base screen</li> <li>• 210: Superimpose window 1</li> <li>• 220: Superimpose window 2</li> <li>• 310: Overlap window 1</li> <li>• 320: Overlap window 2</li> <li>• 330: Overlap window 3</li> <li>• 340: Overlap window 4</li> <li>• 350: Overlap window 5</li> </ul> If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. <ul style="list-style-type: none"> <li>• When a base screen is called, 1 is added.</li> <li>• When a window screen is called, 2 is added.</li> </ul> Example) When a window screen is called from overlap window 3 $330 + 2 = 332$ The device stores 0 for a project script.
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.

Storage device	Item	Description
GD1007	Use prohibited	The device stores 0.

## (5) List of script execution error codes

Error code	Description	Corrective action
1	Initialization of project script failed.	<ul style="list-style-type: none"> <li>Reduce the number of monitor devices in scripts.</li> <li>Reduce the number of project scripts to be executed.</li> </ul>
2	Initialization of screen script (base screen) failed.	<ul style="list-style-type: none"> <li>Reduce the number of monitor devices in scripts and base screens.</li> <li>Reduce the number of screen scripts (base screen) to be executed.</li> </ul>
3	Initialization of screen script (superimpose window 1) failed.	<ul style="list-style-type: none"> <li>Reduce the number of monitor devices in scripts and superimpose window 1.</li> <li>Reduce the number of screen scripts (superimpose window 1) to be executed.</li> </ul>
4	Initialization of screen script (overlap window 1) failed.	<ul style="list-style-type: none"> <li>Reduce the number of monitor devices in scripts and overlap window 1.</li> <li>Reduce the number of screen scripts (overlap window 1) to be executed.</li> </ul>
5	Initialization of screen script (overlap window 2) failed.	<ul style="list-style-type: none"> <li>Reduce the number of monitor devices in scripts and overlap window 2.</li> <li>Reduce the number of screen scripts (overlap window 2) to be executed.</li> </ul>
6	An error occurred in reading data from the device that always collects the data.	Correct the description of the device whose data is out of the specified device range.
7	The number of scripts to be executed exceeded the limit. And some scripts were left unexecuted.	<ul style="list-style-type: none"> <li>Change the number of scripts to be executed in one project to 256 or less.</li> <li>Change the number of scripts to be executed in one screen to 256 or less.</li> </ul>
8	When [BCD16] or [BCD32] was selected as the script data type, the monitor device value could not be handled as BCD.	<ul style="list-style-type: none"> <li>Check whether the device to be monitored is correct.</li> <li>Check the processing for the device which could not be handled as BCD, and correct the script and sequence program.</li> </ul>
9	When [BCD16] or [BCD32] was selected as the script data type, the operation result was outside the BCD data range.	Check the processing for the device that is out of the BCD data range.
10	The numerator was divided by the denominator of 0.	Check the factor that caused zero division in the script, and correct the script.
11	Writing to a device failed.	Check the device description of the script.
12	Reservation of an internal area for writing to a device failed.	Reduce the number of devices to be written in the script.
13	The while statement includes the description of a device that causes an assignment delay.	Replace the device causing an assignment delay in the while statement with the temporary device area or a GOT internal device.
14	The expression was too complicated to process.	Simplify or divide the operation expression in the script.
15	A script did not end within the script monitoring time.	<ul style="list-style-type: none"> <li>Check whether the script has gone into an endless loop.</li> <li>Increase the value of the Script Monitoring Time (GS385).</li> </ul>
16	Access to the GOT internal device failed, resulting in an error (out of the specified device range).	<ul style="list-style-type: none"> <li>Check the processing to the GOT internal device and correct the script and sequence program.</li> <li>Check the description of the script.</li> </ul>
	Access to gateway device failed.	<ul style="list-style-type: none"> <li>Check that the system applications (extended functions) for the gateway function are installed on the GOT.</li> <li>Check the cable.</li> </ul>
18	The number of consecutive devices handled by the FMOV or BMOV function exceeded the maximum as shown below. <ul style="list-style-type: none"> <li>Maximum number of word devices: 32766</li> <li>Maximum number of double-word devices: 16383</li> </ul>	<ul style="list-style-type: none"> <li>Reduce the number of consecutive devices handled by the FMOV or BMOV function.</li> </ul>
19	Initialization of screen script (superimpose window 2) failed.	<ul style="list-style-type: none"> <li>Reduce the number of monitor devices in scripts and superimpose window 2.</li> <li>Reduce the number of screen scripts (superimpose window 2) to be executed.</li> </ul>
20	The GOT failed to access a temporary device area because the area is invalid.	Correct the descriptions of temporary device areas in the relevant script.
23	The GOT failed to access a script parts temporary device area because the area is invalid.	Correct the descriptions of script parts temporary device areas in the relevant script.
24	The GOT failed to execute the file operation function because data in the argument used in the function is invalid. (The path is invalid, the data is out of range, or the other errors occur.)	<ul style="list-style-type: none"> <li>Check if the argument is not out of the available range.</li> <li>Correct the folder and file names.</li> <li>Check if the storage device data and the file size are not out of the available range by the offset, number of write bytes, and/or number of read bytes.</li> </ul>
25	The GOT failed to write data because the data storage has insufficient free space.	Check the free space of the data storage.

Error code	Description	Corrective action
26	The GOT failed to access the file because no data storage is installed or the SD card cover is opened.	<ul style="list-style-type: none"> <li>• Check that a data storage is installed on the GOT.</li> <li>• Check that the SD card cover is closed.</li> <li>• Check that the SD card access switch is turned on.</li> </ul>
27	The GOT failed to write the data because the data storage is write-protected, the specified file is a read-only file, or a file in the same name as the folder name in the path of the copy destination exists.	<ul style="list-style-type: none"> <li>• Check if the data storage is not write-protected.</li> <li>• Check if the specified file is not a read-only file.</li> <li>• Check if a file in the same name as the folder name in the path of the copy destination does not exist.</li> </ul>
28	The GOT failed to access the file because the data storage is not formatted or is faulty.	<ul style="list-style-type: none"> <li>• Check if the data storage is formatted.</li> <li>• Check if the data storage is not broken.</li> </ul>
29	The GOT failed to access the file because the specified file is used for the other functions.	Check if the file which is being used by the file operation function is not used by other functions at the execution of the file operation function.
30	The GOT stopped copying the file because a file in the same name as the copy source file exists in the copy destination folder.	<ul style="list-style-type: none"> <li>• Check if the copy destination folder has no file in the name which is the same as the copy source file.</li> <li>• If the copy mode is write protection, disable write protection.</li> </ul>
31	The GOT failed to execute the string operation function because arguments in the function specify invalid character strings.	<ul style="list-style-type: none"> <li>• Correct the format.</li> <li>• Check if the arguments are not out of the available range for specifying.</li> </ul>
35	Initialization of screen script (overlap window 3) failed.	<ul style="list-style-type: none"> <li>• Reduce the number of monitor devices in scripts and overlap window 3.</li> <li>• Reduce the number of screen scripts (overlap window 3) to be executed.</li> </ul>
36	Initialization of screen script (overlap window 4) failed.	<ul style="list-style-type: none"> <li>• Reduce the number of monitor devices in scripts and overlap window 4.</li> <li>• Reduce the number of screen scripts (overlap window 4) to be executed.</li> </ul>
37	Initialization of screen script (overlap window 5) failed.	<ul style="list-style-type: none"> <li>• Reduce the number of monitor devices in scripts and overlap window 5.</li> <li>• Reduce the number of screen scripts (overlap window 5) to be executed.</li> </ul>

#### ■4 How to check a script execution record

The following shows how to check a script execution record on the GOT.

Item	Description
Checking the execution status of a file operation function	<p>While a file operation function is being executed, GS154.b0 is on.</p> <p>After the execution is complete, GS154.b0 turns off.</p> <p>The following script types are supported: project script, screen script, and script part.</p>
Checking a script execution record	<p>Check the script number of an executed script.</p> <p>The following script types are supported: project script and screen script.</p> <p>→(1) Checking a script execution record</p>
Checking a detailed script execution record	<p>Check the following information on an executed script.</p> <ul style="list-style-type: none"> <li>• Script type</li> <li>• Screen number</li> <li>• Script number or object ID number</li> <li>• Execution order number</li> <li>• Screen type</li> <li>• Number of the displayed base screen</li> </ul> <p>The following script types are supported: project script, screen script, and script part.</p> <p>→(2) Checking a detailed script execution record</p>

To check device values, use the device monitor function or objects (including a numerical display and lamp).

##### (1) Checking a script execution record

The following script types are supported: project script and screen script.

When a script runs, the script number is stored into the device in the range of GS49 to GS79.

GS48 stores the device number of the device where the latest script execution record is stored.

The following shows the operation of the relevant GOT internal devices.

GOT internal device	Description
GS48	<p>Stores the device number of the device where the latest script execution record is stored. The device is in the range of GS49 to GS79.</p> <p>The value of GS48 changes as follows each time a script is executed.</p> <p>-1 → 49 → 50 → 51 → 52 → ... → 79 (The next loop will start from 49.)</p>
GS49 to GS79	<p>Store the script numbers of the executed scripts.</p> <p>One word device is used for one script.</p> <p>If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.</p>

## (2) Checking a detailed script execution record

The following script types are supported: project script, screen script, and script part.

The specified GOT data registers (GD) store script execution records.

These GD devices are specified with the following GOT special registers (GS).

- GS396: Specify the start device number of the GD devices to store script execution records.
- GS398: Specify the maximum number of script execution records.

Example) When GS396 stores 1000, and GS398 stores 5

GD1000 to GD1007	∴ 1st script execution record
GD1008 to GD1015	∴ 2nd script execution record
GD1016 to GD1023	∴ 3rd script execution record
GD1024 to GD1031	∴ 4th script execution record
GD1032 to GD1039	∴ 5th script execution record

Eight word devices are used for one script execution record.

For the details of a script execution record, refer to the following.

### ⇒(3) Details of a script execution record

To start storing script execution records, turn on GS399.b0.

You can identify the devices storing the latest script execution record based on the values of GS396 and GS158.

The following shows the operation of the relevant GOT internal devices.

- Write device

GOT internal device	Description
GS158	Stores a number showing the devices where the latest script execution record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest script execution record by using the following expression. • $GS396 + (GS158 \times 8)$ Example) When GS396 stores 1000, and GS158 stores 5 $1000 + (5 \times 8) = 1040$ In this case, GD1040 to GD1047 (eight GD devices) store the latest script execution record.

- Read device

GOT internal device	Description	
GS396	Specify the start device number of the GD devices to store script execution records. Data type: Unsigned binary	
GS398	Specify the maximum number of script execution records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no script execution record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS399.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.	
GS399	b0	When this bit is turned on, storing script execution records starts. When this bit is turned off, storing script execution records ends.
	b1	Specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records specified with GS398. When this bit is turned on, storing script execution records stops. When this bit is turned off, storing script execution records continues by overwriting the oldest record.
	b8	When this bit is turned on, the project script execution records are not stored.
	b9	When this bit is turned on, the screen script execution records are not stored.
	b10	When this bit is turned on, the script execution records of script parts objects are not stored.

### (3) Details of a script execution record

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• 1: Project script</li> <li>• 2: Screen script (set for a base screen)</li> <li>• 3: Screen script (set for a window screen)</li> <li>• 4: Script part</li> </ul>
GD1001	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1002	Script number or object ID number	The device stores a script number or object ID number according to the script type. <ul style="list-style-type: none"> <li>• For project scripts and screen scripts: script number</li> <li>• For script parts: object ID number</li> </ul>
GD1003	Execution order number	Script execution order number specified on GT Designer3 The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• For project scripts: 1 to 256</li> <li>• For screen scripts: 1 to 256 (per screen)</li> <li>• For script parts: 1 to 16 (per script parts object)</li> </ul>
GD1004	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"> <li>• 200: Base screen</li> <li>• 210: Superimpose window 1</li> <li>• 220: Superimpose window 2</li> <li>• 310: Overlap window 1</li> <li>• 320: Overlap window 2</li> <li>• 330: Overlap window 3</li> <li>• 340: Overlap window 4</li> <li>• 350: Overlap window 5</li> </ul> <p>If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type.</p> <ul style="list-style-type: none"> <li>• When a base screen is called, 1 is added.</li> <li>• When a window screen is called, 2 is added.</li> </ul> <p>Example) When a window screen is called from overlap window 3  <math>330 + 2 = 332</math></p> <p>The device stores 0 for a project script.</p>
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

## 9.10 Object Script

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 9.10.1 Overview of the object script

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Object scripts are settable by object.

If the trigger condition for an object script is satisfied while the relevant object is being displayed, the script runs.

### 9.10.2 Specifications of the object script

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■ 1 Object script

##### (1) Targets for setting and operation

Object scripts are set and operate for the following objects.

- Touch switch ([Switch] only)
- [Bit Lamp]
- [Word Lamp]
- [Numerical Display]
- [Numerical Input]
- [Text Display]
- [Text Input]
- [Date Display]
- [Time Display]
- [Comment Display]
- [Line Graph]
- [Trend Graph]
- [Bar Graph]
- [Statistics Bar Graph]
- [Statistics Pie Graph]
- [Scatter Graph]
- [Historical Trend Graph]
- [Graphical Meter]
- [Level]
- [Panelmeter]
- [Parts Display]
- [Parts Movement]

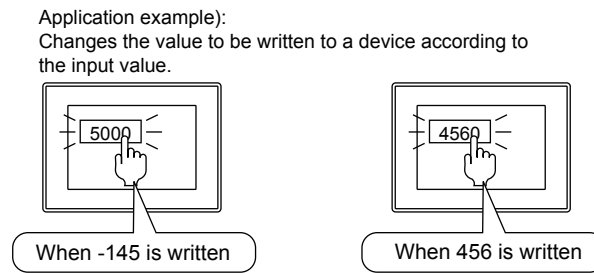

## (2) Object script type

The following three types of object scripts are provided.

### (a) Input object script

Scripts that are executed for objects that input numerical values.

→9.10.4 ■ 1 Data operation by a numerical input script

### (b) Display object script

Scripts that are executed for objects that display texts and lamps.

→9.10.4 ■ 2 To start blinking after set time

Application example):  
Changes the color of numerical display and lets the value blink when the value is not changed for 5 seconds.  
(Notifies that a device value update has been stopped.)

### (c) Switch object script

Scripts that are executed for touch switches ([Switch] only).

→9.10.4 ■ 3 Showing and hiding objects for input and touch operations

Application example):  
Displays or hides a touch switch so that the switch can be touched only when a touch operation is necessary.

## (3) The GOT condition under which scripts can be executed

Object scripts can be executed when all the following four conditions are satisfied.

- The GOT is in the online process.
- The screen where the target object is placed has been displayed.
- The target object has been displayed or in operation.
- The target object has no limit on its operations by the security function.

## (4) Operating conditions of scripts

Scripts are executed when the operating conditions set for each script are satisfied. The execution is also tied to: Input to the object, the display on the object, and a touch operation on a touch switch.

## (5) Maximum number of scripts

For a single object for numerical input and character string input, both an input object script and a display object script can be set.

For a single object for other than numerical input and character string input, either an input object script or a display object script can be set.

Note that it takes longer time than usual for the monitor screen to display when the number of monitor devices in the object script is large.

## ■2 Control structure of object scripts

For object scripts, the control structure of project scripts and screen scripts (except the following function) and the control structure described in this section are available.

Function for project and screen scripts unavailable in object scripts	
Classification	Name
Contiguous device operation function	bmov
	fmov

For the control structure of project scripts and screen scripts, refer to the following.

→9.9.2 ■ 3 Control structures for a project script, screen script, and script part

### (1) Object internal variables (input object script)

Variable	Description	
\$\$	Statement example	[w:D100] = \$\$
	Function	Referred to for the script to process a monitor device value. Values cannot be assigned. Using \$\$ before the object displays the monitor device value interrupts the execution process of the script. (No error occurs.) If the object is displaying the monitor device value at the subsequent script executions, \$\$ can be read.
	Data type	Data type set in the script setting
\$K	Statement example	[w:D100] = \$K
	Function	Referred to for the script to process the latest key code input from a touch key. Assigned when a key code is written to the object. If this variable is referred to when no key code has been input, 0xFFFF is obtained.
	Data type	Unsigned BIN 16
\$W	Statement example	[w:D100] = \$W
	Function	Referred to for the script to process the value input by the determination key of a touch key. Assigned when a value is written to the object. If this variable is referred to when no value has been input by the determination key, 0 is obtained.
	Data type	Data type set in the script setting

Available object internal variables for input object scripts differ depending on the combination of objects and trigger types used.

The following shows available object internal variables.

RW: Reference or substitution is possible, R: Reference is possible, W: Substitution is possible, -: Use prohibited

Object	Trigger type	Variable			
		\$\$	\$K	\$W	\$V
Numerical Input	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	R	-	-	-
	Key Code Input	R	RW	-	-
	Input Fixation	R	-	RW	-
Text Display	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	-	-	-	-
	Key Code Input	-	RW	-	-
	Input Fixation	-	-	-	-

## (2) Object internal variables (display object script)

Variable	Description	
\$\$	Statement example	[w:D100] = \$\$
	Function	Referred to for the script to process a monitor device value. Values cannot be assigned. Using \$\$ before the object displays the monitor device value interrupts the execution process of the script. (No error occurs.) If the object is displaying the monitor device value at the subsequent script executions, \$\$ can be read.
	Data type	Data type set in the script setting
\$V	Statement example	\$V = [w:D100]
	Function	Reference is unavailable. Assigned when the value displayed on the object is changed for another one.
	Data type	Data type set in the script setting

Available object internal variables for display object scripts differ depending on the combination of objects and trigger types used.

The following shows available object internal variables.

RW: Reference or substitution is possible, R: Reference is possible, W: Substitution is possible, -: Use prohibited

Object	Trigger type	Variable			
		\$\$	\$K	\$W	\$V
Numerical Display, Numerical Input, Comment Display, Level, Parts Display, Parts Movement	Ordinary, Synchronize Display Trigger	R	-	-	W
	ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	R	-	-	-
	View Change	R	-	-	R
Bit lamp, word lamp, panel meter, graphical meter	Ordinary	R	-	-	W
	ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling	R	-	-	-
	View Change	R	-	-	R
Text Display, Text Input, Date Display, Time Display, Line Graph, Trend Graph, Bar Graph, Statistics Bar Graph, Statistics Pie Graph, Scatter Graph, Historical Trend Graph	ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling, View Change, Synchronize Display Trigger <sup>*1</sup>				

\*1 [Trigger Type] cannot be set to [Synchronize Display Trigger] if the object is for date display or time display.

## (3) Object internal variables (switch object script)

Variable	Description	
\$W	Statement example	\$W = [w:D100]
	Function	Reference is unavailable. Assigned when a value processed in the script is used in writing with the touch switch.
	Data type	Data type set in the script setting

Available object internal variables for switch object scripts differ depending on the combination of objects and trigger types used.

The following shows available object internal variables.

RW: Reference or substitution is possible, R: Reference is possible, W: Substitution is possible, -: Use prohibited

Object	Trigger type	Variable			
		\$\$	\$K	\$W	\$V
Touch switch ([Switch] only)	Ordinary, ON, OFF, Rise, Fall, Rise/Fall, Sampling, ON Sampling, OFF Sampling, Device Writing	-	-	W	-

### Using object internal variables that cannot be checked by the syntax check

In the syntax check, object internal variables in the following uses are not checked.

- In referring to an object internal variable that cannot be referred to
- In assigning a value to an object internal variable to which no value can be assigned

Use object internal variables correctly when creating scripts.

#### (4) Object property

For the correspondence between the read/write operation and object properties, refer to the following.

⇒ Object script tab of each object

For the timing of the screen reflecting after the settings of object properties, refer to the following.

⇒ (5) Timing at which the setting change of an object property is reflected

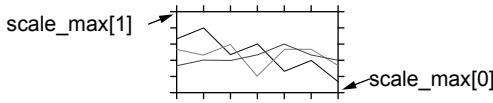

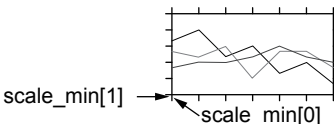

Changes of object properties are retained until the GOT is powered on/powered off/reset, the package data are written, or screen switching is performed.

The following shows the list of the object properties.

Property	Description	
active	Statement example	my.active = 1
	Function	Specifies whether to update the object itself or not. 1: Updates the object itself. 0: Does not update the object itself. The object is not updated even if the display condition is satisfied. When "0" is specified after the screen being switched and before the object being displayed subsequently on the screen, the object itself is not displayed.
x	Statement example	my.x = 0
	Function	Specifies in dots the X coordinate to which the object itself moves. The setting range is 0 to 32767. The left end of the screen is 0. For a parts movement object, this property is enabled only when [Line] is selected for [Move Way] of [Move Format] with GT Designer3. When a specified coordinate is outside the screen size, the object itself is not displayed.
y	Statement example	my.y = 0
	Function	Specifies in dots the Y coordinate to which the object itself moves. The setting range is 0 to 32767. The upper end of the screen is 0. For a parts movement object, this property is enabled only when [Line] is selected for [Move Way] of [Move Format] with GT Designer3. When a specified coordinate is outside the screen size, the object itself is not displayed.
width	Statement example	[w:D100] = my.width
	Function	Obtains the width of the object frame. The setting range is 1 to 32767.
height	Statement example	[w:D100] = my.height
	Function	Obtains the height of the object frame. The setting range is 1 to 32767.
decimal_point	Statement example	my.decimal_point = 1
	Function	Specifies the number of digits after the decimal point. The setting range is 0 to 32. This property is for a numerical display or numerical input object and enabled only when [Real] is selected for [Format] of [Display Format].

Property	Description	
blink* <sup>2</sup>	Statement example	my.blink = 0
	Function	Specifies a blink interval and the target item for the blink. (The setting values 129 and greater specify only objects for numerical display, numerical input, character string display, character string input, and comment display.) 0: No blink. 1: Lets numerical values/characters blink. (1 second intervals) 2: Lets numerical values/characters blink. (0.5 second intervals) 3: Lets numerical values/characters blink. (0.2 second intervals) 128: No blink. 129: Lets numerical values/characters and a plate blink. (1 second intervals) 130: Lets numerical values/characters and a plate blink. (0.5 second intervals) 131: Lets numerical values/characters and a plate blink. (0.2 second intervals) Reading out my.blink after writing 128 causes the script to obtain 0.
highlight* <sup>2</sup>	Statement example	my.highlight = 0
	Function	Specifies whether to invert the colors of characters on the object itself or not. 0: Does not invert the colors. 1: Inverts the colors.
part_no* <sup>2</sup>	Statement example	my.part_no = 1
	Function	Specifies the part's number associated with the part to be displayed. The setting range is 0 to 32767.
mark_color* <sup>2</sup>	Statement example	my.mark_color = 255
	Function	When a part is displayed as a mark, specifies a color for which the white color is changed. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
frame_color	Statement example	[w:D100] = my.frame_color
	Function	Obtains the frame color. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
plate_color* <sup>2</sup>	Statement example	my.plate_color = 255
	Function	Specifies the plate color of the figure. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
graph_color* <sup>2</sup>	Statement example	my.graph_color = 255
	Function	Specifies the level/needle color of the needle/color fill display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
back_color* <sup>2</sup>	Statement example	my.back_color = 0
	Function	Specifies the background color of the meter panel display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
pattern* <sup>2</sup>	Statement example	my.pattern = 1
	Function	Specifies a pattern. The setting range is 1 to 37. 0: Does not use any pattern. (Use is prohibited when a panel meter is used.) For details of patterns, refer to the following. →7.5.1 [Rectangle] dialog
pattern_bg_color	Statement example	my.pattern_bg_color = 255
	Function	Specifies the fill color of the meter panel display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.

Property	Description	
fill_color	Statement example	my.fill_color = 255
	Function	Specifies the fill color of the needle/color fill display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
fill_bg_color	Statement example	my.fill_bg_color = 255
	Function	Specifies the background color of the needle/color fill display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
fill_pattern	Statement example	my.fill_pattern = 1
	Function	Specifies the pattern of the needle/fill display attribute. The setting range is 1 to 37. 0: Use is prohibited. For details of patterns, refer to the following. →7.5.1 [Rectangle] dialog
core_color	Statement example	my.core_color = 255
	Function	Specifies the fill color of the middle coat display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
core_bg_color	Statement example	my.core_bg_color = 255
	Function	Specifies the background color of the middle coat display attribute. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
core_pattern	Statement example	my.core_pattern = 1
	Function	Specifies the pattern of the middle coat display attribute. The setting range is 1 to 37. 0: Use is prohibited. For details of patterns, refer to the following. →7.5.1 [Rectangle] dialog
text_color*2	Statement example	my.text_color = 255
	Function	Specifies the color of numerical values/characters to be displayed. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.
text_width	Statement example	my.text_width = 1
	Function	Specifies the scale factor (width) of numbers and characters the object itself displays. 0: 0.5 times 1 to 8: 1 to 8 time (s) For HQ characters, only the setting values 2, 4, 6, and 8 can be specified.
text_height	Statement example	my.text_height = 1
	Function	Specifies the scale factor (height) of numbers and characters the object itself displays. 0: 0.5 times 1 to 8: 1 to 8 time (s) For HQ characters, only the setting values 2, 4, 6, and 8 can be specified.
arrange	Statement example	my.arrange = 1
	Function	Select the alignment position of character strings in multiple lines. <ul style="list-style-type: none"> <li>• 0: Left justification</li> <li>• 1: Right justification</li> <li>• 2: Center justification</li> </ul> <div style="display: flex; justify-content: space-around; align-items: center; margin-top: 10px;"> <div style="text-align: center;"> <div style="border: 1px solid black; padding: 5px; width: 40px;">AAAA BB CCCC</div> <p>Left justification</p> </div> <div style="text-align: center;"> <div style="border: 1px solid black; padding: 5px; width: 40px;">AAAA BB CCCC</div> <p>Right justification</p> </div> <div style="text-align: center;"> <div style="border: 1px solid black; padding: 5px; width: 40px;">AAAA BB CCCC</div> <p>Center justification</p> </div> </div>

Property	Description	
scale_max[0] <sub>1</sub> , scale_max[1] <sub>1</sub>	Statement example	my.scale_max[0] = 255
	Function	<p>Specifies the upper limit value of the scale. scale_max[0] specifies the upper limit value in the horizontal direction and scale_max[1] the vertical direction. (Range: Range of the monitor devices)</p> 
scale_min[0] <sub>1</sub> , scale_min[1] <sub>1</sub>	Statement example	my.scale_min[0] = 0
	Function	<p>Specifies the lower limit value of the scale. scale_min[0] specifies the lower limit value in the horizontal direction and scale_min[1] the vertical direction. (Range: Range of the monitor devices)</p> 
security	Statement example	my.security = 0
	Function	<p>Sets the security level of the object. The setting range is 0 to 15. For the object that can have the security levels of both input and display set with it, this property sets the security level of the display.</p>
input_security	Statement example	my.input_security = 0
	Function	<p>For the object that can have the security levels of both input and display set with it, this property sets the security level of the input. The setting range is 0 to 15.</p>
draw_mode	Statement example	my.draw_mode = 0
	Function	<p>Specifies a drawing mode.</p> <ul style="list-style-type: none"> <li>• For numerical display, numerical input, and comment display <ul style="list-style-type: none"> <li>0: Transparent</li> <li>1: XOR</li> </ul> </li> <li>• For parts display <ul style="list-style-type: none"> <li>0: Replace</li> <li>1: XOR</li> <li>2: Overwrite</li> </ul> </li> </ul> <p>Each drawing mode is the same as that which appears in the setting dialog of GT Designer3.</p>
delay	Statement example	my.delay = 5
	Function	<p>Specifies the delay time in second the object itself takes before it performs an action after a touch. The setting range is 0 to 5. If 0 is set, the object itself takes the action immediately after the touch.</p>
beep	Statement example	my.beep = 0
	Function	<p>Specifies the length of the buzzer and the timing of it being made.</p> <ul style="list-style-type: none"> <li>0: One shot</li> <li>1: One shot (only when the operating condition is satisfied)</li> <li>2: No buzzer</li> <li>128: While a key is pressed</li> <li>129: While a key is pressed (only when the operating condition is satisfied)</li> </ul>

\*1 For a panel meter, only scale\_max[0] and scale\_min[0] can be specified.  
scale\_max[1] or scale\_min[1] cannot be specified.

\*2 When the object has various status imposed, such as the on/off status of a bit and a condition, the object property is reflected only in the normal cases (when the bit is off or the condition is set to 0).  
When the bit is on or other than 0 is set for the condition, the object property is not reflected.

## (5) Timing at which the setting change of an object property is reflected

If an object property setting is changed, the object type and the object property type determine the timing at which the new setting is reflected.

For the correspondence between object types, object property types, and the timing at which the setting change of an object property is reflected, refer to the following.

⇒[Script] tab in the setting dialog for each object

If an object property setting is changed, the new setting is reflected at the following timing.

### (a) Upon the setting change of the object property

The object display is refreshed upon the setting change of the object property.

### (b) When the object performs the specified action

The new setting is applied when the object performs the specified action.

### (c) When the object is updated

The object display is refreshed or the object operates with the new setting at the following timing.

- When the "redraw\_object()" function is executed

⇒(8) Functions (screen control)

The object may be displayed or operate incorrectly until the new setting is reflected.

To reflect the new settings of multiple object properties, use a single "redraw\_object()" function to reduce the number of times that the object is redrawn.

- When the display or operating condition of the object is satisfied

### (d) When the screen is updated

The object display is refreshed or the object operates with the new setting at the following timing.

- When the "redraw\_screen()" function is executed

⇒(8) Functions (screen control)

- When screen switching is performed

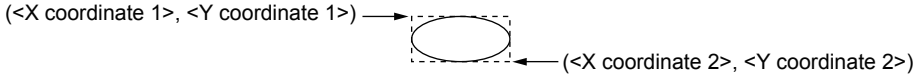

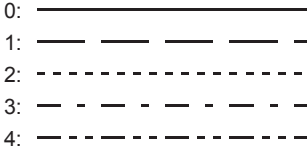

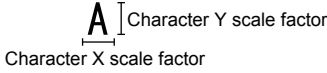

**(6) Functions (free figure drawing)**

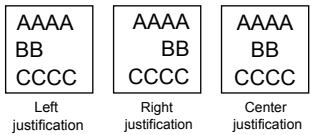

Function	Description	
d_line	Statement example	d_line(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>)
	Function	Draws a line. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
d_rectangle	Statement example	d_rectangle(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>)
	Function	Draws a rectangle. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
d_circle	Statement example	d_circle(<X coordinate>, <Y coordinate>, <Radius>, <Line type>, <Line width>, <Line color>)
	Function	Draws a circle.
d_ellipse	Statement example	d_ellipse(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>)
	Function	Draws an ellipse. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
p_rectangle	Statement example	p_rectangle(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>, <Pattern>, <Figure color>, <Background color>)
	Function	Draws a rectangle (color fill). Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
p_circle	Statement example	p_circle(<X coordinate>, <Y coordinate>, <Radius>, <Line type>, <Line width>, <Line color>, <Pattern>, <Figure color>, <Background color>)
	Function	Draws a circle (color fill).
p_ellipse	Statement example	p_ellipse(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Line type>, <Line width>, <Line color>, <Pattern>, <Figure color>, <Background color>)
	Function	Draws an ellipse (color fill). Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
d_textout	Statement example	d_textout(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Character X scale factor>, <Character Y scale factor>, <Character attribute>, <Character color>, <Character shadow color>, "<Text>")
	Function	Draws a text.
d_commentout	Statement example	d_commentout(<X coordinate 1>, <Y coordinate 1>, <X coordinate 2>, <Y coordinate 2>, <Character X scale factor>, <Character Y scale factor>, <Character attribute>, <Comment group No.>, <Comment No.>)
	Function	Displays a comment in a comment group. Draws between (<X coordinate 1>, <Y coordinate 1>) and (<X coordinate 2>, <Y coordinate 2>).
screen_draw	Statement example	screen_draw(<screen draw flag>)
	Function	Specifies the area in which drawing is executed by the free figure drawing function. If the drawing area is not specified by screen_draw(), the drawing is executed in the object area. The object area is equivalent to the area indicated by the coordinates shown in the data list of GT Designer3.

For the arguments of the free figure drawing function, refer to the following.

⇒(7) Functions (arguments used for the free figure drawing function)

**(7) Functions (arguments used for the free figure drawing function)**

Argument	Description
<p>&lt;X coordinate 1&gt;, &lt;Y coordinate 1&gt;, &lt;X coordinate 2&gt;, &lt;Y coordinate 2&gt;</p>	<p>Specifies the area (specified by two points of (&lt;X coordinate 1&gt;, &lt;Y coordinate 1&gt;) and (&lt;X coordinate 2&gt;, &lt;Y coordinate 2&gt;)) in which a figure is drawn in dots. The setting range is -32768 to 32767. (0, 0) indicates the coordinates of the upper left position of the object. Example) Ellipse (d_ellipse())</p> 
<p>&lt;X coordinate 1&gt;, &lt;Y coordinate 1&gt;</p>	<p>Specifies the coordinates of the center of a figure in dots. The setting range is -32768 to 32767.</p>
<p>&lt;Radius&gt;</p>	<p>Specifies the radius of a circle in dots. The setting range is 1 to 32767.</p>
<p>&lt;Line type&gt;*1</p>	<p>Selects a line type from those shown below.</p> 
<p>&lt;Line width&gt;*1</p>	<p>Specifies a line width in dots. The setting range is 0 to 5, 7. The setting value 0 is available only for the color fill functions (p_rectangle, p_circle, p_ellipse). When 0 is specified, the line is filled without the frame line displayed.</p>
<p>&lt;Line color&gt;, &lt;Character color&gt;, &lt;Figure color&gt;, &lt;Character shadow color&gt;</p>	<p>Specifies the color of a line, character, figure, background, and background of a character with the corresponding color code number. The setting range is 0 to 255. The correspondence between colors and color code numbers is the same as that in the specification of figure colors by GT Designer3.</p>
<p>&lt;Pattern&gt;</p>	<p>Select a color fill pattern from the following. The setting range is 1 to 37. 0: Use is prohibited. For details of patterns, refer to the following. →7.5.1 [Rectangle] dialog</p>
<p>&lt;Character X scale factor&gt;, &lt;Character Y scale factor&gt;</p>	<p>Specifies the scale factor of a character. Specify 2, 4, 6, or 8 when the HQ character is set for the argument &lt;Character attribute&gt;. Specify 0 and 1 to 8 when the HQ character is not set. If 0 is specified, the scale factor is 0.5.</p> 

Argument	Description
<Character attribute>	<p>Specifies the display attribute of a character. The explanation below assumes binary notation. When specifying in a script, change the representation meeting the applicable notation of the script, such as hexadecimal number.</p> <div style="text-align: center; border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> <span style="border: 1px solid black; padding: 0 2px;">b12</span> <span style="border: 1px solid black; padding: 0 2px;">b11 to 10</span> <span style="border: 1px solid black; padding: 0 2px;">b9</span> <span style="border: 1px solid black; padding: 0 2px;">b8</span> <span style="border: 1px solid black; padding: 0 2px;">b7</span> <span style="border: 1px solid black; padding: 0 2px;">b6 to 5</span> <span style="border: 1px solid black; padding: 0 2px;">b4 to 3</span> <span style="border: 1px solid black; padding: 0 2px;">b2</span> <span style="border: 1px solid black; padding: 0 2px;">b1 to 0</span> </div> <ul style="list-style-type: none"> <li>• b1 to b0: Select the display type of a character. These bits can be used only for d_textout(). Specify 00 (fixed) for other functions. 00: Standard 01: Bold 10: Shadow 11: Engrave</li> </ul> <div style="text-align: center; margin: 10px 0;">  <p style="text-align: center;">Standard    Bold    Shadow    Engrave</p> </div> <ul style="list-style-type: none"> <li>• b2: 0 (fixed)</li> <li>• b4 to b3: Select the alignment position of character strings in multiple lines. 00: Left justification 01: Right justification 10: Center justification 11: Use prohibited</li> </ul> <div style="text-align: center; margin: 10px 0;">  <p style="text-align: center;">Left justification      Right justification      Center justification</p> </div> <ul style="list-style-type: none"> <li>• b6 to b5: 00 (fixed)</li> <li>• b7: Select whether to use HQ characters or not. This bit can be used only for d_commentout(). Specify 0 (fixed) for other functions. 0: Does not use HQ characters. 1: Uses HQ characters.</li> <li>• b8: 0 (fixed)</li> <li>• b9: Specify a font size. 0: 16 dots 1: 12 dots</li> <li>• b11 to b10: Specify a Kanji region. 00: Japanese 01: Chinese (Simplified) 10: Chinese (Traditional) 11: Use prohibited</li> <li>• b12: Specify a font. This bit can be used only when the use of HQ characters is specified (b7=1). Specify 0 (fixed) when HQ characters are not used. 0: Mincho 1: Gothic</li> </ul>
<Character>	Specify a character sting in up to 256 characters.
<Comment group No.>	Specify a comment group No. The setting range is 1 to 500.
<Comment No.>	Specify a comment No. The setting range is 0 to 32767.
<Screen draw flag>	Specifies the area in which drawing is executed by the free figure drawing function. 0: After the execution of screen_draw(), the figure is drawn in the object area. The object area is equivalent to the area indicated by the coordinates shown in the data list of GT Designer3. 1: After the execution of screen_draw(), the figure is drawn within the whole screen.

\*1 To use the circle and ellipse drawing functions (d\_circle(), d\_ellipse(), p\_circle(), p\_ellipse()), set the solid line for the line type and 1 dot for the line width.  
When a line type other than the solid line is specified for the line type and 2 dots or more is specified for the line width, the circle or ellipse is drawn as shown below.  
Drawing example d\_ellipse() with the dashed line for the line type and 4 dots for the line width specified

### (8) Functions (screen control)

The functions (redraw\_object(), clear\_object()) are executed while the object script is executed.

The function (redraw\_screen()) is executed at the timing of the screen being drawn after the execution of the object script.

Operator	Description	
redraw_object	Statement example	redraw_object()
	Function	Performs the following operations of the object itself. 1. Deletes a figure which was drawn using the free figure drawing function. 2. Redraws the object itself.
clear_object	Statement example	clear_object()
	Function	Deletes the following items. • Data (such as numbers or characters) the object itself has displayed • Figure drawn by the free figure drawing function of the object script for the object itself If the object is the type that can have a plate color set, such as an object for numerical display, character string display, and comment display, only the frame figure is displayed. If the object is other than those described above, the object itself is deleted.
redraw_screen	Statement example	redraw_screen()
	Function	Performs the following operations for the whole screen. 1. Deletes all figures drawn using the free figure drawing function. 2. Redraws all objects.

### ■3 Available data and how to express the data

The following describes available data used for object scripts and how to express the data.

For object scripts, the data and the form of the expression that are available for project scripts and screen scripts are also available, as well as the data and the form of the expression described in this section.

For the data and form of the expression of project scripts and screen scripts, refer to the following.

⇒9.9.2 ■4 Available data and how to express the data

#### (1) Available constants and how to express the constants

For object scripts, constants that are available for project scripts and screen scripts are also available, as well as the following constants.

Constant	Expression example
Text	Enclose the text with the double quotation mark (").

#### (2) Object internal variables

Object internal variables are variables that have been allocated to inputs or outputs of objects.

Using object internal variables enables the following operations.

- Allowing the script to process monitor device values referring to them (\$\$)
- Changing the display on the object to the process result of the script (\$V)
- Assigning the process result of the script with a touch switch (\$W)

For reading and writing object internal variables, refer to the following.

⇒9.10.2 ■2 (4) Object property

Example) In a numerical display operation, when adding the device value (GD0) to the monitor device value (\$\$) and then displaying the result on the object (\$V)

\$V=\$\$+[w:GD0];

### Automatic adjustment to the decimal point

When the automatic adjustment to the decimal point is enabled, a value is processed as shown below.

#### (1) When a value is assigned to \$V

The value which has been assigned to \$V is assigned to the object as is.

#### (2) When a value is assigned to \$W

The value which has been assigned to \$W is multiplied by 10 to the power of the value set for [Decimal Point] and is assigned to the monitor device.

Example) In a numerical input operation, when the automatic adjustment to the decimal point is enabled and 2 is set for [Decimal Point]

- When \$V=1; is executed, 1.00 is displayed for the numerical input.
- When "\$W=1;" is executed, the assigned value is multiplied by  $10^2$  and 100 is written to the monitor device.

### (3) Object property

With object properties, you can refer to or change (assign) the settings of an object drawn with GT Designer3.

For the details of object properties, refer to the following.

⇒Reference, substitution: Object script tab of each object

Setting: 9.10.2 ■ 2 (4) Object property

#### (a) Format

When using an object property in a script, prefix the object property name with "my.".

Example) Changing the character color and the blink interval of display according to the object security level

```
if(5<=my.security){ //If the object security level is 5 or higher
my.text_color=224; //Changes the text color to red (224).
my.blink=1; //Lets the display of the object blink at a low speed.
}else{ //If the object security level is lower than 5
my.text_color=255; //Changes the text color to white (255).
my.blink=0; //Does not let the object blink.
}
```

## 9.10.3 How to use object scripts

---

This section explains how to use object scripts.

### ■ 1 Setting procedure

The following shows the script settings and procedure before execution.

- Step 1** Configure the settings for the script with GT Designer3, such as the data type or the trigger type.
  - ⇒9.9.5 [Script] dialog
- Step 2** Create or edit the script with the script editor or a commercially available text editor.
  - ⇒9.9.7 [Edit Script(script name)] dialog
- Step 3** When you have created or edited a script with a commercially available text editor, read the script with GT Designer3.
- Step 4** Check the syntax of the script with GT Designer3.
  - ⇒9.9.7 [Edit Script(script name)] dialog
  - If an error is detected, return to step 1 to correct the script.
  - Also, using a general C language compiler can simulate the operation.
  - ⇒9.9.14 ■ 1 Simulation using a general C language compiler or debugger/
- Step 5** Write the project from the personal computer to the GOT with GT Designer3.
  - ⇒4. COMMUNICATING WITH GOT
- Step 6** Start monitoring and check the script operation using the device monitor.
  - ⇒GOT2000 Series User's Manual (Monitor)
  - When the script operates properly, the creation of the script is complete.
  - If the script runs improperly, return to step 1 to correct the script.

### ■ 2 Operation

This section explains the functions and execution of object scripts.

#### (1) Functions of object scripts

##### (a) Object internal variables

Object internal variables are variables that have been allocated to inputs or outputs of objects.

By using object internal variables, the monitor device values of an object can be operated and the operation result can be displayed on the object.

For the details of the object internal variables, refer to the following.

- ⇒Types of object internal variables: 9.10.2 ■ 2 Control structure of object scripts
- How to use: 9.10.2 ■ 3 (2) Object internal variables

##### (b) Object property

With object properties, you can read or change (write) the settings for an object drawn with GT Designer3.

The settings for the object on the screen can be changed automatically if the object property is changed during monitoring.

For the details of object properties, refer to the following.

- ⇒Reading and writing: The [Operation/Script] tab or the [Script] tab of each object
- Setting: 9.10.2 ■ 2 Control structure of object scripts
- Expression form: 9.10.2 ■ 3 (2) Object internal variables

##### (c) Free figure drawing function

Figures (such as a line, rectangle, circle, and character), comments, and others can be drawn on an object.

For how to set the free figure drawing function, refer to the following.

- ⇒9.10.2 ■ 2 (6) Functions (free figure drawing)

To use the free figure drawing function, execute object scripts under the operating conditions other than those described below.

If the free figure drawing function is executed under the following operating conditions, no figure is drawn and no error occurs.

- Key Code Input
- Input Fixation
- Device Writing

**(d) Screen Control Function**

The screen control function controls redrawing or erasing of screens and objects. For the screen control function types, refer to the following.

⇒9.10.2 ■ 2 (8) Functions (screen control)

**(e) Script user ID**

A script user ID number is an arbitrary number that is set for an object script.

If the object script causes an error, the script user ID of the object script is stored in the GOT special register (GS).

By setting different user ID numbers for all object scripts, you can identify the object script that has caused an error.

**(f) Operating conditions of scripts**

The execution of an object script can be tied to an input to the object, display on the object, or a touch on a touch switch, according to the object script type.

It is also possible for object scripts to be executed under conditions other than those described above.

For the operating conditions of object scripts, refer to the following.

⇒6.2.2 Setting Trigger Types

**(2) Operating condition**

Object scripts are executed when all the following conditions from (a) to (d) are satisfied.

Even only one of the following conditions that is not satisfied prevents object scripts from being executed.

**(a) On the screen of the GOT, the arranged target object has been displayed.**

The screen on which the target object is arranged must be displayed under the condition that the GOT and controller are connected.

**(b) The target object has been displayed or operating.**

The target object must be displayed or in operation.

**(c) The target object has no restriction imposed by the security function of the GOT.**

When the security function is used, the object with the object script set at a high security level must not be restricted while it is on display or in operation.

**(d) The operating condition of the script is satisfied.**

The object script can be executed when the operating condition set for it is satisfied.

For the details of the script operating conditions, refer to the following.

⇒6.2.2 Setting Trigger Types

**(3) Execution unit**

Object scripts are executed one by one.

Even when multiple operating conditions are satisfied, the scripts are not processed simultaneously.

**(4) Execution order**

Object scripts are executed in numerical order of object ID.

**(5) Execution status**

Object scripts are processed as shown below according to the script status.

Script status	Processing
Waiting for turn	<ul style="list-style-type: none"> <li>• Waits for the processing turn according to the execution order.</li> <li>• When the turn has come, the script enters the "Waiting for execution" status.</li> </ul>
Waiting for execution	<ul style="list-style-type: none"> <li>• The processing differs depending on the operating condition.</li> <li>Satisfied: The script enters the "Execution" status.</li> <li>Not satisfied: The script enters the "Waiting for turn" status, and the next script enters the "Waiting for execution" status.</li> </ul>
Execution	<ul style="list-style-type: none"> <li>• When the script has ended, the processing result is written to the PLC CPU and the script enters the "Waiting for turn" status.</li> <li>The next script enters the "Waiting for execution" status.</li> <li>• If a fatal error occurs, execution of the script stops and the script enters the "Stop" status. *1</li> <li>• If an execution error occurs, execution of the script stops and the script enters the "Waiting for turn" status. *1</li> </ul>
Stop	<ul style="list-style-type: none"> <li>• The "Stop" status is held until the error history is cleared.</li> </ul>

\*1 For details of fatal errors and execution errors, refer to the following.

⇒9.9.14 ■ 3 Script execution errors and their corrective actions on the GOT

### ■3 Monitoring time of an object script

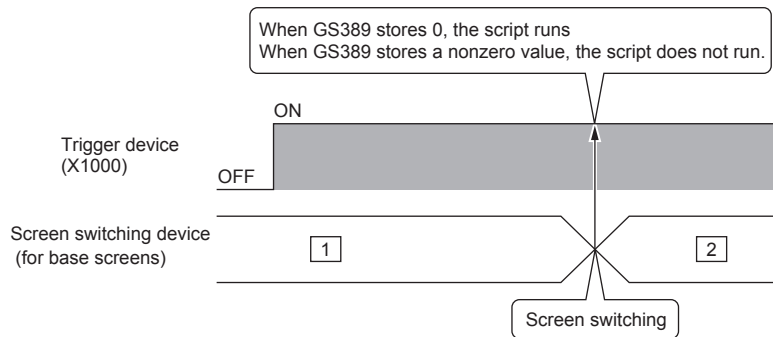

Specify the monitoring time of an object script with GS388.  
 If a script does not end after a lapse of the specified monitoring time, the script is aborted.  
 The setting range is 1 second to 300 seconds. (Units of 1 second)  
 If the set value falls outside this range, 10 seconds are assumed.  
 If error code 1015 is output during script execution, specify a longer monitoring time with GS388.

### ■4 Running an object script upon an applicable process

Use GS389 to set whether to run an object script upon screen switching or other applicable processes.  
 When GS389 stores 0: Runs the script upon an applicable process.  
 When GS389 stores a nonzero value: Does not run the script upon an applicable process.  
 This setting is applied to the object scripts where the following trigger types are set.

Trigger type	When running a script upon an applicable process
[Rise]	When the trigger device is on, the script runs upon screen switching or other applicable processes.
[Fall]	When the trigger device is off, the script runs upon screen switching or other applicable processes.
[Rise/Fall]	When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

When the object script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for a switch on base screen 2

The following shows the processes upon which a script runs.

Process	Remarks
When the GOT is powered on or when the GOT returns from offline	-
Screen switching	The script set for the destination screen runs.
Security switching *1	-
Language switching *1	-
System language switching *1	-
Station No. switching *1	If a station No. switching device is set for a screen type, the script set for a screen of this type runs.

\*1 When [Perform script initial operation (screen/object) only when switching screens] is deselected on the [Option] tab in the [Script] dialog, the script runs upon the process.  
 →9.9.5 ■ 4 [Option] tab

## 9.10.4 Program examples of object scripts

GT27 GT25 GT23 GT21 SoftGOT2000 GS

This section explains program examples of object scripts.

### 1 Data operation by a numerical input script

#### (1) Operation

Data operation is performed when a device value is written.

Screen image	Operation of each object
	Numerical input: When the written value is 0 or greater, the written value is multiplied by 10. When the written value is less than 0, the written value is set to 5000.

#### (2) Program example

Item	Description	
Data type	Signed BIN 16	
Trigger type	Input Fixation	
Script	<pre>[w:TMP0] = \$W; if([w:TMP0] &gt;= 0) { \$W = [w:TMP0] * 10; }else{ \$W = 5000; }</pre>	<pre>//Stores the written value to the temporary area. //If the written value is 0 or greater, //the written value is multiplied by 10. //If the written value is less than 0, //the written value is set to 5000.</pre>

### 2 To start blinking after set time

#### (1) Operation

A displayed value (monitored device value) blinks when it does not change for set time.

This operation is useful when urging the use of caution is necessary after set time.

Screen image	Operation of each object
	Numerical display: If the displayed value (monitored device value) does not change for 5 seconds, the characters blink in red.

#### (2) Program example

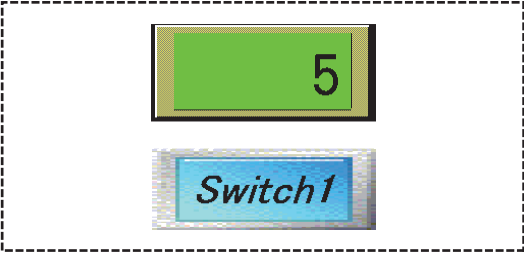

Item	Description	
Data type	Signed BIN 16	
Trigger type	Cycle (1 second)	
Script	<pre>if([w:TMP0002] != \$\$){ [w:TMP0001] = 5; [w:TMP0002] = \$\$; my.blink = 0; my.text_color = 0xFF; }else{ if([w:TMP0001] &gt; 0){ [w:TMP0001] = [w:TMP0001] - 1; if([w:TMP0001] == 0){ my.text_color = 0xE0; my.blink = 3; } } }else{ [w:TMP0001] = 5; } } redraw_object();</pre>	<pre>//If the displayed value changes, //starts counting (sets time (seconds) when the blinking starts). //saves the displayed value. //sets so that blinking is not performed. //changes the character color to white. //If the displayed value does not change, //If the count is not 0, //starts counting down. //If counting down to 0, //changes the character color to red. //starts high-speed blinking. //Lets the object reflect this property.</pre>

### ■3 Showing and hiding objects for input and touch operations

#### (1) Operation

At screen switching, objects for specific input and touch operations are switched between being displayed and hidden according to the operating conditions.

Since objects used for input and touch operations are displayed only when necessary, this operation is useful for avoiding a wrong input.

Screen image	Operation of each object
	Numerical input: If M0 turns on, the object for numerical input is displayed. If M0 turns off, the object for numerical input is hidden. Switch 1 switch: If M1 turns on, the touch switch is displayed. If M1 turns off, the touch switch is hidden.

#### (2) Monitor screen setting

Object name	Type	Setting item	Setting	
Numerical input	Numerical input	Display condition, operating condition	Trigger type	ON
			Trigger device	M0
Switch 1	Switch	Operating condition	Trigger type	ON
			Trigger device	M1

#### (3) Program example

Numerical input

Item	Description
Data type	Signed BIN 16
Trigger type	Always
Script	<pre>if([b:M0] == ON){   my.active = 1;   redraw_object(); }else{   my.active = 0;   clear_object(); }</pre> //Enables an update. //Updates the object. //Disables an update. //Clears the object.

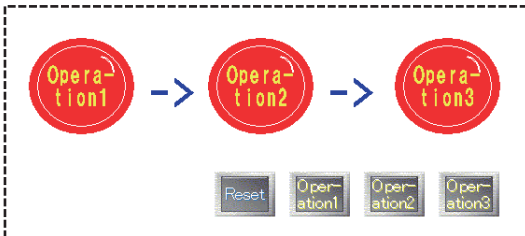

Switch 1 switch

Item	Description
Data type	Signed BIN 16
Trigger type	Always
Script	<pre>if([b:M1] == ON){   my.active = 1;   redraw_object(); }else{   my.active = 0;   clear_object(); }</pre> //Enables an update. //Updates the object. //Disables an update. //Clears the object.

## ■4 Drawing according to a device value

### (1) Operation

A figure is drawn on the screen according to a device value.

Screen image	Operation of each object
	<p>Operation 1 lamp: Turns on if D500 is 1 and a circle is drawn around the lamp.                      Operation 2 lamp: Turns on if D500 is 2 and a circle is drawn around the lamp.                      Operation 3 lamp: Turns on if D500 is 3 and a circle is drawn around the lamp.                      Reset switch:                      Resets operation 1 to operation 3.                      Operation 1 switch to operation 3 switch:                      Starts operation 1 to operation 3.</p>

### (2) Monitor screen setting

Object name	Type	Setting item		Setting
Operation 1 lamp	Word lamp	Device		D500
		Text		Operation 1
		Condition 0	Lamp color	Red
			Range	\$V<1
		Condition 1	Lamp color	Black
Device			D500	
Operation 2 lamp	Word lamp	Text		Operation 2
		Condition 0	Lamp color	Red
			Range	\$V<2
		Condition 1	Lamp color	Black
			Device	
Operation 3 lamp	Word lamp	Text		Operation 3
		Condition 0	Lamp color	Red
			Range	\$V<3
		Condition 1	Lamp color	Black
			Device	
Reset switch	Word switch	Set value (fixed)		0
		Text		Reset
		Device		D500
Operation 1 switch	Word switch	Set value (fixed)		1
		Text		Operation 1
		Device		D500
Operation 2 switch	Word switch	Set value (fixed)		2
		Text		Operation 2
		Device		D500
Operation 3 switch	Word switch	Set value (fixed)		3
		Text		Operation 3
		Device		D500

### (3) Program example

#### Operation 1 lamp

Item	Description	
Data type	Signed BIN 16	
Trigger type	Always	
Script	<pre>if ([w:D500] == 1){ screen_draw(1); d_circle(57, 52, 65, 0, 2, 224); }else{ screen_draw(1); d_circle(57, 52, 65, 0, 2, 255); }</pre>	<pre>//If D500 is 1, //sets the drawing area to the whole screen. //draws a circle. //If D500 is not 1, //sets the drawing area to the whole screen. //deletes a circle. (draws a circle in the same color as the background color.)</pre>

#### Operation 2 lamp

Item	Description	
Data type	Signed BIN 16	
Trigger type	Always	
Script	<pre>if ([w:D500] == 2){ screen_draw(1); d_circle(57, 52, 65, 0, 2, 224); }else{ screen_draw(1); d_circle(57, 52, 65, 0, 2, 255); }</pre>	<pre>//If D500 is 2, //sets the drawing area to the whole screen. //draws a circle. //If D500 is not 2, //sets the drawing area to the whole screen. //deletes a circle. (draws a circle in the same color as the background color.)</pre>

#### Operation 3 lamp

Item	Description	
Data type	Signed BIN 16	
Trigger type	Always	
Script	<pre>if ([w:D500] == 3){ screen_draw(1); d_circle(57, 52, 65, 0, 2, 224); }else{ screen_draw(1); d_circle(57, 52, 65, 0, 2, 255); }</pre>	<pre>//If D500 is 3, //sets the drawing area to the whole screen. //draws a circle. //If D500 is not 3, //sets the drawing area to the whole screen. //deletes a circle. (draws a circle in the same color as the background color.)</pre>

## 9.10.5 [Object Script Symbol] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

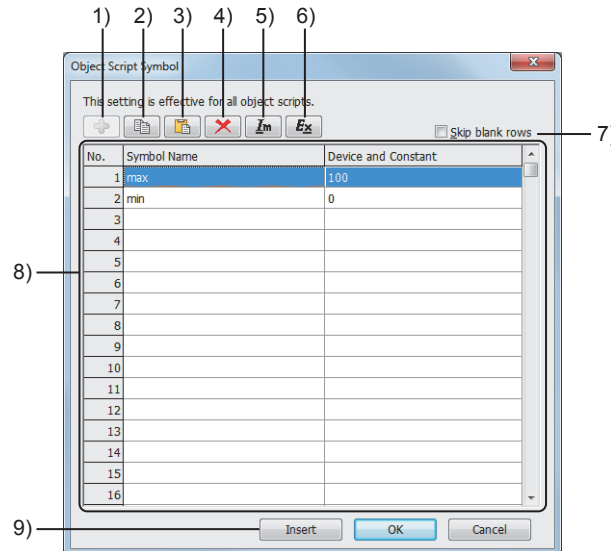

This dialog is used for setting an object script.

Select [Common] → [Script] → [Object Script Symbol] from the menu to display the setting dialog.

Register character strings as script symbols.

Devices and constants in a script can be substituted by the registered character strings.

This setting is enabled only for the object script.

### 1) [Add] button

This button is available when [Skip blank rows] is selected.

Displays the [Add Object Script Symbol] dialog.

- [No.]  
Set a number for the script symbol to be added.  
The setting range is [1] to [10000].
- [Symbol Name]  
Set a character string to be described in a script.  
Up to 32 alphanumeric characters and symbols can be entered.  
However, the symbol # is not usable.
- [Device and Constant]  
Set a device or constant for the symbol name.  
Up to 32 alphanumeric characters and symbols can be entered.

### 2) [Copy] button

Copies the setting from the row selected in the script symbol list.

You can copy the settings from multiple rows at one time.

When [Skip blank rows] is selected, the settings in the hidden rows are also copied.

The copied settings can be pasted to another script symbol setting dialog.

### 3) [Paste] button

Pastes the copied setting to the selected row.

When [Skip blank rows] is selected, the [Paste Symbol] dialog is displayed.

When pasting a setting to one row

When pasting settings to multiple rows

- [Symbol No.]  
Set a symbol number for the destination row.  
The setting range is [1] to [10000].
- [First Symbol No.]  
Set a symbol number for the first destination row.  
The setting range is [1] to [10000].

#### 4) [Delete] button

Deletes the setting from the selected row.

You can delete the settings from multiple rows at one time.

#### 5) [Import] button

Displays the [Open] dialog.

Read the script symbol settings from a Unicode text file or CSV file.

#### 6) [Export] button

Displays the [Save As] dialog.

Save the script symbol settings to a Unicode text file or CSV file.

If multi-language characters are used in the settings, use the Unicode text file format.

For the precautions for using a Unicode text file, refer to the following.

⇒ 12.5 Precautions for Using Unicode Text File

#### 7) [Skip blank rows]

Displays only the rows in which script symbols have been registered.

#### 8) Script symbol list

Lists the registered script symbols.

[Symbol Name] and [Device and Constant] are editable.

Item	Description
[No.]	Row number. Clicking a row number selects the relevant row.
[Symbol Name]	Set a character string to be described in a script. Up to 32 alphanumeric characters and symbols can be entered. However, the symbol # is not usable.
[Device and Constant]	Set a device or constant for the symbol name. Up to 32 alphanumeric characters and symbols can be entered.

#### 9) [Insert] button

This item appears when this dialog is brought up from the [Edit Script(script name)] dialog.

Inserts the selected script symbol into the script edit area in the [Edit Script(script name)] dialog.

### (1) Editing method of scripts

You can edit scripts in the exported Unicode text file or CSV file using spreadsheet software and other software.

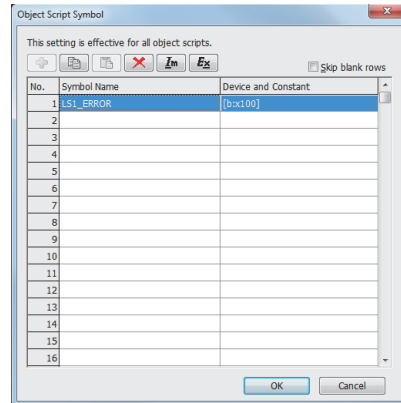

The edited Unicode text file or CSV file can be imported and read to GT Designer3.

### (2) Editing the exported file

When 0 is set at the beginning of the symbol name, device, or constant, 0 at the beginning may be deleted depending on the function of the application for editing files (spreadsheet software and other software).

Pay attention to the above for editing exported files.

Example) When script settings are exported into and imported from a CSV file

Export the set script symbols to a CSV file.

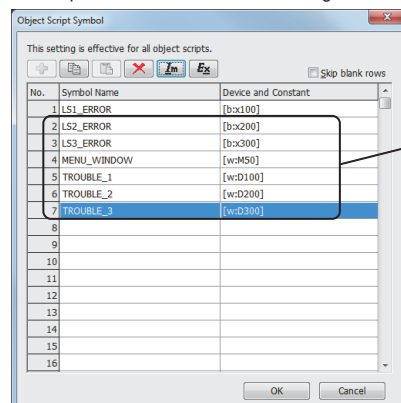

1	LS1_ERROR	[b:x100]

Edit the exported file.

1	LS1_ERROR	[b:x100]
2	LS2_ERROR	[b:x200]
3	LS3_ERROR	[b:x300]
4	MENU_WINDOW	[w:M50]
5	TROUBLE_1	[w:D100]
6	TROUBLE_2	[w:D200]
7	TROUBLE_3	[w:D300]

Add settings using applications such as spreadsheet software.

Import from the CSV file to GT Designer3.

The added settings are reflected.

## 9.10.6 How to set object scripts

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 [Script] or [Operation/Script] tab for input object scripts
- 2 [Script] or [Operation/Script] tab for display object scripts
- 3 [Script] tab for switch object scripts

**Step 1** Double-click an arranged object to display the setting dialog.

**Step 2** Open the [Script] or [Operation/Script] tab to configure the setting for using the object script.

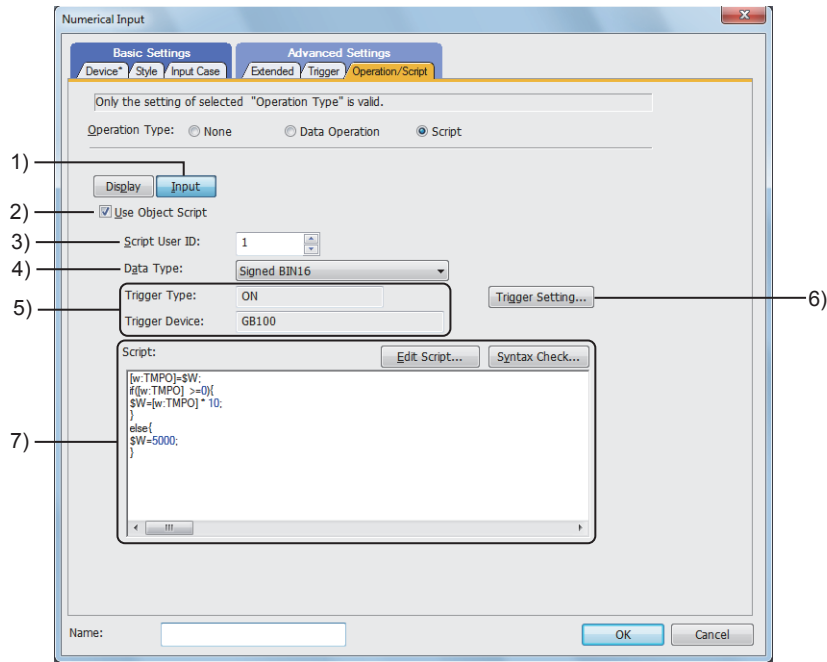

[Operation/Script] tab of numerical input

The setting of the [Script] or [Operation/Script] tab differs depending on the object type. For the details of the setting of the [Script] or [Operation/Script] tab for each object, refer to the following.

Object script type	Target object	Reference
Input object script	Numerical input, Character string input	→ ■ 1 [Script] or [Operation/Script] tab for input object scripts
Display object script	Bit lamp, Word lamp, Numerical display, Numerical input, Text Display, Text Input, Date Display, Time Display, Comment Display, Line Graph, Trend Graph, Bar Graph, Statistics Bar Graph, Statistics Pie Graph, Scatter Graph, Historical Trend Graph, Graphical meter, Level, Panel meter, Parts Display, Parts Movement	→ ■ 2 [Script] or [Operation/Script] tab for display object scripts
Switch object script	Touch switch ([Switch] only)	→ ■ 3 [Script] tab for switch object scripts

■1 [Script] or [Operation/Script] tab for input object scripts

Screen in setting an input object script for numerical input

1) [Input] button

To set an input object script, click the [Input] button. Then, the setting items of the input object script are displayed. This button is displayed only for the following objects.

- [Numerical Input]
- [Text Input]

2) [Use Object Script]

Enables the object script.

3) [Script User ID]

Set the script user ID number.

The setting range is [1] to [65535].

Set the script user ID number which is different from that of other object scripts.

When a different number is set, the object script in which an error has occurred can be identified.

4) [Data Type]

Select the data type of the script to be executed.

The following shows the items to be selected.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [BCD16]
- [BCD32]
- [Real]

5) [Trigger Type], [Trigger Device]

Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

6) [Trigger Setting] button

Click the [Trigger Setting] button to display the [Trigger Setting] dialog.

• **[Trigger type]**

Select the operating condition of the script. The following shows the items to be selected.

- [Ordinary]
- [ON]
- [OFF]
- [Rise]
- [Fall]
- [Rise/Fall]
- [Sampling]
- [ON Sampling]
- [OFF Sampling]
- [Key Code Input]
- [Input Fixation]

• **[Settings]**

Set the trigger device which executes the script. (When [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling] is selected in [Trigger type])

When [Sampling], [ON Sampling], or [OFF Sampling] is selected, set the cycle in units of seconds.

The setting range is [1] to [3600]. \*2

\*1 For the precautions for selecting [ON], [OFF], [Sampling], [ON Sampling], or [OFF Sampling], refer to the following.

→9.10.7 ■ 8 Precautions when making a script perform its operation periodically

\*2 When the trigger condition is satisfied, the count of the cycle starts.

When [ON Sampling] is set and the cycle is set to 10 seconds, the script is executed 10 seconds after the device set in [Trigger Device] turns on. (When [Trigger Device] turns off within 10 seconds, the script is not executed.)

When the trigger condition is not satisfied, the count of the cycle is reset.

→6.2.2 Setting Trigger Types

7) **[Script]**

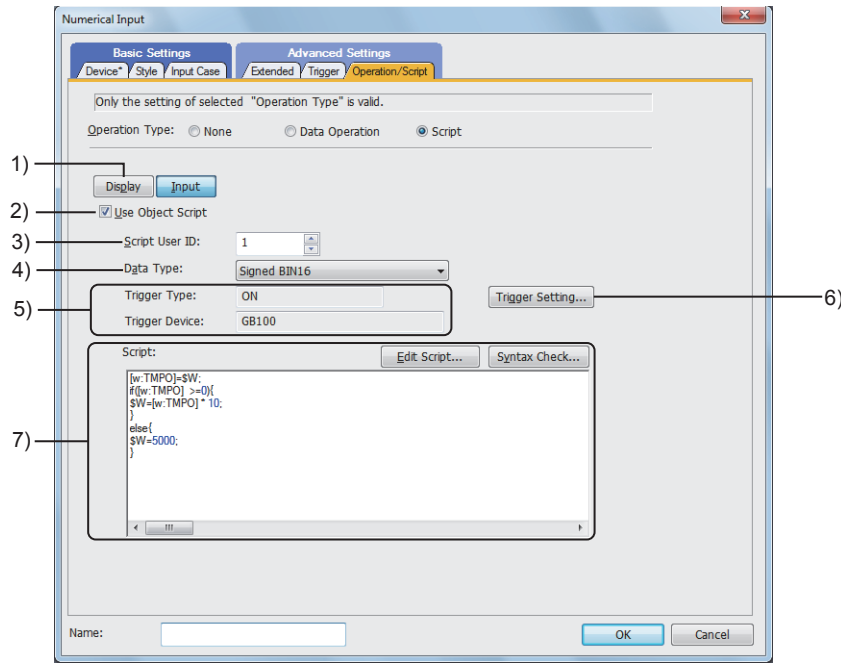

Displays the content of the script.

You can edit the script.

After editing the script, click the [Syntax Check] button to check the syntax.

Item	Description
[Edit Script] button	Opens the editor to edit the script. →9.9.7 [Edit Script(script name)] dialog
[Syntax Check] button	Checks the syntax of the displayed script. The available device type and device range are also checked. →9.10.9 ■ 2 Messages to be displayed at the syntax check

## ■2 [Script] or [Operation/Script] tab for display object scripts

Screen in setting a display object script for numerical input

### 1) [Display] button

To set an input object script, click the [Display] button. Then, the setting items of the input object script are displayed. This button is displayed only for the following objects.

- [Numerical Input]
- [Text Input]

### 2) [Use Object Script]

Enables the object script.

### 3) [Script User ID]

Set the script user ID number.

The setting range is [1] to [65535].

Set the script user ID number which is different from that of other object scripts.

When a different number is set, the object script in which an error has occurred can be identified.

### 4) [Data Type]

Select the data type of the script to be executed.

The following shows the items to be selected.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [BCD16]
- [BCD32]
- [Real]

### 5) [Trigger Type], [Trigger Device]

Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

### 6) [Trigger Setting] button

Click the [Trigger Setting] button to display the [Trigger Setting] dialog.

- [Trigger type]  
Select the operating condition of the script.  
The following shows the items to be selected.
  - [Ordinary]
  - [ON]
  - [OFF]
  - [Rise]
  - [Fall]
  - [Rise/Fall]
  - [Sampling]
  - [ON Sampling]
  - [OFF Sampling]
  - [View Change]
  - [Synchronize Display Trigger]<sup>\*2</sup>
- [Settings]  
Set the trigger device which executes the script. (When [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling] is selected in [Trigger type])  
When [Sampling], [ON Sampling], or [OFF Sampling] is selected, set the cycle in units of seconds.  
The setting range is [1] to [3600].<sup>\*3</sup>

\*1 For the precautions for selecting [ON], [OFF], [Sampling], [ON Sampling], or [OFF Sampling], refer to the following.

→9.10.7 ■ 8 Precautions when making a script perform its operation periodically

\*2 This item is unavailable for the bit lamp, word lamp, date display, time display, graphical meter, and panel meter.

\*3 When the trigger condition is satisfied, the count of the cycle starts.

When [ON Sampling] is set and the cycle is set to 10 seconds, the script is executed 10 seconds after the device set in [Trigger Device] turns on. (When [Trigger Device] turns off within 10 seconds, the script is not executed.)

When the trigger condition is not satisfied, the count of the cycle is reset.

→6.2.2 Setting Trigger Types

## 7) [Script]

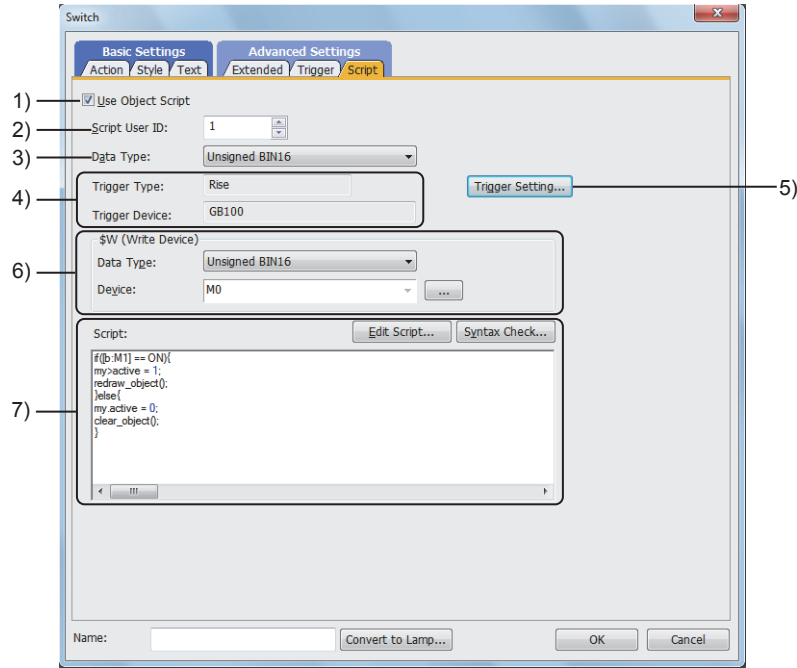

Displays the content of the script.

You can edit the script.

After editing the script, click the [Syntax Check] button to check the syntax.

Item	Description
[Edit Script] button	Opens the editor to edit the script. →9.9.7 [Edit Script(script name)] dialog
[Syntax Check] button	Checks the syntax of the displayed script. The available device type and device range are also checked. →9.10.9 ■ 2 Messages to be displayed at the syntax check

■3 [Script] tab for switch object scripts

1) [Use Object Script]

Enables the object script.

2) [Script User ID]

Set the script user ID number.

The setting range is [1] to [65535].

Set the script user ID number which is different from that of other object scripts.

When a different number is set, the object script in which an error has occurred can be identified.

3) [Data Type]

Select the data type of the script to be executed.

The following shows the items to be selected.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN32]
- [BCD16]
- [BCD32]
- [Real]

4) [Trigger Type], [Trigger Device]

Displays the operating condition and trigger device of the script which are set in the [Trigger Setting] dialog.

5) [Trigger Setting] button

Click the [Trigger Setting] button to display the [Trigger Setting] dialog.

• **[Trigger type]**

Select the operating condition of the script. The following shows the items to be selected.

- [Ordinary]
- [ON]
- [OFF]
- [Rise]
- [Fall]
- [Rise/Fall]
- [Sampling]
- [ON Sampling]
- [OFF Sampling]
- [Device Writing]

• **[Settings]**

Set the trigger device which executes the script. (When [ON], [OFF], [Rise], [Fall], [Rise/Fall], [ON Sampling], or [OFF Sampling] is selected in [Trigger type])

When [Sampling], [ON Sampling], or [OFF Sampling] is selected, set the cycle in units of seconds.

The setting range is [1] to [3600]. \*2

\*1 For the precautions for selecting [ON], [OFF], [Sampling], [ON Sampling], or [OFF Sampling], refer to the following.

→9.10.7 ■ 8 Precautions when making a script perform its operation periodically

\*2 When the trigger condition is satisfied, the count of the cycle starts.

When [ON Sampling] is set and the cycle is set to 10 seconds, the script is executed 10 seconds after the device set in [Trigger Device] turns on. (When [Trigger Device] turns off within 10 seconds, the script is not executed.)

When the trigger condition is not satisfied, the count of the cycle is reset.

→6.2.2 Setting Trigger Types

6) **[\$W (Write Device)]**

To assign the value processed in the script to the device with the touch switch, set the target device.

Item	Description
[Data type]	Select the data type of the object internal variable \$W (write device).
[Device]	Set the object internal variable \$W (write device). →6.1 Device Settings

7) **[Script]**

Displays the content of the script.

You can edit the script.

After editing the script, click the [Syntax Check] button to check the syntax.

Item	Description
[Edit Script] button	Opens the editor to edit the script. • 9.9.6 [Script Editor (Script Name)] dialog
[Syntax Check] button	Checks the syntax of the displayed script. The available device type and device range are also checked. →9.10.9 ■ 2 Messages to be displayed at the syntax check

## 9.10.7 Precautions

This section explains the precautions for using object scripts.

### ■ 1 Precautions for use

#### (1) Applicable range of the scripts

Since this function is designed to control the GOT display, do not use it for machine control that requires precise time management.

When changing the data in PLC through the GOT, create an interlock circuit using a sequence program to ensure the whole system can always operate safely.

The following periods may vary depending on projects.

- The period between when the trigger device condition of the script is satisfied and when the script is actually executed
- Processing time of the script

#### (2) Stop of the script processing

In any of the following cases, the corresponding script being processed stops and an error occurs.

- In division, when the divisor becomes 0 and the calculation becomes zero division
- When [BCD16] or [BCD32] is selected as a script data format but a value of the monitor device cannot be handled as BCD

Example) [w:D0] = [w:D1]: Current value of D1 is 0x991A

- When [BCD16] or [BCD32] is selected as a script data format but the operation result is out of the BCD range

Example) 16-bit: Other than 0 to 9999, 32-bit: Other than 0 to 99999999

- When a device of the controller is specified as the write destination device of a while statement

For the available data type and data range, refer to the following.

→9.10.2 ■ 3 Available data and how to express the data

For the details of the while statement, refer to the following.

→9.10.2 ■ 2 Control structure of object scripts

For troubleshooting the script processing stop, refer to the following.

→9.10.9 Troubleshooting

#### (3) Variation of the result of processing depending on data types

In the following cases, you may get an unexpected result of processing.

- When a format other than [BCD16] or [BCD32] is selected as the script data type but a constant out of the selected format range is included
- When [Unsigned BIN16] or [Unsigned BIN32] is selected as the script data type but a negative constant is included
- When a format other than [Real] is selected as the script data type but a decimal is used as a constant

For the details of data types, refer to the following.

→9.10.2 ■ 3 Available data and how to express the data

#### (4) Bitwise operation and data type

If you perform a bitwise operation on the device with a signed data type, an unexpected value may result.

Set an unsigned data type for the target device of a bitwise operation.

#### (5) Digit limitation when describing monitor devices

Depending on controllers to be monitored, the device number for them must be described in specific digits.

Otherwise, malfunction may result.

For the details of how to describe the device number, refer to the following.

→9.10.2 ■ 3 Available data and how to express the data

#### (6) Writing the project in the GOT after editing the script

If you edit a screen script or an object script, write the project being edited in the GOT.

Otherwise, the change you made is not reflected to the GOT.

#### (7) Operation while a script is being edited

When you click the [Edit Script] button and edit a script using a script editor or a text editor, you cannot operate GT Designer3.

GT Designer3 reacts as if it freezes up then, but once you close the script editor or the text editor, you can operate GT Designer3 again.

#### (8) Precautions for assignment delay

**(a) Assignment delay**

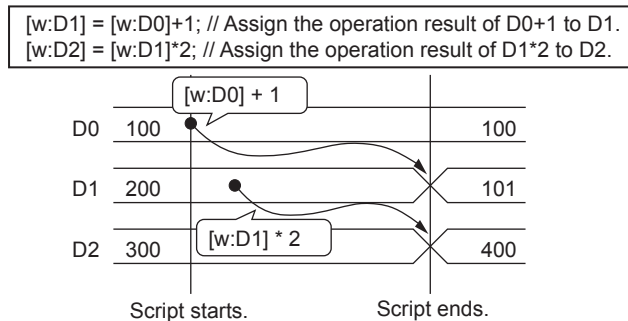

Depending on devices where you write the operation result of scripts, some time (called assignment delay) is needed for writing the result to the device when the operation of a script is complete. The following shows whether each device needs assignment delay or not.

Synchronized: The result is written in synchronization with the script. Delay: Assignment delay occurs.

Device and temporary device area	Script
	Object script
Controller device	Delay
GB	Synchronized
GD	
GS	
TMP	

If you perform an assignment as shown in example 1, an assignment delay leads to an unexpected operation result. To reduce the frequency of communication with the PLC CPU to lower the influence on the monitoring process, describe the script as shown in example 2 or 3.

Example 1) Assignment using PLC CPU devices

In this example, due to an assignment delay, after the script ends, the operation result of the first line (D0+1) is reflected to D1.

Therefore, the operation result of the first line is not reflected to that of the second line (D1\*2).

Example 2) Assignment using a temporary device area

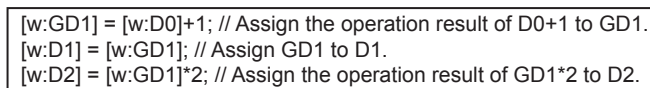

Using a temporary device area for the script avoids an assignment delay.

For the details of temporary device areas, refer to the following.

⇒9.9.2 (10) Temporary device areas and their uses

Example 3) Assignment processing using GOT internal devices (GD, GB)

The processing timing with GOT internal devices (GD and GB) is the same as one with temporary device areas. Therefore, you can avoid assignment delays.

**(1) LS devices described within the script language that is created using Digital package**

The LS devices described in the script language of Digital Electronics Corporation (D-script) are designed to be free from assignment delays.

Therefore, when D-script including LS devices shown in example 1 is converted, the operation on the GOT may not be as intended.

To prevent an assignment delay, use temporary device areas for D-script including LS devices as shown in example 2.

**(b) Assignment delay when an offset is specified**

- When reading values from devices

If you specify an offset in a script when devices of controllers are used as base devices, assignment delays may occur and the script may not operate correctly even if the values of offset devices are changed.

Example 1) Specifying a target device for reading with an offset device does not work correctly (when R200 = 10)

---

```
[w:TMP0000]=[w:R200];
[w:TMP0001]=[w:R100[w:TMP0000]];  The value of R110 cannot be referred at this timing.
Base device └──┬── Offset device
```

---

In the above example, the value of the offset device (TMP0000) remains the same as that before the assignment. If the device numbers are out of the range of the base device (R), an error occurs.

If no assignment delays occur, use the temporary device area or GOT internal devices for both base devices and offset devices.

Example 2) Measure to avoid the assignment delay using temporary device areas (when R200 = 10)

---

```
bmov([w:R100],[w:TMP0100],11)
[w:TMP0000]=[w:R200];
[w:TMP0001]=[w:TMP0100[w:TMP0000]];  The value of R110 can be referred at this timing.
```

---

By assigning the values of R devices to the temporary device areas using bmov in advance, the operation that cannot be done in example 1 becomes available.

Notes on example 2

In example 2, the range of the offset device (R200) is 0 to 10, and the values of 11 devices counted from the base device (R100) are assigned to the temporary device areas.

Therefore, the number of devices to be assigned to the temporary device areas must be changed according to the range of offset devices.

- When writing values to devices

When writing values to devices, there are no specific restrictions applied when reading values from devices. (Refer to the following example 1.) However, when controller devices are used as base devices, you cannot assign values repeatedly by switching values of offset devices in a while statement as shown in example 2.

Even in this case, it becomes available by using the temporary device area or GOT internal devices (GB and GD) for both base devices and offset devices in the same way as mentioned earlier for reading values from devices.

Example 1) Specifying a target device for writing with an offset device (Enabled)

---

```
[w:TMP0000]=10;
[w:R100[w:TMP0000]]=[w:TMP0001];  The value can be assigned to R110 at this timing.
Base device └──┬── Offset device
```

---

Example 2) Specifying a target device for writing with an offset device in a while statement (Disabled)

---

```
[W:TMP0000]=10;
while([w:TMP0000]<20){
[W:R100[w:TMP0000]]=[w:TMP0001];    An error occurs.
[W:TMP0000]=[w:TMP0000]+2;
}
```

---

Example 3) Measure to avoid the error in example 2

---

```

bmov([w:R110],[W:TMP0110],10);
[w:TMP0000]=10;
while([w:TMP0000]<20){
[w:TMP0100[w:TMP0000]]=w:TMP0001;    No error occurs.
[w:TMP0000]=w:TMP0000+2;
}
bmov([W:TMP0110],[w:R110],10);

```

---

By assigning the values last assigned in the temporary device areas with R devices using `bmov`, the operation that cannot be done in example 2 becomes available.

### (9) Simulating using a general C language compiler or debugger

- If [BCD32] or [BCD16] is selected as the script data type, you cannot perform a simulation using a general C language compiler or debugger.
- Since the `set`, `rst`, `alt`, `bmov`, and `fmov` statements are dedicated for scripts, you cannot perform a simulation using a general C language compiler or debugger.  
Use assignment of 1 or 0 instead of the `set` or `rst` statement.
- When you use the system define (ON, OFF description) of the GOT as they are, the define for it must be added to the C language source file.
- The assignment delay which occurs when a script is executed on the GOT does not occur during a simulation using a general C language compiler or debugger.  
Therefore, when performing a simulation, take a possibility of occurrence of assignment delays into consideration.
- By applying the measures above, a new program created using C language then debugged can be used as a GOT script.
- Offset device specification cannot be made in the above debugging process.  
If you debug the offset specified device, it is necessary to set the corresponding device in advance.

### (10) Object script error control and GOT status

While the GOT displays any screen other than a user-created screen, the following operations are not available.

- Clearing object script error data or executing an object script stopped due to an error by using the Object Script Common Control (GS387)
  - ⇒ 12.1.3 ■ 5 (4) Object Script Common Control (GS387)
- Resetting object script error data in the [GOT Diagnostics] dialog
  - ⇒ 11.14.5 [GOT Diagnostics] dialog

Perform the above operations while the GOT displays a user-created screen.

## ■ 2 Precautions for drawing

If you close the setting dialog clicking the [OK] button after changing numerical input for numerical display or character string input for character string display, the input object script settings are cleared.  
Only the display object script settings remain.

## ■ 3 Precautions for the operating conditions of object scripts

### (1) Functions that cannot be set simultaneously

When any of the following functions is set, object scripts cannot be used.  
To use object scripts, do not set the following functions.

- Data operation
- Memory storage
- Locus display (line graph only)

### (2) Object status

You cannot execute an object script when it is in either of the following statuses.

- The object is not displayed or operated because it has been extending off the screen.
- The object is not displayed or operated because no monitor device has been set.

**(3) Executing an object script for the same window from multiple sources**

When the same window is displayed from multiple sources including an overlap window, a superimpose window, and the overlay screen function, only the object script for the window that is displayed first is executed.

Even if the window displayed first is deleted, the object scripts for the windows displayed after the first one are not executed.

If, in the above situation, the same window is newly displayed from an overlap window, a superimpose window, or the overlay screen function, the object scripts for the multiple windows which are the same and have been already displayed are not executed but the object script for the new window is executed.

**(4) When setting the operating trigger to the timing of writing to a device**

Set the target device for the write operation for the object that has the script set for it.

Otherwise, the script is not executed.

**■4 Precautions for devices****(1) Number of writable devices**

If the following type of devices is the target for writing, a single script can perform a single write operation of the type.

- Controller device

If the following types of devices are the targets for writing, a single script can perform the write operation of each type.

- GOT bit register (GB)
- GOT data register (GD)
- GOT special register (GS)
- Temporary device area (TMP)

**(2) Operation while data are being written to devices by an object script**

- The execution process of the script is interrupted temporarily, and resumed after the completion of the write operation. Interrupted operation restarts after the completion of write device.

- The display on the object is updated after the completion of the write operation.

Object display is updated after the completion of write device.

- Inputting a value by touching the object on the screen is enabled after the completion of the write operation.

Input is enabled after the completion of write device.

**■5 Precautions for object properties****(1) The numerical display or comment display movement on the GOT when a level is overlaid**

If the objects are drawn with GT Designer3 so that the level can be overlaid, the numerical display or comment display correctly works only when it can be moved within the range of the level display.

If you move the numerical display or the comment display out of the area of the level display, the numerical display or the comment display cannot be displayed normally.

If you draw the numerical display or comment outside the area of the level display with GT Designer3, the numerical display or comment display is not superimposed even it is moved into the area of the level display.

**(2) Properties that are not valid unless enabled by GT Designer3 settings**

Among the setting items of objects, those which become valid only by GT Designer3 settings (such as the settings which are not valid unless another item is selected) cannot be referred or changed by the object properties.

**■6 Precautions for the free figure drawing function****(1) Restrictions when the object stacking order adjustment setting is made**

When [Adjust object display order in GOT to the one in GT Designer3] is selected in the [Type Setting] dialog, some restrictions are placed on the free figure drawing function.

For the details of the restrictions, refer to the following.

→5.1.3 ■ 5 Precautions for the object stacking order adjustment setting

**(2) Overlap of a drawn figure and an object**

If a figure drawn using the free figure drawing function overlaps with an object, the part of the figure that overlaps may disappear.

**(3) Drawing when other than [View Change] and [Synchronize Display Trigger] are set for the operating condition**

When the operating condition is other than [View Change] and [Synchronize Display Trigger], the object itself is overwritten and replaced with the figure drawn by the free figure drawing function. Therefore, the figure drawn by the free figure drawing function may be cleared.

**(4) When [Key Code Input], [Input Fixation], or [Device Writing] is set for the operating condition**

Drawing is not executed.

In this case, no error occurs.

When using the free figure drawing function, set other than [Key Code Input], [Input Fixation], and [Device Writing] for the operating condition.

**(5) Number of drawable figures**

Up to 1280 figures can be drawn by one object script.

**GOT Graphic Ver.2**

If the number of drawn figures exceeds 1280, the oldest figure is deleted and a new figure is drawn.

The maximum number of the text figures drawn with the d\_textout or d\_commentout function differs depending on the number of lines in the text figure.

Example)

- One-line text: 1280 figures
- Two-line text: 640 figures

**GOT Graphic Ver.1**

More than 1280 figures cannot be drawn.

**(6) Drawing area**

In the coordinate system with (0, 0) at the upper left corner of the GOT screen, figures cannot be drawn outside the area of (-2400, -2400) to (4799, 4799).

Specify coordinates inside the area of (-2400, -2400) to (4799, 4799) to draw figures.

**7 Precautions when writing a script**

Do not write a script that causes an operation result which exceeds the allowable range of a device value.

Script operation is processed internally in double-precision real numbers.

Therefore, when a judgment is made using an if statement and others, the result of the judgment may differ depending on the operation methods.

Example) Judgment for the difference between GD100 and D100 using an if statement (in the case of 16-bit signed binary)  
When GD100 = -32758 and D100 = 32767

**(1) Operation in an evaluation expression**

```
if(([w:GD100]-[w:D100])>=10){ //If the difference between GD100 and D100 is 10 or larger,
  [w:D200]=0; //Writes 0 to D200.
}
```

The calculation result of "GD100 - D100" (-32758 - 32767) is -65525, thus the condition is not satisfied.

**(2) Processing the script after assignment**

```
[w:GD200]=[w:GD100]-[w:D100]; //Assigns the value of "GD100 - D100" to GD200.
if([w:GD200]>=10){ //When the value of GD200 is 10 or larger,
  [w:D200]=0; //Writes 0 to D200.
}
```

When -65525; the calculation result of "GD100 - D100" (-32758 - 32767), is assigned to GD200 in 16-bit signed binary, GD200 becomes 10, so the condition is satisfied.

(Since a value out of the range that can be handled by a variable (device) is assigned as the result of an operation, the result differs from the result obtained in (1).)

## ■8 Precautions when making a script perform its operation periodically

### (1) Execution timing when [Trigger Type] is set to [ON Sampling] or [OFF Sampling]

→9.10.6 How to set object scripts

#### (a) Execution timing

The device status is checked in the sampling cycles set for [Trigger Type].

If the condition is not satisfied at the timing of the check, the object script is not executed.

(when [Trigger Type] is set to [ON Sampling] and [Sampling] is set to 1 second)

The object script is executed at timing 1.

The object script is executed at timing 2.

At timing 3, the object script is not executed because the timing does not match the end of one cycle and thus the condition is not checked.

At timing 4, the object script is not executed because the device condition is not satisfied.

The object script is executed at timing 5.

#### (b) Using a device condition to trigger the sampling cycle count when the device condition is satisfied

The sampling cycle set for [Trigger Type] does not depend on the device status. (The sampling cycle does not change whether the device is turned on or off.)

To start the cyclic sampling, follow the instructions described below.

- Set [Rise] or [Fall] for [Trigger Type].
- Create a sequence program that turns the device on or off when the object script should be executed.

### (2) Execution timing when [Sampling], [ON Sampling], or [OFF Sampling] is set

The sampling cycle count starts and is reset at the following timing.

- When the object itself is displayed (in screen switching, a security level change, or other possible cases)
- When the language switches
- When the station No. switches
- When the security level changes

After the execution of any of the events above, the object script is executed at the start timing of the sampling cycle.

## 9.10.8 Relevant settings

Set the relevant settings other than the specific settings for object scripts as required.  
The following shows the functions that are available by the relevant settings.

### ■ 1 GOT internal device

⇒ 12.1.3 GOT special register (GS)

Function	Setting item
Notifying that an object script error has occurred.	GS80.b0
Notifying that a BCD error has occurred.	GS80.b7
Notifying that a zero division error has occurred.	GS80.b8
Notifying that a communication error (including access to an invalid device) has occurred.	GS80.b12
Storing the start device number of the devices where the latest error record is stored. The devices range from GS82 to GS113.	GS81
Storing the object script error records (including script user ID numbers and error codes).	GS82 to GS113
Storing the device number of the device where the latest script execution record is stored. The device is in the range of GS115 to GS145.	GS114
Storing the script user ID numbers of the executed scripts.	GS115 to GS145
Storing a number showing the GOT data registers (GD) where the latest error record is stored. The GD devices are specified with GS432 and GS434.	GS159
Storing a number showing the GOT data registers (GD) where the latest script execution record is stored. The GD devices are specified with GS436 and GS438.	GS160
Notifying occurrence of an error which occurs while the integer ← → real number conversion is processed.	GS260.b14
Notifying the completion of the integer ← → real number conversion.	GS260.b15
Storing the error code of an error which occurs while the integer ← → real number conversion is processed.	GS261
Clearing object script error records as shown below. • GS80.b0, b7, b8, and b12 store 0. • GS81 stores -1. • GS82 to GS113 store 0.	GS387.b0
Re-executing the object script aborted due to an error.	GS387.b1
Setting the monitoring time for one script.	GS388
Controlling whether to run an object script upon screen switching or other applicable processes. The applicable script trigger types are as follows. • [Rise] • [Fall] • [Rise/Fall]	GS389
Storing the detailed object script error records.	GS432 GS434 GS435
Storing the detailed object script execution records.	GS436 GS438 GS439
Executing an integer-to-real number conversion.	GS460 GS461 GS462 GS463 GS464

**1 Simulation using a general C language compiler or debugger**

Since scripts and C language are similar, you can simulate the scripts by making minor corrections using a general C language compiler or debugger.

Complicated scripts including many control statements can be debugged easily by using them.

The following shows the procedure to simulate scripts using a general C language compiler or debugger.

- Step 1** Export an object script created with GT Designer3 to a text file or Unicode text file (extension.txt) and change it into a C language source file (extension.c).
  - Change of the file extension: text1.txt → text1.c
- Step 2** Open the C language source file in a commercially-available text editor and create a frame with "main(){}". Describe "#include<stdio.h>" at the beginning.
  - Additional description of "main" and "include"

Additional description→	#include<stdio.h>
Additional description→	main(){
	[w:TMP0001]=0;
	while([w:TMP0000]<[w:D100]){
	if(!([w:TMP0000]-1900)%4){
	[w:TMP0001]=[w:TMP0001]+1;
	my.x = 200;
	my.scale_max[0] = 500;
	... ( Omitted) ...
	[w:TMP0010]=[w:TMP0002]+[w:TMP0003]+[w:TMP0004]-1;
	\$W = [w:TMP0010]%7;
Additional description→	}

- Step 3** Change the description method of devices (variables, properties) from the one for scripts to the one for C language.

Using the following definitions to change the variables into the one for C language enables you to smoothly restore them into the GOT scripts.

- Definition 1 [w: → \_w
- Definition 2 [b: → \_b
- Definition 3 ] → \_\_
- Definition 4 my. → my\_
- Definition 5 \$W → device\_write
- Definition 6 \$V → device\_value
- Definition 7 \$\$ → monitor\_device
- Definition 8 \$K → key\_input
- Definition 9 [ → \_

Using the batch replacement function of a commercially-available text editor may be useful for the change as well.

- Change of the description method of devices (variables)

	#include<stdio.h>
	main(){
Description change→	_wTMP0001__=0;
Description change→	while(_wTMP0000__<_wD100__){
Description change→	if(!((_wTMP0000__-1900)%4){
Description change→	_wTMP0001__=_wTMP0001__+1;
Description change→	my_x = 200;
Description change→	my_scale_max_0__ = 500;
	... ( Omitted) ...
Description change→	_wTMP0010__ = _wTMP0002__+_wTMP0003__+_wTMP0004__-1;
Description change→	device_write = _wTMP0010__%7;
	}

- Step 4** For C language, variables to be used must be defined in advance.

Since only one data type can be set for one script, the same variable type of C language must be set for all the variables.

The following shows the data type of scripts.

If [BCD32] or [BCD16] is selected as the script data type, you cannot perform a simulation using the general C language compiler or debugger.

Data type of scripts	Variable type
Signed BIN 16	short
Unsigned BIN 16	unsigned short
Signed BIN 32	long
Unsigned BIN 32	unsigned long
Real number	float
BCD32, BCD16	-

Use an appropriate property according to the property range.

Assign an internal variable whose variable type is the same as the data type of the script.

- Variable definition (auto variable declaration)

Description change →	#include<stdio.h>
Addition →	void main(void){
Addition →	unsigned short _wTMP0000__;
Addition →	unsigned short _wTMP0001__;
Addition →	unsigned short _wTMP0002__;
Addition →	unsigned short _wD100__;
Addition →	short my_c;
Addition →	unsigned sort my_scale_max_0__;
Addition →	unsigned sort device_write;
	*** ( Omitted) ***
	_wTMP0001__=0;
	while(_wTMP0000__<_wD100__){
	if(!((_wTMP0000__-1900)%4)){
	_wTMP0001__=_wTMP0001__+1;
	my_x = 200;
	my_scale_max_0__ = 500;
	*** ( Omitted) ***
	_wTMP0010__=_wTMP0002__+_wTMP0003__+_wTMP0004__-1;
	device_write = _wTMP0010__%7;
	}

**Step 5** Perform a simulation with the general C language compiler or debugger.

The step run, variable watch, and other functions specific to the debugger can be used.

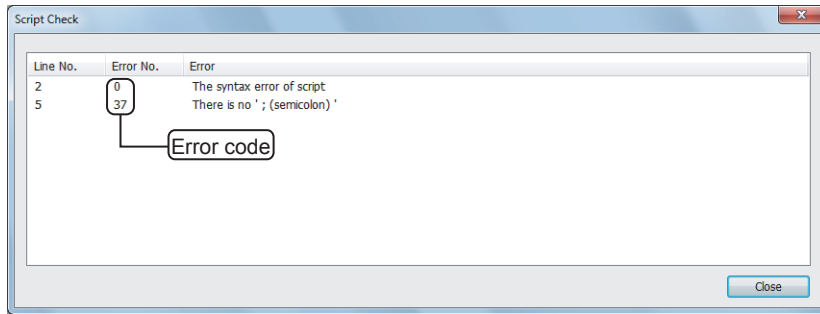

**■2 Messages to be displayed at the syntax check**

**(1) Dialog to be displayed at the syntax check**

When you execute a syntax check, the [Script Check] dialog appears to display the error codes of the errors detected in a script.

For the details of the error codes, refer to the following.

→9.9.14 ■ 2 (2) List of syntax error codes

Some errors cannot be detected by the syntax check.

If any error which cannot be detected by the syntax check exists in the script, the error is detected when the script is executed on the GOT.

For the errors for the execution of a script and the corrective action on the GOT, refer to the following.

→ ■ 3 Object script execution errors and their corrective actions on the GOT

**■3 Object script execution errors and their corrective actions on the GOT**

The following shows how to check the errors and their error codes on the GOT.

Item	Description
Checking for the occurrence of an error	Check for the occurrence of the following errors. <ul style="list-style-type: none"> <li>• Script error</li> <li>• BCD error</li> <li>• Zero division error</li> <li>• Communication error (including access to an invalid device)</li> </ul> →(1) Checking for the occurrence of an object script error
Checking an error record	Check the following information of an error. <ul style="list-style-type: none"> <li>• Script user ID number</li> <li>• Error code</li> </ul> →(2) Checking an object script error record
Checking a detailed error record	Check the following information of an error. <ul style="list-style-type: none"> <li>• Error code</li> <li>• Script type</li> <li>• Screen number</li> <li>• Object ID number</li> <li>• Screen type</li> <li>• Number of the displayed base screen</li> </ul> →(3) Checking a detailed object script error record
Clearing error records	Turn on GS387.b0 to clear object script error records as shown below. <ul style="list-style-type: none"> <li>• GS80.b0, b7, b8, and b12 store 0.</li> <li>• GS81 stores -1.</li> <li>• GS82 to GS113 store 0.</li> </ul>
Re-executing the object script aborted due to an error	Turn on GS387.b1 to re-execute the object script aborted due to an error.

To check device values, use the device monitor function or objects (including a numerical display and lamp).

### (1) Checking for the occurrence of an object script error

The following GOT internal devices notify the occurrence of errors.

GOT internal device		Description
GS80	b0	Turns on when a script error occurs.
	b7	Turns on when a BCD error occurs.
	b8	Turns on when a zero division error occurs.
	b12	Turns on when a communication error (including access to an invalid device) occurs.

To reset each bit of GS80, turn on GS387.b0.

### (2) Checking an object script error record

When an error occurs, the error record is stored into the devices ranging from GS82 to GS113.

GS81 stores the start device number of the devices where the latest error record is stored.

To clear error records, turn on GS387.b0.

The following shows the operation of the relevant GOT internal devices.

GOT internal device	Description																		
GS81	<p>Stores the start device number of the devices where the latest error record is stored. The devices range from GS82 to GS113.</p> <p>The value of GS81 changes as follows each time an error occurs.                      -1 → 82 → 84 → 86 → 88 → ... → 112 (The next loop will start from 82.)</p> <p>Example) Relationship between the value of GS81 and the storage location of the latest error record</p> <ul style="list-style-type: none"> <li>• When GS81 stores 82, the latest error information is stored in GS82 and GS83.</li> <li>• When GS81 stores 112, the latest error information is stored in GS112 and GS113.</li> </ul> <p>Turning on GS387.b0 resets GS81 to -1.</p>																		
GS82 ~ GS113	<p>Stores the following information when a script error occurs.</p> <ul style="list-style-type: none"> <li>• Script number</li> <li>• Error code</li> </ul> <p>Two word devices are used for one error.</p> <table border="1" style="margin-left: 40px;"> <tr> <td>GS82</td> <td>Script user ID number</td> <td rowspan="2">} 1st error record</td> </tr> <tr> <td>GS83</td> <td>Error code</td> </tr> <tr> <td>GS84</td> <td>Script user ID number</td> <td rowspan="2">} 2nd error record</td> </tr> <tr> <td>GS85</td> <td>Error code</td> </tr> <tr> <td>⋮</td> <td>⋮</td> <td></td> </tr> <tr> <td>GS112</td> <td>Script user ID number</td> <td rowspan="2">} 15th error record</td> </tr> <tr> <td>GS113</td> <td>Error code</td> </tr> </table> <p>If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.</p>	GS82	Script user ID number	} 1st error record	GS83	Error code	GS84	Script user ID number	} 2nd error record	GS85	Error code	⋮	⋮		GS112	Script user ID number	} 15th error record	GS113	Error code
GS82	Script user ID number	} 1st error record																	
GS83	Error code																		
GS84	Script user ID number	} 2nd error record																	
GS85	Error code																		
⋮	⋮																		
GS112	Script user ID number	} 15th error record																	
GS113	Error code																		

### (3) Checking a detailed object script error record

The specified GOT data registers (GD) store error records.

These GD devices are specified with the following GOT special registers (GS).

- GS432: Specify the start device number of the GD devices to store error records.
- GS434: Specify the maximum number of error records.

Example) When GS432 stores 1000, and GS434 stores 5

GD1000 to GD1007	⋯ 1st error record
GD1008 to GD1015	⋯ 2nd error record
GD1016 to GD1023	⋯ 3rd error record
GD1024 to GD1031	⋯ 4th error record
GD1032 to GD1039	⋯ 5th error record

Eight word devices are used for one error.

For the details of an error record, refer to the following.

⇒(4) Details of an object script error record

To start storing error records, turn on GS435.b0.

You can identify the devices storing the latest error record based on the values of GS432 and GS159.

The following shows the operation of the relevant GOT internal devices.

• Write device

GOT internal device	Description
GS159	Stores a number showing the devices where the latest error record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest error record by using the following expression. • $GS432 + (GS159 \times 8)$ Example) When GS432 stores 1000, and GS159 stores 5 $1000 + (5 \times 8) = 1040$ In this case, GD1040 to GD1047 (eight GD devices) store the latest error record.

• Read device

GOT internal device	Description	
GS432	Specify the start device number of the GD devices to store error records. Data type: Unsigned binary	
GS434	Specify the maximum number of error records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no error record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS435.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.	
GS435	b0	When this bit is turned on, storing error records starts. When this bit is turned off, storing error records ends.
	b1	Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS434. When this bit is turned on, storing error records stops. When this bit is turned off, storing error records continues by overwriting the oldest record.
	b11	When this bit is turned on, the records of warnings (that do not abort a script) are not stored.

**(4) Details of an object script error record**

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. →(5) List of object script execution error codes
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 10: Display object script • 11: Input object script
GD1002	Screen number	Number of the screen where the object is placed.
GD1003	Object ID number	ID number of the object where a script error has occurred. • For project scripts and screen scripts: script number • For script parts: object ID number
GD1004	Use prohibited	The device stores 0.

Storage device	Item	Description
GD1005	Screen type	Type of the screen where the object is placed. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"> <li>• 200: Base screen</li> <li>• 210: Superimpose window 1</li> <li>• 220: Superimpose window 2</li> <li>• 310: Overlap window 1</li> <li>• 320: Overlap window 2</li> <li>• 330: Overlap window 3</li> <li>• 340: Overlap window 4</li> <li>• 350: Overlap window 5</li> <li>• 400: User-created key window</li> <li>• 500: Dialog window substituted for a system message</li> </ul> If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. <ul style="list-style-type: none"> <li>• When a base screen is called, 1 is added.</li> <li>• When a window screen is called, 2 is added.</li> </ul> Example) When a window screen is called from overlap window 3 $330 + 2 = 332$
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

### (5) List of object script execution error codes

Error code	Error category <sup>*1</sup>	Description	Corrective action
1002	Fatal error	Initialization of objects related to the object scripts failed when a screen is switched.	<ul style="list-style-type: none"> <li>• Reduce the number of monitor devices in object scripts and base screens.</li> <li>• Reduce the number of object scripts presently executed.</li> </ul>
1006	Fatal error	An error occurred in reading data from the device that always collects the data.	Correct the description of the device whose data is out of the specified device range.
1011	Execution error	Writing to a device failed.	Check the description of the script.
1014	Fatal error	The expression is too complicated to process.	Simplify the script operation expression by dividing it or by using other appropriate methods.
1015	Fatal error	The object script does not end although the object script monitoring time has elapsed.	<ul style="list-style-type: none"> <li>• Check whether the script has gone into an endless loop.</li> <li>• Increase the value of the Object Script Monitoring Time (GS388).</li> </ul>
1016	Fatal error	The access to a GOT internal device failed.	<ul style="list-style-type: none"> <li>• Check the operation to a GOT internal device, the script, and sequence program.</li> <li>• Check the description of the script.</li> </ul>
1017	Fatal error	The script where an error is detected by the syntax check of GT Designer3 was executed.	Correct the script where an error is detected by the syntax check of GT Designer3.
1018	Fatal error	The access failed since a temporary device area outside the range has been specified.	Specify the temporary device area within the range.
1020	Fatal error	Writing to multiple devices was attempted in a single script.	Correct the number of write devices to the available number.
1021	Fatal error	An invalid device type was detected.	Correct the device to the one that can be used by the script.
1031	Fatal error	Reference of the internal variable was impossible.	Correct the internal valuable according to the object, object script, trigger type that allow referring to the internal variable.
1032	Fatal error	Assignment to the internal variable was impossible.	Correct the internal valuable according to the object, object script, trigger type that allow assigning to the internal variable.
1039	Fatal error	The script where an error is detected by the syntax check of GT Designer3 was executed.	Correct the script where an error is detected by the syntax check of GT Designer3.
1045	Fatal error	Setting that is not in the object was referred to or changed.	Refer to or change the property that can be set by the object itself.
1057	Fatal error	The script where an error is detected by the syntax check of GT Designer3 was executed.	Correct the script where an error is detected by the syntax check of GT Designer3.
1060			
1070	Fatal error	An error occurs in the trigger device setting.	Check the trigger device setting.
1108	Execution error	The operation result cannot be handled in BCD data.	<ul style="list-style-type: none"> <li>• Check the setting of the monitored device.</li> <li>• Check the operation of device which could not process the BCD data.</li> </ul>

Error code	Error category*1	Description	Corrective action
1109	Execution error	The operation result was outside the BCD data range.	Check the operation of the device whose BCD data is outside the range.
1110	Execution error	Zero division was executed.	Check the zero division of the script.
1131	Execution error	Reference of the internal variable was impossible.	Check the internal variable to be referred to.
1141	Execution error	A value outside the property range was set.	Check the assigned value of the property.
1142	Execution error	For the element number of the property that specifies an array, a value outside the range was set.	Check the element number of the property that specifies an array.
1143	Execution error	<ul style="list-style-type: none"> <li>The object font was not the standard font.</li> <li>For object fonts other than 16-dot standard, 0 (display in 0.5 times) was set.</li> </ul>	Check the assigned value of the property.
1144	Execution error	The magnification value set in the target object is larger than the value set in the figure.	Check the assigned value of the property.
1246	Warning	The number of decimal places specified for a numerical display or numerical input object cannot be read or written using an object property in the script.	The number of decimal places specified with a device cannot be read or written using an object property in the script. Correct the relevant setting.
1251	Warning	Either of the coordinate or radius is incorrect.	Check the argument in the drawing execution function.
1252	Warning	Any of the line type, line width, or line color is incorrect.	Check the argument in the drawing execution function.
1253	Warning	Any of the pattern, shape color, or background color is incorrect.	Check the argument in the drawing execution function.
1254	Warning	Any of the character attribute, character color, character shade color, character scale ratio, character string code, or character string length is incorrect.	Check the argument in the drawing execution function.
1255	Warning	No comment is assigned to the comment No. of the specified comment group No.	Check the argument in the drawing execution function.
1256	Warning	The stored amount of drawing data exceeded the allowable capacity.	Reduce the number of functions.

\*1 For the details of the error categories, refer to the following.

⇒(6) Error category of object scripts and operation at error occurrence

## (6) Error category of object scripts and operation at error occurrence

### (a) Error category

The following shows the categories of the object script error codes. When an error occurs, the object script operates as follows.

Error category	Object script operations at error occurrence
Fatal error	The object script stops. Even if the trigger condition is satisfied again, the object script does not operate. For the object script where the error has occurred, drawing the object and writing to a device stop.*1
Execution error	The object script stops. If the trigger condition is satisfied again, the object script operates. For the object script where the error has occurred, drawing the object and writing to a device stop.*1 If this error occurs repeatedly, the subsequent errors are not written into GS82 to GS113.
Warning	The object script does not stop.

\*1 The operation of the object with the object script where the error has occurred varies according to the set operating condition.

Operating condition of object script	Monitor function of object	Write function of object
Key code input Input fixation Device writing	Operates	Stops
View Change Synchronize Display Trigger	Stops	Operates
Other than above	Stops	Stops

**(b) Script which has been executed before an error occurs**

Reflection of the written value and execution of a function differ depending on the target device to be written and function to be executed.

Writing to a device:

If writing to a device is executed by the script which has been executed before an error occurs, the written value is reflected as follows.

○ : Written value is reflected. ×: Written value is not reflected.

Target device to be written	Operation at error occurrence
GOT internal device (GB and GD)	○
GOT internal device (Other than GB and GD)	×
Controller device	×
Temporary device area	○

Executing a function:

If a function is executed by the script which has been executed before an error occurs, the function is executed as follows.

○ : Function is executed. ×: Function is not executed.

Target function to be written or executed	Operation at error occurrence
Free figure drawing	×
Object update function	○
Object display clear function	○
Screen update function	○
Internal variable	×
Property	○

**■ 4 How to check an object script execution record**

The following shows how to check a script execution record on the GOT.

Item	Description
Checking a script execution record	Check the script user ID number of an executed script. →(1) Checking an object script execution record
Checking a detailed script execution record	Check the following information on an executed script. • Script type • Screen number • Object ID number • Screen type • Number of the displayed base screen →(2) Checking a detailed object script execution record

To check device values, use the device monitor function or objects (including a numerical display and lamp).

**(1) Checking an object script execution record**

When a script runs, the script user ID number is stored into the device in the range of GS115 to GS145.

GS114 stores the device number of the device where the latest script execution record is stored.

The following shows the operation of the relevant GOT internal devices.

GOT internal device	Description
GS114	Stores the device number of the device where the latest script execution record is stored. The device is in the range of GS115 to GS145. The value of GS114 changes as follows each time a script runs. -1 → 115 → 116 → 117 → 118 → ... → 145 (The next loop will start from 115.)
GS115 to GS145	Store the script user ID numbers of the executed scripts. One word device is used for one script. If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

## (2) Checking a detailed object script execution record

The specified GOT data registers (GD) store script execution records.  
 These GD devices are specified with the following GOT special registers (GS).

- GS436: Specify the start device number of the GD devices to store script execution records.
- GS438: Specify the maximum number of script execution records.

Example) When GS436 stores 1000, and GS438 stores 5

GD1000 to GD1007	... 1st script execution record
GD1008 to GD1015	... 2nd script execution record
GD1016 to GD1023	... 3rd script execution record
GD1024 to GD1031	... 4th script execution record
GD1032 to GD1039	... 5th script execution record

Eight word devices are used for one script execution record.  
 For the details of a script execution record, refer to the following.

### →(3) Details of an object script execution record

To start storing script execution records, turn on GS439.b0.

You can identify the devices storing the latest script execution record based on the values of GS436 and GS160.  
 The following shows the operation of the relevant GOT internal devices.

- Write device

GOT internal device	Description
GS160	Stores a number showing the devices where the latest script execution record is stored. Data type: Signed binary Initial value: -1 Calculate the start device number of the devices storing the latest script execution record by using the following expression. • $GS436 + (GS160 \times 8)$ Example) When GS436 stores 1000, and GS160 stores 5 $1000 + (5 \times 8) = 1040$ In this case, GD1040 to GD1047 (eight GD devices) store the latest script execution record.

- Read device

GOT internal device	Description	
GS436	Specify the start device number of the GD devices to store script execution records. Data type: Unsigned binary	
GS438	Specify the maximum number of script execution records. Data type: Unsigned binary The setting range is 0 to 5000. If the device stores 0, no script execution record will be stored. If the device stores 5001 or more, up to 5000 records will be stored. GS439.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.	
GS439	b0	When this bit is turned on, storing script execution records starts. When this bit is turned off, storing script execution records ends.
	b1	Specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records specified with GS438. When this bit is turned on, storing script execution records stops. When this bit is turned off, storing script execution records continues by overwriting the oldest record.

### (3) Details of an object script execution record

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. <ul style="list-style-type: none"><li>• 10: Display object script or switch object script</li><li>• 11: Input object script</li></ul>
GD1001	Screen number	Number of the screen where the object is placed.
GD1002	Object ID number	ID number of the object where a script runs.
GD1003	Use prohibited	The device stores 0.
GD1004	Screen type	Type of the screen where the object is placed. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"><li>• 200: Base screen</li><li>• 210: Superimpose window 1</li><li>• 220: Superimpose window 2</li><li>• 310: Overlap window 1</li><li>• 320: Overlap window 2</li><li>• 330: Overlap window 3</li><li>• 340: Overlap window 4</li><li>• 350: Overlap window 5</li><li>• 400: User-created key window</li><li>• 500: Dialog window substituted for a system message</li></ul> If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. <ul style="list-style-type: none"><li>• When a base screen is called, 1 is added.</li><li>• When a window screen is called, 2 is added.</li></ul> Example) When a window screen is called from overlap window 3 $330 + 2 = 332$ The device stores 0 for a project script.
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

# 10.FUNCTIONS USED WITH PERIPHERAL DEVICES

---

10.1	Using a Barcode Reader with the GOT (Barcode Function) . . . . .	10 - 2
10.2	Using an RFID with the GOT (RFID Function) . . . . .	10 - 19
10.3	Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Ethernet)) . . . . .	10 - 37
10.4	Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Serial)) . . . . .	10 - 49
10.5	Viewing the GOT from a Personal Computer (VNC Server Function) . . . . .	10 - 59
10.6	Displaying an Image Taken by a Video Camera on the GOT (Video Display Function) . . . . .	10 - 73
10.7	Displaying Image from a Personal Computer on the GOT (RGB Display Function) . . . . .	10 - 92
10.8	Recording or Playing Images Taken by a Video Camera on the GOT (Multimedia Function) . . . . .	10 - 99
10.9	Using an External I/O Device on the GOT (External I/O Function and Operation Panel Function) . . . . .	10 - 136
10.10	Displaying the GOT Screen on an External Display (Video Output Function) . . . . .	10 - 147
10.11	Outputting the Collected Data as a Report (Report Function) . . . . .	10 - 149
10.12	Outputting Sound with the GOT (Sound Output Function) . . . . .	10 - 180
10.13	Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions) . . . . .	10 - 191
10.14	Sending a Mail from the GOT (Mail Send Function) . . . . .	10 - 215
10.15	Transferring a File between the GOT (FTP Server) and the Peripheral Device (FTP Client) (FTP Server Function) . . . . .	10 - 225
10.16	Transferring a File between the GOT (FTP Client) and Peripheral Device (FTP Server) (File Transfer Function (FTP Transfer)) . . . . .	10 - 245
10.17	Transferring a File between the GOT Drives (File Transfer Function (GOT Internal Transfer)) . . . . .	10 - 265
10.18	Monitoring a Controller from Tablets or Other Clients (GOT Mobile Function) . . . . .	10 - 276

## 10.1 Using a Barcode Reader with the GOT (Barcode Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

### 10.1.1 Overview of the barcode function

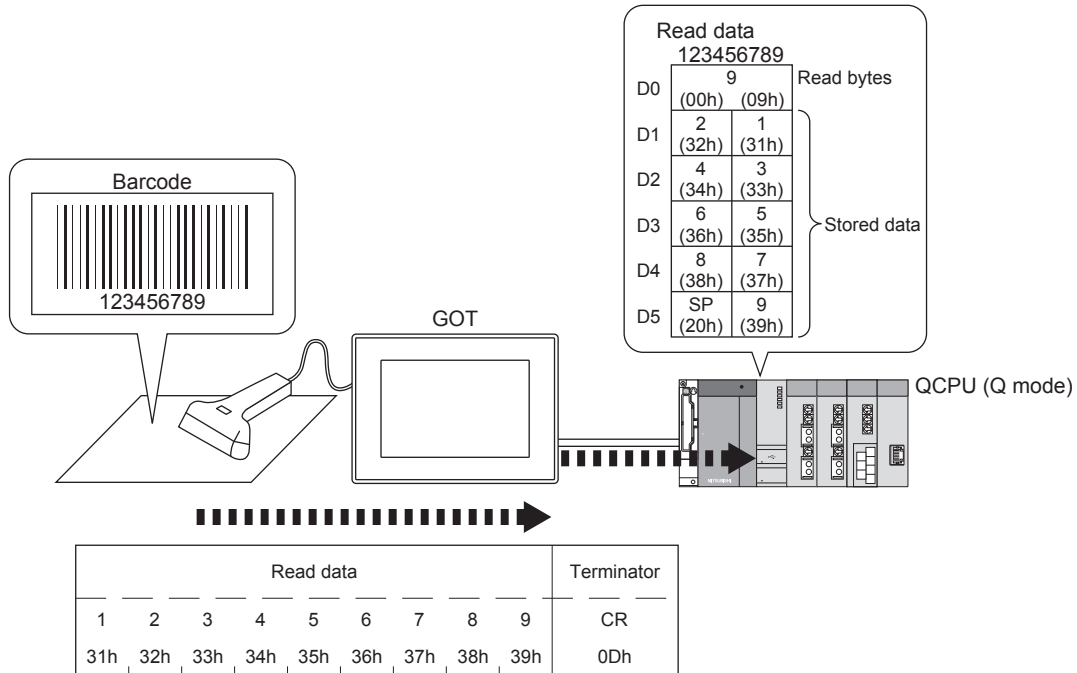

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

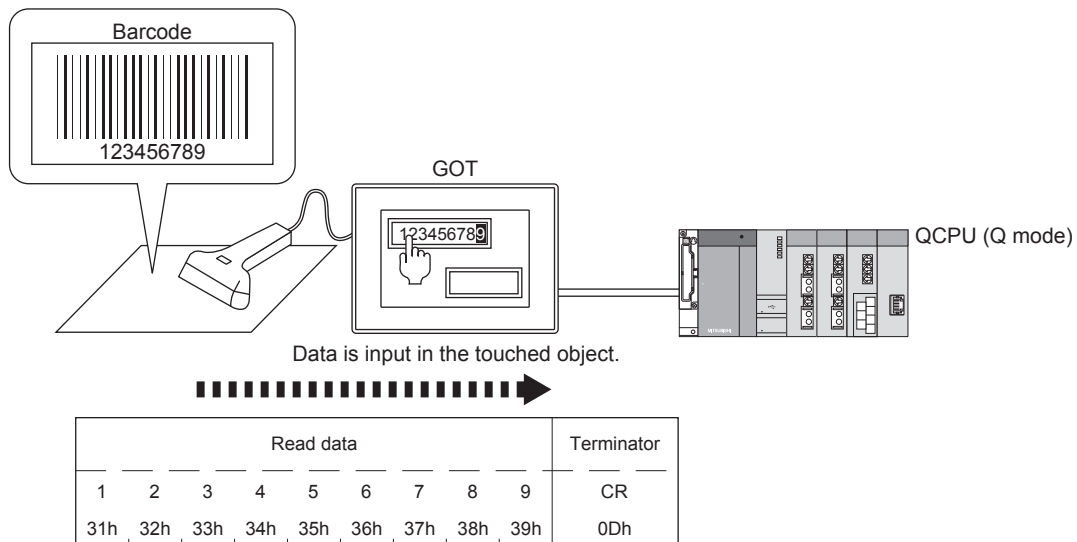

The barcode function enables the GOT to read the data from a barcode by using a barcode reader.

The read data is processed as follows.

#### ■ 1 Writing read data into controllers

#### ■ 2 Directly inputting read data to objects (numerical input and text input)

## 10.1.2 Specifications of the barcode function

Not available to GT25HS-V.

### ■1 System application (extended function)

#### (1) Serial barcode reader

To use the barcode function, a system application (extended function) of [Bar Code (Serial)] is required. Select [Use Serial Bar Code] in the [Bar Code] dialog ([Serial] tab) to incorporate the application into the package data automatically.

⇒10.1.5 [Bar Code] dialog

To use the function on GT21 or GT SoftGOT2000, the application is not required.

#### (2) USB barcode reader

Only available to GT2107-W of GT21 models.

Not available to GT SoftGOT2000.

To use the barcode function, a system application (extended function) of [Bar Code (USB)] is required.

Select [Use USB Bar Code] in the [Bar Code] dialog ([USB] tab) to incorporate the application into the package data automatically.

⇒10.1.5 [Bar Code] dialog

To use the function on GT21, the application is not required.

### ■2 Applicable barcode readers

One serial barcode reader and one USB barcode reader are usable simultaneously.

#### (1) Serial barcode reader

You can use the serial barcode readers that satisfy the header and terminator specifications referred to in the following.

⇒10.1.7 ■ 2 Header and terminator

For the validated serial barcode readers, refer to Technical News GOT-A-0064 "List of Valid Devices Applicable for GOT2000 Series" separately available.

#### (2) USB barcode reader

Only available to GT2107-W of GT21 models.

Not available to GT SoftGOT2000.

You can use the USB barcode readers that satisfy the following conditions.

- A USB keyboard interface is provided.
- The Japanese 106 keyboard or the English 101 keyboard is settable as the USB keyboard type.
- "Enter" is settable as the terminator.

For the validated USB barcode readers, refer to Technical News GOT-A-0064 "List of Valid Devices Applicable for GOT2000 Series" separately available.

### ■3 Number of barcode function settings for one project

One barcode function setting is available for one project.

### ■4 Devices for storing data read by the barcode reader and device points

#### (1) Devices that can store the data

The data can be stored in the word device.

The bit device cannot be specified as the word device.

#### (2) Maximum number of devices

Up to 2000 device points can be set.

One read byte and up to 1999 read data are stored in the device.

## 10.1.3 Basic use of the barcode function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

### 1 System configuration

GT SoftGOT2000 does not support USB barcode readers.

The following shows the system configuration of the barcode reader.

When you use the barcode reader on GT SoftGOT2000, the barcode reader is connected to the personal computer.

Therefore, the barcode reader requires no connection to the GOT hardware.

For the connection method with GT SoftGOT2000, refer to the following.

→GT SoftGOT2000 Version1 Operating Manual

The system configuration between GOT and PLC depends on the connection type.

Barcode reader	Connection cable	GOT	PLC	Number of connectable barcode readers
For the connectable barcode readers and system devices, the type of the barcode that can be read, and the connection cables, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	Depending on the specifications of the barcode reader	GT27, GT25, GT23 <sup>*1</sup> , GT21 <sup>*1</sup>	For the system configuration between the GOT and the PLC, refer to each connection manual.	One serial barcode reader and one USB barcode reader for one GOT

\*1 Only available to GT2107-W with a USB barcode reader.

### 2 Setting procedure

#### (1) Serial barcode reader

**Step 1** Connect a serial barcode reader to the GOT.

→ 1 System configuration

**Step 2** In the [Bar Code] dialog ([Serial] tab), configure the barcode function setting.

→ 10.1.5 [Bar Code] dialog

**Step 3** Set the system signal according to the channel number used.

→ 10.1.6 System information settings

**Step 4** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→ 4. COMMUNICATING WITH GOT

**Step 5** Check proper operation of the barcode function.

→ 10.1.7 Action of the barcode function

#### (2) USB barcode reader

Only available to GT2107-W of GT21 models.

Not available to GT SoftGOT2000.

**Step 1** Connect a USB barcode reader to the GOT.

→ 1 System configuration

**Step 2** In the [GOT Setup] window ([USB Host]), select [Use USB keyboard/USB bar code] and set [Keyboard Type] according to the setting of the USB barcode reader used.

→ 5.3.4 4 [USB Host]

**Step 3** In the [Bar Code] dialog ([USB] tab), configure the barcode function setting.

→ 10.1.5 [Bar Code] dialog

**Step 4** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→4. COMMUNICATING WITH GOT

**Step 5** Check proper operation of the barcode function.

→10.1.7 Action of the barcode function

## 10.1.4 Advanced use of the barcode function

Not available to GT25HS-V.

### ■1 Directly inputting the data to the object (numerical input or text input)

To directly input the data to the object (numerical input or text input), the setting for using the barcode function is required for the object.

When the object (numerical input or text input) is not in the ready state for the data read by the barcode reader to be directly input, the read data is cleared.

To input the data, touch the object (numerical input or text input) input, and read the data with the cursor displayed.

### ■2 Input completion notification settings

This setting is required for using a serial barcode reader.

#### (1) When the input completion notification is disabled

Establishing a handshake is not required by using the External Device I/O signal and the External Device I/O Complete signal.

If the data is sequentially read into the object, old data is immediately overwritten by new data in each time.

#### (2) When the input completion notification is enabled

The data cannot be input to the object until the External Device I/O signal is turned off by the External Device I/O Complete signal.

For the action of the System signal, refer to the following.

→10.1.7 (1) Control devices

### ■3 Switching the behavior of the USB barcode reader

Only available to GT2107-W of GT21 models.

Not available to GT SoftGOT2000.

The Switch USB Barcode Input signal is usable to switch between the USB keyboard function and the barcode function.

For setting the Switch USB Barcode Input signal, refer to the following.

→10.1.5 ■ 2 [USB] tab

- When the Switch USB Barcode Input signal is on  
The USB barcode reader performs the USB keyboard function.  
For the details of the USB keyboard function, refer to the following.  
→5.3.4 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])
- When the Switch USB Barcode Input signal is off  
The USB barcode reader performs the barcode function.

## 10.1.5 [Bar Code] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

Select [Common] → [Peripheral Setting] → [Bar Code] from the menu to display the setting dialog.

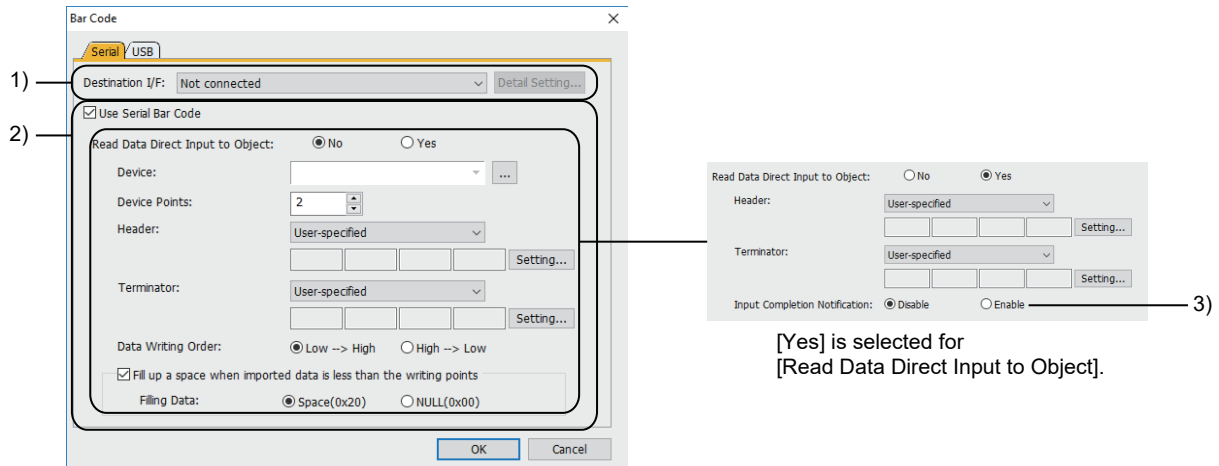

- ■ 1 [Serial] tab
- 2 [USB] tab

### ■ 1 [Serial] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

This setting is required for using a serial barcode reader.

[No] is selected for [Read Data Direct Input to Object].

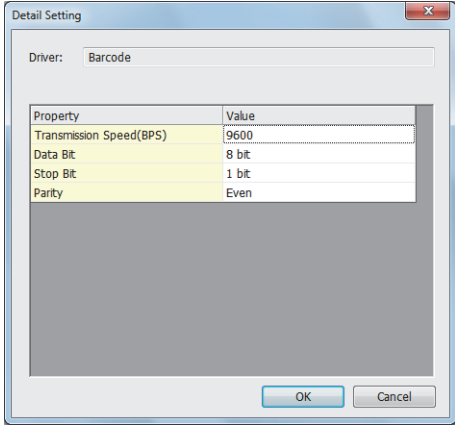

**1) [Destination I/F]**

Set the interface of the GOT.

The following shows the items to be selected.

- [Standard I/F(RS422/485)] (For GT21-P: [Standard I/F(RS422/485/232(Side))])
- [Standard I/F(RS232)] (For GT21-P: [Standard I/F(RS232(Back))])
- [Extend I/F(1st)]
- [Extend I/F(2nd)]
- [Extend I/F(3rd)]
- [Not connected]

[Extend I/F(1st)], [Extend I/F(2nd)], and [Extend I/F(3rd)] are not available to GT25-W, GT2505-V, GT23, GT21, and GT SoftGOT2000.

Item	Description
[Detail Setting] button	<p>Configure the detail setting in the [Detail Setting] window.</p>  <ul style="list-style-type: none"> <li>• <b>[Transmission Speed(BPS)]</b> Select the transmission speed. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [4800]</li> <li>• [9600]</li> <li>• [19200]</li> <li>• [38400]</li> <li>• [57600]</li> <li>• [115200]</li> </ul> </li> <li>• <b>[Data Bit]</b> Select the data length. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [7bit]</li> <li>• [8bit]</li> </ul> </li> <li>• <b>[Stop Bit]</b> Select the stop bit length. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [1bit]</li> <li>• [2bit]</li> </ul> </li> <li>• <b>[Parity]</b> Select the type for a parity check. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [None]</li> <li>• [Even]</li> <li>• [Odd]</li> </ul> </li> </ul>

**2) [Use Serial Bar Code]**

Enables the barcode function setting.

Item	Description
[Read Data Direct Input to Object]	<p>Select whether to write the data read by a serial barcode reader into controller devices, or to input the read data to an object (numerical input or text input).</p> <ul style="list-style-type: none"> <li>• [No]: Writes the data into the controller.</li> <li>• [Yes]: Directly inputs the data to the numerical input or text input.</li> </ul> <p>To directly input the data to the object (numerical input or text input), the setting for using the barcode reader is required for the object.  →8.4.5 [Numerical Input] dialog  8.5.5 [Text Input] dialog</p>

Item	Description
[Device]	Set the start device of consecutive devices that store the data read by a serial barcode reader.
[Device Points]	Set the number of devices that store the data read by the barcode reader. The setting range is [2] to [2000].
[Header]	Select a header for the barcode read by a serial barcode reader. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [None]</li> <li>• [STX]</li> <li>• [ENQ]</li> <li>• [User-specified]: Up to four bytes are settable. Specify a value for a byte in the range of 0x00 to 0xFF. When you select [User-specified], refer to the following. →(1) [Setting] dialog (for setting the header or terminator)</li> </ul>
[Terminator]	Select a terminator for the barcode read by a serial barcode reader. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [ETX]</li> <li>• [LF]</li> <li>• [CR]</li> <li>• [CR+LF]</li> <li>• [User-specified]: Up to four bytes are settable. Specify a value for a byte in the range of 0x00 to 0xFF. When you select [User-specified], refer to the following. →(1) [Setting] dialog (for setting the header or terminator)</li> </ul>
[Data Writing Order]	Select the order of writing the data into the controller device. <ul style="list-style-type: none"> <li>• [Low --&gt; High]: The data is written into the controller device in the order of lower 8 bits to upper 8 bits.</li> <li>• [High --&gt; Low]: The data is written into the controller device in the order of upper 8 bits to lower 8 bits.</li> </ul>
[Fill up a space when imported data is less than the writing points]	Select this item to fill blank devices with spaces or NULLs when the number of bytes of the data read by the barcode reader is less than the set device points. <ul style="list-style-type: none"> <li>• [Space]: Fills the blank device with spaces (20H).</li> <li>• [NULL]: Fills the blank device with NULLs (00H).</li> </ul>

### 3) [Input Completion Notification]

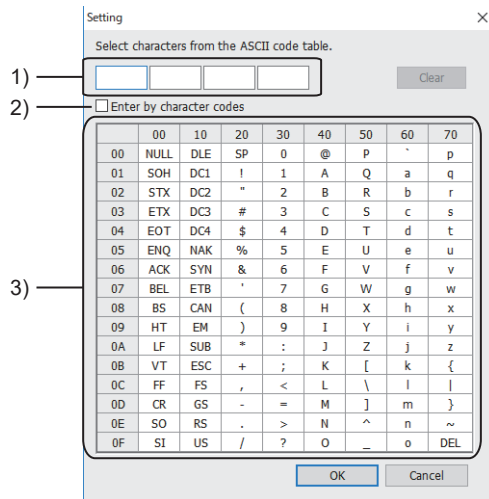

Select whether to enable or disable the completion notification of data input processing by the System signal (External Device I/O signal and External Device I/O Complete signal).

The setting range is [Disable] or [Enable].

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

(1) [Setting] dialog (for setting the header or terminator)

1) Header/terminator entry field

Enter values for the header or terminator.  
A cell where an entry is made is counted as a valid byte.

2) [Enter by character codes]

Enter values in hexadecimal.

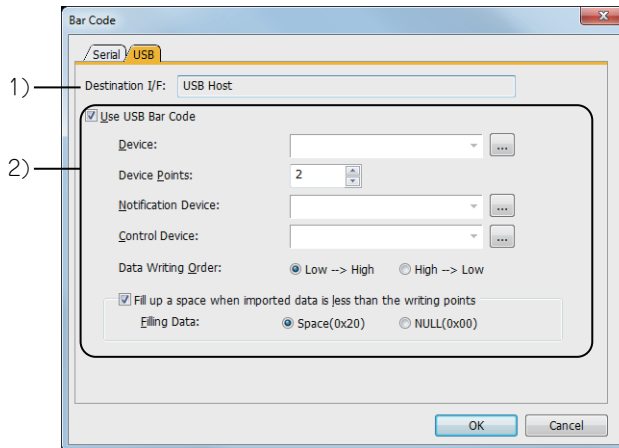

3) ASCII code table

Lists the selectable ASCII codes.  
Click a character to enter it into the header/terminator entry field.

■ 2 [USB] tab

Not available to GT25HS-V.  
Only available to GT2107-W of GT21 models.  
This setting is required for using a USB barcode reader.

1) [Destination I/F]

Displays the GOT interface to be used.  
The interface is fixed at [USB Host].

2) [Use USB Bar Code]

Enables the barcode function setting.

Item	Description
[Device]	Set the start device of consecutive devices that store the data read by a USB barcode reader.
[Device Points]	Set the number of devices that store the data read by the barcode reader. The setting range is [2] to [2000].

Item	Description
[Notification Device]	Set the device that notifies the processing status of the data read by a USB barcode reader. →6.1 Device Settings A word device is settable. For the function of each bit of the device, refer to the following. →(1) [Notification Device]
[Control Device]	Set the device that controls the processing of the data read by a USB barcode reader. →6.1 Device Settings A word device is settable. For the function of each bit of the device, refer to the following. →(2) [Control Device]
[Data Writing Order]	Select the order of writing the data into the controller device. • [Low --> High]: The data is written into the controller device in the order of lower 8 bits to upper 8 bits. • [High --> Low]: The data is written into the controller device in the order of upper 8 bits to lower 8 bits.
[Fill up a space when imported data is less than the writing points]	Select this item to fill blank devices with spaces or NULLs when the number of bytes of the data read by the barcode reader is less than the set device points. • [Space]: Fills the blank device with spaces (20H). • [NULL]: Fills the blank device with NULLs (00H).

### (1) [Notification Device]

The following shows the function of each bit of the set device.

Bit number	Signal name	Function
b0 to b5	Use prohibited	-
b6	USB Barcode Input signal	Turns on when the data read by a USB barcode reader is stored to specified devices. Turns off when the USB Barcode Read Completed signal (b6 of the control device) turns on.
b7 to b15	Use prohibited	-

### (2) [Control Device]

The following shows the function of each bit of the set device.

Bit number	Signal name	Function
b0	Switch USB Barcode Input signal	Switches the behavior of the USB barcode reader This signal is disabled when the Enable Operator Authentication signal (Control device.b1) is turned on and the GOT displays the screen for login with an external authentication device. • ON The USB barcode reader performs the USB keyboard function. For the details of the USB keyboard function, refer to the following. →5.3.4 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host]) • OFF The USB barcode reader performs the barcode function.
b1	Enable Operator Authentication signal	Turn on this signal and display the screen for login with an external authentication device on the GOT to enable the operator authentication with a USB device. For the details of the operator authentication, refer to the following. →5.2.7 Configuring the security settings for displaying screen data on the GOT ([Screen Security] (Operator authentication))
b2	Enable USB Device Input During Operator Authentication signal	Turn on this signal to enable the operator authentication data read by a USB device to be saved into devices. For the details of the operator authentication, refer to the following. →5.2.7 Configuring the security settings for displaying screen data on the GOT ([Screen Security] (Operator authentication))
b3 to b4	Use prohibited	-
b5	Disable USB Barcode Input signal	Turn on this signal to disable the barcode function.
b6	USB Barcode Read Completed signal	Turn on this signal for the GOT to recognize that the stored barcode data has been transferred from the specified devices to different devices. Turn on this signal to turn off the USB Barcode Input signal (b6 of the notification device).
b7 to b15	Use prohibited	-

## 10.1.6 System information settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

This setting is required for using a serial barcode reader.

If you use a USB barcode reader, set [Notification Device] and [Control Device] in the [Bar Code] dialog ([USB] tab).

→ 10.1.5 ■ 2 [USB] tab

### ■ 1 Setting the system information

Make sure to set one of the following System signals according to the channel No. you use.

For GT SoftGOT2000, set the System signal used for channel No.5 of the GOT.

The barcode function is not available without the setting.

Channel No.	System signal
Channel No.8	System signal 1-1, System signal 2-1
Channel No.5	
Channel No.6	System signal 1-2, System signal 2-3 (Not available to GT21.)
Channel No.7	

For the details of the system information, refer to the following.

→ 5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

### ■ 2 Action of the barcode function according to the System signal status

While the following System signals are on, the data read by the barcode reader is not written into the controller.

Use a sequence program or other methods to turn off the External Device I/O signal and the External Device I/O Complete signal.

#### (1) System signal 1-1

#### (2) System signal 2-1

## 10.1.7 Action of the barcode function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

### 1 Order of writing data into the controller

Set the order of writing the data read by the barcode reader into the controller.

#### (1) Low → High

The data is written into the controller device in the order of lower 8 bits to upper 8 bits.

#### (2) High → Low

The data is written into the controller device in the order of upper 8 bits to lower 8 bits.

## 2 Header and terminator

If you use a serial barcode reader, set the header and terminator for the read barcode.

Item	Description																										
Header	<p>The read data is as follows when the header is not added to the head of data.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th colspan="5">Read data</th> </tr> <tr> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> </tr> </tbody> </table>	Read data					1	2	3	4	5	31h	32h	33h	34h	35h											
	Read data																										
	1	2	3	4	5																						
	31h	32h	33h	34h	35h																						
<p>The read data and STX are set as follows when STX is added to the head of data.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Header</th> <th colspan="5">Read data</th> </tr> <tr> <td>STX</td> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>02h</td> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> </tr> </tbody> </table>	Header	Read data					STX	1	2	3	4	5	02h	31h	32h	33h	34h	35h									
Header	Read data																										
STX	1	2	3	4	5																						
02h	31h	32h	33h	34h	35h																						
<p>The read data and ENQ are set as follows when ENQ is added to the head of data.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Header</th> <th colspan="5">Read data</th> </tr> <tr> <td>ENQ</td> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>05h</td> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> </tr> </tbody> </table>	Header	Read data					ENQ	1	2	3	4	5	05h	31h	32h	33h	34h	35h									
Header	Read data																										
ENQ	1	2	3	4	5																						
05h	31h	32h	33h	34h	35h																						
<p>The user-specified values are prepended to the read data. Example) When 41h, 42h, 43h, and 44h are specified</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th colspan="4">Header</th> <th colspan="5">Read data</th> </tr> <tr> <th>A</th> <th>B</th> <th>C</th> <th>D</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>41h</td> <td>42h</td> <td>43h</td> <td>44h</td> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> </tr> </tbody> </table>	Header				Read data					A	B	C	D	1	2	3	4	5	41h	42h	43h	44h	31h	32h	33h	34h	35h

Read data					Terminator																						
1	2	3	4	5	CR																						
31h	32h	33h	34h	35h	0Dh																						
<p>The read data and CR+LF are set as follows when CR+LF is added to the end of data.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th colspan="5">Read data</th> <th colspan="2">Terminator</th> </tr> <tr> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th>CR</th> <th>LF</th> </tr> </thead> <tbody> <tr> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> <td>0Dh</td> <td>0Ah</td> </tr> </tbody> </table>	Read data					Terminator		1	2	3	4	5	CR	LF	31h	32h	33h	34h	35h	0Dh	0Ah						
Read data					Terminator																						
1	2	3	4	5	CR	LF																					
31h	32h	33h	34h	35h	0Dh	0Ah																					
<p>The user-specified values are appended to the read data. Example) When 61h, 62h, and 63h are specified</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th colspan="5">Read data</th> <th colspan="3">Terminator</th> </tr> <tr> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th>a</th> <th>b</th> <th>c</th> </tr> </thead> <tbody> <tr> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> <td>61h</td> <td>62h</td> <td>63h</td> </tr> </tbody> </table>	Read data					Terminator			1	2	3	4	5	a	b	c	31h	32h	33h	34h	35h	61h	62h	63h			
Read data					Terminator																						
1	2	3	4	5	a	b	c																				
31h	32h	33h	34h	35h	61h	62h	63h																				

### ■3 Data to be stored in devices

The data read by the barcode reader is written into the controller device as the string data.

Example)

- Read data: 123456789
- Order of writing data: Low → High

#### (1) When the number of read data is less than the set device points

Settings (Storage device: D0, Data points: 8)

Write device	Stored data	String data	
D0	0009h	-	— The GOT writes the bytes of the read data.
D1	3231h	21	— The GOT writes the read data in the order from lower byte.
D2	3433h	43	
D3	3635h	65	
D4	3837h	87	
D5	2039h	␣9	— When the number of bytes of the data read by the barcode reader is less than the set device points, fill blank devices with spaces (20h) or NULLs (00h).
D6	2020h	␣␣	
D7	2020h	␣␣	

␣: Space

#### (2) When the number of read data is more than the set device points

Settings (Storage device: D0, Data points: 4)

Write device	Stored data	String data	
D0	0009h	-	— The GOT writes the bytes of the read data.
D1	3231h	21	— The GOT writes the read data in the order from lower byte.
D2	3433h	43	
D3	3635h	65	
			— The data that exceeds the set device points is not written.

### ■4 Operation example of the barcode function (Serial barcode reader)

The following shows the action timing of the barcode function.

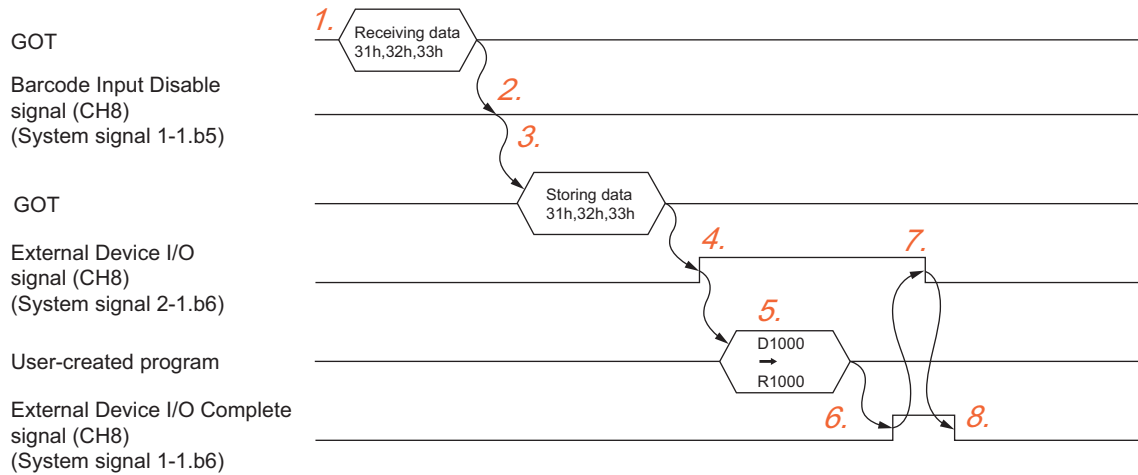

Example) GT Designer3 settings

- The barcode reader is connected to the GOT by using channel No.8.
- [No] is selected for [Read Data Direct Input to Object].
- System signal 1-1: D11
- System signal 2-1: D11
- Device: D1000
- Data points: 8

#### (1) Control devices

Device	Item
System information	External Device I/O Complete signal (CH8)(System signal 1-1.b6) External Device I/O signal (CH8)(System signal 2-1.b6) →5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

## (2) Handshake

- Step 1** The GOT receives data from a serial barcode reader.
- Step 2** When the Barcode Input Disable signal is off, the process proceeds to the next step.
- Step 3** The received data is stored to specified devices.
- Step 4** The External Device I/O signal (CH8) turns on upon storage of the data.
- Step 5** A user-created program transfers the stored data from the specified devices to different devices.
- Step 6** The user-created program turns on the External Device I/O Complete signal (CH8).
- Step 7** The External Device I/O signal (CH8) turns off upon turn-on of the External Device I/O Complete signal (CH8).
- Step 8** The user-created program turns off the External Device I/O Complete signal (CH8).

## (3) Example of the sequence program (When the GOT is connected to QCPU by using channel No.8)

While the External Device I/O Complete signal and the External Device I/O signal are on, the data read by the barcode reader is not written into the controller.

Create a sequence program so that the External Device I/O Complete signal and the External Device I/O signal are turned off.

## ■5 Operation example of the barcode function (USB barcode reader)

Only available to GT2107-W of GT21 models.

Not available to GT SoftGOT2000.

The following shows the action timing of the barcode function.

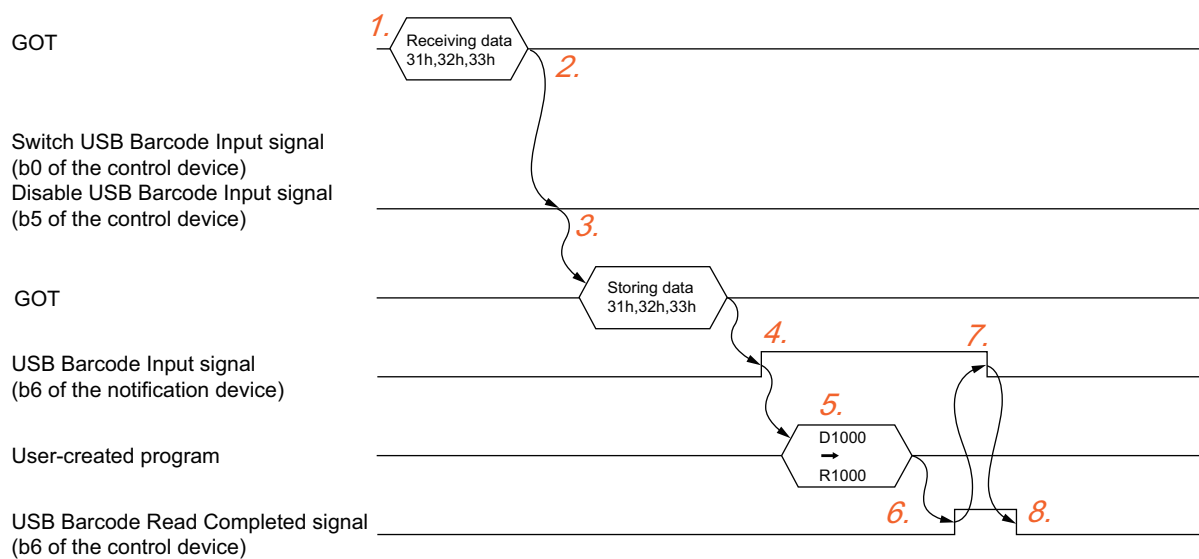

Example) GT Designer3 settings

- [Notification Device]: D11
- [Control Device]: D12
- Device: D1000
- Data points: 8

### (1) [Notification Device], [Control Device]

Device	Item
[Notification Device]	• USB Barcode Input signal (b6 of the notification device)
[Control Device]	• Switch USB Barcode Input signal (b0 of the control device) • Disable USB Barcode Input signal (b5 of the control device) • USB Barcode Read Completed signal (b6 of the control device)

### (2) Handshake

- Step 1** The GOT receives data from a USB barcode reader.
- Step 2** When the Switch USB Barcode Input signal and the Disable USB Barcode Input signal are off, the process proceeds to the next step.
- Step 3** The received data is stored to specified devices.
- Step 4** The USB Barcode Input signal turns on upon storage of the data.
- Step 5** A user-created program transfers the stored data from the specified devices to different devices.
- Step 6** The user-created program turns on the USB Barcode Read Completed signal.
- Step 7** The USB Barcode Input signal turns off upon turn-on of the USB Barcode Read Completed signal.
- Step 8** The user-created program turns off the USB Barcode Read Completed signal.

While the USB Barcode Input signal or the USB Barcode Read Completed signal is on, the read barcode data is not stored to the specified devices.

Create a sequence program so that the USB Barcode Input signal and the USB Barcode Read Completed signal are turned off.

## 10.1.8 Precautions

Not available to GT25HS-V.

### ■1 Precautions for hardware

When the barcode reader is used with [Standard I/F(RS232)], 5V power supply from the GOT should be enabled on some barcode readers.

For the barcode that can be read, refer to Technical News GOT-A-0064 "List of Valid Devices Applicable for GOT2000 Series" separately available, or contact your local distributor.

### ■2 Precautions for using a USB barcode reader

#### (1) Handshake when a USB barcode reader reads data

When you use a USB barcode reader for writing the read data to specified devices, turn off the USB Barcode Input signal and the USB Barcode Read Completed signal before a barcode reading.

If a barcode reading is performed while the signals are on, the read data is deleted.

#### (2) Outputting a special interrupt code through the microcomputer connection

Even if the special interrupt code output is enabled, the special interrupt code (23H) is not output.

For the special interrupt code output through the microcomputer connection, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

#### (3) Switching between the ON and OFF states of the Switch USB Barcode Input signal

If you switch between the ON and OFF states of the Switch USB Barcode Input signal while a USB barcode reader is reading data, unintended behavior may result.

Do not switch the ON and OFF states of the signal while a USB barcode reader is reading data.

## 10.1.9 Relevant settings

Not available to GT25HS-V.

Set the relevant settings other than the specific settings for the barcode function as required.

The following shows the functions that are available by the relevant settings.

### 1 GOT environmental settings (System information)

These settings are unavailable when a USB barcode reader is used.

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Target CH	Function	Setting item
CH5*1	Switching the enabled or disabled status of the barcode function. (Read device: System signal 1-2.b2)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b0). (Read device: System signal 1-2.b3)	[System Signal 1-2]
	Notifying that the data read by the barcode reader is stored into the specified device. (Write device: System signal 2-3.b0)	[System Signal 2-3]
CH6*1	Switching the enabled or disabled status of the barcode function. (Read device: System signal 1-2.b5)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b1). (Read device: System signal 1-2.b6)	[System Signal 1-2]
	Notifying that the data read by the barcode reader is stored into the specified device. (Write device: System signal 2-3.b1)	[System Signal 2-3]
CH7*1	Switching the enabled or disabled status of the barcode function. (Read device: System signal 1-2.b8)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b2). (Read device: System signal 1-2.b9)	[System Signal 1-2]
	Notifying that the data read by the barcode reader is stored into the specified device. (Write device: System signal 2-3.b2)	[System Signal 2-3]
CH8	Switching the enabled or disabled status of the barcode function. (Read device: System signal 1-1.b5)	[System Signal 1-1]
	Turning on this signal turns off the External Device I/O signal (System signal 2-1.b6). (Read device: System signal 1-1.b6)	[System Signal 1-1]
	Notifying that the data read by the barcode reader is stored into the specified device. (Write device: System signal 2-1.b6)	[System Signal 2-1]

\*1 Not available to GT21.

### 2 GOT Internal Device

⇒12.1.3 GOT special register (GS)

Function	Setting item
Notifying that the object is in the ready state for the data read by the barcode reader and the RFID to be directly input. (Write device)*1	GS243.b15

\*1 Not available to GT21.

## 10.2 Using an RFID with the GOT (RFID Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

### 10.2.1 Overview of the RFID function

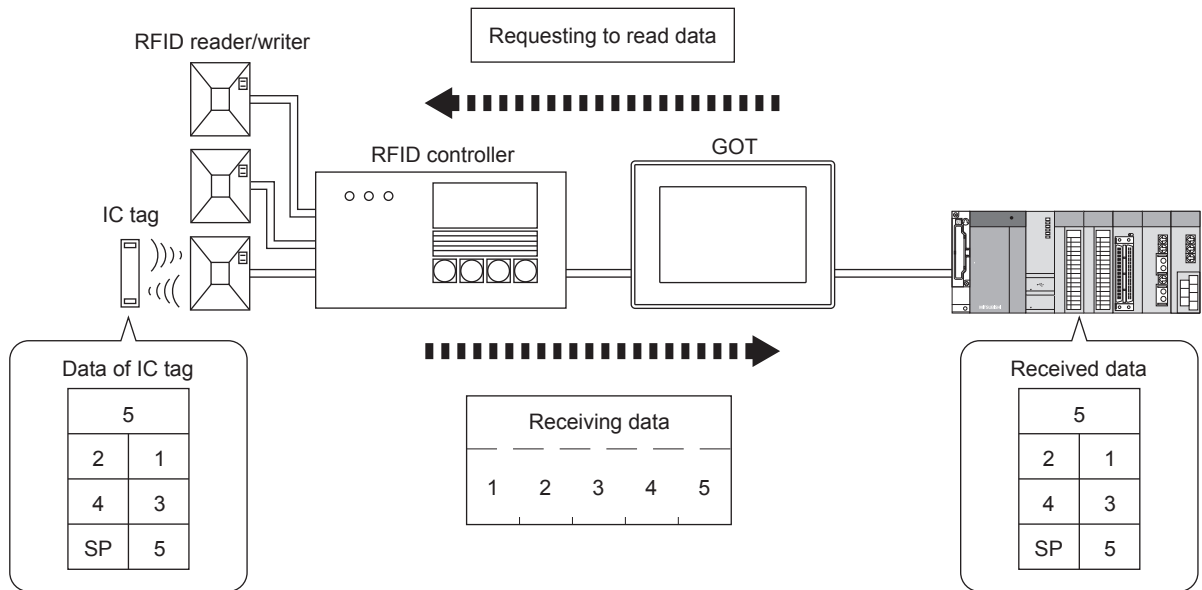

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

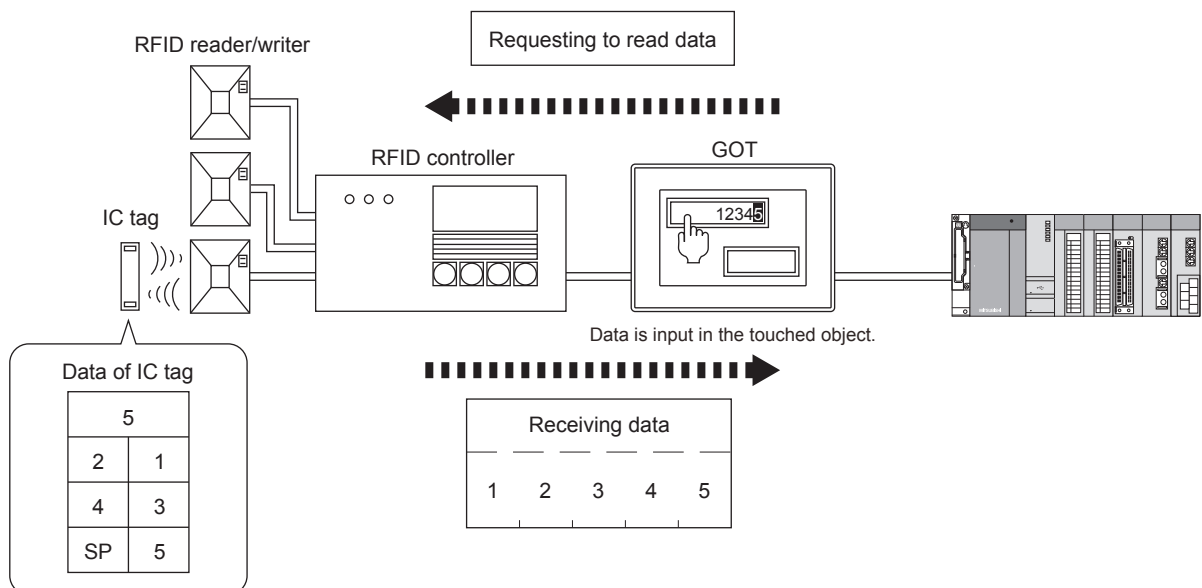

The RFID function enables you to send and receive the data by an RFID reader/writer of an RFID controller connected to the GOT, and enables you to read the data from the received data.

The read data is processed as follows.

#### ■1 Writing read data into controllers

#### ■2 Directly inputting read data to objects (numerical input and text input)

## 10.2.2 Specifications of the RFID function

Not available to GT25HS-V.

### ■ 1 System application (extended function)

To use the RFID function, a system application (extended function) of [RFID] is required.

Selecting [Use RFID] in the [RFID] dialog incorporates the application into the package data automatically.

→ 10.2.5 [RFID] dialog

To use the function on GT SoftGOT2000, the application is not required.

### ■ 2 Applicable RFID controllers

Applicable RFID controllers should meet the specifications of the dedicated protocol and nonprocedural protocol as shown below.

Protocol	Reference
Dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.)	→ 10.2.7 ■ 6 (1) Dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.)
Dedicated protocol (ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.)	→ 10.2.7 ■ 6 (2) Dedicated protocol (ICU-60S or ICU-215 (Mifare) manufactured by MARS TOHKEN SOLUTION CO.LTD.)
Dedicated protocol (ICU-215 (Mifare) manufactured by MARS TOHKEN SOLUTION CO.LTD.)	
Nonprocedural protocol	→ 10.2.7 ■ 6 (3) Nonprocedural protocol

Select the dedicated protocol that corresponds to the RFID controller to be used.

When no dedicated protocol corresponds to the RFID controller to be used, select the nonprocedural protocol.

For selecting the protocol, refer to the following.

→ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

The following shows devices used for each protocol and a handshake example.

→ 10.2.7 Action of an RFID

For applicable RFID controllers, refer to Technical News GOT-A-0064 "List of Valid Devices Applicable for GOT2000 Series" separately available, or contact your local distributor.

### ■ 3 Connecting the RFID controller for the operator authentication

To use an RFID controller for the operator authentication, the controller can be connected to only the RS-232 interface built in the GOT.

### ■ 4 Number of RFID function settings for one project

One RFID function setting is available for one project.

### ■ 5 Devices for storing data read by RFID reader/writer and the number of device points

#### (1) Devices that can store the data

The data can be stored in the word device.

The bit device cannot be specified as the word device.

#### (2) Maximum number of devices

Up to 10000 devices can be set for the sent data and the received data in total.

For GT21, up to 2000 devices can be set for the sent data and the received data, respectively.

## 10.2.3 Basic use of the RFID function

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

Not available to GT25HS-V.

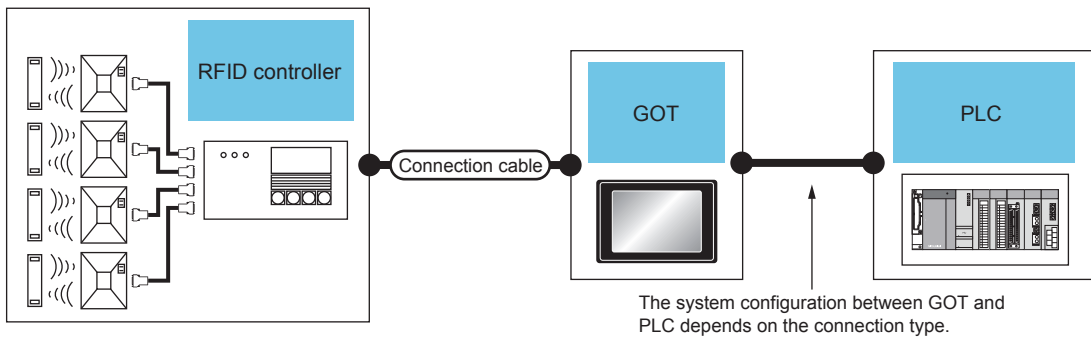

### 1 System configuration

The following shows the system configuration of RFID.

When you use the RFID on GT SoftGOT2000, the RFID is connected to the personal computer. Therefore, the RFID requires no connection to the GOT hardware.

For the connection method with GT SoftGOT2000, refer to the following.

→ GT SoftGOT2000 Version1 Operating Manual

RFID controller	Connection cable	GOT	PLC	Number of connectable RFID controllers
Model				
For the connectable RFID controllers and system devices, refer to the following Technical News. → List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	Depending on the specifications of the RFID controller	GT27, GT25, GT23, GT21	For the system configuration between the GOT and the PLC, refer to each connection manual.	One RFID controller for one GOT

### 2 Setting procedure

**Step 1** Connect the GOT and the RFID

→ 1 System configuration

**Step 2** Configure the settings for the RFID function in the [RFID] dialog.

→ 10.2.5 [RFID] dialog

**Step 3** Set the System signal according to the channel No. you use.

→ 10.2.6 System information settings

**Step 4** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→ 4. COMMUNICATING WITH GOT

**Step 5** Operate the RFID function.

→ 10.2.7 Action of an RFID

## 10.2.4 Applicative use of the RFID function

Not available to GT25HS-V.

### ■ 1 Directly inputting the data to the object (numerical input or text input)

To directly input the data to the object (numerical input or text input), the setting for using the RFID function is required for the object.

#### (1) Precautions during communication

Do not store or change the send data after starting communication with the RFID controller. The communication error may occur.

#### (2) Action when the GOT receives an error

When the GOT receives an error from an RFID reader/writer, the received error is directly input to the object (numerical input or text input).

For details of errors, refer to the following.

⇒ 10.2.7 ■ 5 Errors during communication

#### (3) Receiving data that is divided into segments

When the data that is divided into segments is received, the segments of the received data are not combined in one.

When the segments of data are received, each segment of data is directly input to the object (numerical input or text input) in each time.

#### (4) Timing of starting communication

The RFID Request signal is not used for directly inputting data to the numerical input or text input.

The GOT starts communication with the RFID controller after the object (numerical input or text input) is touched and a cursor appears.

Set the data to be used for the communication with the RFID controller before displaying the cursor on the object (numerical input or text input).

The following shows the data used for each protocol communication.

Protocol	Data to be used for the communication with the RFID controller
Dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.)	RFID Controller signal (IC tag communication time, RFID reader/writer No.)
Nonprocedural protocol	Send data area

For the RFID Controller signal and send data area, refer to the following.

⇒ 10.2.7 ■ 4 RFID Controller signal, send data area, and receive data area

#### (5) RFID controllers that cannot directly input data

When the following RFID controllers are used, data cannot be directly input to the object.

##### (a) Communication using dedicated protocols

- ICU-60S manufactured by MARS TOHKEN SOLUTION CO.LTD.
- ICU-215 (Mifare) manufactured by MARS TOHKEN SOLUTION CO.LTD.

##### (b) Communication using nonprocedural protocols

- RFID controllers that receive data for the first time after sending or receiving data in multiple times

#### (6) Input completion notification

##### (a) When the input completion notification is disabled

Establishing a handshake is not required by using the External Device I/O signal and the External Device I/O Complete signal.

While the cursor is displayed, data is sequentially read to the object, and old data is immediately overwritten by new data in each time.

##### (b) When the input completion notification is enabled

The data cannot be input to the object until the External Device I/O Signal is turned off by the External Device I/O Complete signal.

For communication using nonprocedural protocols, turn off the RFID Receive signal before starting the following communication.

If the data input starts while the RFID Receive signal is turned on, the GOT cannot determine whether the data input is

completed.

For the actions of the System signal and RFID Controller signal, refer to the following.

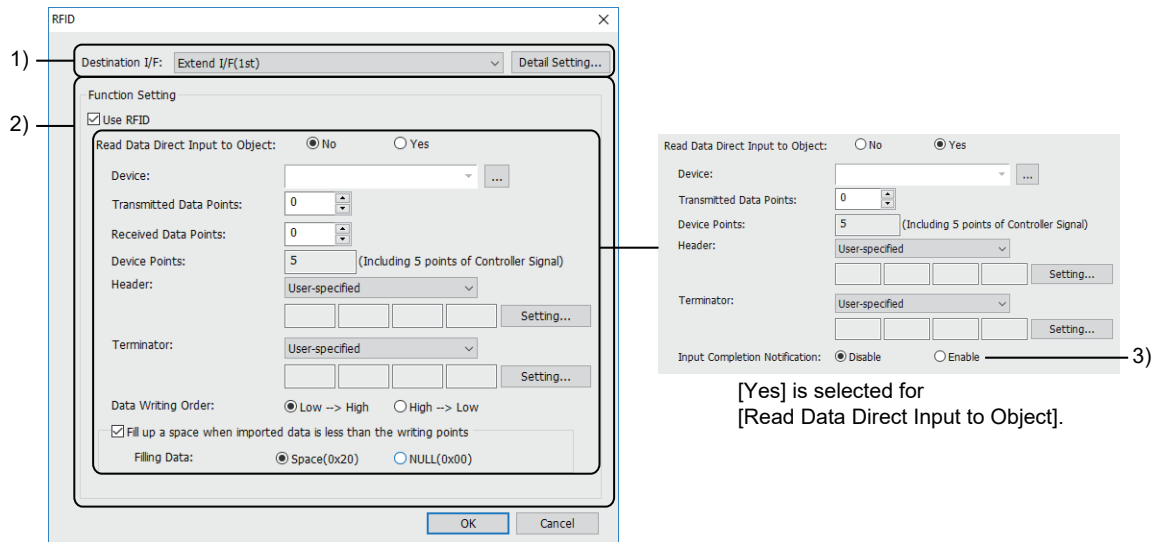

→ 10.2.7 ■ 6 (1) Dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.)

## 10.2.5 [RFID] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

Select [Common] → [Peripheral Setting] → [RFID] from the menu to display the setting dialog.

[No] is selected for [Read Data Direct Input to Object].

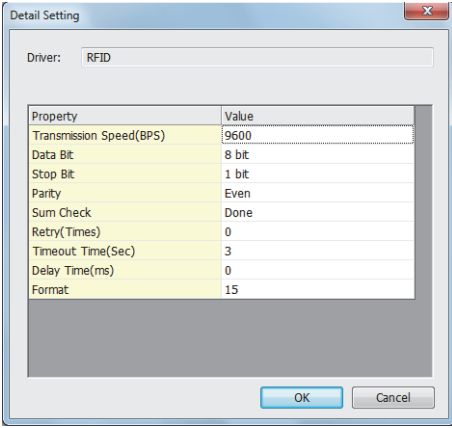

### 1) [Destination I/F]

Set the interface of the GOT.

The following shows the items to be selected.

- [Standard I/F(RS422/485)] (For GT21-P: [Standard I/F(RS422/485/232(Side))])
- [Standard I/F(RS232)] (For GT21-P: [Standard I/F(RS232(Back))])
- [Extend I/F(1st)]
- [Extend I/F(2nd)]
- [Extend I/F(3rd)]
- [Not connected]

[Extend I/F(1st)], [Extend I/F(2nd)], and [Extend I/F(3rd)] are not available to GT25-W, GT2505-V, GT23, GT21, and

Item	Description
<p>[Detail Setting] button</p>	<p>Configure the detail setting in the [Detail Setting] window.</p>  <ul style="list-style-type: none"> <li>• <b>[Transmission Speed(BPS)]</b> Select the transmission speed. [Data Writing Order]	<p>Select the order of writing data into the controller device.</p> <ul style="list-style-type: none"> <li>• [Low --&gt; High]: The data is written into the controller device in the order of lower 8 bits to upper 8 bits.</li> <li>• [High --&gt; Low]: The data is written into the controller device in the order of upper 8 bits to lower 8 bits.</li> </ul>
[Fill up a space when imported data is less than the writing points]	<p>Select this item to fill blank devices with spaces or NULLs when the number of bytes of the received data by the RFID reader/writer is less than the device points set for [Received Data Points]. After selecting the item, select the data to fill in blank devices.</p> <ul style="list-style-type: none"> <li>• [Space]: Fills the blank device with spaces (20H).</li> <li>• [NULL]: Fills the blank device with NULLs (00H).</li> </ul>

### 3) [Input Completion Notification]

Select whether to enable or disable the completion notification of data input processing by the System signal (External Device I/O signal and External Device I/O Complete signal) and the RFID Controller signal (RFID Receive signal). The following shows the items to be selected.

- [Disable]
- [Enable]

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

## 10.2.6 System information settings

---

Not available to GT25HS-V.

### ■ 1 Setting the system information

Make sure to set one of the following System signals according to the channel No. you use.

For GT SoftGOT2000, set the System signal used for channel No.8 of the GOT.

The RFID function is unavailable without the settings.

Channel No.	System signal
Channel No.8	System signal 1-1, System signal 1-2, System signal 2-1
Channel No.5	
Channel No.6	System signal 1-2, System signal 2-3
Channel No.7	

For the details of the system information, refer to the following.

⇒ 5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

### ■ 2 Action of the RFID function according to status of the control device

Depending on status of the control device to be used for communication, the GOT may not send or receive data to/from the RFID controller. For control devices for each protocol, refer to the following.

⇒ 10.2.7 ■ 6 Example of the RFID action

## 10.2.7 Action of an RFID

GT27 GT25 GT23 GT21 SoftGOT2000 GS

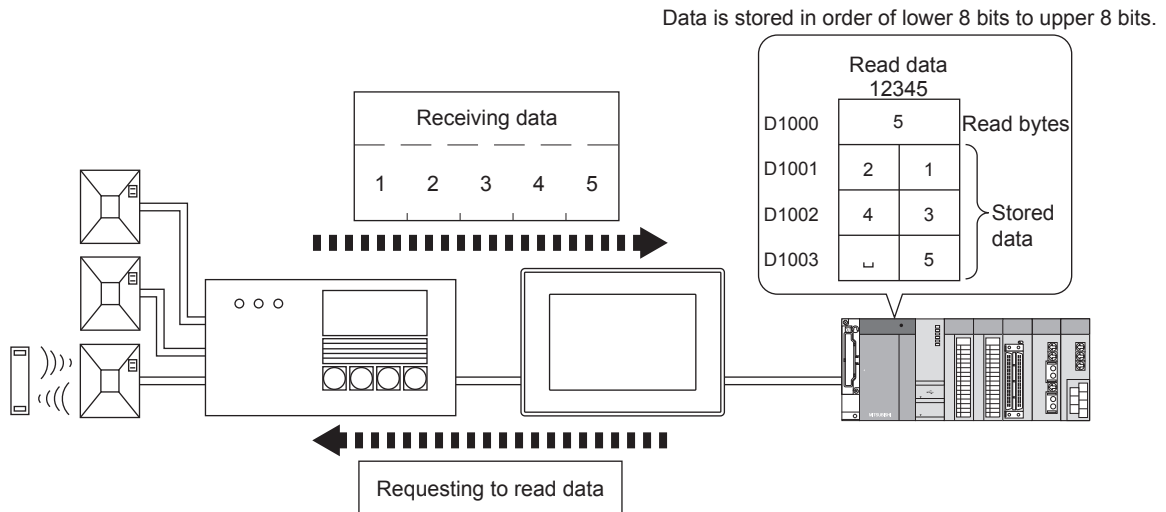

Not available to GT25HS-V.

### 1 Order of writing data into the controller

Set the order of writing the data read by the RFID reader/writer into the controller devices.

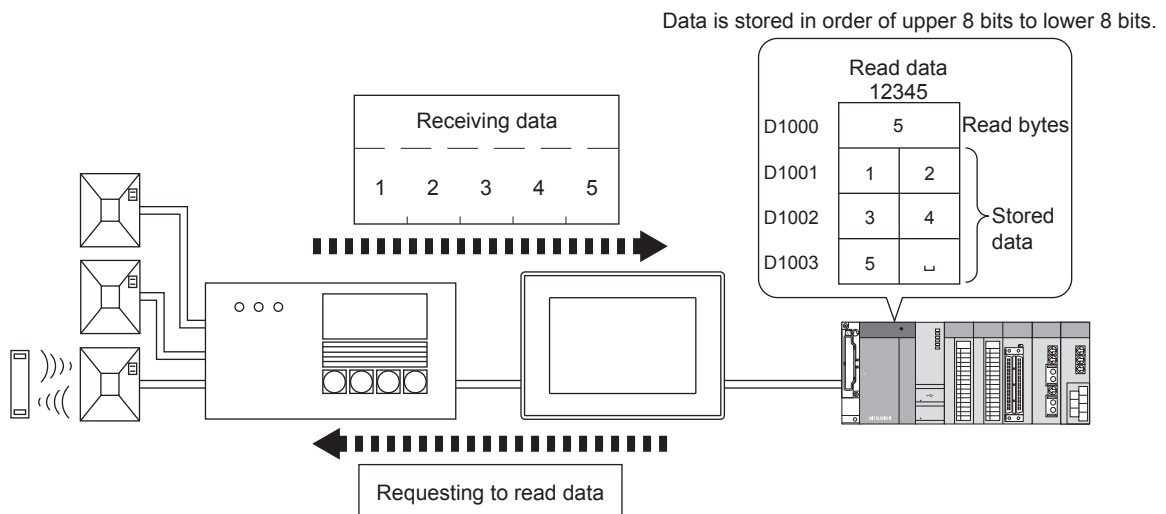

#### (1) Low → High

The data is written into the controller device in the order of lower 8 bits to upper 8 bits.

#### (2) High → Low

The data is written into the controller device in the order of upper 8 bits to lower 8 bits.

## ■2 Header/terminator

Set the header and terminator of the RFID read by the RFID.

Item	Description																										
Header	<p>The read data is as follows when the header is not added to the head of data.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th colspan="5">Read data</th> </tr> <tr> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>31h</td> <td>32h</td> <td>33h</td> <td>34h</td> <td>35h</td> </tr> </tbody> </table>	Read data					1	2	3	4	5	31h	32h	33h	34h	35h

31h	32h	33h	34h	35h	61h	62h	63h																				

### ■ 3 Data to be stored in devices

The following shows how the GOT writes data to be sent or received by the RFID reader/writer into controller devices as string data.

Example)

- Received data: 123456789
- Order of writing data: Low → High

#### (1) When the number of read data is less than the set device points

Settings (Storage device: D1005, Data points: 8)

Write device	Stored data	String data
D1005	0009h	-
D1006	3231h	21
D1007	3433h	43
D1008	3635h	65
D1009	3837h	87
D1010	2039h	␣9
D1011	2020h	␣␣
D1012	2020h	␣␣

- The GOT writes the bytes of the read data.
- The GOT writes the read data in the order from lower byte.
- When the number of bytes of the data read by the barcode reader is less than the set device points, fill blank devices with spaces (20h) or NULLs (00h).

␣: Space

#### (2) When the number of read data is more than the set device points

Settings (Storage device: D1005, Data points: 4)

Write device	Stored data	String data
D1005	0006h	-
D1006	3231h	21
D1007	3433h	43
D1008	3635h	65

- The GOT writes the bytes of the read data.
- The GOT writes the read data in the order from lower byte.
- The data that exceeds the set device points is not written.

### ■ 4 RFID Controller signal, send data area, and receive data area

Set the RFID Controller signal for controlling data transmissions with the RFID function.

Set [Device] in the RFID dialog to automatically set the RFID Controller signal.

→ 10.2.5 [RFID] dialog

The following shows a setting example of the RFID Controller signal, send data points, and receive data points.

Example) RFID settings

- Device: D1000
- Send data points: 4
- Receive data points: 8

#### (1) RFID Controller signal

Device	Bit number	Item	Description
D1000	b0	RFID Receive signal	The bit turns on when the GOT receives data from the RFID controller, when the nonprocedural protocol is used.
	b1 to b14	-	-
	b15	Error signal	The bit turns on when the GOT receives an Error signal.
D1001	b0 to b7	IC tag communication time	The time (second) that the RFID reader/writer sends or receives data from/to an IC tag is stored in the bits when the dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.) is used.
	b8 to b15	RFID reader/writer No.	RFID reader/writer numbers that send or receive data from/to an IC tag are stored in the bits when the dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.) is used.
D1002	b0 to b15	-	-
D1003	b0 to b7	Error No.	Error codes are stored in the bits when errors occur.
	b8 to b15	Number of errors	The number of error occurrences is stored in the bits.

Device	Bit number	Item	Description
D1004	b0 to b15	RFID communication time	The communication time for the RFID function is stored in the bits. <ul style="list-style-type: none"> <li>• With the dedicated protocol The total elapsed time of sending and receiving data is stored.</li> <li>• With the nonprocedural protocol The elapsed time of sending or receiving data is not stored.</li> </ul>

## (2) Send data area, receive data area

Device	Item	Description
D1005 to D1008	Send data area	The data to be sent to an IC tag is stored in the devices. The number of bytes for data to be sent is stored in the start device.
D1009 to D1016	Receive data area	The received data from an IC tag is stored in the devices. The number of bytes for the received data is stored in the start device.

## ■ 5 Errors during communication

The GOT detects errors when the errors occur while the GOT communicates with the RFID controller.

For the RFID Controller signal, refer to the following.

➔ ■ 4 RFID Controller signal, send data area, and receive data area

### (1) When using a dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.)

When an error occurs, the Error signal of the RFID Controller signal turns on, the number of error occurrences is counted, and an error code is stored in the error No.

Check if an error occurs with the Error signal of the RFID Controller signal.

The following shows error codes to be stored in the error No.

Error code	Description	Corrective action
FFh	Time out	Check if the cable is unplugged and check the RFID controller status. Take the following corrective actions. <ul style="list-style-type: none"> <li>• Connect the cable again.</li> <li>• Correctly wire the cable.</li> <li>• Turn on the RFID controller.</li> </ul>
FEh	SIO error	Check the communication settings and communication environments surrounding controllers. Set the communication settings for the RFID controller suitable for those for the GOT.
FDh	Send setting error	Set the station No. and time within the setting range.
FCh	Receive overflow	Set the receive data area suitable for the received data size.
14h	Time out or no IC tags	Make the GOT send a data read request when communications are available between an RFID controller and an IC tag.

For error codes and corrective actions other than the above, refer to the manual for the RFID controller.

After removing error causes, manually turn off the Error signal and send data again.

### (2) When using a dedicated protocol (ICU-60S or ICU-215 (Mifare) manufactured by MARS TOHKEN SOLUTION CO.LTD.) or a nonprocedural protocol

When an error occurs, an error code is stored in the receive data area or the error No. of the RFID Controller signal.

#### (a) When the GOT receives an error reply from the RFID controller

When the GOT receives the error replay from the RFID controller, an error code is stored in the receive data area.

Check if an error occurs with the Error signal of the RFID Controller signal.

For errors and corrective actions, refer to the manual for the RFID controller. After removing error causes, send data again.

#### (b) When the GOT receives no error reply from the RFID controller

When the GOT receives no error reply from the RFID controller, the GOT turns on the Error signal of the RFID Controller signal, and the error code is stored in the error No.

Check if an error occurs with the Error signal of the RFID Controller signal.

The following shows error codes to be stored in the error No.

Error code	Description	Corrective action
FFh	Time out	Check if the cable is unplugged and check the RFID controller status. Take the following corrective actions. <ul style="list-style-type: none"> <li>• Connect the cable again.</li> <li>• Correctly wire the cable.</li> <li>• Turn on the RFID controller.</li> </ul>
FEh	SIO error	Check the communication settings and communication environments surrounding controllers.
FDh	Send setting error	Correctly set the send data length

Error code	Description	Corrective action
FCh	Receive overflow	Set the receive data area suitable for the received data size.

After removing error causes, manually turn off the Error signal and send data again.

## 6 Example of the RFID action

### (1) Dedicated protocol (LSRF manufactured by LS Industrial Systems Co., Ltd.)

Example) Settings with GT Designer3 (When the GOT is connected to the RFID controller by using channel No.8)

- System signal 1-1: D10, System signal 1-2: D11, System signal 2-1: D12
- Device: D1000, Receive data points: 4

#### (a) Control devices

Device	Item
System information	External Device I/O Complete signal (CH8)(System signal 1-1.b6) RFID Request signal (CH8) (System signal 1-2.b1), External Device I/O signal (CH8)(System signal 2-1.b6) →5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
RFID Controller signal	IC tag communication time, RFID reader/writer No. → 4 RFID Controller signal, send data area, and receive data area

#### (b) Handshake

- Step 1** Set the RFID reader/writer No. and the time that the RFID reader/writer sends data to an IC tag.  
Example) RFID reader/writer No: 3, Time to send data to IC tag: two seconds 2 seconds
- Step 2** Turn on the RFID Request signal, and then the RFID reader/writer communicates with an IC tag.
- Step 3** Data of the IC tag read by the RFID reader/writer is stored in the receive data area.
- Step 4** After data is stored in the receive data area, the GOT turns on the External Device I/O signal (CH8).
- Step 5** Move the data stored in the receive data area to any of the other devices.
- Step 6** Check that the data is moved, and then turn on the External Device I/O Complete signal (CH8).
- Step 7** The GOT turns off the External Device I/O Complete signal (CH8).
- Step 8** Turn off the External Device I/O Complete signal (CH8) and the RFID Request signal (CH8).

(c) **Example of the sequence program (When the GOT is connected to QCPU by using channel No.8)**

After the GOT receives data from the RFID controller, make sure to turn off the External Device I/O Complete signal and the RFID Request signal.

When the External Device I/O Complete signal and the RFID Request signal are on, the GOT cannot read the data. Create a sequence program so that the External Device I/O Complete signal and the RFID Request signal turn off.

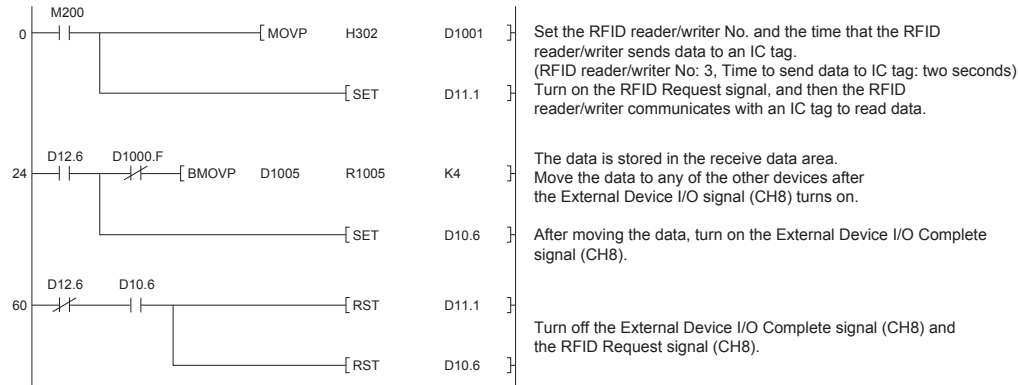

**Point**

**Before using example programs**

For applying the example programs in this manual to the actual system, make sure that the target system has no troubles on the control.

Signal to be used in a sequence program

- RFID reader/writer No.3 read command: M200

(2) **Dedicated protocol (ICU-60S or ICU-215 (Mifare) manufactured by MARS TOHKEN SOLUTION CO.LTD.)**

Example) Settings with GT Designer3 (When the GOT is connected to the RFID controller by using channel No.8)

- System signal 1-1: D10, System signal 1-2: D11, System signal 2-1: D12
- Device: D1000, Send data points: 30, Receive data points: 30

(a) **Control devices**

Device	Item
System information	External Device I/O Complete signal (CH8)(System signal 1-1.b6) RFID Request signal (CH8) (System signal 1-2.b1), External Device I/O signal (CH8)(System signal 2-1.b6) →5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

(b) **Handshake**

- Step 1** Set the data to be sent to the RFID controller in the send data area.  
Set the data suitable for the protocol of the RFID controller to be used.  
Example) Reading record No.3 by "rf\_read" command

- Step 2** Turn on the RFID Request signal, and then the RFID reader/writer communicates with an IC tag.
- Step 3** Data of the IC tag read by the RFID reader/writer is stored in the receive data area.
- Step 4** After data is stored in the receive data area, the GOT turns on the External Device I/O signal (CH8).
- Step 5** Move the data stored in the receive data area to any of the other devices.
- Step 6** Check that the data is moved, and then turn on the External Device I/O Complete signal (CH8).
- Step 7** The GOT turns off the External Device I/O Complete signal (CH8).
- Step 8** Turn off the External Device I/O Complete signal (CH8) and the RFID Request signal (CH8).

**(c) Example of the sequence program (When the GOT is connected to QCPU by using channel No.8)**

After the GOT receives data from the RFID controller, make sure to turn off the External Device I/O Complete signal and the RFID Request signal.

When the External Device I/O Complete signal and the RFID Request signal are on, the GOT cannot read the data. Create a sequence program so that the External Device I/O Complete signal and the RFID Request signal turn off.

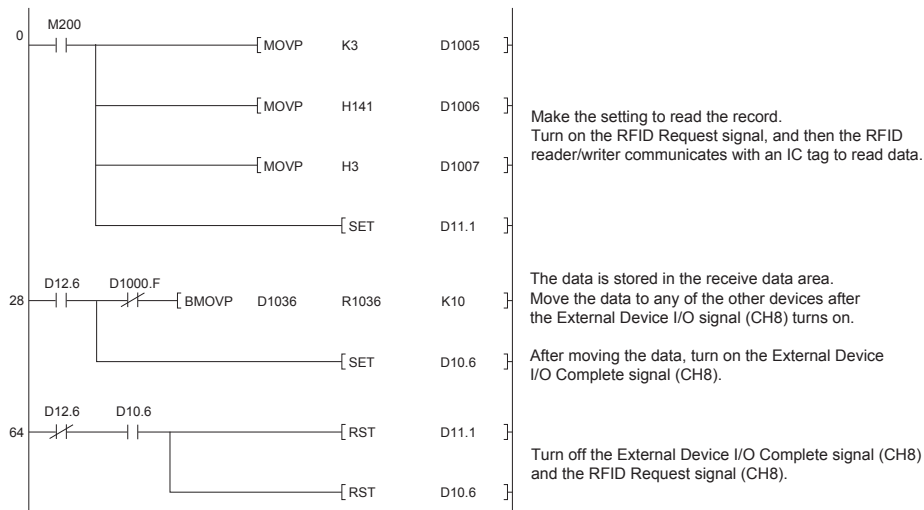

**Point**

**Before using example programs**

For applying the example programs in this manual to the actual system, make sure that the target system has no troubles on the control.

Signal to be used in a sequence program

- Record No.3 read command: M200

### (3) Nonprocedural protocol

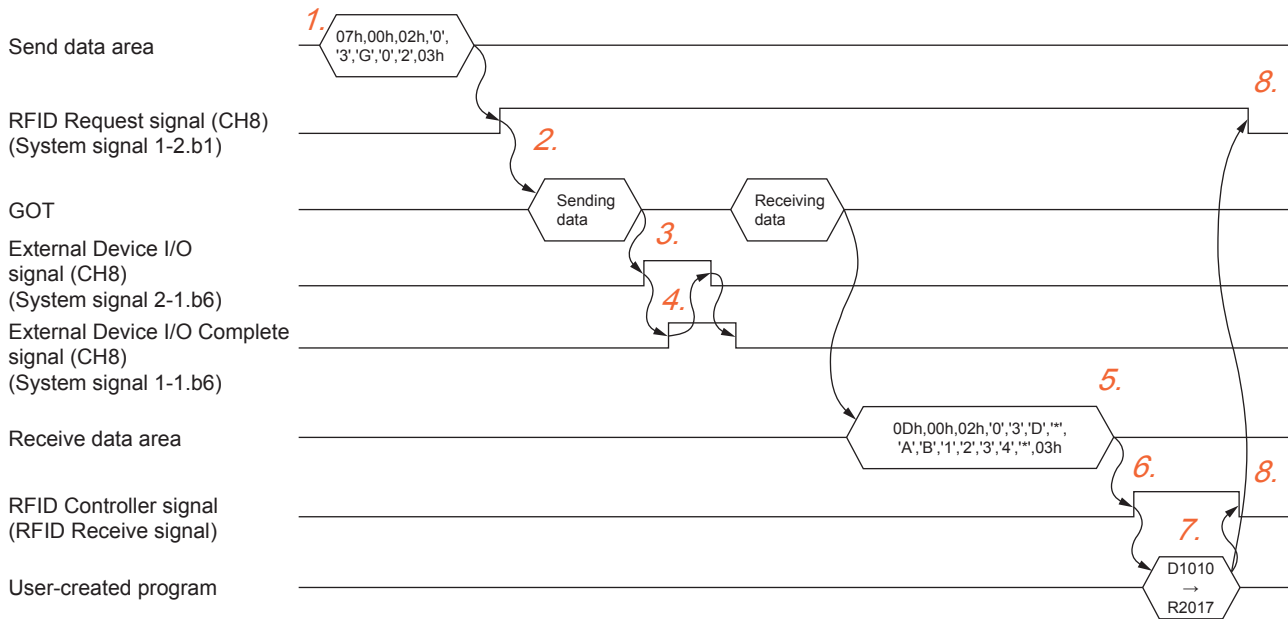

Example) Settings with GT Designer3 (When the GOT is connected to the RFID controller by using channel No.8)

- System signal 1-1: D10, System signal 1-2: D11, System signal 2-1: D12
- Device: D1000, Send data points: 5, Receive data points: 8

#### (a) Control devices

Device	Item
System information	External Device I/O Complete signal (CH8)(System signal 1-1.b6) RFID Request signal (CH8) (System signal 1-2.b1), External Device I/O signal (CH8)(System signal 2-1.b6) →5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])
RFID Controller signal	IC tag communication time, RFID reader/writer No. → ■ 4 RFID Controller signal, send data area, and receive data area

#### (b) Handshake

- Step 1** Set the data to be sent to the RFID controller in the send data area.  
Set the data suitable for the protocol of the RFID controller to be used.  
Example) "07h, 00h, 02h, '0', '3', 'G', '0', '2', 03h"
- Step 2** Turn on the RFID request signal (CH8), and then the RFID reader/writer sends the data stored in the send data area to the IC tag.
- Step 3** The GOT turns on the External Device I/O signal (CH8).
- Step 4** Check that the External Device I/O signal (CH8) is on, and then turn on the External Device I/O Complete signal (CH8).  
The GOT turns off the External Device I/O Complete signal (CH8).  
Turn off the External Device I/O Complete signal (CH8).
- Step 5** The IC tag sends data to the RFID reader/writer, and the data is stored in the receive data area.
- Step 6** The GOT turns on the RFID Receive signal.
- Step 7** Move the data stored in the receive data area to any of the other devices.
- Step 8** Turn off the RFID Request signal (CH8) and the RFID Receive signal.

#### (c) Example of the sequence program (When the GOT is connected to QCPU by using channel No.8)

Be sure to turn off the RFID Request signal and the RFID Receive signal before the GOT sends the next data read request to the RFID controller.

When the RFID Request signal and the RFID Receive signal are on, the GOT cannot communicate with the RFID controller.

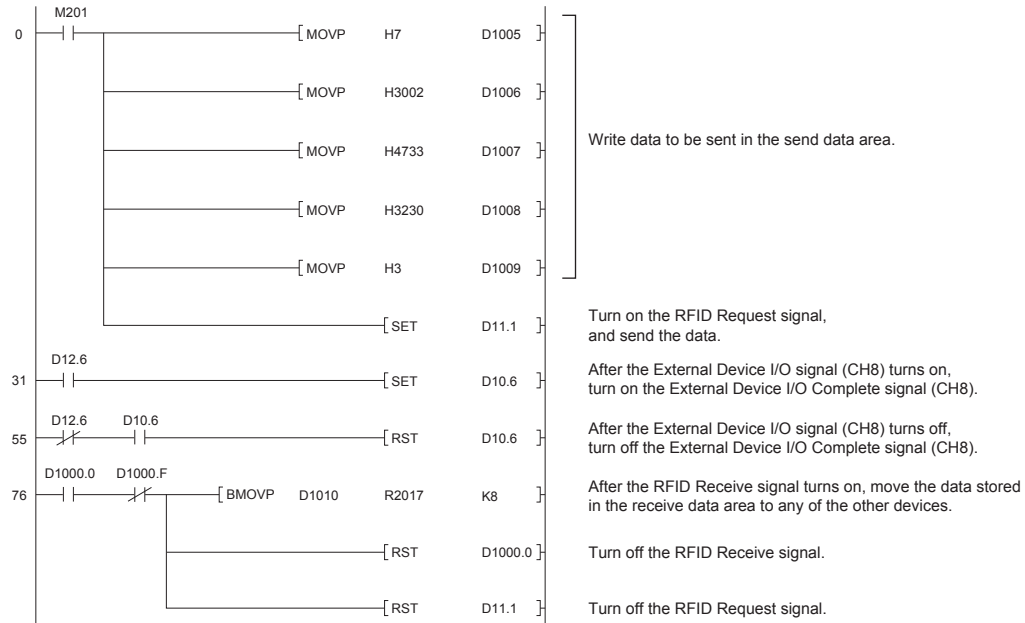

Create a sequence program so that the RFID Request signal and the RFID Receive signal turn off.

### Before using example programs

For applying the example programs in this manual to the actual system, make sure that the target system has no troubles on the control.

Signal to be used in a sequence program

- Data send command: M201

## 10.2.8 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25HS-V.

### 1 Precautions for hardware

When the RFID controller is used with [Standard I/F(RS232)], 5V power supply from the GOT should become enabled on some RFID controllers.

For applicable RFID controllers, refer to Technical News GOT-A-0064 "List of Valid Devices Applicable for GOT2000 Series" separately available, or contact your local distributor.

## 10.2.9 Relevant settings

Not available to GT25HS-V.

Set the relevant settings other than the specific settings for the RFID function as required.

The following shows the functions that are available by the relevant settings.

### 1 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu to display the [Environmental Setting] dialog.

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Target CH	Function	Setting item
CH5	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b4)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b0). (Read device: System signal 1-2.b3)	[System Signal 1-2]
	Notifying that the data read by the RFID reader/writer is stored into the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-3.b0)	[System Signal 2-3]
CH6	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b7)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b1). (Read device: System signal 1-2.b6)	[System Signal 1-2]
	Notifying that the data read by the RFID reader/writer is stored into the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-3.b1)	[System Signal 2-3]
CH7	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b10)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-3.b2). (Read device: System signal 1-2.b9)	[System Signal 1-2]
	Notifying that the data read by the RFID reader/writer is stored into the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-3.b2)	[System Signal 2-3]
CH8	Turning on this signal requests the RFID controller to read data. (Read device: System signal 1-2.b1)	[System Signal 1-2]
	Turning on this signal turns off the External Device I/O signal (System signal 2-1.b6). (Read device: System signal 1-1.b6)	[System Signal 1-1]
	Notifying that the data read by the RFID reader/writer is stored into the specified device when the dedicated protocol is used. Notifying that sending data to the RFID controllers is completed when the nonprocedural protocol is used. (Write device: System signal 2-1.b6)	[System Signal 2-1]

### 2 GOT Internal Device

⇒12.1.3 GOT special register (GS)

Function	Setting item
Notifying that external authentication of operator authentication function succeeds. (Write device)	GS240.b0
Notifying that external authentication of operator authentication function fails. (Write device)	GS240.b1
Notifying that the login screen for the external authentication of operator authentication function is displayed. (Write device)	GS240.b14
Notifying that the object is in the ready state for the data read by the barcode reader and the RFID to be directly input. (Write device)	GS243.b15

## 10.3 Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Ethernet))

GT27 GT25 GT23 GT21 SoftGOT2000 GS

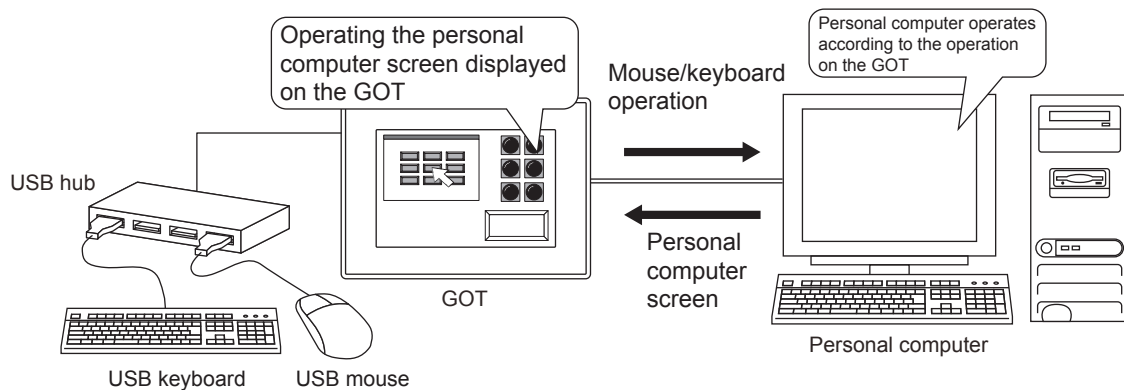

**GOT Graphic Ver.1**

### 10.3.1 Overview of the remote personal computer operation function (Ethernet)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The remote personal computer operation (Ethernet) enables you to operate the personal computer by using the GOT via Ethernet.

#### ■1 Operating the personal computer on the GOT screen.

Using the USB mouse/keyboard function enables you to use the USB mouse and USB keyboard for the remote personal computer operation (Ethernet).

For the details of the USB mouse/keyboard function, refer to the following.

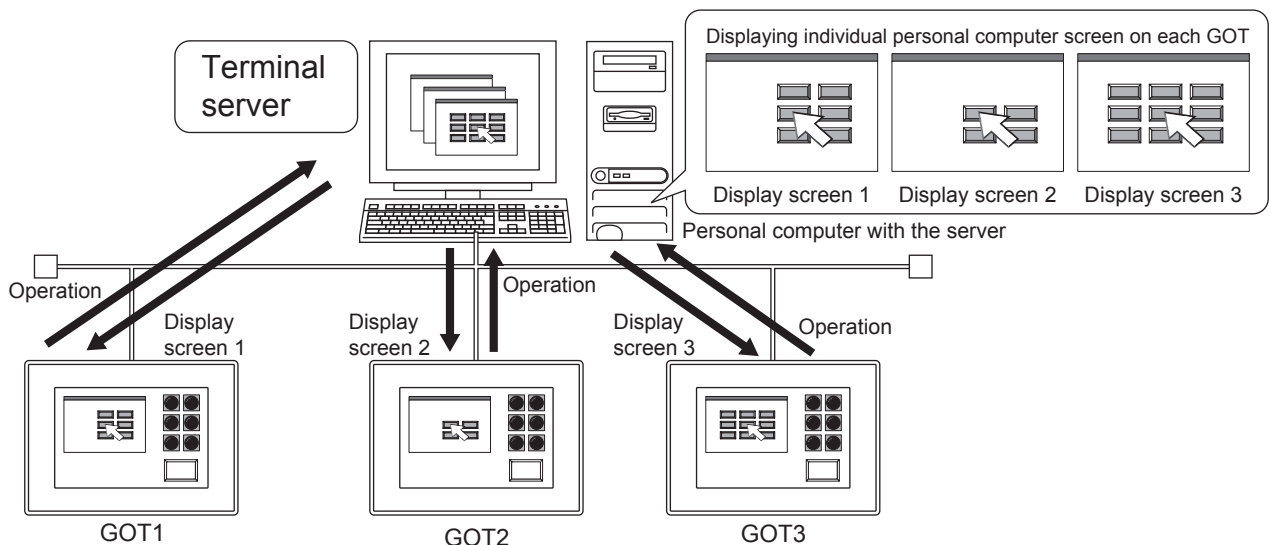

→5.3.4 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

#### ■2 Remote personal computer operation (Ethernet) with multiple GOTs

When the personal computer with the server OS is used, the terminal server function of the personal computer enables the multiple GOTs to perform the remote personal computer operation (Ethernet).

When the personal computer screen appears on the GOT, the GOT logs on to the terminal server automatically.

After the logon, the terminal server displays the individual screen of the personal computer on each GOT.

## 10.3.2 Specifications of the remote personal computer operation (Ethernet)

### ■ 1 System application (extended function)

To use the remote personal computer operation (Ethernet), a system application (extended function) of [PC Remote Operation(Ethernet)] is required.

Selecting [Use PC Remote Operation (Ethernet)] in the [PC Remote Operation] dialog incorporates the application into the package data automatically.

⇒ 10.3.4 [PC Remote Operation] dialog

### ■ 2 Remote personal computer operation (Ethernet) to be set for one project

One remote personal computer operation function is available for one project.

### ■ 3 License number registration

To use the remote personal computer operation (Ethernet), register a license number on the GOT.

For how to register the license number, refer to the following.

⇒ GOT2000 Series User's Manual (Utility)

When the license number is not registered, the 30 minutes of trial for the function is available upon connection to the VNC server.

Up to 30 trials are available.

To start a trail again, turn off and then on the GOT.

After 30 trials, you must register the license number to use the function.

### ■ 4 Required software to be installed

Software you need to install depends on the number of the connected GOT and personal computer.

⇒ ■ 5 Specifications of relevant software

#### (1) VNC server

##### (a) Applicable VNC server software

Use the software with the following version.

If you use the software with the later version, the GOT may not operate properly.

Name	Manufacturer	Version
UltraVNC	UltraVNC team	1.0.5, 1.0.5.6, 1.1.9.6, 1.2.1.1

##### (b) Operating environment

For the operating environment of the software, refer to the following website.

<http://www.uvnc.com/>

##### (c) How to obtain the software

Refer to the following website to download UltraVNC. (English only)

<http://www.uvnc.com/>

Download the Win32 Full version software.

Note that the above website may be changed without notification.

#### (2) Windows terminal server function

##### (a) Applicable terminal server function

The terminal server function with the following OS is applicable.

- Windows Server 2012 R2 (x64): Automatic logon to the terminal server is not supported.
- Windows Server 2003

### (3) Encryption software (OpenSSL)

#### (a) Applicable software

Name	Manufacturer	Version
Win32OpenSSL	The OpenSSL Project	<ul style="list-style-type: none"><li>• For Windows Server 2012 R2 (x64): 1.0.2 (Use the latest version.)</li><li>• For Windows Server 2003: 0.9.8 (Use the latest version.)</li></ul>

#### (b) Operating environment

For the operating environment of the software, refer to the following website.  
<http://www.slproweb.com/products/Win32OpenSSL.html>

#### (c) How to obtain the software

Refer to the following website to download the updated Win32OpenSSL.  
<http://www.slproweb.com/products/Win32OpenSSL.html>

### (4) Terminal service function software (RDPGateway(rdp2vnc))

#### (a) Applicable software

Name	Manufacturer
RDPGateway (rdp2vnc)	Hitachi Solutions, Ltd.

#### (b) How to obtain the software

Refer to the following website to download RDPGateway (rdp2vnc).  
<https://csps.hitachi-solutions.co.jp/rdp2vnc/>

## ■ 5 Specifications of relevant software

### (1) For the remote personal computer operation (Ethernet) with one GOT

Install the following software on the personal computer.

- VNC server software

For the installation instructions, refer to the following.

→ 10.3.5 ■ 1 For the remote personal computer operation (Ethernet) with one GOT

### (2) For the remote personal computer operation (Ethernet) with multiple GOTs

Install the following software on the personal computer.

- Windows terminal server function
- Encryption software
- Terminal service function software

For the installation instructions, refer to the following.

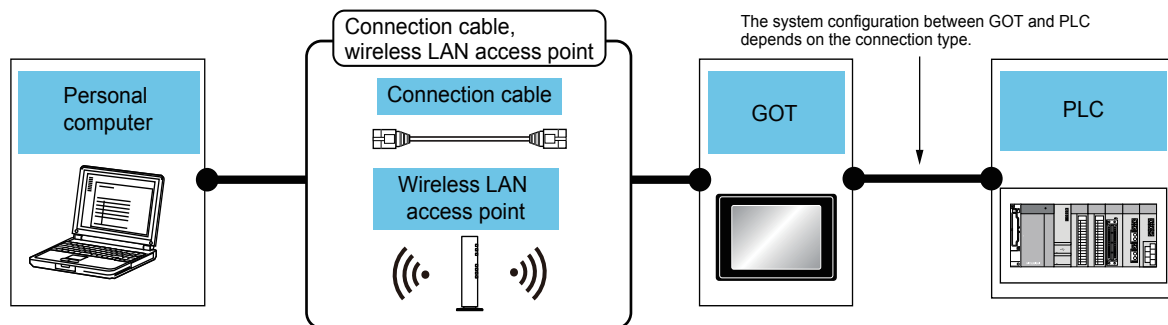

→ 10.3.5 ■ 2 For the remote personal computer operation (Ethernet) with multiple GOTs

### 10.3.3 How to use the remote personal computer operation (Ethernet)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1 System configuration

The following shows the system configuration of the personal computer.

Personal computer	Connection cable <sup>*1,2</sup> , wireless LAN access point	Maximum segment length <sup>*3</sup>	GOT		PLC	Number of connectable personal computers
			Option	GOT model		
Select by each user	<ul style="list-style-type: none"> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>• 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built into GOT)	GT27, GT25	For the system configuration between the GOT and the PLC, refer to each connection manual.	One personal computer for one GOT
			GT25-J71E71-100	GT27, GT25 <sup>*6</sup>		
	-	-	GT25-WLAN	GT27 <sup>*4</sup> , GT25 <sup>*4*6</sup>		
	<ul style="list-style-type: none"> <li>• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*5</sup> , GT25 <sup>*5*6</sup>		

\*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (N22WL-JPA or N22WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard. For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*2 A straight cable is applicable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

\*3 The length between the hub and node.

The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades. For the limit, contact the switching hub manufacturer.

\*4 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*5 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*6 Not available to GT2505-V and GT25HS-V.

#### 2 Setting procedure

The following shows how to configure the settings for the remote personal computer operation (Ethernet).

**Step 1** Connect the personal computer to the GOT.

→ ■ 1 System configuration

**Step 2** Set the destination I/F for the Ethernet download in [Destination I/F] in [Ethernet Download] in the peripheral device setting ([PC (Data Transfer)] dialog).

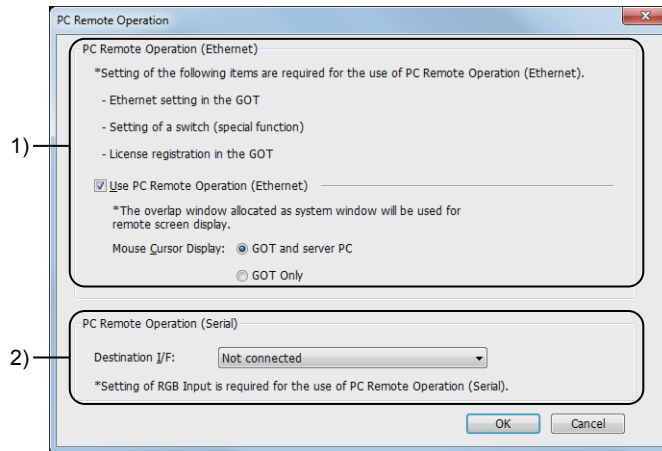

- ⇒4.8.1 [PC (Data Transfer)] dialog
- Step 3** Configure the settings for the remote personal computer operation (Ethernet) in the [PC Remote Operation] dialog.  
⇒10.3.4 [PC Remote Operation] dialog
- Step 4** Set the GOT Ethernet interface.  
⇒5.4 Setting the GOT Ethernet Interface ([GOT Ethernet Setting])
- Step 5** Arrange the special function switch on the GT Designer3 screen, then select [PC Remote Operation (Ethernet)] for the switch action.  
For the special function switch settings, refer to the following.  
⇒8.2.9 [Special Function Switch] dialog
- Step 6** Install the software on the personal computer.  
⇒10.3.5 Installation of the software
- Step 7** Write the package data to the GOT.  
For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.  
⇒4. COMMUNICATING WITH GOT
- Step 8** Register the license number on the GOT.  
For how to register the license number, refer to the following.  
⇒GOT2000 Series User's Manual (Utility)
- Step 9** Operate the personal computer screen on the GOT.  
⇒10.3.6 Personal computer screen on the GOT

### 10.3.4 [PC Remote Operation] dialog

Select [Common] → [Peripheral Setting] → [PC Remote Operation] from the menu to display the setting dialog.

#### 1) Remote personal computer operation (Ethernet)

Set the actions of the remote personal computer operation (Ethernet).

Item	Description
[Use PC Remote Operation (Ethernet)]	Select this item to enable the remote personal computer operation (Ethernet).
[Window to be used for remote screen display]	Select the overlap window to display the personal computer screen on the GOT. ⇒ 1.2.3 ■ 2 Screen specifications
[Mouse Cursor Display]	Select how to display the mouse cursor on the GOT when the USB mouse is used. <ul style="list-style-type: none"> <li>• [GOT and server PC] Select this item to display the mouse cursor on the GOT and the mouse cursor on the personal computer.</li> <li>• [GOT Only] Select this item to display only the mouse cursor on the GOT. The mouse cursor on the personal computer is not displayed.</li> </ul>

#### 2) Remote personal computer operation (Serial)

No setting is required.

## 10.3.5 Installation of the software

---

For the remote personal computer operation (Ethernet) with GOT, install the following software on the personal computer, and configure the settings.

### ■ 1 For the remote personal computer operation (Ethernet) with one GOT

Install the VNC server software on the personal computer.

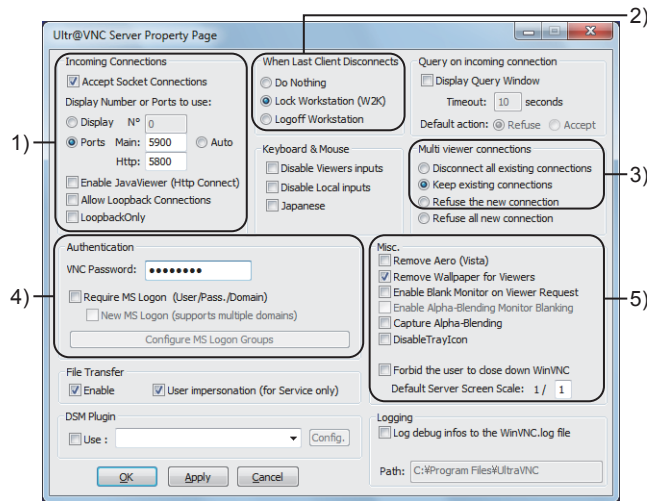

The following shows how to install the software and configure the settings.

#### (1) How to install Remote Personal Computer Operation Driver (MES\_2X)

- Step 1** Execute the downloaded file, and start the installer.
- Step 2** The setup window appears.
- Click the [Next] button until the [License Agreement] screen is displayed.  
Confirm the description in the screen, and then select [I accept the agreement].
- Step 3** Click the [Next] button until the [Select Destination Location] screen is displayed.
- In the screen, select the location where the software is installed.
- Step 4** The [Select Components] screen appears.
- Select [Full installation] or [UltraVNC Server Only].
- Step 5** The [Select Start Menu Folder] screen appears.
- Select a start menu folder to create a shortcut.
- Step 6** The confirmation window appears to confirm whether to download the following software.
- Optional non-GPL addons recommended for Vista  
Download the software when using Windows Vista.
  - Optional non-GPL Mirror Driver  
Download the software.
- Step 7** The [Select Additional Tasks] screen appears.
- Select [Register UltraVNC Server as a system service].  
UltraVNC is registered in the system service.
  - Select [Start or restart UltraVNC service].  
The UltraVNC service becomes available.
  - To create a shortcut icon on the desktop, select [Create UltraVNC desktop icons].
  - To open the file with the extension of .vnc by using UltraVNC Viewer, select [Associate UltraVNC Viewer with the .vnc file extension].
- Step 8** The confirmation screen for installation appears.
- Confirm the description in the screen, and then click the [Install] button.  
Installation of UltraVNC starts.

## (2) Settings

- Step 1** When UltraVNC is not started, click [UltraVNC] → [UltraVNC Server] from the start menu to start UltraVNC.
- Step 2** Right-click the UltraVNC icon in the notification area, and select [Admin Properties].  
The setting window appears, and then configure the settings as shown below.  
(No setting is required for the items which are not explained in the following.)

### 1) [Incoming connections]

Configure the connection settings between the GOT and the VNC server.

Item	Description
[Accept Socket Connection]	Select this item to accept the socket connection. Without selecting, the GOT cannot be connected to the VNC server.
[Display Number or Ports to use]	Set a port number for the connection. [Display]: Set the port number with a display number. The port number is the set display number with 5900 added. [Ports(Main)]: Set the port number without the display number. The setting range is [1024] to [65535].

### 2) [When Last Client Disconnects]

Set the action when the last connected VNC client (GOT) is disconnected.

Select [Lock Workstation(W2K)].

### 3) [Multi viewer connections]

Set the action when multiple VNC clients (GOTs) require to be connected to the VNC server.

Select [Keep existing connections].

### 4) [Authentication]

Configure the authentication setting to connect the GOT to the VNC server.

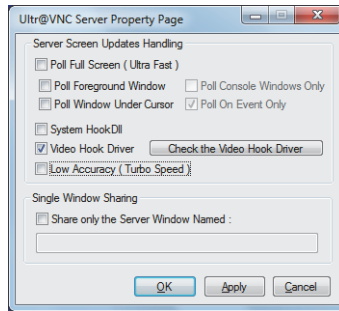

Item	Description
[VNC Password]	Set a password for the VNC server.

### 5) [Misc.]

Configure the settings other than the above.

Item	Description
[Remove Aero (Vista)]	Select this item to disable Windows Aero while the GOT is connected to the viewers. Set this item when using Windows Aero.
[Remove Wallpaper for Viewers]	Select this item not to display a wallpaper while the GOT is connected to the viewers.
[Default Server Screen Scale]	Set the default value of the server screen display magnification. Make sure to set 1 as the default value.

- Step 3** Right-click the UltraVNC icon in the notification area, and select [Properties].  
The setting window appears, and then select [Video Hook Driver].

## ■ 2 For the remote personal computer operation (Ethernet) with multiple GOTs

For the remote personal computer operation (Ethernet) with multiple GOTs, use the terminal server function of the personal computer.

To use the the terminal server function, install the following software.

- Windows terminal server function
- Encryption software (OpenSSL)
- Terminal service function software (RDPGateway(rdp2vnc))

### (1) How to install the software for terminal server function

- Step 1** Click [Start] → [Settings] → [Control Panel].
- Step 2** The [Control Panel] window appears.  
Click [Add or Remove Programs].
- Step 3** The [Add or Remove Programs] window appears.  
Click [Add/Remove Windows Components].
- Step 4** The [Windows Components Wizard] window appears.  
Select [Terminal Server] and [Terminal Server Licensing] in the component list.
- Step 5** Click the [Next] button.  
Installation of the software for terminal server function starts.
- Step 6** After the installation is completed, the [Terminal Server Licensing] window appears.  
Right-click a server name you register, and select [Activate Server].

### (2) Terminal server function settings

Set the following items in the terminal server function settings.

For how to configure the terminal server settings, refer to the Windows manual.

#### (a) User name and password

Register a user name and password to log on to the terminal server.

Set the user name with up to 20 characters, and the password with up to 127 characters.

One-byte alphanumeric characters, one-byte space, and symbols (excluding "/[]:; | =,+\*?<>") are available for the user name. One-byte alphanumeric characters, one-byte space, and the following symbols are available for the password.

!"#\$%&'()\*+,-./:;<=>@[\\]^\_`{|}~

#### (b) Logon screen display settings

Configure the setting so that the logon screen is displayed on the personal computer with the terminal server when the GOT is connected to the personal computer.

If the logon screen is not displayed on the terminal server, unexpected actions may occur on the personal computer.

#### (c) Disabling the network level authentication (for Windows Server 2012 R2 (x64))

- Step 1** From the Windows start menu, select [Control Panel].
- Step 2** In the [Control Panel] window, select [System] → [Remote Settings] from the menu.
- Step 3** In the [System Properties] window, select the [Remote] tab and clear [Allow connections only from computers running Remote Desktop with Network Level Authentication].

### (3) How to install the encryption software

- Step 1** Execute the downloaded file, and start the installer.
- Step 2** The setup window appears.  
Click the [Next] button until the [License Agreement] screen is displayed. Confirm the description in the screen, and then select [I accept the agreement].
- Step 3** Click the [Next] button until the [Select Destination Location] screen is displayed.  
In the screen, select the location where the software is installed.
- Step 4** The [Select Start Menu Folder] screen appears.  
Select a start menu folder to create a shortcut.
- Step 5** The [Select Additional Tasks] screen appears.  
Select a directory where the DLL file for OpenSSL is copied.
- Step 6** The confirmation screen for installation appears.  
Confirm the description in the screen, and then click the [Install] button.  
Installation of OpenSSL starts.
- Step 7** After the installation is completed, the confirmation screen for donation appears.  
Confirm the description in the screen, and then select or clear the check box.  
When you do not make a donation, clear the check box.

### (4) Encryption software settings

No setting is required.

### (5) How to install the terminal service function software

- Step 1** Decompress the downloaded file.
- Step 2** Open the rdp2vnc folder, and execute the install2003jp.bat.  
The command prompt starts.
- Step 3** Enter the name of the personal computer where RDPGateway (rdp2vnc) is installed.
- Step 4** Enter the name and password of the user with administrator authority.  
Installation of the software starts.
- Step 5** After the installation is completed, press the Enter key to exit the command prompt.
- Step 6** Select [Start] → [Control Panel] → [Administrative Tools] → [Services].  
The [Services] window appears.  
Check that [rdp2vnc Server] is registered.
- Step 7** Open the drive C to check that the [rdp2vnc] folder is created.

### (6) Terminal service function software settings

- Step 1** Select [Start] → [Control Panel] → [Administrative Tools] → [Services].  
The [Services] window appears.  
Right-click [rdp2vnc Server], and select [Properties].
- Step 2** The property setting window appears.  
Click the [Recovery] tab to set the following for [First failure], [Second failure], and [Subsequent failures].
- [Restart the Service]

## 10.3.6 Personal computer screen on the GOT

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The personal computer screen on the GOT is displayed on the overlap window.  
No setting is required to use the overlap window.

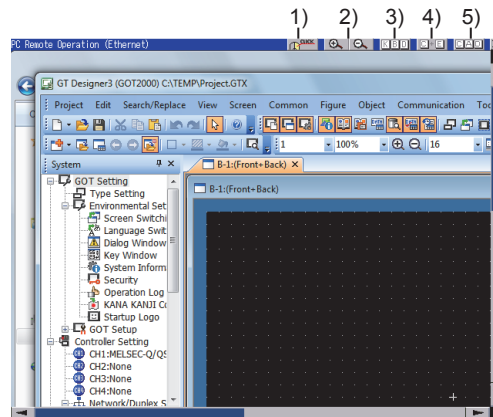

### ■ 1 How to open the personal computer screen on the GOT

Open the personal computer screen on the GOT by using the special function switch.

For the special function switch settings, refer to the following.

⇒8.2.9 [Special Function Switch] dialog

### ■ 2 Operating procedure

#### 1) Click switching button

Touch this button to switch the left-click and right-click.

#### 2) Zoom in button, Zoom out button

Touch these buttons to change the display magnification of the screen.

The zoom in button zooms in the displayed screen.

The zoom out button zooms out the displayed screen.

#### 3) [KBD] button

Touch this button to display the soft keyboard which is set on the special function switch.

#### 4) [C+E] button

This button performs the same operation as that of holding down the [Ctrl] key and the [ESC] key simultaneously.

#### 5) [CAD] button

This button performs the same operation as that of holding down the [Ctrl] key, the [ESC] key, and the [Del] key simultaneously.

#### (1) Mouse cursor operation

Touching the personal computer screen on the GOT enables the click operation.

To switch the left-click and the right-click, touch the click switching button.

The drag operation is also enabled.

## (2) Soft keyboard operation

Touching the [KBD] button displays the soft keyboard which is set on the special function switch.

Japanese 106 keyboard

English 101 keyboard

The continuous touch of the buttons on the soft keyboard will cause the auto-repeat behavior of the characters on the buttons.

However, the [Ctrl] button, the [Shift] button, the [Alt] button, and the [Caps] button are excluded.

Touching the title bar moves the soft keyboard as well as the key window.

Touching the [x] button closes the soft keyboard.

## (3) USB mouse/keyboard operation

For the USB mouse/keyboard operation with the personal computer screen on the GOT, refer to the following.

→5.3.4 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

## 10.3.7 Precautions

### ■ 1 Precautions for use

#### (1) Force close of the personal computer screen on the GOT

The personal computer screen on the GOT is forcibly closed in the following cases.

- When starting the utility
- When starting system applications (extended functions), including the sequence program monitors, by using a special function switch

To use the remote personal computer operation (Ethernet) after the monitor screen appears, open the personal computer screen on the GOT again by using the special function switch.

#### (2) Mouse cursor display when the USB mouse is installed or removed

When the USB mouse is installed or removed while the personal computer screen on the GOT is displayed, the mouse cursor is displayed as shown below.

To display the mouse cursors according to the GT Designer3 settings, close the personal computer screen on the GOT, and then open the screen again.

Mouse cursor display setting	Mouse cursor display method	
GOT and server PC	Installed	Both the mouse cursor on the GOT and the mouse cursor on the personal computer are displayed.
	Removed	Only the mouse cursor on the personal computer is displayed. (The mouse cursor on the GOT is not displayed.)
GOT Only	Installed	Both the mouse cursor on the GOT and the mouse cursor on the personal computer are displayed.
	Removed	The mouse cursors are not displayed. (Neither the mouse cursor on the GOT nor the mouse cursor on the personal computer are displayed.)

## 10.3.8 Relevant settings

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the remote personal computer operation function (Ethernet) as required.

The following shows the functions that are available by the relevant settings.

### ■ 1 GOT Internal Device

⇒ 12.1.3 GOT special register (GS)

Function	Setting item
Hiding the [CAD] button in the personal computer screen on the GOT (Read device)	GS465.b0
Hiding the [C+E] button in the personal computer screen on the GOT (Read device)	GS465.b1
Hiding the [KBD] button in the personal computer screen on the GOT (Read device)	GS465.b2
Hiding the zoom in button and the zoom out button in the personal computer screen on the GOT, and fixing the display magnification to 100% (Read device)	GS465.b3
Applying the display magnification specified for the special function switch that calls the personal computer screen. This function is enabled when GS465.b3 is turned on to fix the magnification to 100%. (Read device)	GS465.b5
Hiding the click switching button of the personal computer screen on the GOT (Read device)	GS465.b6

## 10.4 Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Serial))

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

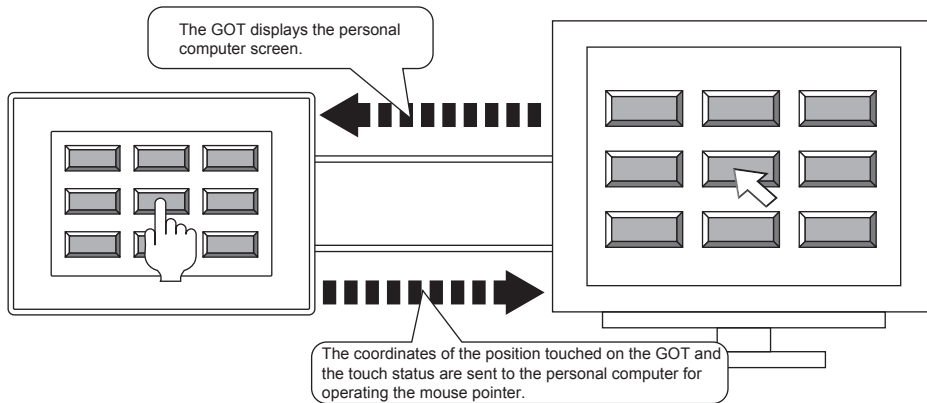

### 10.4.1 Overview of the remote personal computer operation function (Serial)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The remote personal computer operation (Serial) enables you to remotely operate the mouse pointer of a personal computer by touching the personal computer screen displayed on the GOT.

To display the personal computer screen on the GOT, use one of the following functions.

- Video/RGB display object
- RGB display function

Using the USB mouse and keyboard function enables you to use the USB mouse and keyboard, for the remote personal computer operation (Serial).

For the details of the USB mouse/keyboard function, refer to the following.

→5.3.4 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

## 10.4.2 Specifications of the remote personal computer operation (Serial)

---

### ■ 1 System application (extended function)

To use the remote personal computer operation (Serial), a system application (extended function) of [PC Remote Operation(Serial)] is required.

To display the personal computer screen on the GOT, a system application (extended function) of [Video/RGB (Object)] or [Video/RGB] is required.

Configuring the following settings incorporates the applications into the package data automatically.

- [PC Remote Operation(Serial)]

Select [Destination I/F] in the [PC Remote Operation] dialog.

⇒ 10.4.4 [PC Remote Operation] dialog

- [Video/RGB (Object)]

Select [Use Video/RGB Input] and select [GT27-R2 (RGB Screen only)] for [Unit Type Name] in the [Video/RGB Input] dialog.

⇒ 10.6.5 [Video/RGB Input] dialog

- [Video/RGB]

Select [Use Video/RGB Input] and select [GT27-R2-Z (RGB Screen only)] or [GT27-V4-Z/GT27-V4R1-Z] for [Unit Type Name] in the [Video/RGB Input] dialog.

⇒ 10.6.5 [Video/RGB Input] dialog

### ■ 2 Required version of BootOS

To use GT27-R2, install version N or later of BootOS on the GOT.

⇒ 4.3.2 Transferring data

### ■ 3 Remote personal computer operation (Serial) to be set for one project

One remote personal computer operation function is available for one project.

### ■ 4 Required software to be installed

#### (1) Remote Personal Computer Operation Driver (DMT-DD, TSC-DD, or MES\_2X)

This is a mouse emulation software for use in operating the mouse pointer on the personal computer according to the device data of the X-coordinate, Y-coordinate, and touch status sent by the GOT.

Select the driver according to the OS of the personal computer used.

- Windows 10, Windows 8.1, or Windows 8: DMT-DD
- Windows 7 or Windows Vista: TSC-DD
- Windows XP: MES\_2X

For the details, refer to the following.

⇒ (3) Operating environment

The copyright of the software belongs to DMC Co., Ltd.

Use the software under the license agreement displayed when installing the software.

#### (2) How to obtain the software

Obtain the software with either of the following methods.

- Disk5 folder in the DVD-ROM of GT Works3  
The location where the software is stored is shown in the ReadmeE.txt.
- Contact your local distributor.

### (3) Operating environment

The following shows the operating environment of the personal computer and the drivers for the remote personal computer operation.

Item	Driver	Description
Model	-	Personal computer that Windows runs on. Equipped with the RS-232 serial port (9-pin).
OS (English)	DMT-DD *4*5*6*7	<ul style="list-style-type: none"> <li>• Microsoft Windows 10 Enterprise (32 bit, 64 bit)</li> <li>• Microsoft Windows 10 Pro (32 bit, 64 bit)</li> <li>• Microsoft Windows 10 Home (32 bit, 64 bit)</li> <li>• Microsoft Windows 8.1 Enterprise (32 bit, 64 bit)</li> <li>• Microsoft Windows 8.1 Pro (32 bit, 64 bit)</li> <li>• Microsoft Windows 8.1 (32 bit, 64 bit)</li> <li>• Microsoft Windows 8 Enterprise (32 bit, 64 bit)</li> <li>• Microsoft Windows 8 Pro (32 bit, 64 bit)</li> <li>• Microsoft Windows 8 (32 bit, 64 bit)</li> </ul>
	TSC-DD *1*2	<ul style="list-style-type: none"> <li>• Microsoft Windows 7 Ultimate (32 bit) Service Pack1</li> <li>• Microsoft Windows 7 Enterprise (32 bit) Service Pack1</li> <li>• Microsoft Windows 7 Professional (32 bit) Service Pack1</li> <li>• Microsoft Windows 7 Home Premium (32 bit) Service Pack1</li> <li>• Microsoft Windows 7 Starter (32 bit) Service Pack1</li> <li>• Microsoft Windows Vista Ultimate (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows Vista Enterprise (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows Vista Business (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows Vista Home Premium (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows Vista Home Basic (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows XP Professional (32 bit) Service Pack3 or later *3</li> <li>• Microsoft Windows XP Home Edition (32 bit) Service Pack3 or later *3</li> </ul>
	MES_2X	<ul style="list-style-type: none"> <li>• Microsoft Windows XP Professional (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows XP Home Edition (32 bit) Service Pack2 or later</li> <li>• Microsoft Windows 2000 Professional Service Pack4 or later</li> </ul>

\*1 Version 1.00.27 or later is supported.

\*2 Compatible with GT Designer3 Version 1.108N or later.

\*3 Microsoft .NET Framework 2.0, 3.0, or 3.5 must be installed.

\*4 Compatible with GT Designer3 Version 1.200J or later.

\*5 Microsoft .NET Framework 3.5 must be installed.

\*6 The system builder version is not applicable.

\*7 For installation, the administrator authority is required.

## 10.4.3 How to use the remote personal computer operation (Serial)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1 System configuration

The following shows the system configuration of the personal computer.

Personal computer	Connection cable*1		GOT		PLC	Number of connectable multimedia controllers
	Cable model	Maximum length	Option	GOT model		
Select by each user	Connection cable 1: GT01-C30R2-9S or Preparing connection cables by each user*3	15m	-(Built into GOT)	GT27*4	For the system configuration between the GOT and the PLC, refer to each connection manual.	One personal computer for one GOT
	Connection cable 2: GT15-C50VG or Preparing connection cables by each user*3	*2	GT27-R2			
			GT27-R2-Z			
			GT27-V4R1-Z			

\*1 Between the personal computer and the GOT, the connecting connection cable 1 (RS-232 cable) and connection cable 2 (analog cable) is required.

\*2 The cable length depends on the specifications of the personal computer to be used. Prepare a cable with a length suitable for the specifications of the personal computer to be used.

\*3 The cable length depends on the specifications of the personal computer to be used. For details, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*4 Not available to GT2705-V.

### 2 Setting procedure

**Step 1** Connect the personal computer to the GOT.

→ 1 System configuration

**Step 2** Set one of the following functions to display the personal computer screen on the GOT.

- Video/RGB display object

To use the remote personal computer operation (Serial), select [PC Remote Operation (Serial)] for [Touch Mode] in the [Video/RGB Display] dialog.

→8.27.2 2 Setting procedure

- RGB display function

→10.7.3 2 Setting procedure

**Step 3** Configure the settings for the remote personal computer operation (Serial) in the [PC Remote Operation] dialog.

→10.4.4 [PC Remote Operation] dialog

**Step 4** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→4. COMMUNICATING WITH GOT

**Step 5** Install Remote Personal Computer Operation Driver (DMT-DD, TSC-DD, or MES\_2X) on the personal computer.

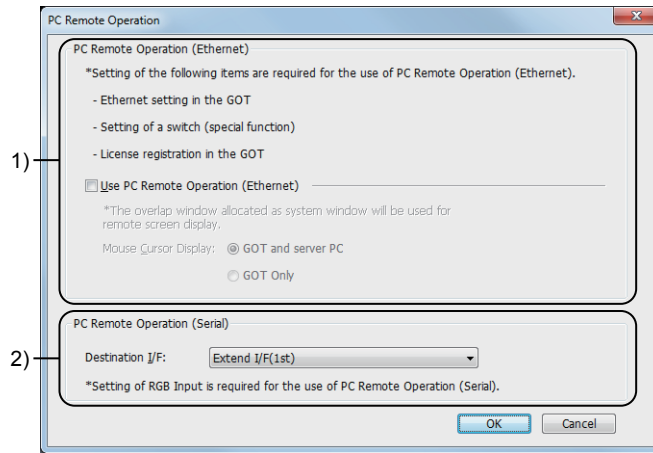

→10.4.5 Settings of Remote Personal Computer Operation Driver

**Step 6** Operate the GOT.

## 10.4.4 [PC Remote Operation] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Select [Common] → [Peripheral Setting] → [PC Remote Operation] from the menu to display the setting dialog.

### 1) Remote personal computer operation (Ethernet)

No setting is required.

### 2) Remote personal computer operation (Serial)

Set the interface of the GOT.

The following shows the items to be selected.

- [Standard I/F(RS232)]
- [Extend I/F(1st)]
- [Extend I/F(2nd)]
- [Extend I/F(3rd)]
- [Not connected]

### Point

#### Device setting

To send the touch status of the GOT screen to the personal computer, turn on the Touch Status Communication Control signal (GS511.b0).

For details of the Touch Status Communication Control signal (GS511.b0), refer to the following.

→12.1.3 GOT special register (GS)

## 10.4.5 Settings of Remote Personal Computer Operation Driver

### ■ 1 Before installation

Before installing Remote Personal Computer Operation Driver, check the following.

- The personal computer is properly connected to the GOT.
  - ⇒ 10.4.3 How to use the remote personal computer operation (Serial)
- Settings are properly made in the project.
  - ⇒ 10.4.4 [PC Remote Operation] dialog

### ■ 2 When using Remote Personal Computer Operation Driver (DMT-DD)

Remote Personal Computer Operation Driver calibrates the difference between the coordinates of a touch on the GOT screen and the coordinates of a click on the personal computer screen.

The following shows how to install and set Remote Personal Computer Operation Driver.

- Step 1** Run setup.exe.
- Step 2** Follow the on-screen instructions to install.
- Step 3** After the message [Installation Complete] appears, click the [Close] button to exit the setup wizard.
- Step 4** From the Windows start menu, select [DMC] → [DMT-DD] to display the [Touch Screen Properties] screen.  
\*1

\*1 How to open the start menu differs depending on the Windows version.  
Check how to operate Windows.

- Step 5** On the [Software Setting] tab of [Basic Setting], click the [4Point] button.
- Step 6** On the GOT screen, touch the calibration point four times.

- Step 7** Click the [OK] button.
- Step 8** Click the [Exit] button to exit the [Touch Screen Properties] screen.

### ■ 3 When using Remote Personal Computer Operation Driver (TSC-DD)

Remote Personal Computer Operation Driver calibrates the difference between the coordinates of a touch on the GOT screen and the coordinates of a click on the personal computer screen.

The following shows how to install and set Remote Personal Computer Operation Driver.

- Step 1** Run Installer.exe.
- Step 2** Follow the on-screen instructions to install.
- Step 3** After the message [Installation Complete] appears, click the [Close] button to exit the setup wizard.
- Step 4** Select [Start] → [All Programs] → [DMC] → [DMC Touch Panel Configuration] from the menu to display the [Touch Panel Driver Properties] screen.
- Step 5** Select [5p] for [Calibration Point], and click the [Calibration] button.
- Step 6** On the GOT screen, touch the calibration point five times.

- Step 7** Click the [OK] button.
- Step 8** On the [Touch Panel Driver Properties] screen, click the [Test] button to display the test screen in the RGB display area on the GOT screen.
- Step 9** On the GOT screen, touch the left [Clear] button and then the right [Clear] button to check for proper operation.

- Step 10** On the GOT screen, touch the left [End] button and then the right [End] button to exit the test screen.
- Step 11** Click the [Close] button to exit the [Touch Panel Driver Properties] screen.

#### ■4 When using Remote Personal Computer Operation Driver (MES\_2X)

Remote Personal Computer Operation Driver calibrates the difference between the coordinates of a touch on the GOT screen and the coordinates of a click on the personal computer screen.

The following shows how to install and set Remote Personal Computer Operation Driver.

- Step 1** Run Install.exe.
- Step 2** Configure the settings as shown below, and follow the on-screen instructions to install.
- On the [MES\_2X Driver Select] screen, select [RS232C] and a communication port.
  - On the [MES\_2X Driver EEPROM] screen, select [DO NOT USE].
- Step 3** After the message [Installation Complete] appears, click the [Close] button to exit the setup wizard.
- Step 4** Select [Start] → [All Programs] → [Touch Panel Driver MES\_2X] → [TP Control] from the menu to display the setting screen.
- Step 5** Select [5p] for [Calibration Point], and click the [Calibration] button.
- Step 6** On the GOT screen, touch the calibration point five times.

- Step 7** Click the [OK] button.
- Step 8** On the [Touch Panel Driver Properties] screen, click the [Test] button to display the test screen in the RGB display area on the GOT screen.
- Step 9** On the GOT screen, touch the left [Clear] button and then the right [Clear] button to check for proper operation.

- Step 10** On the GOT screen, touch the left [End] button and then the right [End] button to exit the test screen.
- Step 11** Click the [OK] button to exit the [Touch Panel Driver Properties] screen.

## 10.4.6 Action of the remote personal computer operation (Serial)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

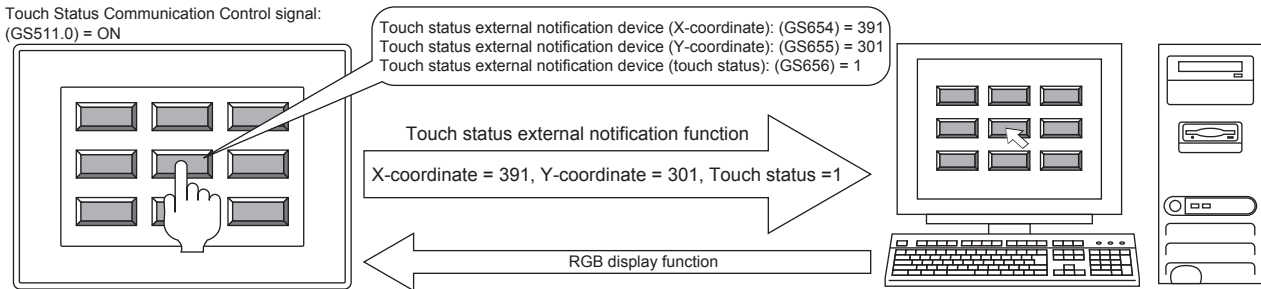

### ■1 Action of the GOT with the RGB display

When the GOT displays the personal computer screen using the RGB display, turning on the Touch Status Communication Control signal (GS511.b0) of the touch status communication control function sends the data in the touch status external notification function (X-coordinate (GS654), Y-coordinate (GS655), touch status (GS656)) to the personal computer.

The following shows the action according to the touch status.

For the GOT internal devices, refer to the following.

→ 12.1.3 GOT special register (GS)

### ■2 Action of the mouse pointer

The following explains the action of the mouse pointer according to the touch status.

#### (1) Touching the GOT screen

When the GOT screen is touched while the Touch Status Communication Control signal is on, the data in the touch status external notification function (X-coordinate (GS654), Y-coordinate (GS655)) is sent to the personal computer and the mouse pointer moves to the corresponding position.

The device value 1 is sent to the personal computer as the touch status (GS656) in the touch status external notification function while the GOT is touched.

As a result, the mouse pointer moves on the personal computer screen.

#### (2) Stopping the touch operation on the GOT

When the touch operation is stopped while the Touch Status Communication Control signal is on, the device value 0 is sent to the personal computer only one time as the touch status (GS656) in the touch status external notification function. As a result, the mouse pointer clicks the personal computer screen one time.

#### (3) Turning off the Touch Status Communication Control signal during the GOT screen touch

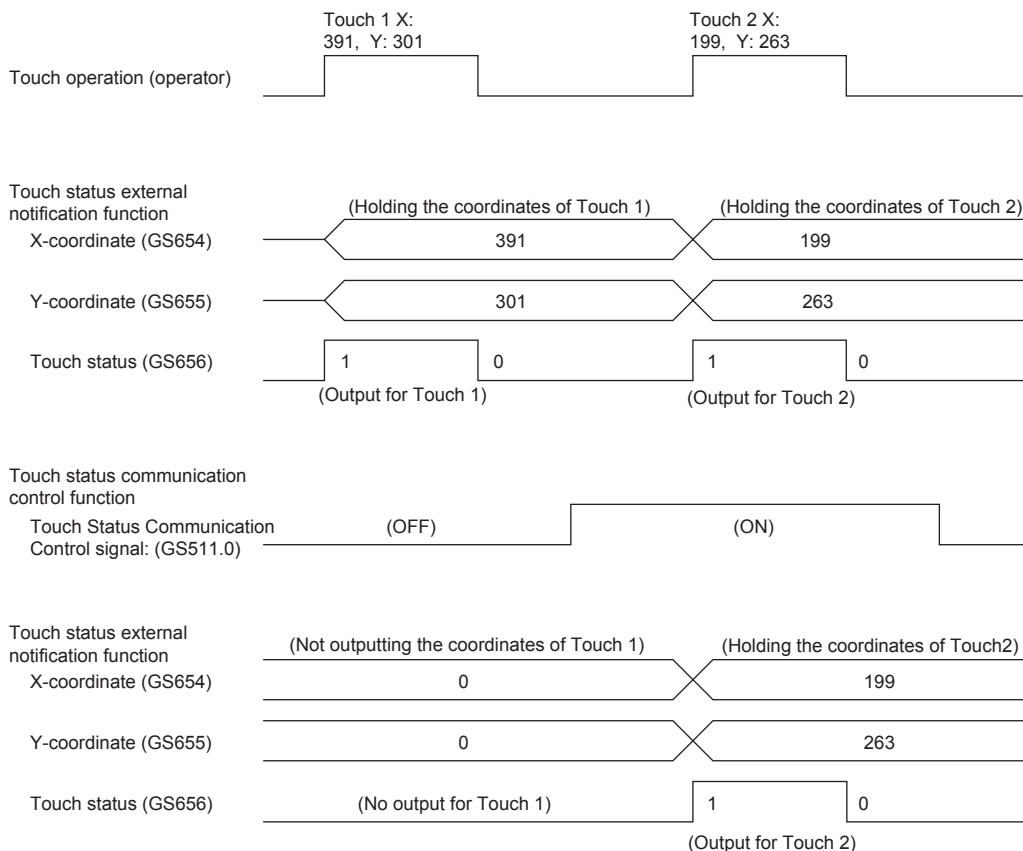

When the Touch Status Communication Control signal turns off during the GOT screen touch due to cable disconnection, GOT power disconnection, and others, the touch status external notification function (X-coordinate (GS654), Y-coordinate (GS655)) holds the values right before the signal turns off.

The device value 0 is sent to the personal computer only one time as the touch status (GS656) in the touch status external notification function while the GOT is touched.

As a result, the mouse pointer clicks the personal computer screen one time.

The following shows the action timing.

## 10.4.7 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

This section explains the precautions for using the remote personal computer operation (Serial).

### ■ 1 Precautions for installation

#### (1) TSC-DD-compatible mode

If Remote Personal Computer Operation Driver (DMT-DD) is installed successfully, TSC-DD-compatible mode is enabled and the title bar of the [Touch Screen Properties] screen displays [Touch Screen Properties [TSC-DD] Mode].

Otherwise, the installation may have failed.

Reinstall the driver with administrator privileges.

### ■ 2 Precautions for use

#### (1) Drag operation

As a drag operation on the GOT screen is performed, the touch status data is not correctly sent to the personal computer, the mouse pointer operation may stop.

For the remote personal computer operation (Serial), do not perform the drag operation.

#### (2) USB mouse and keyboard function

The USB keyboard is not available for the remote personal computer operation (Serial).

The left button is only available for the USB mouse.

For details on the USB mouse and keyboard function, refer to the following.

⇒ 5.3.4 Configuring the settings for a mouse and a keyboard used with the GOT ([USB Host])

#### (3) Precautions for the video/RGB display object

For the precautions for the video/RGB display object, refer to the following.

⇒ 8.27.3 Precautions for a video/RGB display object

#### (4) Precautions for RGB display function

For the precautions for the RGB display function, refer to the following.

⇒ 10.7.6 Precautions

## 10.4.8 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the remote personal computer operation (Serial) as required. The following shows the functions that are available by the relevant settings.

### 1 GOT Internal Device

⇒ 12.1.3 GOT special register (GS)

Function	Setting item
Controlling whether to send or not the touch status to the personal computer. (Read device)	GS511.b0
Notifying the position touched (X-coordinate, Y-coordinate) on the GOT. (Write device)	GS654,GS655
Notifying whether the screen is touched or not. (Write device)	GS656

#### (1) Action at a simultaneous 2-point press

When two points are touched simultaneously on the GOT, or when one point on the GOT is touched and the GOT remote screen is clicked simultaneously by the remote personal computer operation, the devices of GS654, GS655, and GS656 notify the GOT as the priority below.

If some screens have the same priority, the devices of GS654, GS655, and GS656 notify the GOT of the screen which is placed on the leftmost and uppermost position in priority to the other screens.

(The left position has higher priority than the upper position.)

Screen	Priority
Popup window screen	
Comment window screen	
Key window	
Video window	
Overlap window 5 screen (area of a touchable object)	
Overlap window 5 screen (area out of a touchable object)	
Overlap window 4 screen (area of a touchable object)	
Overlap window 4 screen (area out of a touchable object)	
Overlap window 3 screen (area of a touchable object)	
Overlap window 3 screen (area out of a touchable object)	
Overlap window 2 screen (area of a touchable object)	
Overlap window 2 screen (area out of a touchable object)	
Overlap window 1 screen (area of a touchable object)	
Overlap window 1 screen (area out of a touchable object)	
Base screen (area of a touchable object)	
Base screen (area out of a touchable object)	

## 10.5 Viewing the GOT from a Personal Computer (VNC Server Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

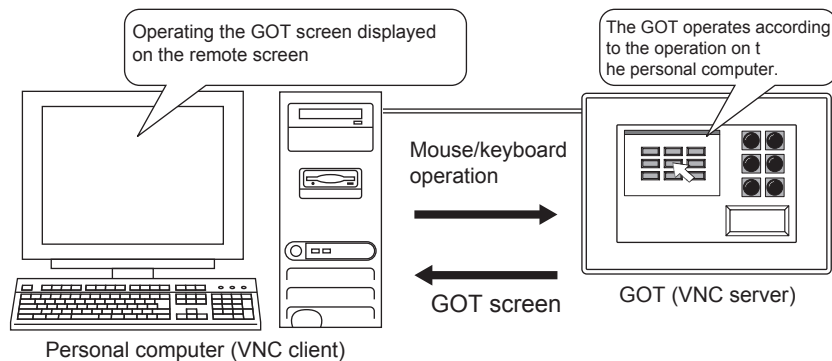

Only available to GT2107-W of GT21 models.

### 10.5.1 Overview of the VNC server function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Only available to GT2107-W of GT21 models.

The VNC server function enables you to remotely operate the GOT from the personal computer at a distant location via Ethernet by using Virtual Network Computing (VNC).

### 10.5.2 Specifications of the VNC server function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Only available to GT2107-W of GT21 models.

#### ■ 1 System application (extended function)

To use the VNC server function, a system application (extended function) of [VNC Server] is required. Selecting [Use VNC Server] in the [VNC Server] dialog incorporates the application into the package data automatically.  
→ 10.5.4 [VNC Server] dialog

#### ■ 2 Number of VNC server function settings for one project

One VNC server function setting is available for one project.

#### ■ 3 Specifications of VNC server and VNC client

The GOT and the personal computer are used as a VNC server and a VNC client, respectively.

##### • VNC server

The VNC server is the GOT that is remotely operated from the personal computer by using this function.

→ 10.5.5 ■ 3 Remote screen

##### • VNC client

The VNC client is the personal computer or other equipment that is used to remotely operate the GOT by using this function.

VNC client software must be installed on the personal computer.

For the installation instructions, refer to the following.

→ 10.5.5 Personal computer setting

#### ■ 4 License number registration

To use the VNC server function, register a license number on the GOT.

For how to register the license number, refer to the following.

→ GOT2000 Series User's Manual (Utility)

When the license number is not registered, the 30 minutes of trial for the function is available upon connection to the VNC server.

Up to 30 trials are available.

To start a trial again, turn off and then on the GOT.

After 30 trials, you must register the license number to use the function.

## ■5 Required software for the equipment that is used to remotely operate the GOT

When the GOT is used as the VNC server, the VNC client software must be installed on the equipment that is used to remotely operate the GOT.

Install the either of the following VNC client software according to the equipment that is used to remotely operate the GOT.

### (1) For personal computer

- Applicable VNC client software

Name	Manufacturer	Version
UltraVNC (32 bit)	UltraVNC team	1.1.9.6, 1.0.9.6.2, 1.0.8.2 recommended

- Operating environment

For the operating environment of the software, refer to the following website.

⇒<http://www.uvnc.com/>

### (2) For smartphone or tablet

- Applicable VNC client software

For the VNC client software whose operations have been validated, refer to the following Technical News.

⇒VNC client software that can be used with the GOT2000 series VNC server function (GOT-A-0069)

- Operating environment

The operating environment depends on the smartphone or tablet you use.

Refer to the website of the smartphone or tablet.

- How to obtain the software

How to obtain the software depends on the software which is applicable to the smartphone or tablet you use.

## Point

### (1) Precautions for using the VNC client software

The VNC client software may not operate properly depending on the OS on a smartphone or tablet, VNC client software version, and usage environment. Before using the software, fully validate its operations in a usage environment.

## ■6 Authorization control

Enabling the authorization control disables the simultaneous operation from the personal computer and the GOT.

To enable the authorization control, select [Restrict simultaneous operations of PC and GOT] in the [VNC Server] dialog.

⇒10.5.4 [VNC Server] dialog

### (1) Obtaining the authorization

Enabling the authorization control allows you to operate the GOT on only the equipment (personal computer or GOT) that holds the authorization.

The equipment, whose popup display is clicked or touched when the authorization guarantee time is 0, obtains the authorization.

Once the personal computer or the GOT obtains the authorization, the authorized equipment holds the authorization until the authorization guarantee time is passed.

While the personal computer holds the authorization, [The remote device (###.###.###.###) is now in operation.] and [Wait time to obtain operating authority: \*\*\*\*s] are alternately displayed on the screens of both equipment.

While the GOT holds the authorization, [The GOT is now in operation.] and [Wait time to obtain operating authority: \*\*\*\*s] are alternately displayed on the screens of both equipment.

###.###.###.### indicates the IP address of the personal computer as the VNC client.

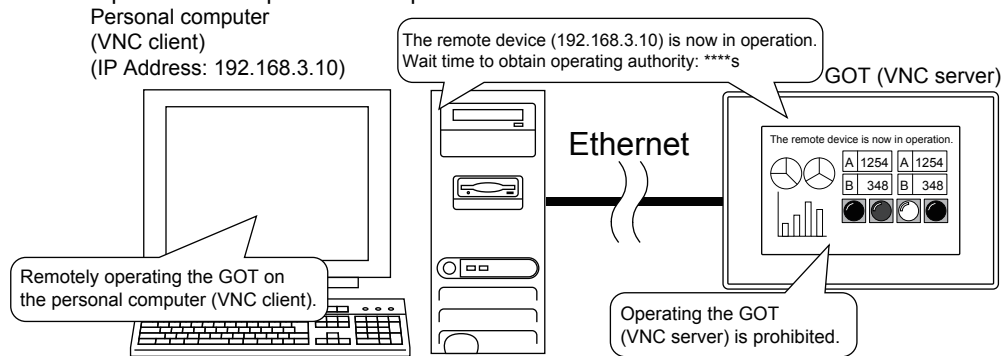

The asterisks \*\*\*\* indicate the authorization guarantee time (second).

Set the authorization guarantee time on the GOT utility.

For how to set the authorization guarantee time on the GOT utility, refer to the following.

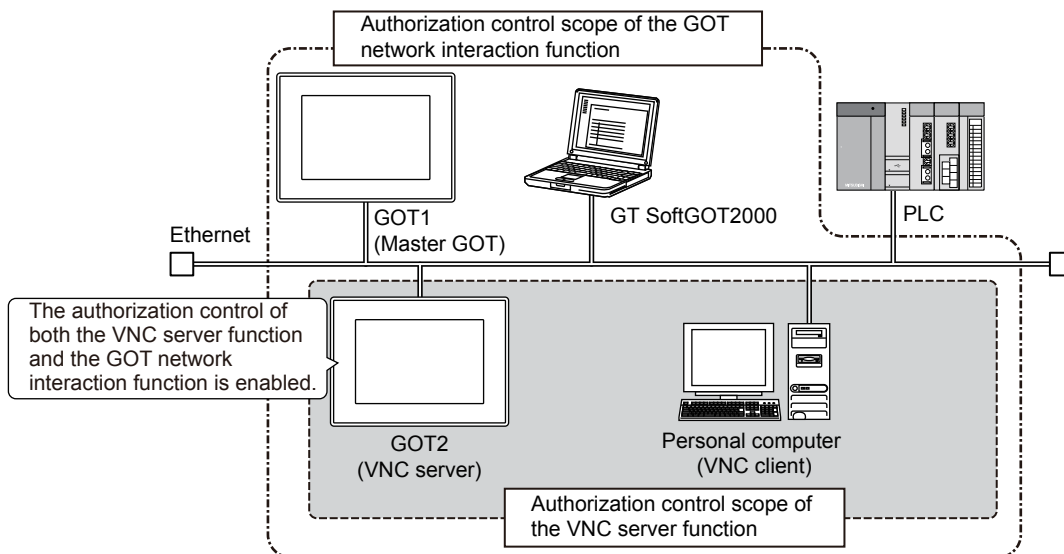

⇒GOT2000 Series User's Manual (Utility)

Example: When the personal computer holds the authorization

## (2) Controlling the authorization among pieces of equipment

To control the authorization among pieces of equipment, use the VNC server function in combination with the GOT network interaction function.

The following shows the differences when the two functions are used in combination.

- To perform operations on the VNC server or VNC client, the authorization of both the VNC server function and the GOT network interaction function is required.
- The setting of [Guaranteed time of operational authority after the last operation] in the [GOT Setup] window becomes invalid. The authorization guarantee time set in the [GOT Network Interaction] dialog becomes valid.
- The popup display of the GOT network interaction function is applied to the VNC server or VNC client screen.

For the details of the GOT network interaction function, refer to the following.

⇒ 5.6 Setting the Interaction Function for Equipment on Ethernet ([GOT Network Interaction])

## (3) How to identify the authorized equipment

Check the GOT internal device to identify the authorized equipment. (Authorized Equipment Notification signal, GS1230.b2)

⇒ 10.5.7 ■ 1 GOT Internal Device

## (4) Operation status popup notification function

This function notifies, with a popup display, the authorized equipment and the waiting time for the unauthorized equipment to obtain the authorization.

The display position of the operation status popup display is the same as that of the alarm popup display.

(To set the display position, select [Display alarms as popups] in the [Screen Property] dialog.)

The operation status popup display appears on the bottom, center, or top of the screen.

When the base screen is switched while the operation status popup display is performed, the operation status popup display appears at the display position of the alarm popup display which is set for the destination base screen.

Each touch of the leftmost portion of the operation status popup display switches its display position to the top, center, or bottom, in that order.

Configure the display setting on the GOT utility or GT Designer3.

For how to configure the display setting on the GOT utility, refer to the following.

⇒GOT2000 Series User's Manual (Utility)

For how to configure the setting on GT Designer3, refer to the following.

⇒2.7.1 ■ 1 [Basic] tab

## ■7 Differences between the functions to remotely operate the GOT

When the GOT is connected to equipment such as a personal computer by Ethernet, you can operate the GOT from the equipment by using the following functions.

- SoftGOT-GOT link function
- VNC server function
- GOT Mobile function

The following shows the differences between these functions.

Item	Function		
	SoftGOT-GOT link function	VNC server function	GOT Mobile function
Equipment	Personal computer or PC CPU module on which GT SoftGOT2000 is installed	Information device (such as a tablet and personal computer) on which an applicable VNC client is installed	Information device (such as a tablet and personal computer) on which an applicable browser is installed
Number of modules or clients connectable to one GOT	One GT SoftGOT2000 module is connectable. Up to seven GT SoftGOT2000 modules are connectable when the GOT network interaction function is enabled.	One VNC client is connectable.	Up to five clients are connectable.
Required number of licenses	One license key is required for one personal computer.	One license is required for one GOT.	One license is required for one GOT.
Screen display contents	The GOT and a GT SoftGOT2000 module can display different contents.	The GOT and the remote screen on the personal computer display the same contents.	The GOT and each client display different contents. (The client displays the dedicated mobile screens.)
Screen targeted for the exclusive authorization control	All screens	All screens	Screen in which the exclusive authorization control is enabled (This control can be enabled for each screen.)
Creation of dedicated screens (project data setting)	Not needed	Not needed	Mobile screens must be created.
Storage location of project data	The GOT and a GT SoftGOT2000 module each store project data. (The GT SoftGOT2000 module reads project data from the GOT.)	Only the GOT stores project data.	Only the GOT stores project data.
Storage location of resource data	When a GT SoftGOT2000 module reads project data from the GOT, the module also reads resource data. Accordingly, the GOT and the GT SoftGOT2000 module each store the resource data.	Only the GOT stores resource data.	Only the GOT stores resource data.
Availability of extended functions for equipment	Limited ⇒GT SoftGOT2000 Version1 Operating Manual	Not limited	Limited ⇒(a) Screen security (level authentication and operator authentication)

The following shows the details and references of each function.

### (1) VNC server function

With the VNC server function, the remote screen of the personal computer displays the GOT screen. You can view the data collected by the GOT, including alarm data and logging data, on the personal computer in real time. Even while an extended function is used, you can also remotely operate the GOT from the personal computer.

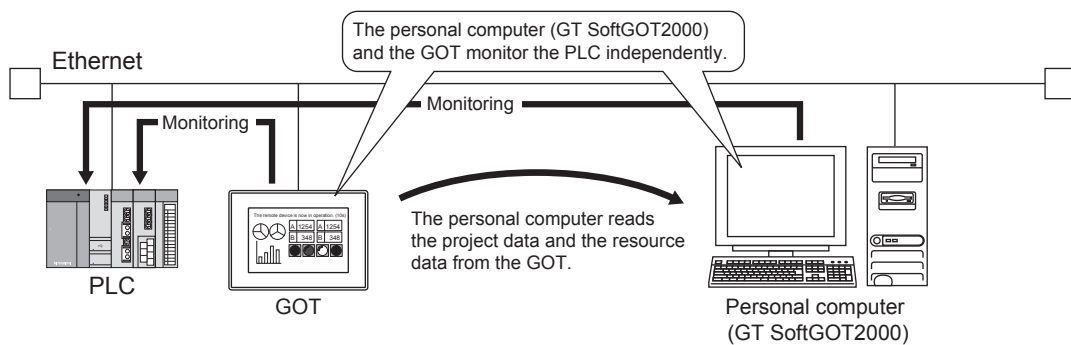

Since the VNC server function increases the processing load on the GOT, the GOT may delay displaying a screen or collecting data, including alarm data and logging data. The GOT may also delay responding to an operation from the VNC client (personal computer).

### (2) SoftGOT-GOT link function

With the SoftGOT-GOT link function, GT SoftGOT2000 and the GOT each have the project data and monitor the controller.

Since GT SoftGOT2000 displays the GOT screen on the personal computer, the processing load on the GOT is reduced. By using a GOT internal device for the screen switching device, GT SoftGOT2000 and the GOT can display different screens.

The GOT and GT SoftGOT2000 each operate independently, which may cause the difference in the collected data including the alarm data and logging data between the GOT and the personal computer. The extended functions which are unavailable for GT SoftGOT2000 cannot be used with the SoftGOT-GOT link function. For the details of the SoftGOT-GOT link function, refer to the following.

→ GT SoftGOT2000 Version1 Operating Manual

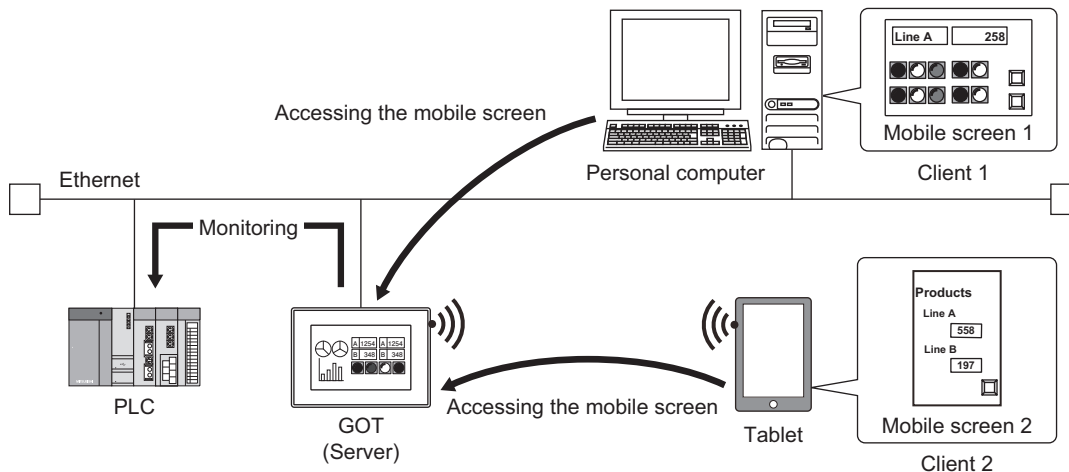

### (3) GOT Mobile function

The GOT Mobile function allows an information device, such as a tablet, to display the mobile screens stored in the server (GOT).

A browser on the information device is used as a client to access the server (GOT), and up to five clients can make access simultaneously.

Each client can display different mobile screens.

The information device does not store project data and resource data, and the server (GOT) stores the data for management.

You cannot use the functions that are incompatible with the GOT Mobile function, such as objects incapable of being placed on mobile screens.

For the details of the GOT Mobile function, refer to the following.

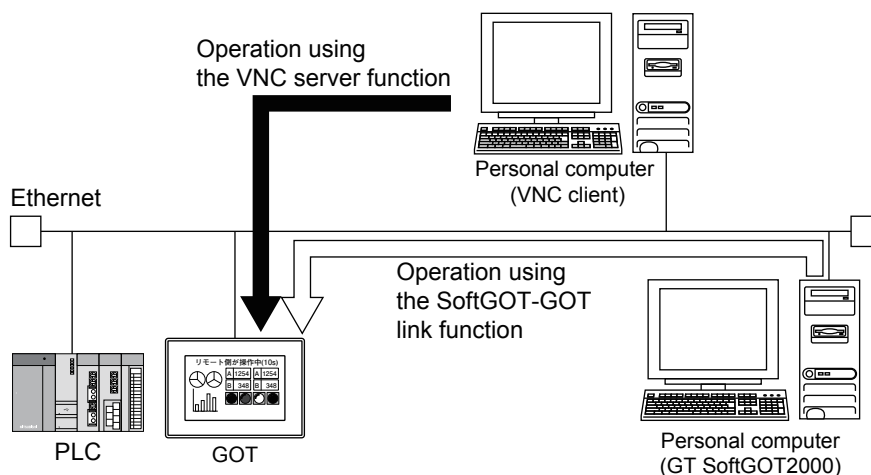

⇒ 10.18 Monitoring a Controller from Tablets or Other Clients (GOT Mobile Function)

## 8 Authorization control when the SoftGOT-GOT link function is used

When the GOT network interaction function is not used, the VNC server function and the SoftGOT-GOT link function control the authorization independently of each other.

(The authorization control of the SoftGOT-GOT link function is always enabled.)

The following shows the authorization control when the VNC server function and the SoftGOT-GOT link function are used in combination.

○ : Available × : Not available

Authorization control setting of the VNC server function	Authorized equipment	Operating the GOT		
		From GOT	From VNC client	From GT SoftGOT2000
Enabled	GOT (VNC server)	○	×	×
	Personal computer (VNC client)	×	○	×
	Personal computer (GT SoftGOT2000)	×	×	○
Disabled	GOT (VNC server)	○	○	×
	Personal computer (VNC client)	○	○	×
	Personal computer (GT SoftGOT2000)	×	×	○

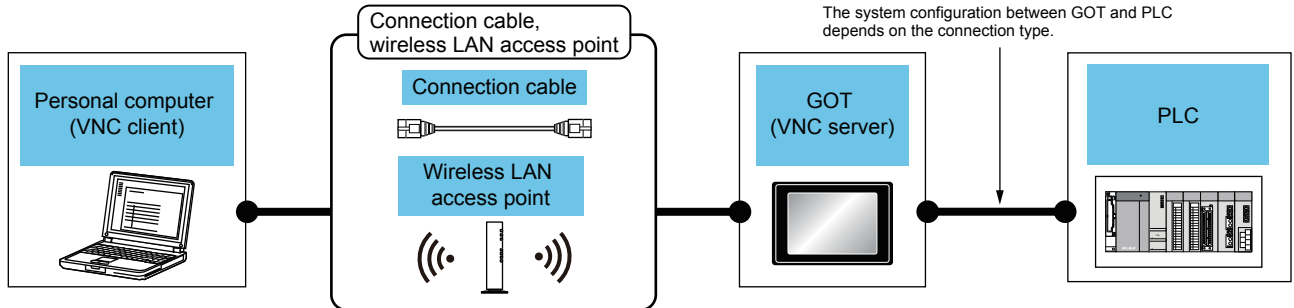

## 10.5.3 How to use the VNC server function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Only available to GT2107-W of GT21 models.

### 1 System configuration

The following shows the system configuration of the personal computer.

Personal computer (VNC client)	Connection cable <sup>*1,2</sup> , wireless LAN access point	Maximum segment length <sup>*3</sup>	GOT (VNC server)		PLC	Number of connectable personal computers
			Option	GOT model		
Select by each user	<ul style="list-style-type: none"> <li>10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built into GOT)	GT27, GT25	For the system configuration between the GOT and the PLC, refer to each connection manual.	One personal computer for one GOT
	-	-	GT25-J71E71-100	GT27, GT25 <sup>*6</sup>		
	<ul style="list-style-type: none"> <li>Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*4</sup> , GT25 <sup>*4,6</sup>		
			GT25-WLAN	GT27 <sup>*5</sup> , GT25 <sup>*5,6</sup>		

\*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard. For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*2 A straight cable is applicable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

\*3 The length between the hub and node.

The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades. For the limit, contact the switching hub manufacturer.

\*4 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*5 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*6 Not available to GT2505-V and GT25HS-V.

### 2 Setting procedure

The following shows how to configure the settings for the VNC server function.

**Step 1** Connect the personal computer to the GOT.

→ 1 System configuration

- Step 2** Configure the settings for the VNC server function in the [VNC Server] dialog.
  - ➔10.5.4 [VNC Server] dialog
- Step 3** Set the GOT Ethernet interface.
  - ➔5.4 Setting the GOT Ethernet Interface ([GOT Ethernet Setting])
- Step 4** To control the authorization among pieces of equipment on a network, set the GOT network interaction function.
  - ➔5.6 Setting the Interaction Function for Equipment on Ethernet ([GOT Network Interaction])
- Step 5** Write the package data to the GOT.
 

Make sure to set [GOT IP Address] and [Peripheral S/W Communication Port No.] for the GOT in the [Communication Configuration] dialog.

  - ➔4.8.8 [Communication Configuration] dialog

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

  - ➔4. COMMUNICATING WITH GOT
- Step 6** Register the license number on the GOT.
 

For how to register the license number, refer to the following.

  - ➔GOT2000 Series User's Manual (Utility)
- Step 7** Install the VNC client software on the personal computer or others, and configure the setting.
 

After the setting is completed, operate the GOT on the remote screen.

  - ➔10.5.5 Personal computer setting

## 10.5.4 [VNC Server] dialog

Only available to GT2107-W of GT21 models.

Select [Common] → [Peripheral Setting] → [VNC Server] from the menu to display the setting dialog.

### 1) [Use VNC Server]

Select this item to enable the VNC server function.

### 2) [Server Connection Setting]

Configure the GOT connection settings.

Item	Description
[Port No.]	Set the port number for the GOT to communicate with a VNC client. The setting range is [1024] to [65534]. Do not set the port number used for the other settings. Duplication of the port number disables communication.

### 3) [Connecting Password]

Up to 31 characters can be set for a connecting password.

Note that only the first eight characters are used for the password verification. The other characters are not used for the verification.

To use the multiple passwords, set the passwords so that the first eight characters are different. One-byte alphanumeric characters, one-byte space, and the following symbols are available for the password. ! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

Item	Description
[Operation/Monitoring password]	Set the password to remotely operate and display the GOT on the personal computer.
[Use exclusive password for monitoring]	Select this item to only remotely display the GOT on the personal computer.
[Exclusive password for monitoring]	Set the password to only remotely display the GOT on the personal computer.

#### 4) [GOT processing balance when VNC server is in operation]

Set the GOT load balance between the VNC server function processing and the other processing (including displaying the screens, and collecting the alarm data and logging data).

- [Standard]

Select this item to set the standard balance for the balance between the VNC server function processing and the other processing.

- [VNC Server Priority]:

Assigns a higher priority to the VNC server function processing.

The update rate of the remote screen increases.

Select this item when the amount of the other processing is small.

When the number of monitoring objects is large or the background processing (including the alarm function and logging function) is performed, the delay in GOT behavior may be caused.

Consider the number of monitoring objects, alarm function settings, logging function settings, and others, and then set the GOT processing load balance.

- [GOT Monitoring Priority]:

Assigns a higher priority to the other processing.

The number of the other processing delays caused by the VNC server function decreases.

Select this item when the amount of the other processing is large.

#### 5) [Restrict simultaneous operations of PC and GOT]

Select this item to disable the simultaneous operation from the GOT and the remote screen of the personal computer. Selecting the item enables the authorization control.

→10.5.2 ■ 6 Authorization control

#### 6) [Display video/multimedia]

Not available to GT2107-W.

Set whether to display a video image displayed on the GOT on the remote screen of the personal computer.

Select this item to display the video image displayed on the GOT on the remote screen of the personal computer.

Deselect this item not to display the video image displayed on the GOT on the remote screen of the personal computer.

The display area of the video image displays the object, figure, or others that is placed behind the video image.

When the remote screen of the personal computer displays the video image displayed on the GOT, the update rate of the remote screen decreases.

#### 7) [Reset the security level or re-authenticate the operator at the time of VNC server connection]

Resets the security level or performs a forced logout of the GOT at the time of connection between the GOT (VNC server) and the VNC client.

## 10.5.5 Personal computer setting

---

Only available to GT2107-W of GT21 models.

### ■1 How to install the UltraVNC

- Step 1** Download the Win32 Full version of UltraVNC (English only) from the following website.  
<http://www.uvnc.com/>  
Note that the above website may be changed without notification.
- Step 2** Execute the downloaded file, and start the installer.
- Step 3** The setup window appears.  
Click the [Next] button until the [License Agreement] screen is displayed.  
Confirm the description in the screen, and then select [I accept the agreement].
- Step 4** Click the [Next] button until the [Select Destination Location] screen is displayed.  
In the screen, select the location where the software is installed.
- Step 5** The [Select Components] screen appears.  
Select [Full installation] or [UltraVNC Viewer Only], and click the [Next] button.
- Step 6** The [Select Start Menu Folder] screen appears.  
Select the start menu folder to create a shortcut, and click the [Next] button..
- Step 7** The confirmation window appears to confirm whether to download the following software. (Not displayed when [UltraVNC Viewer Only] is selected in the [Select Components] screen)
- Optional non-GPL addons recommended for Vista  
Download this software only when you use Windows Vista.
  - Optional non-GPL Mirror Driver  
Make sure to download this software.
- Step 8** The [Select Additional Tasks] screen appears.
- To create the shortcut icon on the desktop, enable [Create UltraVNC desktop icons].
  - To open the file with the extension of .vnc by using UltraVNC Viewer, select [Associate UltraVNC Viewer with the .vnc file extension].
- When [Full installation] is selected in the [Select Components] screen, setting items other than the above are also displayed.  
Since the additional setting items depend on the personal computer you use, configure the settings as required.
- Step 9** The confirmation screen for installation appears.  
Confirm the description in the screen, and then click the [Install] button.  
Installation of UltraVNC starts.

### ■2 Settings

After UltraVNC Viewer is started, set the GOT IP address.

⇒ ■ 3 Remote screen

With the remote personal computer operation (Ethernet), the GOT as the VNC client can be connected to the VNC server.  
For the setting of the remote personal computer operation (Ethernet), refer to the following.

⇒ 10.3 Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Ethernet))

### ■3 Remote screen

The remote screen of the personal computer is used to display and operate the GOT screen.

#### (1) How to display the remote screen

Display the remote screen by using the VNC client software installed on the personal computer.

- Step 1** Select [UltraVNC] → [UltraVNC Viewer] from the start menu to start UltraVNC Viewer.
- Step 2** In the setting dialog, set the GOT IP address in the [VNC Server] field and click the [Connect] button.

- Step 3** Enter the password, which is set in the [VNC Server] dialog, in the [Password] field, and click the [Log On] button.

- Step 4** The remote screen appears.

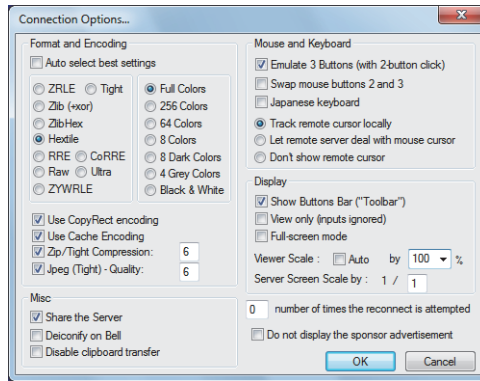

#### (a) When the remote screen does not display the GOT screen

Even though the VNC client is connected to the VNC server by using the VNC client software, if the remote screen does not display the GOT screen, make sure to configure the setting as shown below.

Start UltraVNC Viewer, and click the [Options] button.

The [Connection Options] window appears.

Check that [Full Colors] is selected in [Format and Encoding].

When [Full Colors] is not selected, deselect [Auto select best settings] and select [Full Colors].

## (b) Compression format of the transferred image

The VNC server function supports the following image compression formats.

Select the image compression format in [Format and Encoding].

Usually select [Hextile].

- Raw
- Hextile
- ZRLE

ZRLE provides a high compression rate for the images with many repeated patterns.

However, for the images with few repeated patterns, such as photos, ZRLE provides a low compression rate and a high processing load.

Select the image compression format according to the communication speed and the transferred screen layout.

## (2) Operating procedure

Clicking the remote screen of the personal computer is recognized as touching the corresponding position on the GOT.

The keyboard operation on the remote screen of the personal computer is also recognized as the key input on the GOT.

## 10.5.6 Precautions

Only available to GT2107-W of GT21 models.

### ■1 Precautions for drawing

#### (1) Password setting

If the operation/monitoring password and the exclusive password for monitoring are the same, the password is valid as the operation/monitoring password.

#### (2) Restrictions for the operation status popup display

When the GOT uses the operation status popup display of the VNC server function, the alarm popup display cannot be used.

When the SoftGOT-GOT link function and the VNC server function are simultaneously used, the GOT uses the operation status popup display of the VNC server function and GT SoftGOT2000 uses that of the SoftGOT-GOT link function, respectively.

#### (3) GOT internal device setting

When placing the touch switch that turns on the VNC Client Communication Control signal (GS1792.b0) or the VNC Client Operation Control signal (GS1792.b1) on the screen, set the touch switch not to be operated from the personal computer. (Example: Set the trigger condition so that the touch switch is disabled while the GOT communicates with the personal computer.)

If the signals are turned on while the GOT communicates with the personal computer, the following status is caused.

- When the VNC Client Communication Control signal is turned on  
The communication with the personal computer is disconnected, and the GOT cannot communicate with the personal computer until the signal is turned off on the GOT.
- When the VNC Client Operation Control signal is turned on  
Though the communication with the personal computer is not disconnected, the personal computer cannot remotely operate the GOT.

For the GOT internal devices, refer to the following.

→10.5.7 ■ 1 GOT Internal Device

#### (4) RGB screen display

The RGB screen cannot be displayed on the remote screen of the personal computer.

To use the RGB display function, configure the settings, such as arranging a touch switch for returning to another object. Do not create a screen for displaying the RGB screen only.

(For example, a screen on which the RGB screen and a touch switch having no shape are arranged)

In such a case, no content is displayed on the remote screen.

To avoid no contents displayed on the remote screen, configure the settings, such as arranging the RGB screen together with an object having a shape.

### ■2 Precautions for use

#### (1) Authorization control setting

Without the authorization control setting, do not operate the GOT and the remote screen of the personal computer simultaneously.

Doing so causes a malfunction, resulting in an accident.

#### (2) Use of USB mouse

Even while the USB mouse is used on the GOT with the USB mouse/keyboard function, the mouse cursor is not displayed on the remote screen of the personal computer.

## 10.5.7 Relevant settings

Only available to GT2107-W of GT21 models.

Set the relevant settings other than the specific settings for the VNC server function as required.

The following shows the functions that are available by the relevant settings.

### 1 GOT Internal Device

→ 12.1.3 GOT special register (GS)

#### (1) VNC Server Function Control (GS1792)

Bit number	Signal name	Description
b0	VNC Client Communication Control signal	Enables/disables the communication from the VNC client. • 0: Communication from the VNC client enabled • 1: Communication from the VNC client disabled
b1	VNC Client Operation Control signal	Enables/disables the operation from the VNC client. • 0: Operation from the VNC client enabled • 1: Operation from the VNC client disabled
b2 to b7	Use prohibited	-
b8	Authorization Guarantee Time Cancel signal	Cancels the authorization guarantee time setting of the equipment which last operated the GOT, and enables the other equipment to operate. • 0: Authorization guarantee time valid • 1: Authorization guarantee time invalid
b9 to b15	Use prohibited	-

#### (2) VNC Server Operation Status Notification (GS1230)

Bit number	Signal name	Description
b0	VNC Client Communication Status Notification signal	Notifies the communication status of the VNC client. • 0: VNC client communication suspended • 1: VNC client communication in operation
b1	VNC Client Operation Mode Notification signal	Notifies the operation mode of the VNC client. • 0: Only remote display enabled • 1: Remote display and operation enabled
b2	Authorized Equipment Notification signal	Notifies the equipment that holds the authorization. • 0: VNC server authorized • 1: VNC client authorized
b3 to b14	Use prohibited	-
b15	VNC Server Authorized Notification signal	Notifies the equipment that holds the authorization. • 0: VNC server authorized • 1: VNC client authorized

#### (3) Communicating VNC Client Information Notification (GS1231 to GS1232)

The IP address of the communicating VNC client is stored in hexadecimal.

0 is stored when the VNC client does not communicate with the VNC server.

Example) When the IP address of the VNC client is 192.168.3.10, the devices of GS1231 to GS1232 store C0.A8.03.0A.

The IP address is stored as shown below.

#### (4) VNC Server Authorization Guarantee Status Notification (GS1233)

This device notifies the remaining authorization guarantee time (second).

When the device stores 0, the unauthorized equipment can obtain the authorization.

When the authorization control is set to [Disabled], the device stores 0.

## 10.6 Displaying an Image Taken by a Video Camera on the GOT (Video Display Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### 10.6.1 Overview of the video display function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The video display function displays video images taken by a video camera on the video window.

As the video window operates independently of other screens, the base screen can be switched while leaving the video window open.

## 10.6.2 Specifications of the video display function

Not available to GT2705-V.

### ■ 1 System application (extended function)

To use the video display function, a system application (extended function) of [Video/RGB] is required.

To incorporate the application into the package data automatically, select [Use Video/RGB Input] and select [GT27-V4-Z/ GT27-V4R1-Z] for [Unit Type Name] in the [Video/RGB Input] dialog.

⇒ 10.6.5 [Video/RGB Input] dialog

### ■ 2 Number of video display function settings for one project

One video display function is available for one project.

### ■ 3 Specifications of the video display

For the video display function, the full mode and clip mode are provided.

For the details of each display mode, refer to the following.

⇒ 10.6.4 ■ 5 Displaying in the full mode

10.6.4 ■ 6 Displaying in the clip mode

The following shows the differences between the full mode and clip mode.

Item	Full mode	Clip mode
Overview	Displays the total image.	Displays a part of the image in its original size.
Video window resolution	640×480, 720×480, 768×576 (dots)	64×64 to 768×576(dots)
Display size change	100%, 50%, or 25% of the original size	Unchangeable (fixed at 100%)
Number of screens	4	1 (video window 1 only)

## 10.6.3 Basic use of the video display function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The video display function enables various types of displays by using the [Video/RGB Input Common] device.

For the details of the settings, refer to the following.

→ 10.6.4 Applicative use of the video display function

### 1 System configuration

The following shows the system configuration of the video display function.

Signal type	Video equipment	Connection cable <sup>*3</sup>	GOT		Number of connectable video equipment
			Option	GOT model	
NTSC, PAL	Video equipment, such as a video camera <sup>*1</sup> and vision sensor <sup>*2</sup> , from which images can be output by NTSC or PAL system.	Preparing connection cables by each user <sup>*4</sup>	GT27-V4-Z GT27-V4R1-Z	GT27 <sup>*5</sup>	Four sets of video equipment for one GOT

\*1 For the types of the connectable video camera, refer to the following Technical News.

→ List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)

\*2 Select the vision sensor by each user.

\*3 Cable length depends on the specifications of video equipment you use.

\*4 For how to create a cable, refer to the following.

→ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*5 Not available to GT2705-V.

### 2 Setting procedure

**Step 1** Connect the GOT and video equipment.

→ 1 System configuration

**Step 2** Select [Common] → [Peripheral Setting] → [Video/RGB Input] from the menu to display the [Video/RGB Input] dialog.

→ 10.6.5 [Video/RGB Input] dialog

**Step 3** In the [Video/RGB Input] dialog, set the items as shown below and click the [OK] button.

- [Destination I/F]: [Extend I/F(1st)]
- [Use Video/RGB Input]: Selected
- [Unit Type Name]: [GT27-V4-Z/GT27-V4R1-Z]
- [Video Window]: The number of video windows used (1 to 4)
- [First Device]: Device to control the video display function

**Step 4** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→ 4. COMMUNICATING WITH GOT

**Step 5** Display the video image on the GOT.

## 10.6.4 Applicative use of the video display function

Not available to GT2705-V.

The following shows the setting for applicative display by using the video display function.

### 1 Displaying the video window

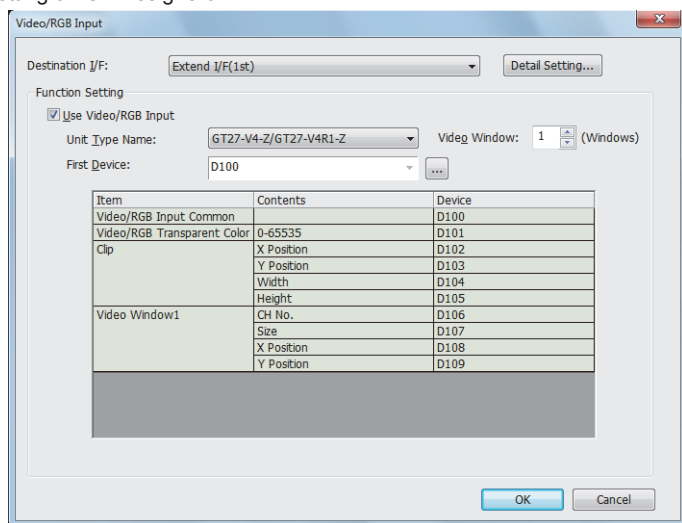

Video windows are displayed when any numbers of 1 to 4 are stored in the video window-channel No. devices.  
 (The video window does not have the close button)

The [Video/RGB Input Common] device controls the full and clip mode, the transparent processing, and others.

Size and position of the video window can be controlled according to the values set at the corresponding devices (video window-size device, video window-X and Y coordinates devices).

Example) Displaying the image of channel number 1 on the video window 1

Setting on GT Designer3

Operation

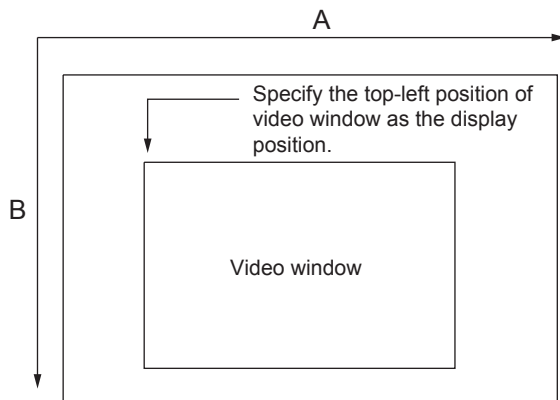

Video window 1 is displayed according to the setting for channel No., size, X and Y coordinates.

## ■2 Display position of the video window

The video window is placed on the base screen or overlap window 1.

The position of the video window can be specified within the range indicated below.

Model	Screen type	A (dots)	B (dots)
GT2712-S, GT2710-S, GT2708-S	Base screen	0 to 736	0 to 528
GT2710-V, GT2708-V	Overlap window 1	0 to 576	0 to 416

### (1) Setting the display position

Set the display position with a multiple of 2 (dots).

Even if the display position is set with a value other than a multiple of 2 (dots), the position is automatically adjusted to a multiple of 2 (dots).

### (2) Video window placed beyond the screen

If the video window is placed beyond the screen, display position of the video window is automatically adjusted to fit to the screen.

### (3) Order of displaying the video window

The video window can be displayed over or behind the overlap window (1 or 2) or test window according to the setting for the [Video/RGB Input Common] device.

→ 10.6.5 [Video/RGB Input] dialog

However, the following items are displayed over the video window.

- Alarm popup display
- Key window
- Comment window
- Confirmation or similar message displayed on the GOT

## ■3 Moving the video window

The video window does not have the move button.

To move the video window, change the device values set for the display position (X and Y coordinates).

If multiple video windows are moved frequently, the overlap window may not be moved even when the window is touched.

In this case, move the overlap window by changing the device values or move it after moving the video window is completed.

## ■4 Placing the video window on the overlap window

### (1) The video window can be placed on the overlap window 1 only.

### (2) Each window displayed on the front of the overlap window 1 is displayed over the video window.

For the display order of each window, refer to the following.

→ 1.2.3 Screen types and the specifications

### (3) When the video window is placed on the overlap window 1, transparent processing will be automatically executed for the video window.

→ ■ 9 Transparent processing

If figures or objects are set on the overlap window, figures or objects may be visible in the background of the video window.

### (4) If the display position (base screen or overlap window 1) is switched while the video window is displayed, the video window is closed temporarily and then opened at the specified position (base screen or overlap window 1).

(5) The size of the video window placed on the overlap window is not changed even when the video window is touched.

To change the size of the video window, change the value of the device set for window size change.

⇒ 10.6.5 [Video/RGB Input] dialog

## ■ 5 Displaying in the full mode

In the full mode, an image taken by a video camera is displayed on the GOT in the actual size.

When the full mode is used, up to four video windows can be displayed simultaneously.

It is also possible to display images taken by different video cameras in one video window by switching the channel No.

### (1) Resolution and display size of the video window

The following shows the resolution of video windows that can be displayed in the full mode.

640×480 dots, 720×480 dots, 768×576 dots

The display size of each video window can be changed in three levels (100%, 50%, or 25%).

Display size	Resolution of video windows (dots) *1		
	640×480	720×480	768×576
100%	640×480	720×480	768×576
50%	320×240	360×240	384×288
25%	160×120	180×120	192×144

\*1 The same resolution is set for 4 channels.

### (2) Changing the display size

The following shows changing the display size of the video window.

#### (a) Changing the size by touching the video window

(Changing the size by touching can be disabled by turning on b4 of the [Video/RGB Input Common] device.)

⇒ ■ 9 Transparent processing

When the video window display size is changed by touching, the window size changes as follows.

- Display size change

Display size: 25% → Display size: 50% → Display size: 100% → Display size: 50% → Display size: 25%

When the video window is displayed at 25% magnification of the first touch changes the magnification of display size to 50%. When the video window is displayed at 50% magnification, the first touch changes the magnification to 100%.

#### (b) Changing the size by writing a value to the display size setting device

The following shows the window display sizes corresponding to values to be written.

- 0: 100%
- 1: 50%
- 2: 25%

### (3) Displaying the multiple video windows

- (a) The last displayed video window is located at the topmost position.
- (b) The video window, of which the display position or size is changed, is displayed in the topmost position.
- (c) When video windows are superimposed, the hidden video window is displayed in the topmost position when it is touched.

If transparent processing is executed, video windows do not operate as above.

- (d) Do not display the same image (taken by the same channel) in multiple video windows.

If you display the same image in multiple video windows, the image is displayed only in the video window assigned with the smallest number and not displayed in other video windows.

### (4) Invalid area of a touch switch around the video window

Depending on the size of displayed video window, the following areas are invalid for the touch switch.

Display size	Resolution of video windows (dots)		
	768×576	720×480	640×480
100%	768×576 (No invalid area)	720×480 (No invalid area)	640×480 (No invalid area)
50%	384×288 (No invalid area)	360×240 (Invalid area: Right 8 dots)	320×240 (No invalid area)
25%	192×144 (No invalid area)	180×120 (Invalid area: Right 12 dots, Lower 8 dots)	160×120 (Invalid area: Lower 8 dots)

#### Point

#### Precautions for using the full mode

- When the display size of the video window is returned to the previous display size by touch operation, the display position is also returned to the position when the video screen was displayed.
- If the resolution of a video image is higher than that of the video window displayed on the GOT, a part of the image is not displayed in the video window.  
The image display position can be adjusted by changing the setting for the video display setting items of the utility.
- If the resolution of the video window displayed on the GOT is higher than that of the video image, an indefinite image is displayed in the window area where the video image is not displayed.

### 6 Displaying in the clip mode

This mode is used to specify a part (clip area) of the image taken by a video camera and display it in the original size on the GOT.

With this mode, the video window display area can be reduced without reducing the size of the image to be displayed.

The clip mode can be used only in video window 1.

The clip mode cannot be used in video window 2 to 4.

### (1) Selecting a clip area

To set a clip area, specify the upper left corner of the part of the video image to be displayed by its coordinate values and specify the vertical size (Y: 64 to 768 dots) and the horizontal size (X: 64 to 576 dots).

### (2) Operations of video windows 2 to 4 in the clip mode

#### (a) When switched from the full mode to the clip mode

If the mode is switched from the full mode to the clip mode while any or all of video windows 2 to 4 are open, these video windows are erased forcibly.

#### (b) When switched from the clip mode to the full mode

When the mode is switched back from the clip mode to the full mode, any or all of video windows 2 to 4 are displayed according to the channel number, display position, and display size specified at that timing.

## 7 Displaying a still image

The video image displayed in the full or clip mode can be switched to a still image.

When multiple video windows are displayed in the full mode, the video images displayed on the multiple video windows are all switched to still images.

### Point

#### Precautions for using a still image

##### (1) Operations that are invalid during still image display

The operations indicated below are disabled during still image display.

To enable these operations, switch the mode back to the motion video mode.

- Changing the video window channel
- Changing the display size
- Changing the display position
- Erasing the video window

- Displaying the video window

### (2) Video window on the overlap window

When the image in the video window placed on the overlap window is switched to a still image, do not move the overlap window.

If the overlap window is moved, the still image is not displayed.

### (3) Turning the GOT ON

When a still image is displayed (motion video/still image selection bit: ON), do not power on the GOT.

If the GOT is powered on while the bit is on, the video window cannot be displayed.

## ■ 8 Setting items of [Video/RGB Input Common] device

The device specified for the [Video/RGB Input Common] stores the data as indicated below.

Turning on/off the bit devices controls the operation of the video window and RGB screen.

The settings for the video window are used in common to video windows 1 to 4.

Bit number	Description	Bit status	Remarks
b0 <sup>*1</sup>	Selecting the full mode or clip mode	ON: Selects the clip mode. OFF: Selects the full mode.	Valid when the video window is displayed. Bit status can be changed while the video window is displayed.
b1	Selecting the screen for placing the video window	ON: Selects the overlap window 1. OFF: Selects the base screen.	Transparent processing is executed automatically when b1 is ON.
b2	Selecting the transparent processing	ON: Executes the transparent processing. OFF: Does not execute the transparent processing.	→ ■ 9 Transparent processing
b3	Selecting how to specify the transparent color	ON: Makes colors other than the specified color transparent. OFF: Makes the specified color transparent.	
b4	Selecting whether the display size of the video window is changed or not when the video window is touched	ON: Does not change the size. OFF: Changes the size.	Valid when the video window is opened. Bit status can be changed while the video window is displayed.
b5	Selecting a motion video or still image <sup>*2</sup>	ON: Selects a still image. OFF: Selects a motion video.	→ ■ 9 Transparent processing
b6 <sup>*3</sup>	Selecting display priority for video windows (When b2 (selecting transparent processing) is OFF.)	ON: Displays the video window over the overlap window or test window. ON: Displays the video window over the overlap window or test window.	Valid when the video window is opened. Bit status can be changed while the video window is displayed.
	Selecting transparent processing target screen (When b2 (selecting transparent processing) is ON.)	ON: Base screen only OFF: Base screen and overlap window 1 and 2	-
b7 <sup>*4</sup>	Extended control	ON: Extended control enabled OFF: Extended control disabled	→ ■ 11 Video window or RGB screen when the extended control is enabled
b8 to b9	Use prohibited	-	-
b10	Selecting the number of transparent color	ON: 65536 colors mode OFF: 256 colors mode	→ ■ 9 Transparent processing
b11 to b12	Use prohibited	-	-
b13 <sup>*4</sup>	Display position of the RGB screen	ON: Displays on the middle side. OFF: Displays on the upper left side.	→ ■ 9 Transparent processing
b14	Selecting displaying or hiding the RGB screen (CH2) <sup>*5*6</sup>	ON: Displays the RGB screen. OFF: Displays the GOT monitor screen.	Valid when mounting GT27-R2-Z → ■ 9 Transparent processing
b15	Selecting displaying or hiding the RGB screen (CH1) <sup>*5*6</sup>	ON: Displays the RGB screen. OFF: Displays the GOT monitor screen.	→ ■ 9 Transparent processing

\*1 When b7 is on, b0 is disabled and the mode is fixed to the clip mode.

\*2 When this bit is turned on with other bits at the same time, the contents of other bits are disregarded. (b5 has priority.)

\*3 The contents of control depend on the setting values for selecting transparent processing (b2).

\*4 When b7 is off and GS449.b0 is on, an RGB screen is displayed on the middle side.

When b7 is off and GS449.b0 is off, the value set in b13 is enabled.

When b7 is on, the values set in GS449.b0 and b13 are disabled and the Extended Control signal determines the display position of the video window.

→ ■ 11 Video window or RGB screen when the extended control is enabled

\*5 When a user-created screen is displayed on the GOT, an RGB screen is displayed with bit on.

\*6 When both b14 and b15 turn on, b15 has priority.

## 9 Transparent processing

### (1) Displaying transparent processing

Specify the transparent color to display objects or figures located behind the video window.

Select the transparent color from the specified color or the colors other than the specified color.

When multiple video windows are displayed, transparent processing is performed on all windows.

Example)

Transparent color specification method selection bit: b3 b3	Transparent color	Display
OFF (makes the specified color transparent)	0(black)	Figures or objects of colors other than black are visible on the video window.
ON (makes colors other than the specified color transparent)	0(black)	Figures or objects in black color are visible on the video window.

#### (a) Placing the video window on the overlap window

When the video window is placed on the overlap window 1, the transparent processing is automatically executed even if the transparent processing selection bit (b2) is OFF.

#### (b) Touch switches, numerical input, and text input behind the video window

By executing the transparent processing, objects such as touch switches, numerical input, and text input functions behind the video window are made visible.

(While the transparent processing is applied, the video window size does not change even if the video window is touched.)

### (2) Display examples (with and without transparent processing)

#### (a) When transparent processing is not executed

The video window is displayed over the base screen.

For overlap and test windows, it is selectable whether the video window is placed over or behind an overlap or test window.

#### (b) When transparent processing is executed

The video window is displayed behind the base screen.

If the target of transparent processing is only the base screen, the overlap window is not made visible.

If both the base screen and the overlap window are set as the target of transparent processing, both of them are made visible.

## 10 Usage examples of the video window

The following shows the usage examples of video window.

### (1) Switching the channels by the touch switch

The channel displayed on the video window 1 is switched each time the touch switch is touched.

The following shows the example of the setting when D100 is set in the start device.

Item	Device	Setting
[Video Window1]	[CH No.]	D106
	[Size]	D107
	[X Position]	D108
	[Y Position]	D109

### (2) Enlarging the screen as necessary

(a) In a normal state, small-size video windows are displayed at the bottom of the screen and the video windows are enlarged as necessary. (The size is changed by the sequence program or the touch switch.)

The following shows the example of the setting when D100 is set in the start device.

Item	Device	Setting
[Video Window1]	[CH No.]	D106
	[Size]	D107
	[X Position]	D108
	[Y Position]	D109
[Video Window2]	[CH No.]	D110
	[Size]	D111
	[X Position]	D112
	[Y Position]	D113
[Video Window3]	[CH No.]	D114
	[Size]	D115
	[X Position]	D116
	[Y Position]	D117
[Video Window4]	[CH No.]	D118
	[Size]	D119
	[X Position]	D120
	[Y Position]	D121

(b) In a normal state, small-size video windows are displayed at the bottom of the screen and the video windows are enlarged one by one as necessary. (The size is changed by the touch switch and script.)

The following shows the example of the setting when D100 is set in the start device.

Item	Device	Setting	
[Video Window1]	[CH No.]	D106	1
	[Size]	D107	2 → 0 → 2
	[X Position]	D108	32 → 32 → 32
	[Y Position]	D109	480 → 0 → 480
[Video Window2]	[CH No.]	D110	2
	[Size]	D111	2 → 2 → 0
	[X Position]	D112	208 → 208 → 32
[Video Window3]	[CH No.]	D114	3
	[Size]	D115	2
	[X Position]	D116	384
	[Y Position]	D117	480
[Video Window4]	[CH No.]	D118	4
	[Size]	D119	2
	[X Position]	D120	560
	[Y Position]	D121	480

Write a script that repeats the following operations each time the touch switch is touched.

- Window 1: Small → Large
- Window 1: Large → Small
- Window 2: Small → Large
- Window 2: Large → Small
- Window 3: Small → Large

(c) In a normal state, a part of the video image is displayed at the bottom of the screen, and the video image is switched to the display of the full size as necessary. (The video display mode is switched between the full mode and clip mode by the sequence program or the touch switch.)

The following shows the example of the setting when D100 is set in the start device.

Item	Device	Setting
[Video/RGB Input Common]	D100	Selecting the full mode or clip mode D100.b0: ON → OFF
[Video/RGB Transparent Color]	D101	Selecting a transparent color

Item	Device	Setting	
[Clip]	[X Position]	D102	70
	[Y Position]	D103	50
	[Width]	D104	256
	[Height]	D105	256
[Video Window1]	[CH No.]	D106	1
	[Size]	D107	0
	[X Position]	D108	32
	[Y Position]	D109	400 → 32

\*1 When b10 is turned on by the [Video/RGB Input Common] device, [0 to 65535] is applied, and when turned off, [0(Black) to 255(White)] is applied, respectively.

### (3) Changing the display position of video image

A part of a video image is displayed at the bottom of the screen and the display position is switched as necessary. (The X and Y coordinates of the area to be clipped are switched by the sequence program or the touch switch.)

The following shows the example of the setting when D100 is set in the start device.

Item	Device	Setting	
[Video/RGB Input Common]	D100	Selects the clip mode.	
[Video/RGB Transparent Color]	[0 to 65535] or [0(Black) to 255(White)]*1	D101	Selecting a transparent color
[Clip]	[X Position]	D102	70 → 90 → 80
	[Y Position]	D103	50 → 60 → 20
	[Width]	D104	256
	[Height]	D105	256
[Video Window1]	[CH No.]	D106	1
	[Size]	D107	0
	[X Position]	D108	112
	[Y Position]	D109	112

\*1 When b10 is turned on by the [Video/RGB Input Common] device, [0 to 65535] is applied, and when turned off, [0(Black) to 255(White)] is applied, respectively.

## ■11 Video window or RGB screen when the extended control is enabled

When b7 (Extended Control signal) of the video and RGB input common device is on, the video window is always displayed in the clip mode.

The value of b0 (selecting the full and clip mode) of the video and RGB input common device is disabled.

To disable the extended control function, refer to the following.

→ ■ 8 Setting items of [Video/RGB Input Common] device

When the extended control is enabled, the following functions are available.

### (1) Full-screen display

To display the video window or RGB screen in full-screen size, specify the video window or RGB screen to the Full-screen Display Control signal (GS1998).

When a value other than the following is specified, the video window or RGB screen operates in the same way as 0.

0: Does not display the video window in full-screen size. (The window display size corresponds to the setting of each video window or RGB screen.)

1 to 4: Displays the specified number of video window in full-screen size.

5: Displays the RGB screen in full-screen size.

## (2) Display setting of the video window

To display the video window or RGB screen on the GOT in the full-screen display or the clip display, configure the following setting.

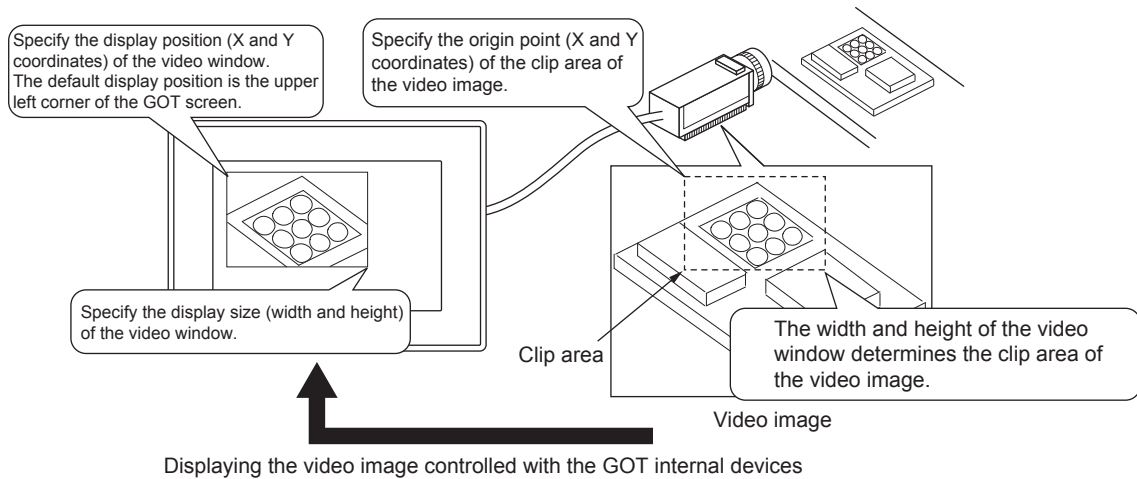

The display position of the video window or RGB screen is specified by using the upper left corner of the GOT screen as the origin point of coordinates.

Device					Function
Video window 1	Video window 2	Video window 3	Video window 4	RGB window	
GS1999	GS2009	GS2019	GS2029	*1	Specify the channel No. of the video window.
GS2000	GS2010	GS2020	GS2030	GS2039	Specify the display magnification of the video window or RGB screen. The display size, which is specified in the display size setting (width and height) for the video window or RGB screen, is used as the reference. <ul style="list-style-type: none"> <li>• 7: 400%</li> <li>• 8: 200%</li> <li>• 0: 100%</li> <li>• 1: 87.5%</li> <li>• 2: 75%</li> <li>• 3: 62.5%</li> <li>• 4: 50%</li> <li>• 5: 37.5%</li> <li>• 6: 25%</li> <li>• Other than the above: 100%</li> </ul>
GS2001	GS2011	GS2021	GS2031	GS2040	Specify the display size (width) of the video window or RGB screen in dots by using the size at 100% magnification as the reference. The actual display size (width) of the video window or RGB screen is enlarged or reduced according to the set display magnification. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2002	GS2012	GS2022	GS2032	GS2041	Specify the display size (height) of the video window or RGB screen in dots by using the size at 100% magnification as the reference. The actual display size (height) of the video window or RGB screen is enlarged or reduced according to the set display magnification. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2003	GS2013	GS2023	GS2033	GS2042	Using the upper left corner of the GOT screen as the origin point of coordinates, specify the display position (X coordinate) of the video window or RGB screen in dots. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2004	GS2014	GS2024	GS2034	GS2043	Using the upper left corner of the GOT screen as the origin point of coordinates, specify the display position (Y coordinate) of the video window or RGB screen in dots. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2005	GS2015	GS2025	GS2035	GS2044	Specify the origin point (X coordinate) of the clip area of the video image. Specify the display magnification within a range of the resolution of the video image.
GS2006	GS2016	GS2026	GS2036	GS2045	Specify the origin point (Y coordinate) of the clip area of the video image. Specify the display magnification within a range of the resolution of the video image.

\*1 Specify a channel number with b14 and b15 of the device specified for [Video/RGB Input Common].

⇒ 10.6.4 ■ 8 Setting items of [Video/RGB Input Common] device

**(a) Displaying the video image with the clip display by controlling the devices**

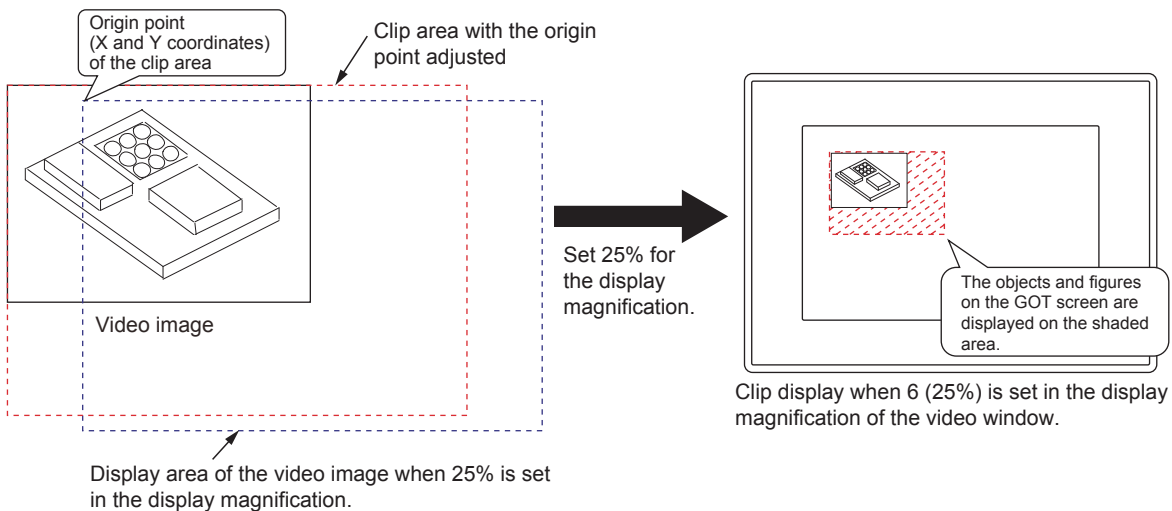

**(b) Clip display when the display magnification is changed**

If any other than 100% is set for the display magnification, the size of the video window displayed on the GOT is enlarged or reduced according to the set display magnification.

- Display example when the display magnification is 100% or 50%

- Display example when the display magnification is 25%

## 10.6.5 [Video/RGB Input] dialog

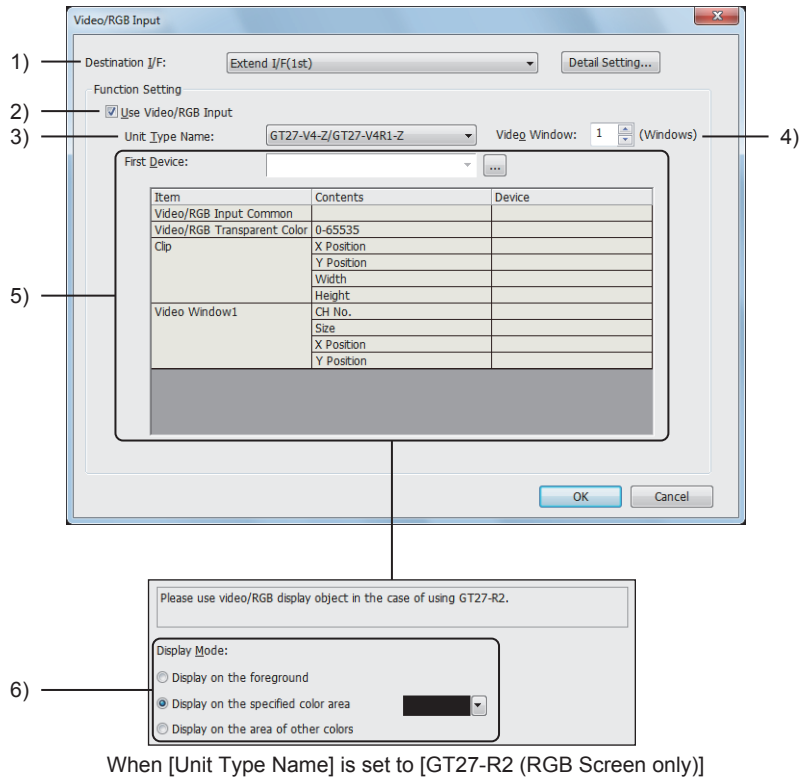

Not available to GT2705-V.

Select [Common] → [Peripheral Setting] → [Video/RGB Input] from the menu to display the setting dialog.

This dialog is common to the following functions.

- Video/RGB display object
- Video display function
- RGB display function

### 1) [Destination I/F]

Set the interface of the GOT.

The following shows the items to be selected.

- [Extend I/F(1st)]
- [Not connected]

Click the [Detail Setting] button to display the detail setting dialog for the video and RGB input.

#### • [Video Input Signal]

Select the video input signal

The following shows the items to be selected.

- [NTSC]
- [PAL]

#### • [Video Resolution]

Select the video resolution.

The following shows the items to be selected.

- [640×480]
- [720×480]
- [768×576]

### 2) [Use Video/RGB Input]

Enables the following functions.

- Video/RGB display object
- Video display function
- RGB display function

### 3) [Unit Type Name]

Select an option unit model according to the function used.

The following shows the items to be selected.

- [GT27-V4-Z/GT27-V4R1-Z]
- [GT27-R2-Z (RGB Screen only)]
- [GT27-R2 (RGB Screen only)]

### 4) [Video Window]

This item appears when [Unit Type Name] is set to [GT27-V4-Z/GT27-V4R1-Z].

Set the number of video windows displayed.

The setting range is [1] to [4].

### 5) [First Device]

This item appears when [Unit Type Name] is set to [GT27-V4-Z/GT27-V4R1-Z] or [GT27-R2-Z (RGB Screen only)].

Set the first device to be used.

By setting the first device, consecutive devices are automatically assigned to the following items.

Item	Description
[Video/RGB Input Common]	Device to display a video window or the RGB screen The device value is handled as a 16-bit binary. →10.6.4 ■ 8 Setting items of [Video/RGB Input Common] device
[Video/RGB Transparent Color]	This item appears when [Unit Type Name] is set to [GT27-V4-Z/GT27-V4R1-Z]. Specify the transparent color for the transparent processing. Transparent color depends on the bit device set by b10 of [Video/RGB Input Common]. • When b10 is on: 0 to 65535 • When b10 is off: 0 (Black) to 255 (White) →10.6.4 ■ 8 Setting items of [Video/RGB Input Common] device
[Clip]	This item appears when [Unit Type Name] is set to [GT27-V4-Z/GT27-V4R1-Z]. • [X Position]: Specify the X coordinate to display a video image when the clip mode is used. • [Y Position]: Specify the Y coordinate to display a video image when the clip mode is used. • [Width]: Specify the width of a clipped image. • [Height]: Specify the height of a clipped image.
[Video Window1], [Video Window2], [Video Window3], [Video Window4]	This item appears when [Unit Type Name] is set to [GT27-V4-Z/GT27-V4R1-Z]. The related setting items appear for each video window according to the set value of [Video Window]. • [CH No.]: Specify the channel number displayed on a video window. The setting range is [1] to [4]. • [Size]: Specify the display size of the video window. The following shows the setting range for the display size. · 0: 100% · 1: 50% · 2: 25% When the display size of the video window is changed by touching the window, the value of the set device remains unchanged. • [X Position]: Specify the X coordinate of the video window. • [Y Position]: Specify the Y coordinate of the video window.

### 6) [Display Mode]

This item appears when [Unit Type Name] is set to [GT27-R2 (RGB Screen only)].

Set the GOT display mode for the video/RGB display object.

For the details of [Display Mode], refer to the following.

→8.27.1 ■ 9 Display mode

The following shows the items to be selected.

- [Display on the foreground]:  
Displays a video/RGB display object in front of the other figures and objects on the same screen.  
Overlapping figures and objects are hidden under the video/RGB display object.  
The transparent function is disabled.
- [Display on the specified color area]:  
Displays a video/RGB display object behind the other figures and objects on the same screen.  
The transparent function is enabled.  
Select a color to become transparent.

→6.4.2 Color settings

If [Set screen background color] is enabled in the [Screen Property] dialog for a target screen, set the same color for [Front Layer Transparent Color].

Otherwise, the video/RGB display object is hidden under the background color.

- [Display on the area of other colors]:

Displays a video/RGB display object behind the other figures and objects on the same screen.

The transparent function is enabled.

Select a color not to become transparent so that other colors become transparent.

→6.4.2 Color settings

If [Set screen background color] is enabled in the [Screen Property] dialog for a target screen, set the same color for [Front Layer Transparent Color].

Otherwise, the video/RGB display object is hidden under the background color.

## 10.6.6 Precautions

---

Not available to GT2705-V.

This section explains the precautions for using the video display function.

### ■1 Precautions for drawing

#### (1) Placing the object on the video window

Objects cannot be placed on the video window.

#### (2) Displaying the video window, RGB screen, and multimedia screen

The simultaneous display of the video window, RGB screen, and multimedia screen is not available.

#### (3) Displaying a window with transparency

##### **GOT Graphic Ver.2**

If a window with transparency is placed on a video window, the video window is invisible.

### ■2 Precautions for use

#### (1) Display of a video image

##### (a) When no video signal is input from a video camera

If a video signal is not input to the specified channel due to cable disconnection or power-off of a video camera, a video image is not displayed.

##### (b) Restrictions when the video display is used with the hard copy or other functions

A video image may be given in still image or disappear temporarily when the hard copy function is executed or when a system message is displayed or cleared.

##### (c) Function unavailable in full screen mode

The hard copy function is not available with the full-screen display.

##### (d) Precautions for the utility setting

A video image may be disturbed or stopped depending on the setting for [Horizontal] or [Vertical] for the utility (video display setting).

(In this case, the normal display will be restored by changing the settings to default values.)

Whether or not such a problem occurs depends on equipment such as a video camera.

Use setting values that allow normal video display

For the operating procedure for the utility, refer to the following manual.

→GOT2000 Series User's Manual (Utility)

##### (e) Restrictions when the video window lies off the GOT screen

The video window may not display a video image properly, if the window lies off the GOT screen.

Make sure that the video window does not lie off the GOT screen.

## (2) Output format of a video camera and video input signal setting

Set a video input signal according to an output format of the video camera to be connected as shown below. If the setting is different, some video images may not be displayed correctly.

Output format of video camera	Video input signal setting
NTSC format	NTSC
PAL format	PAL
EIA format	NTSC
CCIR format	PAL

### (a) When using multiple video cameras

When you use multiple video cameras, refer to the above table. Select a video cameras with output formats that correspond to the video input signal setting of the GOT.

One type of video input signal can be set for each project.

When the output format of the video camera does not correspond to the video input signal setting of the GOT, some video images may not be displayed correctly.

## 10.6.7 Relevant settings

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

Not available to GT2705-V.

Set the relevant settings other than the specific settings for the video display function as required. The following shows the functions that are available by the relevant settings.

### ■ 1 GOT Internal Device

Enabling b7 of the device specified by [Video/RGB Input Common] enables the extended control.

Use the extended control to display the video window with the full-screen display or the clip display on the GOT.

For the details of the devices, refer to the following.

→ 12.1.3 GOT special register (GS)

10.6.4 ■ 11 Video window or RGB screen when the extended control is enabled

Function	Setting item
Checking if the input status of the video signal for CH1 is recognized	GS252.b8
Checking if the input status of the video signal for CH2 is recognized	GS252.b9
Checking if the input status of the video signal for CH3 is recognized	GS252.b10
Checking if the input status of the video signal for CH4 is recognized	GS252.b11
Controlling the display position for the RGB screen	GS449.b0
Specifying the video window or the RGB screen to be enlarged to full screen when the extended control is enabled	GS1998
Controlling the video window 1 with the GOT internal devices when the extended control is enabled	GS1999 to GS2006
Controlling the video window 2 with the GOT internal devices when the extended control is enabled	GS2009 to GS2016
Controlling the video window 3 with the GOT internal devices when the extended control is enabled	GS2019 to GS2026
Controlling the video window 4 with the GOT internal devices when the extended control is enabled	GS2029 to GS2036
Controlling the RGB display with the GOT internal devices when the extended control is enabled	GS2039 to GS2045

## 10.7 Displaying Image from a Personal Computer on the GOT (RGB Display Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### 10.7.1 Overview of the RGB display function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The RGB display function enables screens of the personal computer or others to be displayed on the GOT.

#### Point

##### RGB input unit applicable to the RGB display function

Use GT27-R2-Z or GT27-V4R1-Z for the RGB display function.

GT27-R2 is not applicable.

When using GT27-R2, use a video/RGB display object.

→8.27 Placing a Video/RGB Display Object

### 10.7.2 Specifications of the RGB display function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

#### ■1 System application (extended function)

To use the RGB display function, a system application (extended function) of [Video/RGB] is required.

To incorporate the application into the package data automatically, select [Use Video/RGB Input] and select [GT27-R2-Z (RGB Screen only)] or [GT27-V4-Z/GT27-V4R1-Z] for [Unit Type Name] in the [Video/RGB Input] dialog.

→10.6.5 [Video/RGB Input] dialog

#### ■2 Number of RGB display function settings for one project

One RGB display function setting is available for one project.

#### ■3 Specifications of the RGB display

The following resolutions and refresh rates are applicable to the RGB display function.

Resolution	Refresh rate (Hz)
XGA (1024 × 768 dots)	60
SVGA (800 × 600 dots)	60/72/75
VGA (640 × 480 dots)	60/72/75/85

## 10.7.3 Basic use of the RGB display function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The RGB display function enables various types of displays by using the [Video/RGB Input Common] device.

For the details of the settings, refer to the following.

⇒ 10.7.4 Advanced use of the RGB display function

### ■ 1 System configuration

The following shows the system configuration of the RGB display function.

Signal type	RGB output device	Connection cable <sup>*1</sup>	GOT		Number of connectable RGB devices
			Option	GOT model	
Analog RGB	For the connectable RGB output devices, refer to the following Technical News. ⇒ List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	GT15-C50VG (5m) or Preparing connection cables by each user <sup>*2</sup>	GT27-R2-Z <sup>*3</sup>	GT27 <sup>*4</sup>	Two RGB output devices for one GOT
			GT27-V4R1-Z		One RGB output device for one GOT

\*1 The cable length depends on the specifications of the RGB output device used.

\*2 For how to create a cable, refer to the following.

⇒ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*3 Two channels (CH1 and CH2) can be set as an input source for the RGB screen. For channel switching, refer to the following.

⇒ 10.6.5 [Video/RGB Input] dialog

\*4 Not available to GT2705-V.

### ■ 2 Setting procedure

**Step 1** Connect the GOT and the RGB output device.

⇒ ■ 1 System configuration

**Step 2** Select [Common] → [Peripheral Setting] → [Video/RGB Input] from the menu to display the [Video/RGB Input] dialog.

⇒ 10.6.5 [Video/RGB Input] dialog

**Step 3** In the [Video/RGB Input] dialog, set the items as shown below and click the [OK] button.

- [Destination I/F]: [Extend I/F (1st)]
- [Use Video/RGB Input]: Selected
- [Unit Type Name]: [GT27-R2-Z (RGB Screen only)] or [GT27-V4-Z/GT27-V4R1-Z] according to the unit used
- [First Device]: Device to control the RGB display function

**Step 4** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

⇒ 4. COMMUNICATING WITH GOT

**Step 5** Display the RGB screen on the GOT.

## 10.7.4 Advanced use of the RGB display function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The following shows the settings for applicative display by using the RGB display function.

### 1 How to display the RGB screen

The RGB screen is displayed on the monitor screen of the GOT according to the on/off setting of the RGB screen display/hide selection bit (the bit device in the word device).

The RGB screen is displayed through a black colored base screen by making the base screen transparent.

Set the screen color of the base screen to black.

For how to set the screen color, refer to the following.

⇒2.7 Changing Screen Property

#### (1) Display setting

- (a) **When the resolution of the RGB screen is lower than that of the GOT screen, the RGB display position can be changed to the upper left side or the middle side of the GOT.**

The display size can also be changed.

Set the RGB display position and size in [Video/RGB Input Common] in the [Video/RGB Input] dialog.

For the setting procedure, refer to the following.

⇒10.7.5 [Video/RGB Input] dialog

- (b) **The RGB display can be performed on the user-created screen only.**

For the screens other than the user-created screen (such as the utility and device monitor screen), the RGB display cannot be performed.

- (c) **The display position may be misaligned depending on the RGB output device.**

If the display position is misaligned, adjust the position in the utility ([Display Position] in [RGB Display Settings]) of the GOT. For the details of the utility, refer to the following manual.

⇒GOT2000 Series User's Manual (Utility)

#### (2) Displaying a window screen

The overlap window and test window are displayed over the RGB screen after composition.

A superimpose window is displayed as a part of the base screen.

#### (3) Displaying in the clip mode

Specify a part of the RGB screen (clip area) to display it on the GOT in actual size.

To display the RGB screen in the clip mode, configure the settings in [Video/RGB Input Common] in the [Video/RGB Input] dialog.

For the setting procedure, refer to the following.

⇒10.7.5 [Video/RGB Input] dialog

**(4) Channel switching for the RGB screen**

When the GOT with the GT27-R2-Z is used, select the input source for the RGB screen from CH1 or CH2. Set the input source channel in [Video/RGB Input Common] in the [Video/RGB Input] dialog. For the setting procedure, refer to the following.  
 →10.7.5 [Video/RGB Input] dialog

**(5) Efficient use of the RGB screen**

It provides the convenience to place a touch switch without a shape at the position where the RGB screen is displayed, and to configure the settings for the touch switch so that the RGB screen is hidden and then the monitor screen is displayed.

**(a) Hiding the RGB screen**

Configure the setting for the touch switch so that the RGB screen display/hidden selection bit turns off.

**(b) Displaying the monitor screen after hiding the RGB screen**

Configure the settings for the touch switch so that the RGB screen display/hidden selection bit turns off and the monitor screen is displayed.

Example: Hiding the RGB screen

Example: Displaying the monitor screen after hiding the RGB screen

**2 Screen save function of the RGB screen**

While the RGB screen is displayed, the power saving function of the personal computer display becomes active, followed by the GOT screen save function.

When the power saving function of the personal computer display is not active, the GOT screen save function is disabled even if it is set on the GOT.

The RGB screen save is performed as shown below.

Relation between the personal computer status and the validity of the GOT screen save function

Personal computer status	Validity of GOT screen save function
Personal computer screen displayed	Invalid (Personal computer screen displayed)
Screen saver operating	
Display power saving function operating	Valid (Personal computer screen → Monitor screen → GOT screen save mode)

### (1) Screen save operation while monitoring

While the RGB screen is not displayed, the GOT screen save function operates independently of the power saving function of the personal computer display.

For the details of the GOT screen save function, refer to the following manual.

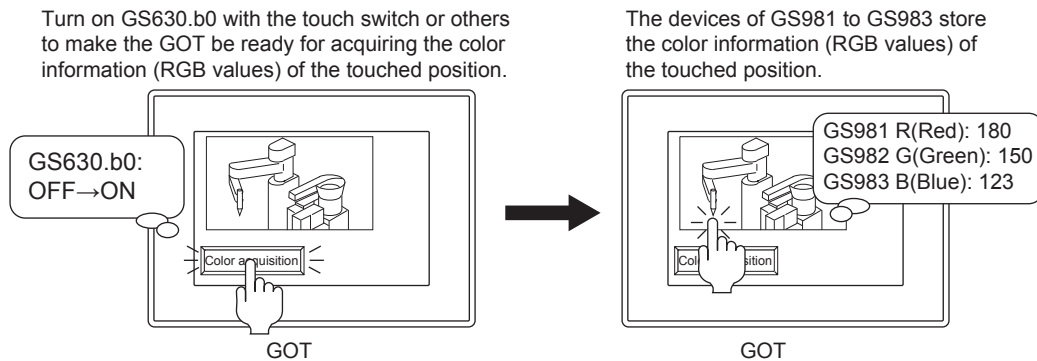

⇒GOT2000 Series User's Manual (Utility)

### (2) When no RGB signal is input to the GOT

When no RGB signal is input to the GOT due to cable disconnection and others, the GOT internal device (GS252.b15) turns on as when the GOT detects the power saving state of the personal computer display.

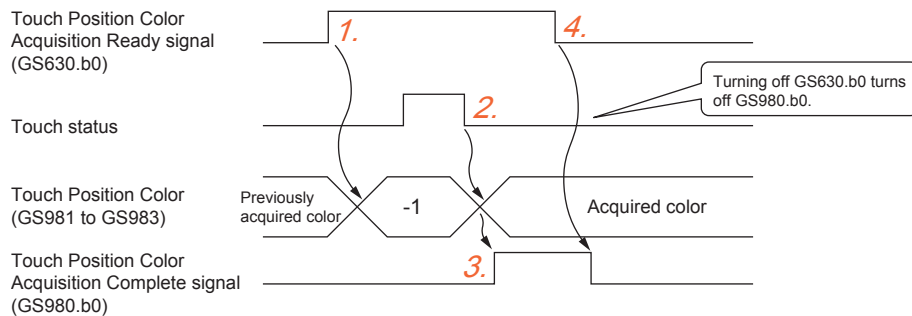

## ■3 Acquiring the color information of the touched position

By using the GOT special registers (GS devices), the color information of the touched position can be acquired.

The following shows the procedure to acquire the color information of the touched position.

- Step 1** Use the touch switch or others to turn on the Touched Position Color Acquisition Ready signal (GS630.b0). Turning on the signal makes the GOT be ready for acquiring the color information of the touched position. The Touch Position Color (GS981 to GS983) stores -1.
- Step 2** Touch the position where you acquire the color information. The Touch Position Color (GS981 to GS983) stores the color information of the touched position.
- Step 3** After the acquisition of the color information of the touched position, the Touch Position Color Acquisition Complete signal (GS980.b0) turns on. Then, the GOT stops to acquire the color information.
- Step 4** Use the touch switch or others to turn off the Touch Position Color Acquisition Ready signal (GS630.b0). Turning off the signal also turns off the Touched Position Color Acquisition Complete signal.

### (1) Color information that can be acquired

Depending on the liquid crystal display, camera, or others, the acquired color information may not be exactly the same as the color of the real image.

### (2) Timing when the color information cannot be acquired

The color information cannot be stored in the Touch Position Color (GS981 to GS983) during the following processes.

- Displaying a dialog window
- Moving a window screen
- Returning from the screen save mode
- Screen switching with the operation timing of [When a finger is touched (ON synchronous)]
- Touch operation
- Executing the hard copy function

- The Key-in Disable signal (System signal 1-1.b9) ON
  - Acquiring the color information of the touched position
- Short touch of the screen may cause the GOT not to recognize the touch operation.  
Use the Touch Position Color Acquisition Complete signal (GS980.b0) to check whether the color information has been acquired.  
When the signal does not turn on, the GOT has not acquired the color information.  
Touch the screen again to acquire the color information.

### (3) Effect on other functions

Acquiring the color information of the touched position may require a maximum of three seconds.  
Therefore, it may cause delay in the processes of the other functions.  
The hard copy function is also unavailable while the color information of the touched position is acquired.

## 10.7.5 [Video/RGB Input] dialog

Not available to GT2705-V.  
For the details of the [Video/RGB Input] dialog, refer to the following.  
→ 10.6.5 [Video/RGB Input] dialog

## 10.7.6 Precautions

Not available to GT2705-V.  
This section explains the precautions for using the RGB display function.

### ■ 1 Precautions for drawing

#### (1) Displaying the video window, RGB screen, and multimedia screen

The simultaneous display of the video window, RGB screen, and multimedia screen is not available.

#### (2) Displaying a window with transparency

##### **GOT Graphic Ver.2**

If a window with transparency is placed on the RGB screen, the RGB screen is invisible.

### ■ 2 Precautions for use

#### (1) Object function while the RGB screen is displayed

Each object operates even while the RGB screen is displayed.

#### (2) Personal computers on which the RGB display is not available

Use the personal computer which meets the resolution requirements indicated in the following reference page.  
The personal computer which does not meet the resolution requirements disables the RGB display on the GOT.  
→ 10.7.2 ■ 3 Specifications of the RGB display

#### (3) RGB screen display

##### (a) Restrictions when the video display is used with the hard copy or other functions

The RGB screen may be displayed as a still image or disappear temporarily when the hard copy function is executed or when a system message is displayed or cleared.

##### (b) Function unavailable in full screen mode

The hard copy function is not available with the full-screen display.

##### (c) Precautions for the utility setting

The RGB display may be disabled, disturbed, or stopped depending on the setting for [Horizontal] or [Vertical] of the utility (RGB display setting).

In this case, change the set values to the default values, and then configure the setting within the range that enables the RGB display.

For the operating procedure for the utility, refer to the following manual.

→ GOT2000 Series User's Manual (Utility)

#### (d) Restrictions when the RGB screen lies off the GOT screen

The RGB screen may not display an RGB image properly, if the screen lies off the GOT screen.  
Make sure that the RGB screen does not lie off the GOT screen.

#### (4) Setting of the resolution and refresh rate for the RGB output device

When the RGB input image is not displayed properly, refer to the following.

⇒ 10.7.2 ■ 3 Specifications of the RGB display

When the resolution and refresh rate are set outside the range for the RGB output device, the RGB input image is not displayed properly.

#### (5) Resolution of the RGB input image

Set the resolution of the RGB input image to be lower than that of the GOT.

When the resolution of the RGB input image is higher than that of the GOT, only the image which can be displayed within the resolution of the GOT is displayed.

To use the RGB input image whose resolution is higher than that of the GOT, take corresponding measures including the following.

- Place the display target within the location that can be displayed on the GOT.
- Use the extended control to reduce the display size of the RGB screen.

### 10.7.7 Relevant settings

Not available to GT2705-V.

Set the relevant settings other than the specific settings for the RGB display function as required. The following shows the functions that are available by the relevant settings.

#### ■ 1 GOT Internal Device

Enabling b7 of the device specified by [Video/RGB Input Common] enables the extended control.

Use the extended control to display the RGB screen with the full-screen display or the clip display on the GOT.

For the details of the devices, refer to the following.

⇒ 12.1.3 GOT special register (GS)

10.6.4 ■ 11 Video window or RGB screen when the extended control is enabled

Function	Setting item
Checking if the input status of the RGB signal for CH1 is recognized	GS252.b15
Checking if the input status of the RGB signal for CH2 is recognized (when an RGB input unit, GT27-R2 or GT27-R2-Z, is used)	GS252.b14
Controlling the display position for the RGB screen	GS449.b0
Making the GOT be ready for acquiring the color information of the touched position	GS630.b0
Checking if the acquisition of the color information of the touched position is completed	GS980.b0
Acquiring the color information of the touched position	GS981 to GS983
Checking the input status of the RGB signal	GS1025
Checking the horizontal resolution of the RGB signal	GS1026
Checking the vertical resolution of the RGB signal	GS1027
Checking the refresh rate of the RGB signal	GS1028
Specifying the video window or the RGB screen to be enlarged to full screen when the extended control is enabled	GS1998
Controlling the RGB display with the GOT internal devices when the extended control is enabled	GS2039 to GS2045

## 10.8 Recording or Playing Images Taken by a Video Camera on the GOT (Multimedia Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### 10.8.1 Overview of the multimedia function

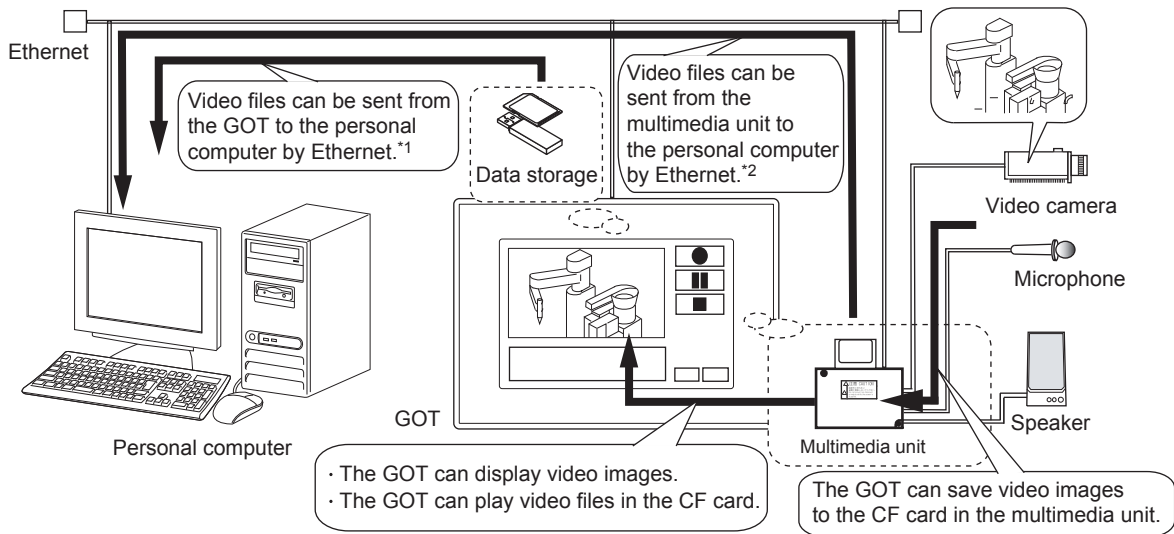

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The multimedia function enables you to display and record the images taken by the video camera connected to the multimedia unit and to play the video files saved in the data storage.

The recorded video images are saved to the CF card installed in the multimedia unit.

The video files recorded in standard mode can be sent to a personal computer by Ethernet.

\*1 Only the video files recorded in standard mode can be sent.

For the details of the recording modes, refer to the following.

→ 10.8.2 ■ 4 Specifications of the video display and the recording mode

## 10.8.2 Specifications of the multimedia function

Not available to GT2705-V.

### ■ 1 Required data storage

A multimedia unit requires one CF card.

The GOT also requires a data storage in the following cases.

- Sending a video file from the GOT to the personal computer
- Sending a video file and the log file of a user alarm to a personal computer

### ■ 2 System application (extended function)

#### (1) Required system application (extended function)

To use the multimedia function, a system application (extended function) of [Multimedia] is required.

Selecting [Enable the setting of Multimedia] in the [Multimedia] dialog incorporates the application into the package data automatically.

→ 10.8.6 [Multimedia] dialog

#### (2) Additional system application (extended function) as needed

To send video files from the GOT to the personal computer, a system application (extended function) of [Gateway(FTP Server)] is also required.

Selecting [Use the function of FTP Server] in the [Controller Setting] window incorporates the application into the package data automatically.

→ 10.15.4 [FTP Server]

However, to send video files from the multimedia unit to the personal computer, the application is not required.

### ■ 3 Number of multimedia function settings for one project

One multimedia function setting is available for one project.

### ■ 4 Specifications of the video display and the recording mode

The following shows the specifications of displaying and recording video images.

#### (1) Specifications of the display

GOT	Video input signal	Display size on the GOT
GT27	NTSC format	640 × 480 dots
	PAL format	672 × 504 dots

#### (2) Specifications of the recording

##### (a) When the recording mode is [Standard]

Record size of the video image	Video input signal	Available frame rate (fps)	Bit rate for recording
VGA (640 × 480)	NTSC format	15	1 Mbps
	PAL format	12.5	
QVGA (320 × 240)	NTSC format	15	384 Kbps
		30	768 Kbps
	PAL format	12.5	384 Kbps
		25	768 Kbps

##### (b) When the recording mode is [Extended]

Record size of the video image	Video input signal	Available frame rate (fps)	Bit rate for recording
QVGA (320 × 240)	PAL format	15	384 Kbps
	NTSC format	12.5	

##### (c) Destination to save video files

The recorded video files are saved in the 3GPP format to the CF card inserted in the multimedia unit.

When [Save to File Server] in the [Multimedia] dialog is selected, video files are sent to the personal computer by Ethernet at the same time when they are saved to the CF card.

(Only the video files recorded in standard mode can be sent.)

For how to send video images to the personal computer by Ethernet, refer to the following.

→ 10.8.4 ■ 6 Interaction method with a personal computer

## ■ 5 Required software to be installed

### (1) Multimedia Interaction Tool

To send video files from the GOT to the personal computer, Multimedia Interaction Tool must be installed to the personal computer.

Multimedia Interaction Tool is for receiving and managing video files and alarm log files that are sent from the GOT or the multimedia unit by Ethernet on the personal computer.

#### (a) How to obtain the software

Obtain the software with either of the following methods.

- Disk5 folder in the DVD-ROM of GT Works3
- Contact your local distributor.

#### (b) Operating environment

The following shows the operating environment.

Item	Description
Model	Personal computer that Windows runs on.
OS(English version)	<ul style="list-style-type: none"> <li>• Microsoft Windows 7 Ultimate (32 bit, 64 bit)<sup>*1*2*3*4</sup></li> <li>• Microsoft Windows 7 Enterprise (32 bit, 64 bit)<sup>*1*2*3*4</sup></li> <li>• Microsoft Windows 7 Professional (32 bit, 64 bit)<sup>*1*2*3*4</sup></li> <li>• Microsoft Windows 7 Home Premium (32 bit, 64 bit)<sup>*1*2*4</sup></li> <li>• Microsoft Windows 7 Starter (32 bit, 64 bit)<sup>*1*2</sup></li> <li>• Microsoft Windows Vista Ultimate (32 bit) Service Pack1 or later<sup>*1*2</sup></li> <li>• Microsoft Windows Vista Enterprise (32 bit) Service Pack1 or later<sup>*1*2</sup></li> <li>• Microsoft Windows Vista Business (32 bit) Service Pack1 or later<sup>*1*2</sup></li> <li>• Microsoft Windows Vista Home Premium (32 bit) Service Pack1 or later<sup>*1*2</sup></li> <li>• Microsoft Windows Vista Home Basic (32 bit) Service Pack1 or later<sup>*1*2</sup></li> <li>• Microsoft Windows XP Professional (32 bit) Service Pack2 or later<sup>*1*2</sup></li> <li>• Microsoft Windows XP Home Edition (32 bit) Service Pack2 or later<sup>*1*2</sup></li> <li>• Microsoft Windows 2000 Professional Service Pack4 or later<sup>*1</sup></li> </ul>
CPU	The system requirements for the above OSs must be met. <sup>*7</sup>
Memory	The system requirements for the above OSs must be met. <sup>*7</sup>
Display	Resolution XGA (1024 × 768 dots) or higher
Hard disk space	<ul style="list-style-type: none"> <li>• For installation: For installation: 1 MB or more (excluding setting information, alarm logs, and video files)</li> <li>• For execution: 500 MB or more (when receiving 10 video files that have the QVGA size, 15 fps, 900 seconds, and approximately 42.2 MB per file)<sup>*5</sup></li> </ul>
Display color	High Color (16 bits) or higher
Network connection	Ethernet 100Base-TX
Video file	3GPP file, MP4 file (only video available)
Other software	<p>To display Help, the following software must be installed.</p> <ul style="list-style-type: none"> <li>• Internet Explorer7 or later recommended</li> </ul> <p>To play and edit a video, the following software must be installed.</p> <ul style="list-style-type: none"> <li>• Quick Time Player<sup>*6</sup> or QuickTime 7 Pro</li> </ul>
Other hardware	<p>Use the hardware compatible with the above OS.</p> <ul style="list-style-type: none"> <li>• For installation: mouse, keyboard, DVD-ROM drive</li> <li>• For execution: mouse, keyboard</li> </ul> <p>Use the following hardware when required.</p> <ul style="list-style-type: none"> <li>• For outputting the sound: Sound card, speaker</li> </ul>

\*1 For installation, the administrator authority is required.

For Windows 7 and Windows Vista, the standard user or administrator account is required.

To interact GT Designer3 with other MELSOFT applications which are used under the administrator authority, use GT Designer3 under the administrator authority.

\*2 The following functions are not supported.

- Application start in Windows compatibility mode
- Fast user switching
- Changing your desktop themes (fonts)
- Remote desktop

- DPI setting other than the normal size (For Windows XP and Windows Vista)
- Setting the size of texts and illustrations on the screen to any size other than [Small-100%] (For Windows 7)

\*3 Windows XP Mode is not supported.

\*4 Windows Touch is not supported.

\*5 The available disk space depends on the data size of alarm logs and video files.

\*6 The required version depends on the OS.

- For Windows XP, Windows Vista, and Windows 7: QuickTime 7.4.5 or later
- For Windows 2000: QuickTime 7.1.6 (final version)

\*7 For the system requirements for the OSs, refer to the following.

→Microsoft official website

### (c) How to install

To send video images from the multimedia unit to the personal computer, Multimedia Interaction Tool and Multimedia Interaction FTP Service must be installed.

⇒10.8.5 Multimedia Interaction Tool

## (2) Software for playing and editing video files

To play and edit the files collected in the personal computer by using Multimedia Interaction Tool, QuickTime Player or QuickTime 7 Pro must be installed.

The software is the copyright of APPLE Inc.

Use the software under the license agreement that appears when installing the software.

### (a) Video files that can be played on the GOT

You can play the following saved video files on the GOT.

- 3GPP file
- MP4 file (only video available)

### (b) Profile of the MP4 file

To play a MP4 file, use the MP4 file created with MPEG-4 Simple Profile.

MP4 files created with profiles other than the above are unavailable.

### (c) How to obtain the software

- QuickTime Player is a software application for playing video.  
It is available for free from the website of APPLE Inc.
- QuickTime 7 Pro is a software application for editing video.  
It is available for a fee from the website of APPLE Inc.

### (d) Playing video files

Set 3GPP- and MP4-format video files to be played by QuickTime Player on the personal computer.

Multimedia Interaction Tool starts the video player that is set on the personal computer to play video files.

### (e) Editing video files

Multimedia Interaction Tool has no editing functions for video files.

Edit the video file using QuickTime 7 Pro.

The video files edited by using the software other than the above may not be played.

## 10.8.3 Basic use of the multimedia function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

The multimedia function enables you to display, play, and record various types of video images by using the [Multimedia] dialog.

For the details of the settings, refer to the following.

→10.8.4 Advanced use of the multimedia function

### ■1 System configuration

The following shows the system configuration of the multimedia function.

#### (1) Saving and displaying video images on the GOT

Multimedia controller	Signal type	Connection cable	Maximum length	GOT		Number of connectable multimedia controllers
				Option	GOT model	
*1	NTSC, PAL	Preparing connection cables by each user*2	*3	GT27-MMR-Z*4	GT27*5	One multimedia controller for one GOT

\*1 For the types of the connectable video camera, refer to the following Technical News.

→List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)

\*2 For how to create a cable, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*3 Cable length depends on the specifications of the video camera you use.

\*4 For the CF card installed in the multimedia unit, refer to the following.

- Types of usable CF cards

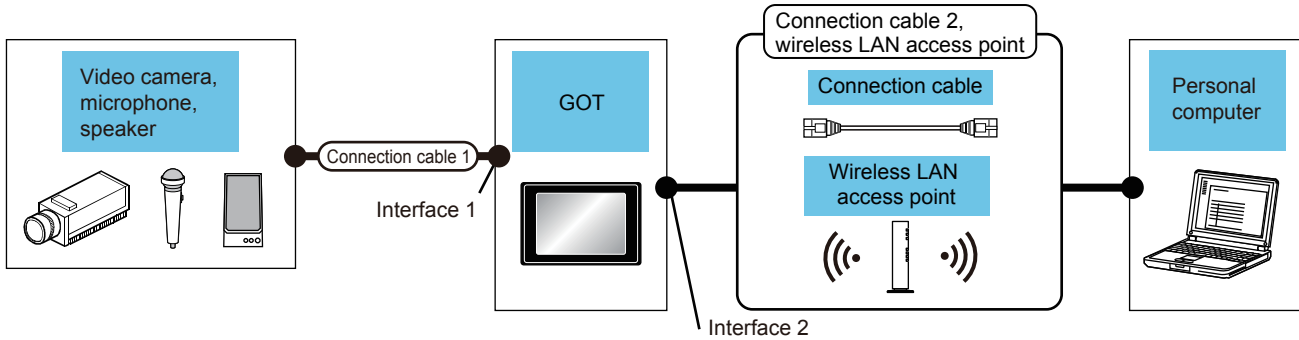

→List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)

- Precautions for using the CF card

→10.8.7 Precautions

\*5 Not available to GT2705-V.

## (2) Sending video images to the personal computer

Multimedia controller	Signal type	Connection cable 1		GOT*5			Connection cable 2, wireless LAN access point		Personal computer <sup>7</sup>	Number of connectable multimedia controllers
		Model	Maximum length	Option (Interface 1)	GOT model	Option (Interface 2)	Model	Maximum segment length <sup>6</sup>		
*1	NTSC, PAL	Preparing connection cables by each user <sup>2</sup>	*3	GT27-MMR-Z <sup>4</sup>	GT27 <sup>8</sup>	Ethernet interface (built into GOT)	• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5 • 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e	100m	Select by each user	One multimedia controller for one GOT
					GT27-MMR-Z					
					GT27 <sup>9</sup>	GT25-WLAN	-	-		
					GT27 <sup>10</sup>	GT25-WLAN	• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	-		

\*1 For the types of the connectable video camera, refer to the following Technical News.

→List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)

\*2 For how to create a cable, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*3 Cable length depends on the specifications of the video camera you use.

\*4 For the CF card installed in the multimedia unit, refer to the following.

- Types of usable CF cards
- List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)
- Precautions for using the CF card
- 10.8.7 Precautions

\*5 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system.

Connect to the applicable hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system.

Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard.

For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*6 The length between the hub and node.

The maximum length depends on the Ethernet equipment you use.

When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.

For the limit, contact the switching hub manufacturer.

\*7 To use the personal computer, install Multimedia Interaction Tool.

For Multimedia Interaction Tool, refer to the following.

→10.8.5 Multimedia Interaction Tool

\*8 Not available to GT2705-V.

\*9 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

- ⇒5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*10 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.
- ⇒5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

## ■2 Setting procedure

- Step 1** Connect the GOT and video equipment.
  - ⇒ ■ 1 System configuration
- Step 2** Configure the settings for the multimedia function in the [Multimedia] dialog.
  - ⇒10.8.6 [Multimedia] dialog
- Step 3** Write the package data to the GOT.
 

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

  - ⇒4. COMMUNICATING WITH GOT
- Step 4** Display the multimedia screen on the GOT.

### 10.8.4 Advanced use of the multimedia function

Not available to GT2705-V.

#### ■1 Display of a video image on the user-created screen

Setting the items in the [Display Setting] tab in the multimedia setting dialog enables the user-created screen to display a video image.

For the details of the settings, refer to the following.

- ⇒10.8.6 ■ 4 [Display Setting] tab

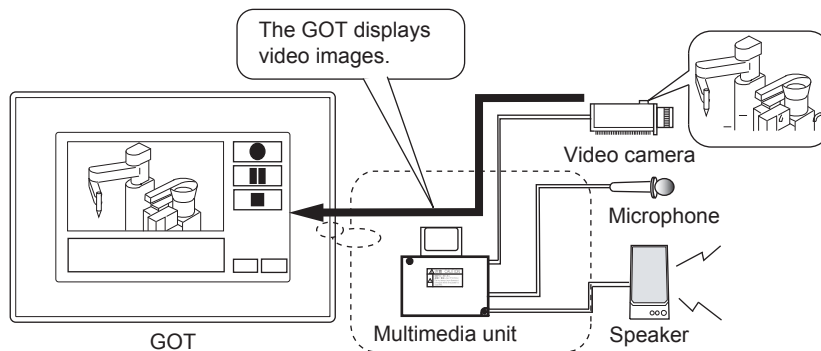

Functions equivalent to the video display function are available for the video images displayed on the user-created screen. Only one channel can be used for the multimedia function.

- ⇒10.6.5 [Video/RGB Input] dialog

Recording and playing video images are unavailable when a video image is displayed on the user-created screen. Only displaying video images is available.

#### ■2 Display of a video image

Connecting a video camera, a microphone, and a speaker to the multimedia unit enables the multimedia screen on the GOT to display a video image with sound.

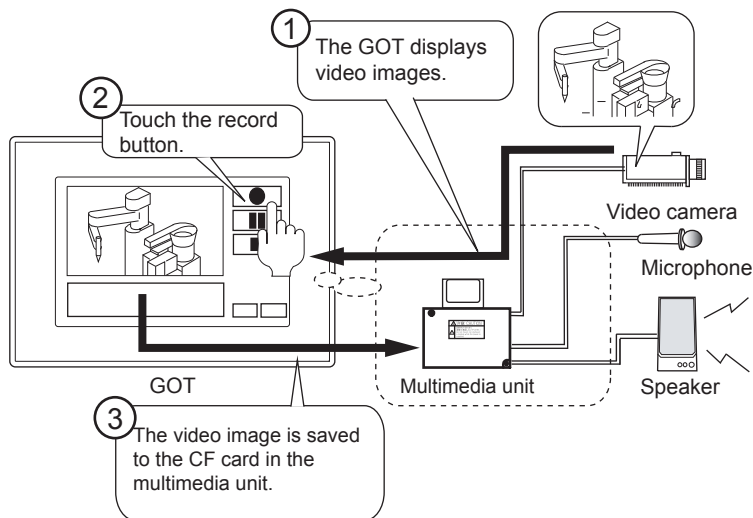

### ■3 Recording of a video image

Connecting a video camera and a microphone to the multimedia unit enables the GOT to record a video image with sound. The following methods are provided for recording.

#### (1) Recording images currently displayed

The GOT records the video image displayed on the multimedia screen of the GOT by the user operation.

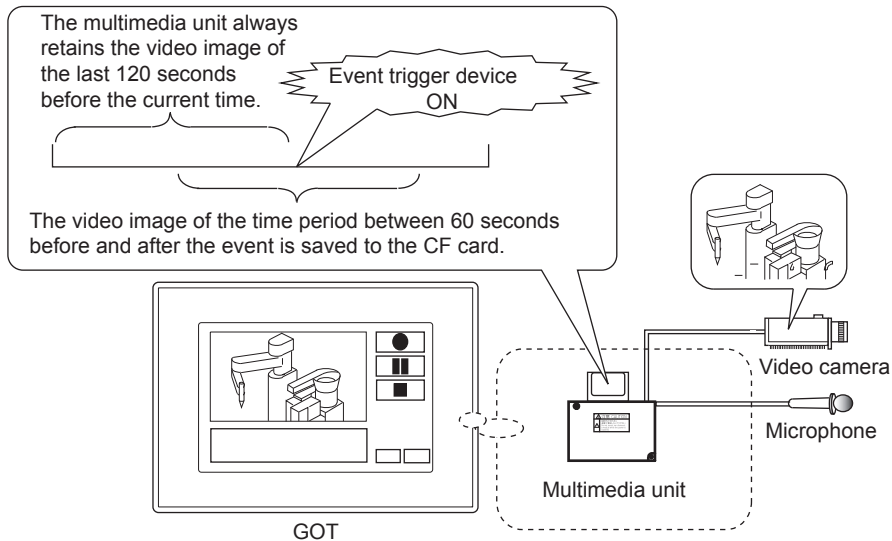

#### (2) Recording before and after the event

The GOT records a video image of before and after an event trigger device turns on for up to 120 seconds.

When the setting for recording before and after the event is enabled, the multimedia unit always holds a video image of before 120 seconds.

When an event trigger device turns on, a video image recorded before and after the device turns on is stored in the CF card.

- Saving a video image 60 seconds before and after an event trigger device turns on

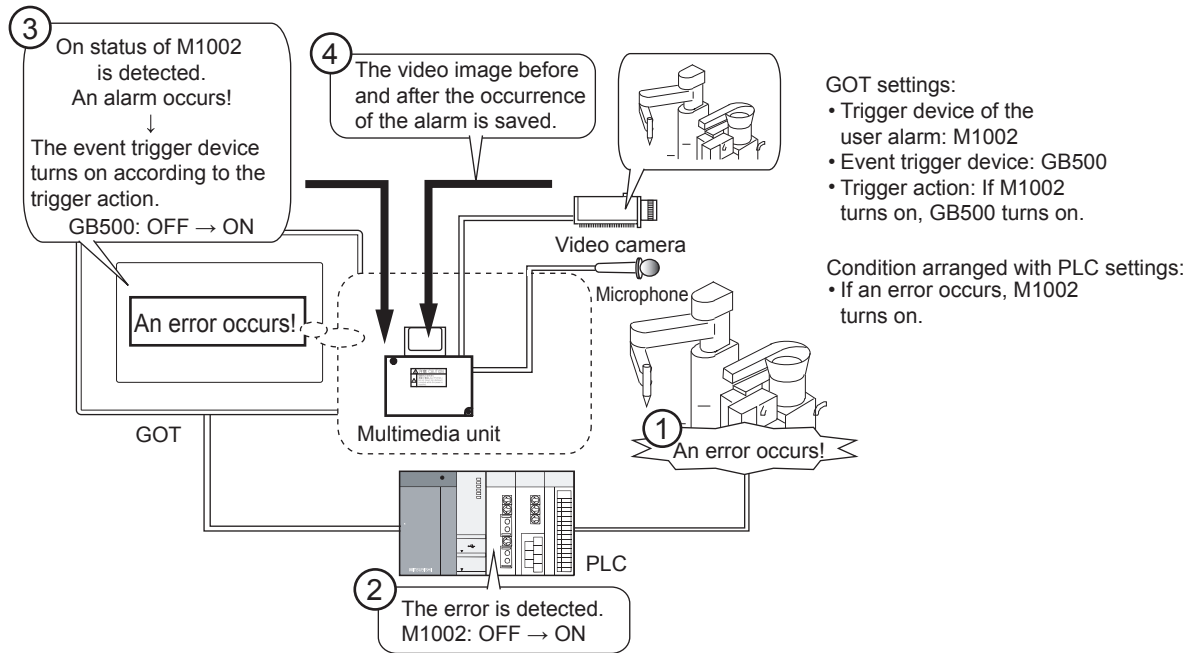

- Use with the user alarm

Using the multimedia function with the user alarm enables the GOT to record a video image before and after an alarm occurs.

Use the trigger action and script to set an event trigger device to turn on when a user alarm is detected.

Example) Saving a video image before and after a user-specified alarm occurs

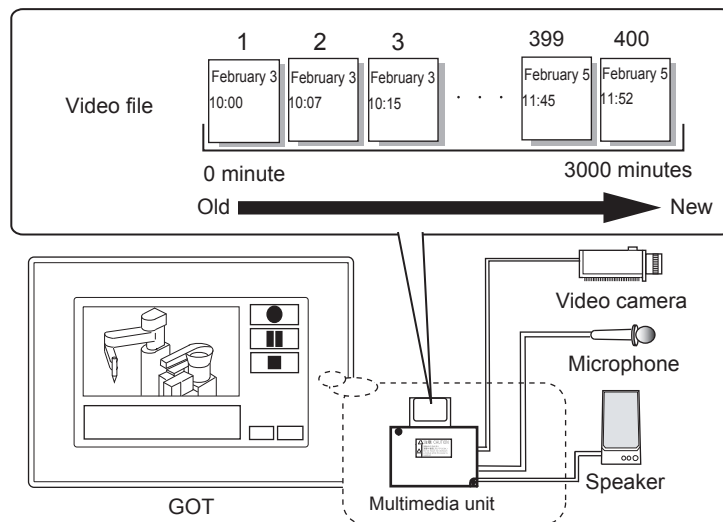

### (3) Long time recording

Setting [Extended] for the recording mode enables the GOT to record a video image for up to approximately 3000 minutes.

In the long time recording mode, a video file is divided into multiple files, and files are separately saved in the specified folder. (A video file is created per recording of approximately 7.5 minutes. Up to 400 video files can be saved.)

If the name of a video file is the same as that of a video file in the CF card when the recording starts, all the files in the CF card are deleted, and then the GOT starts recording.

For how to set the long time recording, refer to the following.

→ 10.8.6 ■ 1 [Recording Setting] tab

**(a) Recording loop**

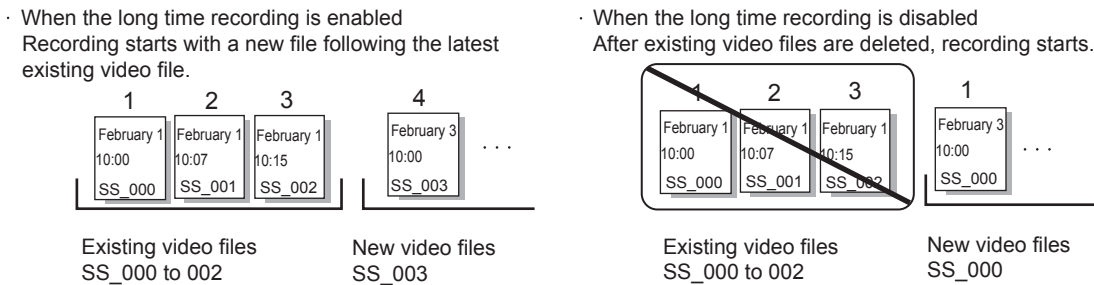

When [Recording Loop] is selected in the recording setting, the GOT can continue recording after recording 400 files (approximately 3000 minutes) by overwriting the existing files from the oldest one. In the recording loop, the GOT continues recording until the user stops recording.

For how to set the recording loop, refer to the following.  
 ⇒10.8.6 ■ 1 [Recording Setting] tab

**(b) Continuous recording (Enabled only when the recording loop is set)**

When continuous recording is enabled, the GOT starts recording creating a new file that follows the latest existing file. In this case, the existing video files are not deleted.

Configure the settings for continuous recording on the GOT utility. For the setting procedure, refer to the following.  
 ⇒GOT2000 Series User's Manual (Utility)

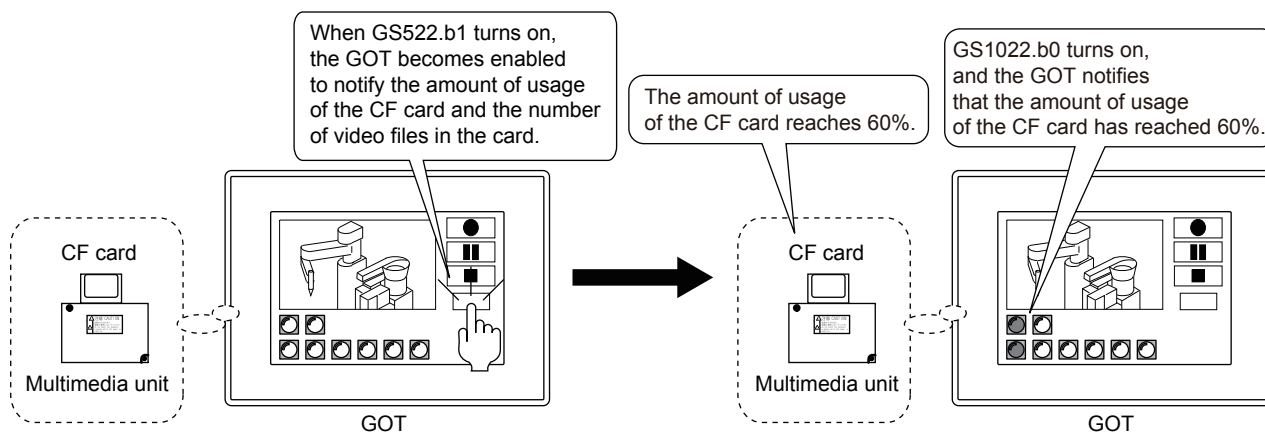

- Recording time and data size per file  
 In the long time recording, the available recording time of a video file is up to approximately 7 minutes and 30 seconds per video file (approximately 20 MB).  
 The GOT records a video file for a minimum of 7 minutes and 30 seconds.  
 Even for recording more than 7 minutes and 30 seconds, the data size of the file does not change.  
 The GOT may stop recording before the recording time reaches 3000 minutes depending on the data size of the CF card.  
 For the long time recording, reserve sufficient available space in the data storage.

**(4) Notifying the amount of usage of the CF card or the number of video files in the card in the multimedia unit**

You can use specific GOT special registers (GS) to receive notification that the amount of usage of the CF card or the number of video files in the card in the multimedia unit reaches a certain amount.

⇒12.1.3 GOT special register (GS)

This function is usable only when [Enable] is selected and [Event Trigger Device] is set in [Before-After Event Recording Setting] on the [Recording Setting] tab of the [Multimedia] dialog.

The Memory Card Usage signal (GS1022.b0 to GS1022.b1) or the Number of Memory Card Files signal (GS1022.b2 to GS1022.b7) turns on according to the amount of usage of the CF card or the number of video files in the card.

Device	Description
GS1022.b0	The amount of usage of the CF card reaches 60%.
GS1022.b1	The amount of usage of the CF card reaches 80%.
GS1022.b2	The number of video files in the CF card reaches 80.
GS1022.b3	The number of video files in the CF card reaches 110.
GS1022.b4	The number of video files in the CF card reaches 150.
GS1022.b5	The number of video files in the CF card reaches 400.
GS1022.b6	The number of video files in the CF card reaches 450.
GS1022.b7	The number of video files in the CF card reaches 500.

The following shows the procedure to notify the amount of usage of the CF card and the number of video files in the card.

**Step 1** Turn on the Start Video File Information Notification signal (GS522.b1) by using functions such as a touch switch.

Accordingly, the GOT becomes enabled to notify the amount of usage of the CF card and the number of video files in the card.

**Step 2** The Memory Card Usage signal (GS1022.b0 to GS1022.b1) or the Number of Memory Card Files signal (GS1022.b2 to GS1022.b7) turns on according to the amount of usage of the CF card or the number of video files in the card.

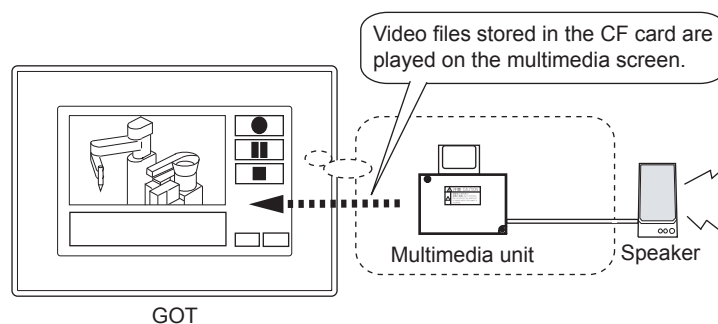

**Step 3** To disable the notification, turn off the Start Video File Information Notification signal (GS522.b1) by using functions such as a touch switch.

Accordingly, the Memory Card Usage signal (GS1022.b0 to GS1022.b1) and the Number of Memory Card Files signal (GS1022.b2 to GS1022.b7) turn off.

## (5) Playing video files

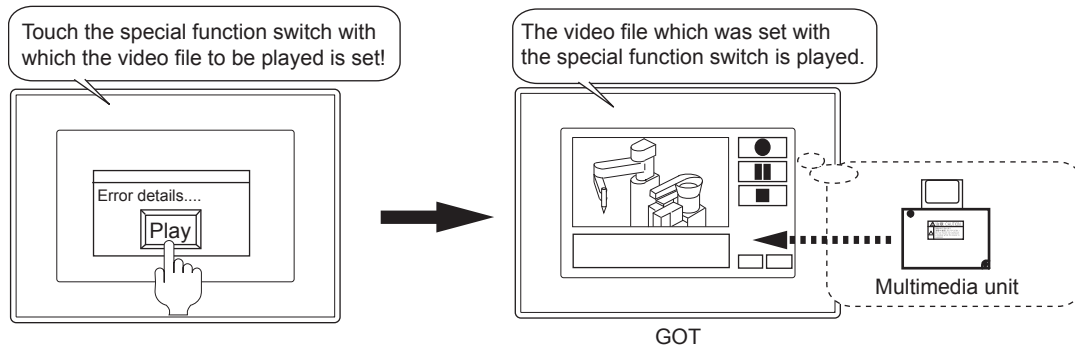

Video files saved in the CF card in the multimedia unit can be played on the multimedia screen on the GOT.

The speaker connected to the multimedia unit outputs the sound of a video file.

- Playing a video file from the monitor screen

Setting the name of a video file to be played by using the special function switch enables the GOT to play the file directly with the touch switch on the monitor screen.

## (6) Hard copy

You can save the image of the entire screen including the image currently displayed to the data storage as a BMP or JPEG file.

## (7) Interaction with a personal computer

Using Multimedia Interaction Tool enables the personal computer to receive video files and alarm log files that are sent from the GOT or the multimedia unit.

(Only the video files recorded in standard mode can be sent.)

The received video files and alarm log files can be combined for list display and search.

### (a) Sending a video file ([Recording Mode]: [Standard])

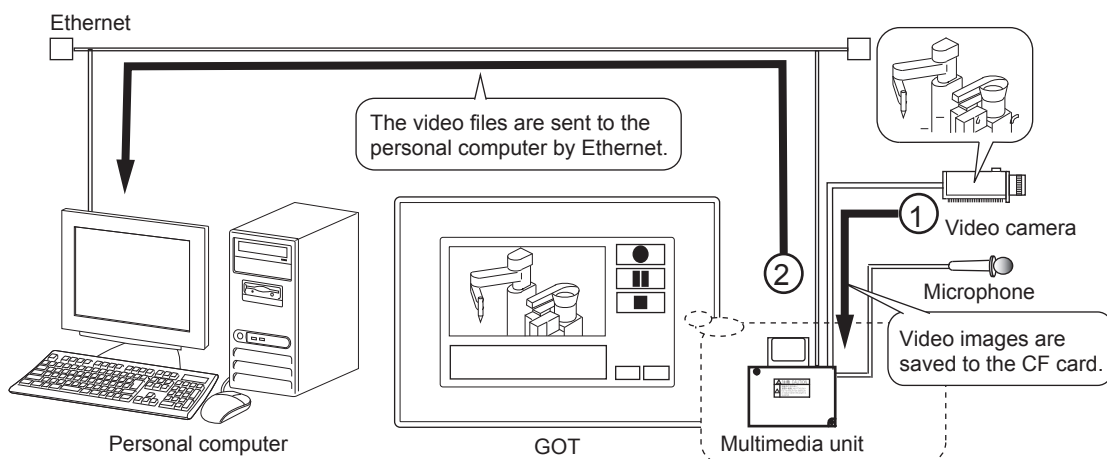

Video files can be sent from the GOT or the multimedia unit to the personal computer by Ethernet.

With the video files created using the recording before and after the event function, the alarm log files of user alarms can be sent simultaneously.

- Sending a video file from the multimedia unit to a personal computer

Connect the multimedia unit to a personal computer by Ethernet to send a video file to the personal computer.

To send alarm log files to the personal computer, a data storage must be installed on the GOT.

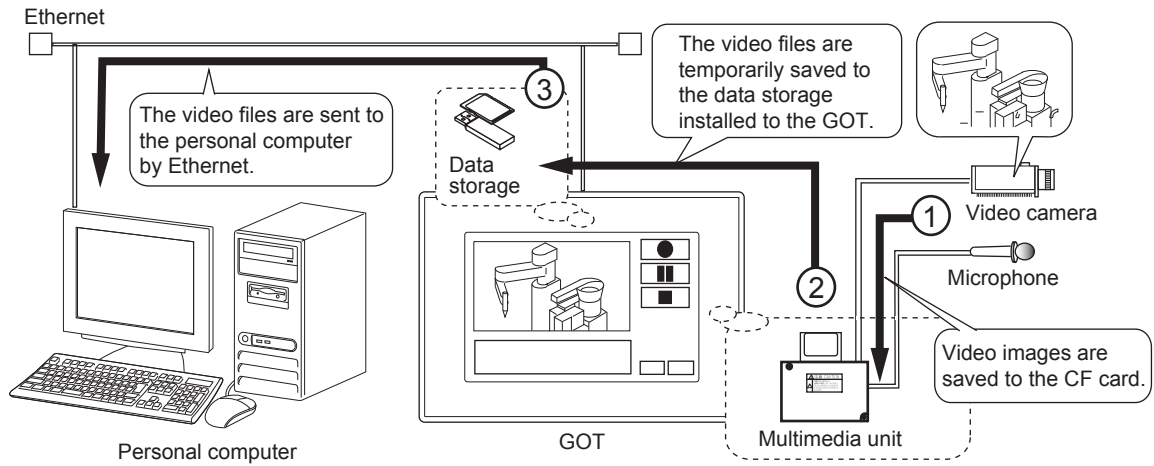

- Sending a video file from the GOT to a personal computer

Connect the GOT to a personal computer by Ethernet to send a video file to the personal computer.

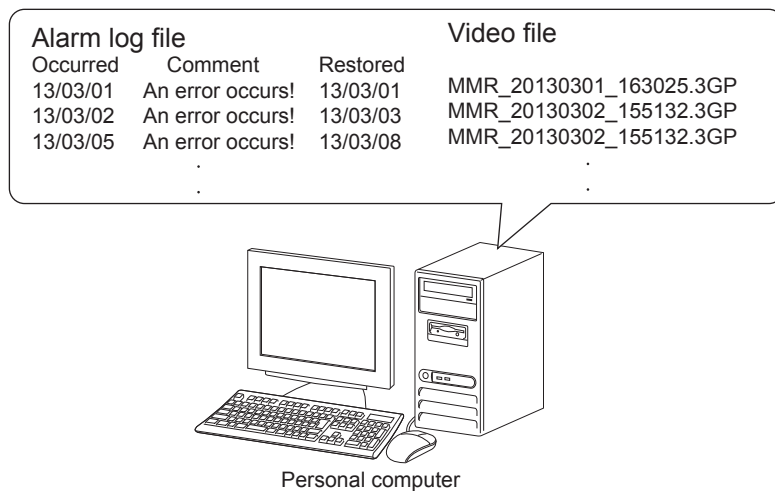

To send a video file to the personal computer, install a data storage on the GOT.

The sent video file is temporarily stored in the data storage.

### (b) Displaying the video file list and searching for video files

By using Multimedia Interaction Tool, the received video files and the alarm log files can be combined for list display and search.

## ■4 Multimedia screen

The multimedia screen is for using the multimedia function on the GOT.

The following operations are available on the multimedia screen.

- Displaying and recording images taken by a video camera connected to the multimedia unit
- Playing video files
- Displaying and deleting a video file list

For the operating procedure for the multimedia screen, refer to the following manual.

⇒GOT2000 Series User's Manual (Utility)

### (1) How to open the multimedia screen

Open the multimedia screen by using the special function switch.

For the special function switch settings, refer to the following.

⇒8.2.9 [Special Function Switch] dialog

## ■5 Hard copy

To print the hard copy of the multimedia screen, prepare the following beforehand.

### (1) Output destination setting for hard copy

To set the output destination for hard copy (data storage), select [Common], and configure the setting in [Hard Copy].

For the setting procedure, refer to the following.

⇒9.7.6 [Hard Copy] dialog

## ■6 Interaction method with a personal computer

For interaction with the personal computer, prepare the following beforehand.

### (1) Preparation on the personal computer

### (a) Installing and setting the software

Install Multimedia Interaction Tool on the personal computer.

To connect the multimedia unit to Ethernet, also install Multimedia Interaction FTP Service.

After installation, configure the settings for Multimedia Interaction Tool.

For the installation instructions and setting procedure, refer to the following.

⇒10.8.5 Multimedia Interaction Tool

### (b) Connecting the personal computer to Ethernet

Connect the personal computer to Ethernet.

For the connection method, refer to the following.

⇒GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

## (2) Preparation on GT Designer3

### (a) Configuring the settings for the multimedia function

Configure the settings in the [Multimedia] dialog.

To send video files to the personal computer, enable the following items.

- [Enable the setting of Multimedia]
- [Recording Setting] in the [Recording Setting] tab  
[Save to File Server]
- [Before-After Event Recording Setting] in the [Recording Setting] tab  
[Enable]

For the setting procedure, refer to the following.

⇒10.8.6 [Multimedia] dialog

### (b) Communication settings

Configure the communication settings to connect the personal computer to the GOT and the multimedia unit. For the setting procedure, refer to the following.

⇒10.8.6 [Multimedia] dialog

5.5.4 Configuring the settings for switching the target station No. for monitoring

### (c) Setting the user alarm

To send alarm log files of user alarms with recording before and after the event, set the following beforehand.

- Specify the alarm ID set in the [Multimedia] dialog for [Alarm ID] in [User Alarm Observation].
- Select [Save the alarm logs and convert them into Unicode Text/CSV (project common)] in [Alarm Common Setting].
- Select [Save alarm log files] in the [File Save] tab in [User Alarm Observation].

For interaction with the personal computer, Unicode text must be specified as the output format of the user alarm log file in [File Save] in [User Alarm Observation].

For how to set the user alarm, refer to the following.

⇒9.1.5 Viewing alarm events (Alarm display)

### (d) Enabling the FTP server function

To connect the GOT to Ethernet, enable the FTP server function.

For the setting procedure, refer to the following.

⇒10.15 Transferring a File between the GOT (FTP Server) and the Peripheral Device (FTP Client) (FTP Server Function)

## (3) Preparing a data storage

### (a) Preparing a data storage

In the following cases, install the data storage on the GOT.

- Sending a video file from the GOT to the personal computer  
When a video file is sent, the G2MMR folder is created in the root folder of the data storage installed on the GOT, and the video file is saved in the folder temporarily.  
Temporary save is unavailable when no data storage is installed on the GOT. Thus, the video file cannot be sent to the personal computer.
- Sending a video file and user alarm data simultaneously from the multimedia unit to the personal computer  
User alarm data is stored to the data storage installed on the GOT.  
The user alarm data cannot be sent to the personal computer when no data storage is installed.

### (b) Connecting the GOT to Ethernet

To send a video file from the GOT to a personal computer, connect the GOT to Ethernet.

To send a video file from the multimedia unit to the personal computer, connect the multimedia unit to Ethernet.

For the connection method, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

## 7 Setting example of recording before and after the event

Combining the recording before and after the event function and the user alarm enables the GOT to record a video image of before and after an alarm and play the video image from the simple alarm display.

The following shows the setting and usage examples for playing the video file recorded when an alarm occurs in simple alarm display.

### (1) Setting

The following shows the setting for each item.

Item	Description	Reference	
[Multimedia]	[Before-After Event Recording Setting]	Enabled	
	[File Name]	ER_MMR	
	[Event Trigger Device]	X1000	→10.8.6 [Multimedia] dialog
	[Playback File Time Specification Device]	GD501 to GD504	
[User Alarm Observation]	[Alarm ID]	5	→9.1.2 Collecting alarms by monitoring devices
	[Trigger device]	X1000	
[Simple Alarm Display]	[Alarm ID]	5	→9.1.5 Viewing alarm events (Alarm display)
	Display setting for [External Notification Information]	Alarm ID: GD500 Date: GD501 to GD502 Time: GD503 to GD504	
[Screen switching device(Overlap window 1)]	GD500	→5.2.1 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])	
[Window Screen]	Placing the special function switch Special function switch settings		→8.2.9 [Special Function Switch] dialog
	• [Action]: [Multimedia]		
	• [Initial display screen]: [Multimedia]		
	[Screen No.]	5	
	[Screen Type]	Window screen	

#### (a) Synchronizing trigger devices

Set the same device for the following setting items to synchronize occurrence of an alarm with the start of recording before and after the event. (X1000)

- [Event Trigger Device] in [Multimedia]
- [Trigger Device] in [User Alarm]

#### (b) Adding date and time of occurrence

To add the date and the time when an alarm occurs to the name of the video file to be played by using the special function switch, set the same device for the following setting items.

(GD501 to GD504)

- [Playback File Time Specification Device] in Multimedia
- [Occurred Date] and [Occurred Time] in [External Notification Information]

#### (c) Setting for [Screen switching device]

To display the window screen with the same number as [Alarm ID] of a generated alarm when touching the simple alarm

display, set the same device for the following setting items. (GD500)

- Screen switching device
- [Alarm ID] in [External Notification Information]

**(2) Description about the action**

**Step 1** The PLC detects an error and turns on X1000.

The GOT detects that the trigger device of the user alarm and the event trigger device are on. (An alarm occurs, and a video image is saved with recording before and after the event.)

**Step 2** When an alarm occurs, a user alarm is displayed.

Touching the information of the generated alarm starts writing the following values to the external notification device.

- Alarm ID
- Occurrence date
- Occurrence time

**Step 3** The value of the alarm ID is written to the screen switching device, and the window screen appears.

Touch the special function switch placed on the window screen.

Touching the special function switch plays the set video file.

The details of the playback file time specification device (date and time of an alarm) are added to the name of the video file to be played.

**Step 4** The GOT plays the video file of when an alarm occurs on the multimedia screen.

## 10.8.5 Multimedia Interaction Tool

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### ■ 1 How to install the software

#### (1) Installing procedure

Software to be installed depends on the connection type to Ethernet.

##### (a) When connecting with the Ethernet interface of the GOT

Install Multimedia Interaction Tool.

##### (b) When connecting with the Ethernet interface of the multimedia unit

Install Multimedia Interaction Tool and Multimedia Interaction FTP Service.

##### (c) When one system has the GOT connected by using the Ethernet interface of the GOT and the GOT connected by using the Ethernet interface of the multimedia unit

Install Multimedia Interaction Tool and Multimedia Interaction FTP Service.

### Point

#### (1) Software version

Use the same version of Multimedia Interaction Tool and Multimedia Interaction FTP Service.

If the versions are different, Multimedia Interaction Tool does not operate properly.

#### (2) Precautions for installing and uninstalling the software

Do not install or uninstall Multimedia Interaction FTP Service while Multimedia Interaction Tool is running.

Multimedia Interaction Tool may end abnormally or the data may be damaged.

#### (2) Firewall setting

After installation, set the following software as exceptions in the Windows firewall setting.

Failure to do so prevents video files from being sent to the personal computer.

##### (a) When sending a video file from the GOT to the personal computer

Set GTMMDataConnector.exe as an exception.

##### (b) When sending a video file from the multimedia unit to the personal computer

Set GTMMFtpService.exe as an exception.

##### (c) When sending a video file from the GOT and the multimedia unit to the personal computer

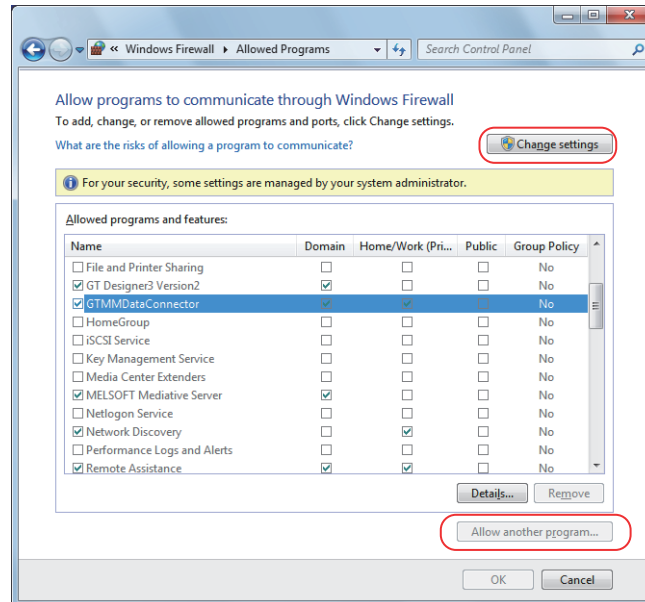

Set GTMMDataConnector.exe and GTMMFtpService.exe as exceptions.

The following shows the setting procedure.

**Step 1** Display Windows Firewall by the following operation.

- Microsoft Windows XP: Select [Control Panel] → [Security Center] → [Windows Firewall].
- Microsoft Windows Vista and 7: Select [Control Panel] → [Security] → [Windows Firewall].

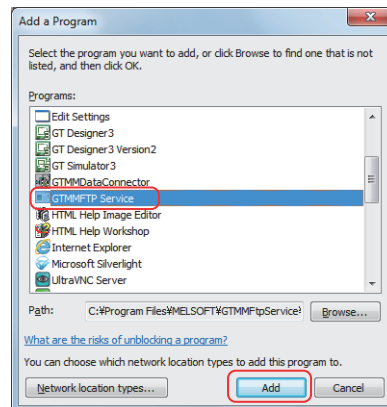

The following shows an example of the screen of Microsoft Windows 7. Click the [Change settings] button on the displayed dialog and click the [Allow another program...] button.

**Step 2** Select the software from the program list.

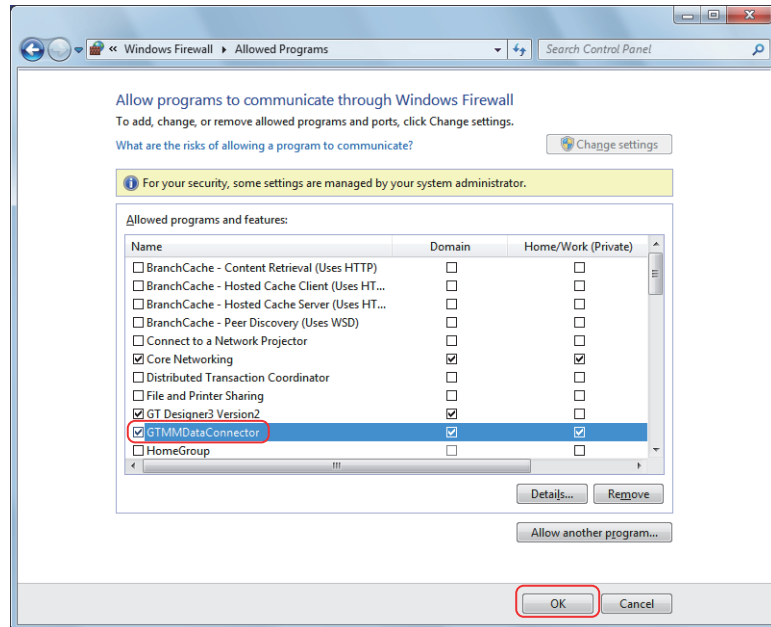

When [GTMMDataConnector.exe] or [GTMMFtpService.exe] is not in the program list, click the [Browse] button to specify the path of the program directly.

After selecting, click the [OK] button.

**Step 3** The screen returns to the [Windows Firewall] window.

Check that [GTMMDataConnector.exe] or [GTMMFtpService.exe] is selected in [Allowed programs and features] and click the [OK] button.

## ■2 How to start Multimedia Interaction Tool

Start Multimedia Interaction Tool by the following procedure.

**Step 1** From the Windows start menu, select [MELSOFT Application] → [GT MMDDataConnector]. \*1

\*1 Select [All Programs] on the [Start] screen, or select [Start] → [All Programs].

**Step 2** Multimedia Interaction Tool starts.

## ■3 Screen configuration

Multimedia Interaction Tool consists of the following screens.

### (1) Main window

In the main window, you can select or display the menu for executing each function of Multimedia Interaction Tool or the GOT alarm list.

This screen appears first after Multimedia Interaction Tool is started.

## (2) GOT alarm list window

This window displays alarm data and video files sent from the GOT.  
You can play the video file by selecting it from the GOT alarm list.

To display the GOT alarm list window, double-click the GOT alarm list, which is on the left side of the main window.

## ■4 Settings

To receive the alarm data and video files from the GOT, the setting must be configured in advance.  
The following shows the setting instructions.

**Step 1** Start Multimedia Interaction Tool and select [File] → [Create new project].

**Step 2** The following dialog appears.

Enter the project name to be saved in [Project name] and the path of the folder that saves the project in [Path name].

Click the [OK] button to complete the creation of a new project file.

**Step 3** Select [Project] → [Create new GOT alarm list].

The following dialog appears.

Enter the name of the GOT alarm list in [Alarm list name] and the path of the folder that saves the list in [Folder].

Click the [OK] button to complete the creation of the GOT alarm list.

**Step 4** Select [Edit] → [Environment setting].

The following dialog appears.

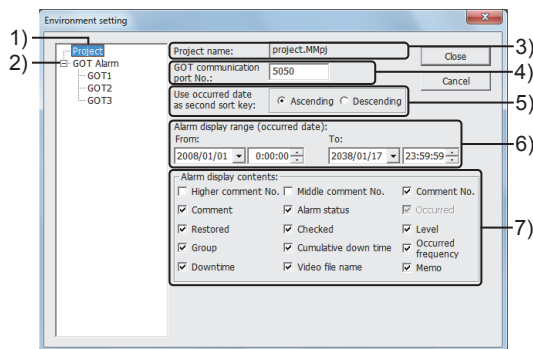

Enter the setting item, and click the [Close] button.

Before setting, check the following information.

- IP address of the GOT
- FTP user name
- FTP password
- Communication port number of the GOT

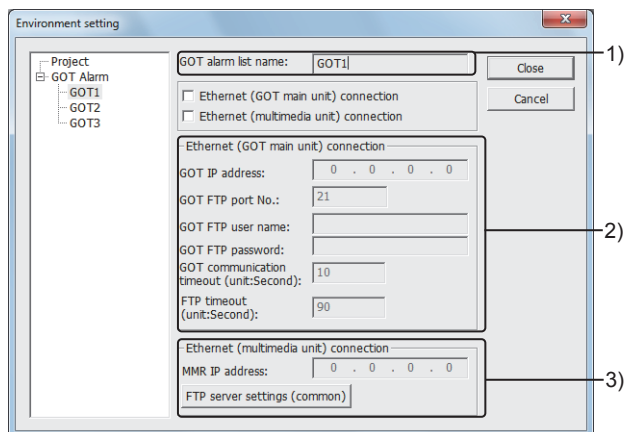

For the checking procedure of the FTP user name and the FTP password, refer to the following.

→ 10.15 Transferring a File between the GOT (FTP Server) and the Peripheral Device (FTP Client)  
(FTP Server Function)

- 1) **[Project]**  
Click this item to set the display condition of the project.
- 2) **[GOT Alarm]**  
Displays the GOT alarm list in the tree structure.  
Click a GOT alarm list in the tree view to configure the GOT connection setting.  
For the details of the setting procedure, refer to the following.  
    ⇒ (1) Connection setting with GOTs
- 3) **[Project name]**  
Displays the name of the project file whose environmental settings are to be configured.
- 4) **[GOT communication port No.]**  
Set the communication port number of the GOT.  
The setting range is [0] to [65534].
- 5) **[Use occurred date as second sort key]**  
When sorting the GOT alarm list by items other than the occurrence date, select ascending or descending order for the secondary sort key (occurrence date and time).
- 6) **[Alarm display range (occurred date)]**  
Set the alarm display range (occurrence date and time) to be displayed in the GOT alarm list.
- 7) **[Alarm display contents]**  
Select the item to be displayed in the GOT alarm list.

**(1) Connection setting with GOTs**

- 1) **[GOT alarm list name]**  
Displays the name of the GOT alarm list that is being set.
- 2) **[Ethernet (GOT main unit) connection]**  
Enable the connection setting with GOTs.

Item	Description
[GOT IP Address]	Set the IP address of the GOT. The setting range is [0.0.0.0] to [255.255.255.255].
[FTP user name]	Set an FTP user name. Up to 12 alphanumeric characters (a to z, A to Z, 0 to 9) can be set.
[FTP Password]	Set an FTP password. Up to 8 alphanumeric characters (a to z, A to Z, 0 to 9) can be set.
[GOT communication timeout (unit: Second)]	Set the time required for the communication with the GOT to time out. The setting range is [1] to [65535].

Item	Description
[FTP timeout (unit: Second)]	Set the time required for the communication by the FTP server function to time out. The setting range is [1] to [65535].

### 3) [Ethernet (multimedia unit) connection]

Enable the connection setting with the multimedia unit.

Item	Description
[MMR IP address]	Set the IP address of the multimedia unit.

### 4) [FTP server settings (common)]

Click this button to check the FTP server setting of Multimedia Interaction FTP Service.

Clicking this button displays the following dialog.

To change the FTP account, click the [Change FTP Account] button.

Clicking the button displays the [Change FTP Account] dialog.

Enter a new FTP user name in [FTP user name] and the password in [Enter FTP password].

Enter the same password as entered in [Enter FTP password] into [Confirm FTP password].

Click the [OK] button to complete the FTP account change.

## 5 Operating procedure

### (1) Project file operation

#### (a) Creating a new project file

To create a new project file, select [File] → [Create new project].

The following dialog appears.

Enter the project name to be saved in [Project name] and the path of the folder that saves the project in [Path name].

Click the [OK] button to complete the creation of a new project file.

#### (b) Opening a project file

To open a project file, select [File] → [Open project].

The following dialog appears.

Select a program to be opened and click the [Open] button.

The selected project file is opened.

### (c) Saving a project file

To save a project file, select [File] → [Save project].  
The project file is overwritten.

### (2) GOT alarm list operation

The alarm data sent from each GOT is displayed in the GOT alarm list.  
Create GOT alarm lists for the number of GOTs connected to the personal computer.

#### (a) Creating a new GOT alarm list

Select [Project] → [Create new GOT alarm list].  
The following dialog appears.  
Enter the GOT alarm list name in [Alarm list name] and the path of the folder that saves the list in [Folder].  
Click the [OK] button to complete the creation of the GOT alarm list.

#### (b) Hiding the GOT alarm list

Select the GOT alarm list to be hidden from the GOT alarm tree, and then select [Project] → [Non-display GOT alarm list].  
The following confirmation dialog appears.  
Click the [Yes] button to hide the GOT alarm list from the GOT alarm tree.

#### (c) Redisplaying the GOT alarm list

Select [Project] → [Re-display GOT alarm list].  
The following dialog appears.  
Enter the hidden GOT alarm list name in [Alarm list name], and click the [OK] button.  
The GOT alarm list appears again in the GOT alarm tree.

#### (d) Deleting the GOT alarm list

Select [Project] → [Delete GOT alarm list].  
The confirmation dialog for the GOT alarm list deletion appears.  
Click the [OK] button to delete the GOT alarm list.  
The deleted GOT alarm list cannot be restored.  
Check that deleting the GOT alarm list causes no problem in advance.

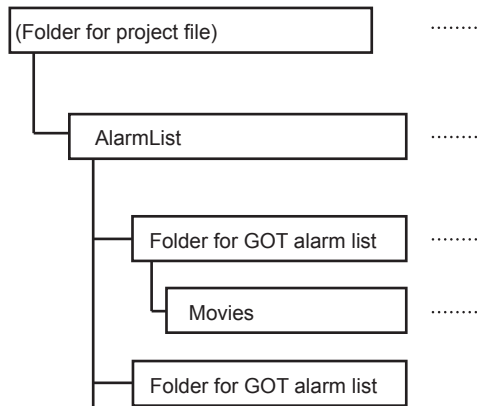

### (3) Receiving alarm data and video files

Multimedia Interaction Tool can receive alarm data and video files from multiple GOTs connected by Ethernet. The received alarm data and video files are saved in the personal computer automatically. You can check the saved data in the GOT alarm list or the distributed video list.

#### Point

#### Directory configuration of the project file

The following shows the folder configuration of the project file of Multimedia Interaction Tool.

### (4) Playing video files

Play the video file in the GOT alarm list by the following procedure.

- Step 1 Select the video file to play in the GOT alarm list.
- Step 2 Select [Display] → [Play video].

- Step 3 QuickTime Player starts.  
Click the play button to play the video file.

Play button

**(5) Searching the alarm data**

You can search the alarm data in the GOT alarm list.

Display the GOT alarm list, and select [Edit] → [Search]. The following dialog appears.

Enter the conditions and click the [Search] button. All the displayed items become searching targets.

Selecting [Edit] → [Search next] searches the next alarm data.

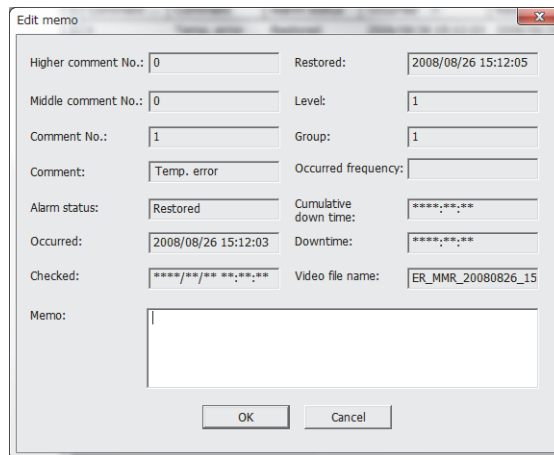

**(6) Editing memos**

You can edit memos of the alarm data.

Click the alarm data with the memo to be edited in the GOT alarm list, and select [Edit] → [Edit memo].

The following dialog appears.

Enter texts in [Memo], and click the [OK] button. The entered contents are reflected.

**(7) Deleting alarms**

You can delete the alarm selected in the GOT alarm list.

Select the alarm in the GOT alarm list, and select [Edit] → [Delete alarms].

The confirmation dialog for the alarm deletion appears.

Select [Backup recording file] when backing up the video files that are associated with the alarms.

At the alarm deletion, video files are saved in the backup folder in the project folder.

Click the [OK] button to delete the alarm.

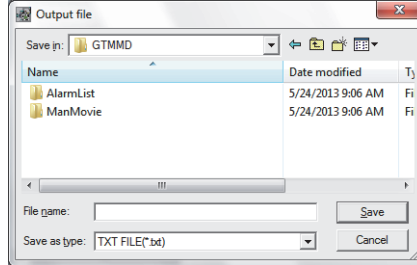

The deleted alarm cannot be restored.

Check that deleting the alarm causes no problem in advance.

## (8) Exporting the GOT alarm list

You can export the GOT alarm list in a CSV file format.  
Export the GOT alarm list by the following procedure.

- Step 1** Select the GOT alarm list to be exported in the GOT alarm tree.
- Step 2** Select [File] → [Export].
- Step 3** The following dialog appears.
- Step 4** Select the saving destination, and click the [Save] button to start the export of the GOT alarm list.

## 6 Error message

The following shows the error messages of Multimedia Interaction Tool.

Message	Cause	Measure
Failed to initialize Windows sockets.	Initializing the communication processing has failed.	<ul style="list-style-type: none"> <li>• Check that the network cables are connected securely.</li> <li>• Check that the network setting is correct.</li> </ul>
Failed to open project "*****".	Any of the project file (*.Mpj), the distributed video definition file (*.Mmd), or the alarm information file (*.Mai) has been write-protected or deleted.	<ul style="list-style-type: none"> <li>• Check that writing data to the folders and the files in the target project is allowed.</li> <li>• Check that the folders and the files in the target project are not deleted.</li> </ul>
Failed to create project "*****".	A new project is not created in the folder specified by the user due to the following causes. <ul style="list-style-type: none"> <li>• The available space of the hard disk is not sufficient.</li> <li>• The folder specified by the user is write-protected.</li> </ul>	<ul style="list-style-type: none"> <li>• Check that the hard disk of the personal computer has the sufficient available space.</li> <li>• Check that the folder specified by the user is write-protected.</li> </ul>
Failed to save project "*****".	The project cannot be saved due to the following causes. <ul style="list-style-type: none"> <li>• The available space of the hard disk is not sufficient.</li> <li>• The folder specified by the user is write-protected.</li> </ul>	<ul style="list-style-type: none"> <li>• Check that the hard disk of the personal computer has the sufficient available space.</li> <li>• Check that writing data to the folders and the files in the existing project is prohibited.</li> </ul>
Failed to create GOT alarm list "*****".	A new GOT alarm list cannot be created due to the following causes. <ul style="list-style-type: none"> <li>• The available space of the hard disk is not sufficient.</li> <li>• The folder specified by the user is write-protected.</li> </ul>	<ul style="list-style-type: none"> <li>• Check that the hard disk of the personal computer has the sufficient available space.</li> <li>• Check that writing data to the folders and the files in the existing project is prohibited.</li> </ul>
Failed to re-display GOT alarm list "*****".	The GOT alarm list cannot be created due to a creation error of the alarm information file (*.Mai).	<ul style="list-style-type: none"> <li>• Check that the hard disk of the personal computer has the sufficient available space.</li> <li>• Check that writing data to the folders and the files in the existing project is prohibited.</li> </ul>
Failed to upload video file "*****" in GOT alarm list "*****".	The video file cannot be uploaded because the format of the user alarm log file is incorrect at the recording before and after the event.	Set the output format of the user alarm log file to the Unicode text file.
Project "*****" already exists.	The existing project name is entered in the project name when a new project is created.	Enter another project name.
GOT alarm list "*****" already exists.	The existing GOT alarm list name is entered when a new GOT alarm list is created.	Enter another GOT alarm list name.
GOT alarm list "*****" is already displayed.	The displayed GOT alarm list is entered in [Re-display GOT alarm list].	Select a hidden GOT alarm list.
Invalid path. Please enter again.	An invalid path is specified when a new project is created.	Enter a valid path.
Invalid project name. Please enter again.	A project name is entered when a new project is created.	Enter a project name.

Message	Cause	Measure
Invalid FTP user name. Please enter user name again.	When the FTP account is changed in the environmental setting, the FTP user name is not entered or 13 or more characters are entered.	Set the FTP user name within 12 characters.
Invalid FTP user password. Please enter password again.	When the FTP account is changed in the environmental setting, the FTP password is not entered or 9 or more characters are entered.	Set the FTP password within 8 characters.
Password entry does not match confirmation entry. Please enter password again.	When the FTP account is changed in the environmental setting, different passwords are entered in [Enter FTP password] and [Confirm FTP password].	Enter the same password in [Enter FTP password] and [Confirm FTP password].
Cannot connect to GTMMFtpService. Ethernet (multimedia unit) connection settings are disabled.	The Multimedia Interaction FTP service is not installed.	Uninstall or invalidate another FTP server software from the personal computer, and install Multimedia Interaction FTP Service again.
***** could not be deleted. Check if the file is in use.	The alarm cannot be deleted due to the following causes. • A video file associated with the alarm is being played.	Close QuickTime Player.
***** could not be backed up.	The video file cannot be backed up due to the following causes. • The video file is being played. • The destination folder does not have sufficient available space. • You do not have a writing authority for the destination folder.	<ul style="list-style-type: none"> <li>• Close QuickTime Player.</li> <li>• Prepare sufficient available space in the destination folder.</li> <li>• Acquire the writing authority for the destination folder.</li> </ul>
The GOT alarm list ***** cannot be deleted. Check if the file or folder is in use.	The GOT alarm list folder cannot be deleted due to the following causes. • The file in the GOT alarm list folder is being executed. • You do not have the authority to write into the GOT alarm list folder.	<ul style="list-style-type: none"> <li>• Check that the file in the target GOT alarm list folder is not being used.</li> <li>• Acquire the writing authority for the GOT alarm list folder.</li> </ul>
The version of GTMMFtpService is old. GTMMDataConnector is shutting down. Install GTMMFtpService version **** or later.	Failed to start Multimedia Interaction Tool because the versions of Multimedia Interaction Tool and Multimedia Interaction FTP Service were different.	Install Multimedia Interaction FTP Service with the same version as Multimedia Interaction Tool.

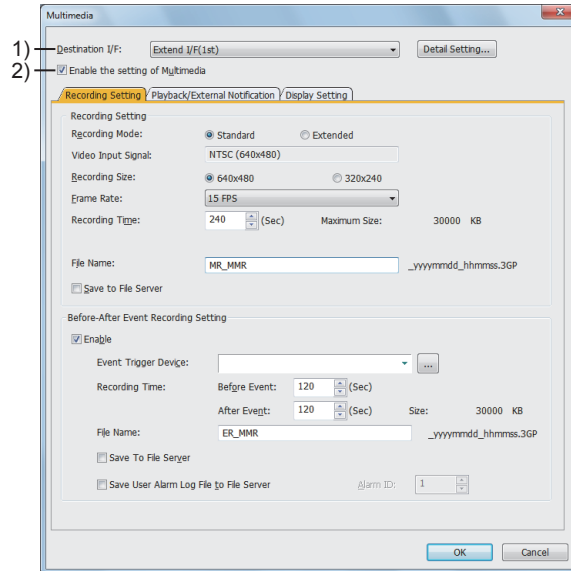

## 10.8.6 [Multimedia] dialog

Not available to GT2705-V.

Select [Common] → [Peripheral Setting] → [Multimedia] from the menu to display the setting dialog.

- ➔ ■ 1 [Recording Setting] tab
- 2 [Playback/External Notification] tab
- 3 [File Server Setting] tab
- 4 [Display Setting] tab

### 1) [Destination I/F]

Set the interface of the GOT.

The following shows the items to be selected.

- [Extend I/F(1st)]
- [Not connected]

Click the [Detail Setting] button to display the detail setting dialog for the multimedia function.

#### • [Video Input Signal]

Select the video input signal

The following shows the items to be selected.

- [NTSC]
- [PAL]

#### • [Video Resolution]

Select the video resolution.

The following shows the items to be selected.

- [640×480]
- [768×576]

#### • [IP Address]

Set the IP address of the multimedia unit.

The setting range is [0.0.0.0] to [255.255.255.255].

#### • [Subnet Mask]

Set the subnet mask.

The setting range is [0.0.0.0] to [255.255.255.255].

#### • [Default Gateway]

Set the default gateway.

The setting range is [0.0.0.0] to [255.255.255.255].

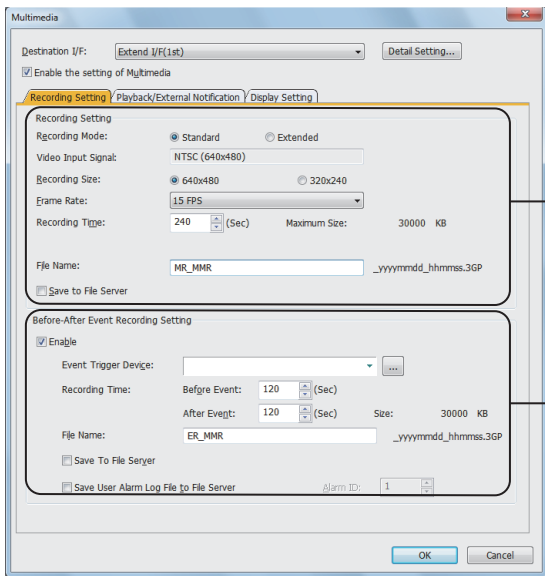

### 2) [Enable the setting of Multimedia]

Select this item to enable the multimedia function setting.

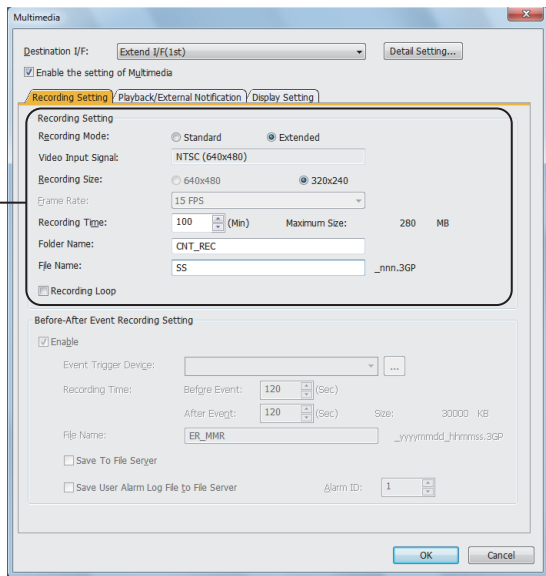

# 1 [Recording Setting] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

When the recording mode is [Standard]

When the recording mode is [Extended]

## 1) [Recording Setting]

Configure the setting regarding the video recording.

Item	Description																															
[Recording Mode]	<p>Select the recording mode.</p> <ul style="list-style-type: none"> <li>[Standard]: Select this item to use the standard mode. In the standard mode, the record size and the frame rate can be selected.</li> </ul> <table border="1"> <thead> <tr> <th>Recording size</th> <th>Video input signal</th> <th>Frame rate (fps)</th> <th>Available recording time (minute)</th> </tr> </thead> <tbody> <tr> <td rowspan="2">VGA (640 × 480)</td> <td>NTSC format</td> <td>15</td> <td rowspan="2">10 to 240</td> </tr> <tr> <td>PAL format</td> <td>12.5</td> </tr> <tr> <td rowspan="4">QVGA (320 × 240)</td> <td rowspan="2">NTSC format</td> <td>15</td> <td>10 to 900</td> </tr> <tr> <td>30</td> <td>10 to 450</td> </tr> <tr> <td rowspan="2">PAL format</td> <td>12.5</td> <td>10 to 900</td> </tr> <tr> <td>25</td> <td>10 to 450</td> </tr> </tbody> </table> <ul style="list-style-type: none"> <li>[Extended]: Select this item to use the long-time mode. 		30	10 to 450																													
	PAL format	12.5	10 to 900																													
		25	10 to 450																													
Recording size	Video input signal	Frame rate (fps)	Available recording time (sec.)																													
QVGA (320 × 240)	NTSC format	15	15 to 3000																													
	PAL format	12.5																														
[Video Input Signal]	<p>Display the current format of the video input signal. Set the video input signal in the detail setting dialog for the multimedia function. For the setting procedure, refer to the following. →10.8.6 [Multimedia] dialog</p>																															
[Recording Size]	<p>Select the resolution for recording. Setting range When the recording mode is [Standard]: 640×480, 320×240 When the recording mode is [Extended]: 320×240</p>																															

Item	Description
[Frame Rate]	Select the frame rate for recording. This item can be selected only when the recording mode is [Standard]. The setting range differs depending on the video input signal and the record size.
[Recording Time]	Set the recording time. Setting range When the recording mode is [Standard]: The setting range differs depending on the video input signal, the recording size, and the frame rate. When the recording mode is [Extended]: 15 minutes to 3000 minutes15
[Folder Name]	Set the name of the folder that stores the recorded video file. The folder name can be set only when the recording mode is [Extended]. Use alphanumeric characters and symbols (#\$%&'()*+.-=@[]^_{}.) for the folder name. Up to 56 characters (total of the folder name and the file name) are available.
[File Name]	Set the file name when saving the recorded video image as a video file. • When the recording mode is [Standard]: MR_MMR (Default) Use up to 44 alphanumeric characters and symbols (#\$%&'()*+.-=@[]^_{}.) for the file name. For a video file recorded on the multimedia screen, the date and the time of recording are added to the end of the file name. For the video file recorded by the recording before and after the event, the event occurrence date and time are added to the end of the file name. Example) When MMR is set to [File Name] and the video file is recorded on 15:31:56 February 25, 2013  <div style="text-align: center;"> <p>MMR_20130225_153156.3GP</p> <p>Time of recording (15:31:56)</p> <p>Date of recording (February 25, 2013) (An underline is automatically added.)</p> </div> • When the recording mode is [Extended]: SS (Default) Use alphanumeric characters and some symbols (#\$%&'()*+.-=@[]^_{}.) for the file name. Up to 56 characters (total of the folder name and the file name) are available. When a file is saved, the serial number that indicates the recording order is added to the end of the file name automatically.  <div style="text-align: center;"> <p>CRT_REC\SS_001.3GP</p> <p>Number indicating the order of recording</p> </div>
[Save to File Server]	Sends the recorded video image to a personal computer. When this item is selected, the [File Server Setting] tab is displayed. This item can be set only when the recording mode is [Standard]. Configure the connection setting for the personal computer with the GOT and the multimedia unit.
[Recording Loop]	When the recording mode is set to [Extended], select this item to continue recording by overwriting old files after the recording time.

## 2) [Before-After Event Recording Setting]

Configure the setting of the recording before and after the event.  
This item can be set only when the recording mode is [Standard].

Item	Description
[Enable]	Select this item to enable the recording before and after the event.
[Event Trigger Device]	Set the trigger device for starting the recording before and after the event. → 6.1 Device Settings
[Recording Time]	Set a recording time before and after the event. • The setting range for a recording time of before the event is [10] seconds to [120] seconds. • The setting range for a recording time of after the event is [10] seconds to [120] seconds.
[File Name]	Set a name of the file created by the recording before and after the event. For the restrictions on the file name, refer to the following. → ■ 1 [Recording Setting] tab
[Save to File Server]	Select this item to send the recorded video image to a personal computer. When this item is selected, the [File Server Setting] tab is displayed. This item can be set only when the recording mode is [Standard]. Configure the connection setting for the personal computer with the GOT and the multimedia unit.

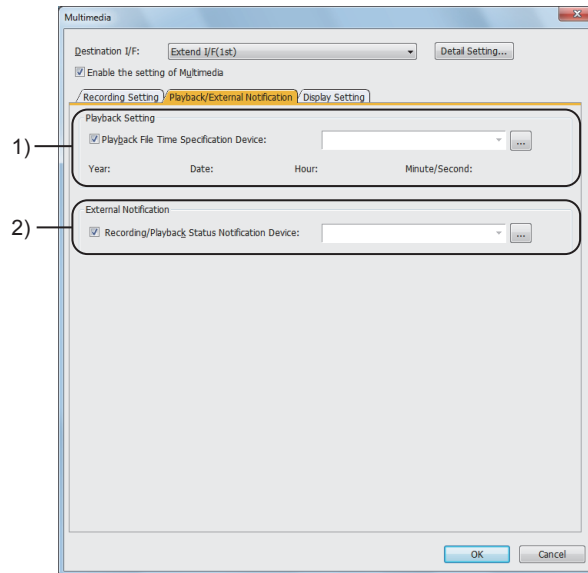

Item	Description
[Save User Alarm Log File to File Server]	<p>Select this item to send an alarm log file to a personal computer at the same time of recording.</p> <p>Set the alarm ID of the user alarm observation to be stored in [Alarm ID].</p> <p>When this item is selected, the [File Server Setting] tab is displayed.</p> <p>This item can be set only when the recording mode is [Standard].</p> <p>Configure the connection setting for the personal computer with the GOT and the multimedia unit.</p>

## ■2 [Playback/External Notification] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### 1) [Playback Setting]

Item	Description
[Playback File Time Specification Device]	<p>Set the device for storing a recording date and time of a video file to be played.</p> <p>→6.1 Device Settings</p> <p>Set a word device of 16-bit unsigned BIN for the playback file time specification device.</p> <p>Contiguous devices for 4 points from the device selected by the user are set.</p> <p>Year: Second device, Month and date: First device, Time: Fourth device, Minutes and seconds: Third device</p> <p>The device value of the device is added to the file name when playing video files on the special function switch directly.</p> <p>Only when [Add date to playback files] is selected in the special function switch setting, the device value is added to a file name to be played.</p> <p>Example) File name of when MMR is set in [File Name] for the video file to be played</p> <p style="text-align: center;">MMR_20130225_153156.3GP</p> <p style="text-align: center;">└──────────────────┘</p> <p style="text-align: center;">The device value of the playback file time specification device is added.</p> <p style="text-align: center;">(An underline is automatically added.)</p> <p>For the special function switch settings, refer to the following.</p> <p>→8.2.9 [Special Function Switch] dialog</p>

## 2) [External Notification]

Item	Description
[Recording/Playback Status Notification Device]	<p>Set devices for notifying the status during the playback for video files.            →6.1 Device Settings            Applicable device: Word device of 16-bit unsigned BIN<sup>*1</sup>The following shows the difference between the recording by the recording switch and the recording before and after the event.</p> <p>·Recording with the recording switch</p> <p>·Recording before and after the event</p>

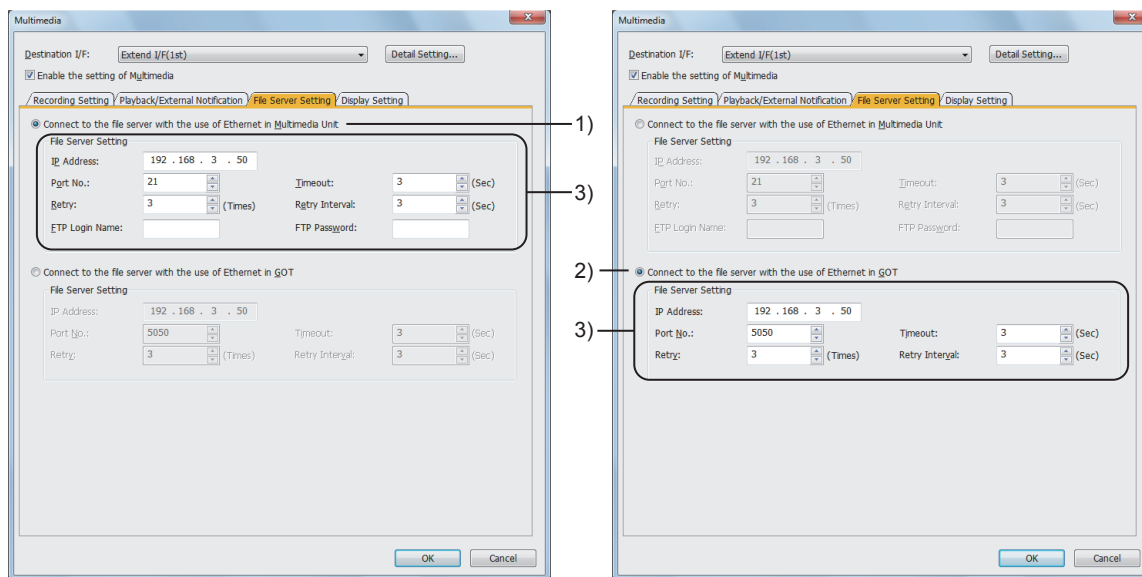

\*1 The following table lists the functions of each bit of the word device.

Bit	Item	Description
b0	Recording status	ON: Recording OFF: Recording is stopped
b1	Enabling or disabling the recording before and after the event	ON: Enabling the recording before and after the event OFF: Disabling the recording before and after the event
b2	Status of the recording before and after the event	ON: Recording after the event OFF: Recording before the event
b3	-	Use prohibited
b4 to b6	Video playback status	000: Stopping 001: Playing 010: Pausing Other than the above: Invalid
b7 to b15	-	Use prohibited

### ■ 3 [File Server Setting] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

When connecting the multimedia unit to Ethernet

When connecting the GOT to Ethernet

#### 1) [Connect to the file server with the use of Ethernet in Multimedia Unit]

Select this item to send the video file to the file server by Ethernet from the Ethernet interface built in the multimedia unit.

#### 2) [Connect to the file server with the use of Ethernet in GOT]

Select this item to send the video file to the file server by Ethernet from the Ethernet interface built in the GOT.

#### 3) [File Server Setting]

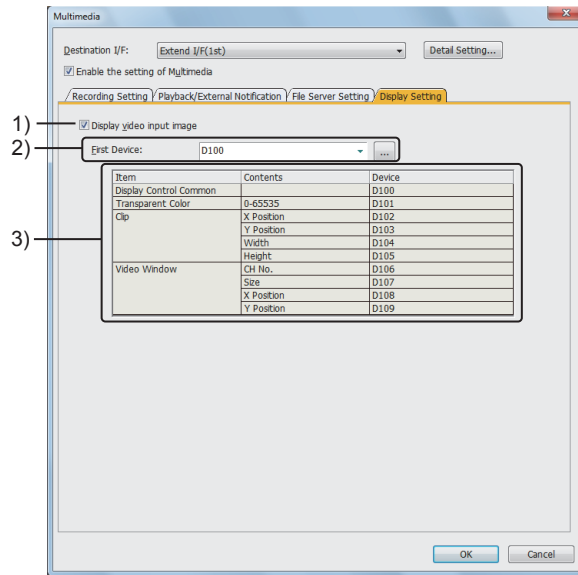

Item	Description
[IP Address]	Set the IP address of the personal computer. The setting range is [0.0.0.0] to [255.255.255.255].
[Port No.]	Set the port number used by the GOT or the multimedia unit. • For the access to the file server from the multimedia unit, the setting range is [0] to [1024]. • For the access to the file server from the GOT, the setting range is [1024] to [5010] or [5014] to [65534].
[Timeout]	Set the interval for communication to time out. The setting range is [3] to [120] seconds.
[Retry]	Set the number of retries to be performed when a communication error occurs. When no response is received after the retries, the communication times out. The setting range is [0] time to [10] times.
[Retry Interval]	Set the interval of retries to be performed when a communication error occurs. The setting range is [0] to [300] second(s).
[FTP Login Name]	Set the login name for the file server. This item can be set only when [Connect to the file server with the use of Ethernet in Multimedia Unit] is selected.
[FTP Password]	Set the password for the file server. This item can be set only when [Connect to the file server with the use of Ethernet in Multimedia Unit] is selected.

## ■ 4 [Display Setting] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

Configure the setting to display the image taken by a video camera on the user-created screen.

### 1) [Display video input image]

Select this item to display the video image on the user-created screen.

### 2) [First Device]

Set a start device of the devices to be used.

When the first device is set, the subsequent devices are automatically set in the [Device] row in the video setting list.

### 3) Video setting list

Item	Description
[Display Control Common]	<p>Set a device for the video window display.</p> <p>The values of the device for the video window display are processed as 16-bit binary values.</p> <p>The device specified for [Display Control Common] stores the data as indicated below.</p> <p>Turning on/off the bit devices controls the operation of the multimedia screen.*1</p>
[Transparent Color]	<ul style="list-style-type: none"> <li>• [0 to 65535], [0(Black) to 255(White)]</li> </ul> <p>Specify the transparent color for the transparent processing.</p> <p>→10.6.4 ■ 8 Setting items of [Video/RGB Input Common] device</p>
[Clip]	<ul style="list-style-type: none"> <li>• [X Position]</li> </ul> <p>Specify the X coordinate to display a video image when the clip mode is used.</p> <ul style="list-style-type: none"> <li>• [Y Position]</li> </ul> <p>Specify the Y coordinate to display a video image when the clip mode is used.</p> <ul style="list-style-type: none"> <li>• [Width]</li> </ul> <p>Specify width of a clip video image.</p> <ul style="list-style-type: none"> <li>• [Height]</li> </ul> <p>Specify height of a clip video image.</p>
[Video Window]	<ul style="list-style-type: none"> <li>• [CH No.]</li> </ul> <p>Specify the channel No. for a video image to be displayed on the video window.</p> <p>Only one channel can be used for the multimedia function.</p> <ul style="list-style-type: none"> <li>• [Size]</li> </ul> <p>Specify the display size of the video window.</p> <p>The following shows the setting range for the display size.</p> <p>0: 100%, 1: 50%, 2: 25%</p> <p>When the display size of the video window is changed by touching the window, the value of the set device remains unchanged.</p> <ul style="list-style-type: none"> <li>• [X Position]</li> </ul> <p>Specify the X coordinate of the video window.</p> <ul style="list-style-type: none"> <li>• [Y Position]</li> </ul> <p>Specify the Y coordinate of the video window.</p>

\*1 The following table lists the functions of each bit of the word device.

Bit number	Description	Bit status	Remarks
b0	Selecting the full mode or clip mode	ON: Selects the clip mode. OFF: Selects the full mode.	Valid when the video window is displayed. Bit status can be changed while the video window is displayed.
b1	Selecting the screen for placing the video window	ON: Selects the overlap window 1. OFF: Selects the base screen.	Transparent processing is executed automatically when b1 is ON.
b2	Selecting the transparent processing	ON: Executes the transparent processing. OFF: Does not execute the transparent processing.	→10.6.4 ■ 9 Transparent processing
b3	Selecting how to specify the transparent color	ON: Makes colors other than the specified color transparent. OFF: Makes the specified color transparent.	
b4	Selecting whether the display size of the video window is changed or not when the video window is touched	ON: Does not change the size. OFF: Changes the size.	Valid when the video window is opened. Bit status can be changed while the video window is displayed.
b5	Selecting a motion video or still image	ON: Selects a still image. OFF: Selects a motion video.	When this bit is turned on with other bits at the same time, the contents of other bits are disregarded. (b5 has priority.) →10.6.4 ■ 7 Displaying a still image
b6	Selecting display priority for video windows (When b2 (selecting transparent processing) is OFF.)	ON: Displays the video window over the overlap window or test window. OFF: Displays the video window behind the overlap window or test window.	Valid when the video window is opened. Bit status can be changed while the video window is displayed.
	Selecting transparent processing target screen (When b2 (selecting transparent processing) is ON.)	ON: Base screen only OFF: Base screen and overlap window 1 and 2	-
b7 to b15	Use prohibited	-	-

## 10.8.7 Precautions

---

Not available to GT2705-V.

This section explains the precautions for using the multimedia function.

### ■1 Precautions for hardware

#### (1) Data storage of the GOT

To interact the GOT with a personal computer, reserve sufficient available space of the data storage of the GOT. Video files are stored in the data storage of the GOT temporarily.

If the available space of the data storage is insufficient, the video files cannot be sent to the personal computer.

#### (2) CF card of the multimedia unit

##### (a) Format type

A CF card to be installed in the multimedia unit should be formatted in FAT32.

Installing a FAT16 formatted CF card may cause the following problems.

- Reading, writing, or saving a video file requires time.
- A video file temporarily looks as if it is stopped while being played.

##### (b) Operation during access to a CF card

After the CF card access switch of the multimedia unit is turned on, the multimedia unit checks the CF card status.

Operations on the multimedia screen may not be performed properly during the check.

Perform the operations on the multimedia screen after the CF card access LED turns off.

##### (c) Number of video files

Up to 512 video files can be stored in the CF card.

When 512 or more video files are stored, some video files are not displayed on the multimedia screen.

In addition, in the following cases, some video files may not be displayed on the multimedia screen even when 512 or less video files are stored.

- A video file with a long file name exists.
- A video file in which two-byte characters are used for the file name exists.
- Data other than video files exists in the CF card.

##### (d) Unavailable character strings

Do not use two-byte characters for the path and the file name.

Failure to do so may operate the multimedia unit incorrectly.

#### (3) Software version of the multimedia unit

The software version must be 03.02.00.\*\* or later.

The functions described in this manual are compatible with the multimedia unit having software version 03.02.00.\*\* or later.

For how to check and update the software version of the multimedia unit, refer to the following.

⇒GOT2000 Series User's Manual (Utility)

#### (4) Ethernet interface of the multimedia unit

The Ethernet interface of the multimedia unit is only for the communication with Multimedia Interaction Tool.

To connect the GOT to Ethernet, use the Ethernet interface built in the GOT.

### ■2 Precautions for drawing

#### (1) Displaying the video window, RGB screen, and multimedia screen

The simultaneous display of the video window, RGB screen, and multimedia screen is not available.

#### (2) Displaying a window with transparency

##### **GOT Graphic Ver.2**

If a window with transparency is placed on the multimedia screen, the multimedia screen is invisible.

### ■3 Precautions for use

#### (1) Display of a video image

- (a) If a video signal is not input to the specified channel due to cable disconnection or power-off of a video camera, a video image is not displayed.
- (b) A video image may be given in still image or disappear temporarily when the hard copy function is executed or when a system message is displayed or cleared.
- (c) A video image may be disturbed or stopped depending on the setting for [Horizontal] or [Vertical] for the utility (video display setting).

(In this case, the normal display will be restored by changing the settings to default values.)

Whether or not such a problem occurs depends on equipment such as a video camera.

Use setting values that allow normal video display

For the operating procedure for the utility, refer to the following manual.

→GOT2000 Series User's Manual (Utility)

#### (2) Video input signal setting

Set a video input signal according to an output format of the video camera to be connected as shown below.

If the setting is different, some video images may not be displayed correctly.

Output format of video camera	Video input signal setting
NTSC format	NTSC
PAL format	PAL
EIA format	NTSC
CCIR format	PAL

#### (3) Playing video files during the recording

A video file cannot be played while a video image is being recorded.

Play the video file after the recording is finished.

#### (4) Installing Multimedia Interaction FTP Service

To connect the GOT to a personal computer from the multimedia unit, Multimedia Interaction Tool and Multimedia Interaction FTP Service must be installed.

For how to install Multimedia Interaction FTP Service, refer to the following.

→10.8.5 Multimedia Interaction Tool

## 10.8.8 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

Set the relevant settings other than the specific settings for the multimedia function as required.

The following shows the functions that are available by the relevant settings.

### ■1 GOT Internal Device

→12.1.3 GOT special register (GS)

Function	Setting item
Enabling or disabling notification of the amount of usage of the CF card and the number of video files in the card in the multimedia unit	GS522.b1
Notifying the amount of usage of the CF card or the number of video files in the card in the multimedia unit	GS1022.b0 to GS1022.b7

## 10.9 Using an External I/O Device on the GOT (External I/O Function and Operation Panel Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25-W, GT2505-V, and GT25HS-V.

### 10.9.1 Overview of the external I/O function and the operation panel function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25-W, GT2505-V, and GT25HS-V.

#### ■ 1 External I/O function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25-W, GT2505-V, and GT25HS-V.

This function enables you to input/output signals from/to an external device.

#### ■ 2 Operation panel function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25-W, GT2505-V, and GT25HS-V.

This function enables you to input data by using an operation panel. (For example, the touch input, numerical input, and screen switching.)

When you use GT SoftGOT2000, use the keyboard of the personal computer.

For the operations with the keyboard on GT SoftGOT2000, refer to the following.

→GT SoftGOT2000 Version1 Operating Manual

## 10.9.2 Specifications of the external I/O function and the operation panel function

Not available to GT25-W, GT2505-V, and GT25HS-V.

### ■ 1 System application (extended function)

To use the external I/O function and the operation panel function, a system application (extended function) of [External I/O / Operation Panel] is required.

Selecting [Destination I/F] in the [External I/O / Operation Panel] dialog incorporates the application into the package data automatically.

⇒ 10.9.4 [External I/O / Operation Panel] dialog

### ■ 2 Number of external I/O function settings for one project

One external I/O function setting is available for one project.

### ■ 3 Specifications of the external I/O

Externally input signals are stored in the GOT internal devices.

The values in the GOT internal devices are output to the outside as output signals.

⇒ 5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

12.1.1 GOT bit register (GB)

12.1.3 GOT special register (GS)

The external I/O function supports the GOT internal devices and the System signals as shown below.

Item	GOT internal device	System Information
Input signal (X0 to X7)	GB30 to GB37	[External I/O Function Input Information1] The signals correspond to the bit numbers (b0 to b7) of the devices.
Input signal (X8 to XF)	GB50 to GB57	[External I/O Function Input Information2] The signals correspond to the bit numbers (b0 to b7) of the devices.
Input signal (X0 to XF) when the 128-point input is enabled <sup>*1</sup>	GS658 to GS665 The signals correspond to the bit numbers (b0 to b15) of the devices.	-
Output signal (Y0 to YF)	GB10 to GB25	[External I/O Function Output Information] The signals correspond to the bit numbers (b0 to b15) of the devices.

\*1 To enable the 128-point input, turn on GS517.b0 (External I/O Function Notification/External I/O Control Function).

#### (1) When the 128-point input is used for the external I/O function

If input signals X0 to XF turn on, the corresponding GOT internal devices (GB30 to GB37 and GB50 to GB57) also turn on. (The 128-point input is disabled, and GS517.b0 turns off.)

#### (2) When the external signal output is controlled with the external I/O function

Do not simultaneously perform the following two operations: specifying the device for [External I/O Function Output Information] and writing the output value into GB10 to GB25. If doing so, the signals may not be output properly to the external device.

### ■ 4 Specifications of the operation panel

#### (1) Screens operable with the operation panel function

The operation panel function is usable for the following screens.

- User-created screen
- Log-in screen (Operator authentication)
- Password change screen (Operator authentication)

For the key codes for the operation panel keys, which are usable on the log-in screen (operator authentication) and the password change screen (operator authentication), refer to the following.

⇒ 10.9.3 How to use the external I/O function and the operation panel function

The [OK] button and the [Cancel] button, which are in the messages on the GOT, operate with the following operation panel keys.

- [OK] button: [Enter] key, [Y] key, and [y] key
- [Cancel] button: [ESC] key, [N] key, and [n] key

For using the operation panel function on GT SoftGOT2000, use the function keys on the keyboard of the personal computer.

**(2) Operation of the operation panel function**

The keys operate according to the set actions on any screens displayed on the GOT.

When you press any touch switch on the GOT and any operation panel key/function key simultaneously, the operations are executed in order of detection.

**10.9.3 How to use the external I/O function and the operation panel function**

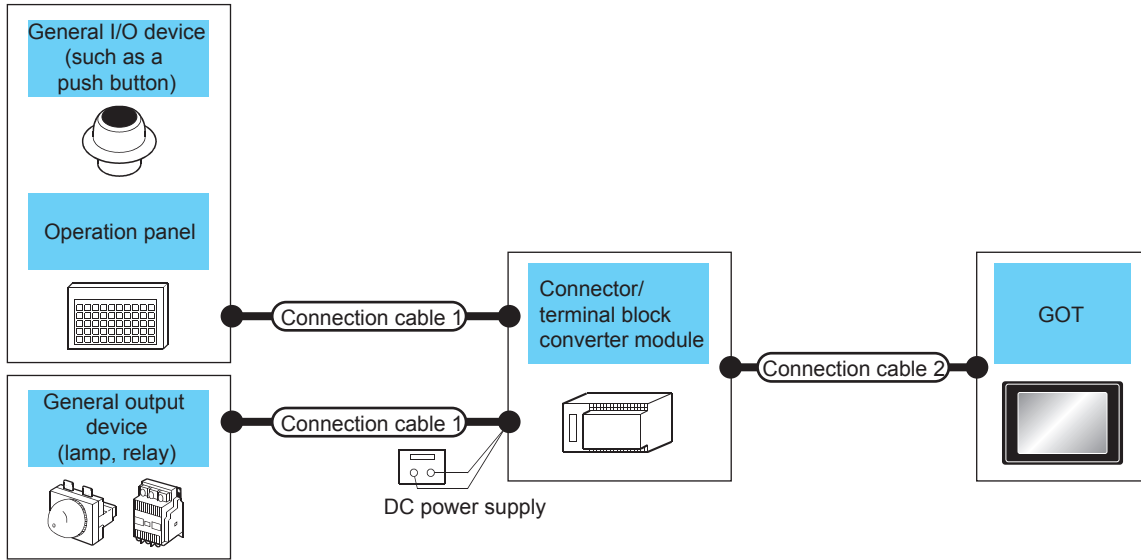

Not available to GT25-W, GT2505-V, and GT25HS-V.

**1 System configuration**

**(1) System configuration of the external I/O device**

The following shows the system configuration of the external I/O device.

Name	Connection cable 1	Connector/terminal block converter module <sup>*2*3</sup>	Connection cable 2	GOT <sup>*5</sup>	
				Option	GOT model
General input device (such as a push button) Operation panel General output device (lamp, relay)	Preparing connection cables by each user <sup>*1</sup>	*4	Preparing connection cables by each user <sup>*1</sup>	GT15-DIO GT15-DIOR	GT27, GT25

\*1 For how to create a cable, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*2 The 24 V DC power must be supplied for the external I/O unit.

When the power supplied to the external I/O unit cuts off in the operation, the operation panel becomes disabled. To use the operation panel again, supply the power to the external I/O unit and reset the GOT.

\*3 When using the connector/terminal block converter module, you can input signals of up to 64 points.

\*4 The model of the connector/terminal block converter module depends on the I/O equipment and the operation panel you use.

For details, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*5 To start the GOT, turn on the external power supply for the external I/O unit, then power on the GOT.

When the external power supply is shut off, a system alarm occurs.

When a system alarm occurs, signals cannot be input or output.

Turn off and then on the GOT or reset the GOT.

(The GOT reset switch does not operate when the bus connection is used.)

## (2) System configuration of the operation panel

Since GT SoftGOT2000 uses a keyboard, GT SoftGOT2000 requires no connection to an operation panel. The following shows the system configuration of the operation panel.

Name	Connection cable	GOT <sup>*3</sup>	
		Option	GOT model
Operation panel	Preparing connection cables by each user <sup>*1*2</sup>	GT15-DIO	GT27, GT25
		GT15-DIOR	

\*1 For how to create a cable, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*2 The 24 V DC power must be supplied for the external I/O unit.

When the power supplied to the external I/O unit cuts off in the operation, the operation panel becomes disabled. To use the operation panel again, supply the power to the external I/O unit and reset the GOT.

\*3 To start the GOT, turn on the external power supply for the external I/O unit, and then turn on the GOT.

When the external power supply is shut off, a system alarm occurs.

When a system alarm occurs, signals cannot be input or output.

Turn off and then turn on the GOT, or reset the GOT.

(The GOT reset switch does not operate when the bus connection is used.)

## ■ 2 Settings of the operation panel keys and the function keys

You can assign actions and key codes to the operation panel keys and the function keys.

### (1) Operation setting

One or more actions can be assigned to each operation panel key or function key as shown below.

GT27,GT25, GT SoftGOT2000	Order of action execution priority for multiple actions <sup>*1</sup>
Data change : 1	High priority ↓ Low priority
Key code : 16	
Word set : 20	
Set : 20	
Reset : 20	
Alternate : 20	
Momentary : 20	
Base screen switching : 1	
Overlap window1 : 1	
Overlap window2 : 1	
Overlap window3 : 1	
Overlap window4 : 1	
Overlap window5 : 1	
Superimpose window1 : 1	
Superimpose window2 : 1	
Station No. switching : 9	
Dialog window : 1	
Total : 135	

\*1 The order of the actions, excluding the data change and the key code, can be changed on the [Action] tab.

## (2) Key code

You can assign the key codes used for the objects. (Up to 16 key codes are settable for one operation panel key or function key.)

- Key codes for inputting alphanumeric characters (Numerical input, text input)
- Key codes for operating the object function  
⇒8.2 Placing a Touch Switch

## (3) Other key codes

You can operate the following screens by assigning the key codes to the operation panel keys or function keys.

- Log-in screen (Operator authentication)
- Password change screen (Operator authentication)

The following shows the key codes usable on the screens.

### (a) Log-in screen and password change screen

Key code(h)	Specifications
0008h	Delete the rightmost character and shift the entire characters to the right by one character.
000Dh	Input the password.
001Bh	Cancel
0030h to 0039h, 0041h to 005Ah, 0061h to 007Ah	Input a numerical value and a character.*1
0088h	Delete a numerical value and a character being input.
0090h	Move cursor to the right inside object.
0091h	Move cursor to the left inside object.
0092h	Switch character input mode (Value).
0093h	Switch character input mode (Capital letter).
0094h	Switch character input mode (Small letter).

\*1 For the key codes for numerical values and characters, refer to the following.

⇒8.2 Placing a Touch Switch

## ■3 Setting procedure

**Step 1** Connect the GOT to the external I/O device or the operation panel.

⇒ ■ 1 System configuration

**Step 2** In the [External I/O / Operation Panel] dialog, configure the settings for the external I/O function and the operation panel function.

⇒10.9.4 [External I/O / Operation Panel] dialog

**Step 3** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

⇒4. COMMUNICATING WITH GOT

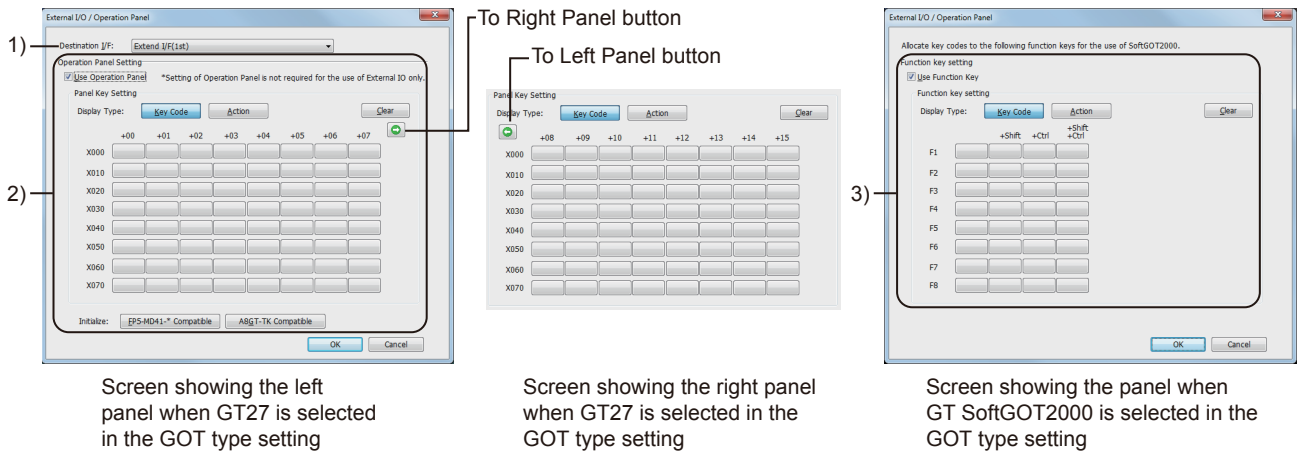

**Step 4** Operate the external I/O device or the operation panel.

## 10.9.4 [External I/O / Operation Panel] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT25-W, GT2505-V, and GT25HS-V.

Select [Common] → [Peripheral Setting] → [External I/O / Operation Panel] from the menu to display the setting dialog.  
Set the actions and key codes to the operation panel keys or function keys.

### 1) [Destination I/F]

Select a destination interface.

The following shows the items to be selected.

- [Extend I/F (1st)]
- [Extend I/F (2nd)]
- [Extend I/F (3rd)]
- [Not connected]

### 2) [Operation Panel Setting]

Item	Description
[Use Operation Panel]	Enables the operation panel function setting.
[Display Type]	Select the display type. <ul style="list-style-type: none"> <li>• [Key Code] button Displays the key codes on the key buttons where the key codes are assigned. Example) [0042]</li> <li>• [Action] button Displays [*] on the key buttons where the actions are assigned.</li> <li>• [Clear] button Clears the setting.</li> </ul>
[Panel Key Setting]	To the input signals, assign the actions when the signals turn on and the key codes. Clicking the input signal button displays the [Action/Key Code Setting] dialog. Set the actions, trigger conditions, and key code. The key buttons correspond to the operation panel input signals (X000 to X07F) respectively. Make sure to configure the proper action setting for each operation panel key button. ⇒ 10.9.5 [Action/Key Code Setting] dialog Clicking the To Right Panel button or the To Left Panel button switches the input signals (+00 to +07 ← → +08 to +15).  The setting is configured for input signal X010.  The setting is configured for input signal X005.

Item	Description																																																																																																																																																																																																																														
[Initialize]	<p>Select the operation panel setting according to the key arrangements of the KANADEN CORPORATION operation panel and A8GT-TK.</p> <ul style="list-style-type: none"> <li>[FP5-MD41-* Compatible] button Sets the key arrangement and key settings of the KANADEN CORPORATION operation panel.</li> <li>[A8GT-TK Compatible] button Sets the key arrangement and key settings of the A8GT-TK.</li> </ul> <p>The operation panel setting is initialized according to the key arrangements of the KANADEN CORPORATION operation panel and the A8GT-TK numeric keypad panel.</p> <p style="text-align: center;"><b>KANADEN operation panel</b></p> <p style="text-align: center;">Arrangement of input signal</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>X0</td><td>X8</td><td>X10</td><td>X18</td><td>X20</td><td>X28</td><td>X30</td><td>X38</td><td>X5</td><td>XD</td><td>X15</td><td>X1D</td></tr> <tr><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td>X25</td><td>X20</td><td>X35</td><td>X3D</td></tr> <tr><td>X1</td><td>X9</td><td>X11</td><td>X19</td><td>X21</td><td>X29</td><td>X31</td><td>X39</td><td>X6</td><td>XE</td><td>X16</td><td>X1E</td></tr> <tr><td>X2</td><td>XA</td><td>X12</td><td>X1A</td><td>X22</td><td>X2A</td><td>X32</td><td>X3A</td><td>X26</td><td>X2E</td><td>X36</td><td>X3E</td></tr> <tr><td>X3</td><td>XB</td><td>X13</td><td>X1B</td><td>X23</td><td>X2B</td><td>X33</td><td>X3B</td><td>X7</td><td>XF</td><td>X17</td><td>X1F</td></tr> <tr><td>X4</td><td>XC</td><td>X14</td><td>X1C</td><td>X24</td><td>X2C</td><td>X34</td><td>X3C</td><td>X27</td><td>X2F</td><td>X37</td><td>X3F</td></tr> </table> <p style="text-align: center;">Key arrangement</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr><td>F1</td><td>F2</td><td>F3</td><td>F4</td><td>F5</td><td>F6</td><td>F7</td><td></td><td>→</td><td>↑</td><td>Scroll up</td><td>Pre.</td></tr> <tr><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td></td><td>←</td><td>↓</td><td>Scroll down</td><td>Next</td></tr> <tr><td>A</td><td>B</td><td>C</td><td>D</td><td>E</td><td>F</td><td>G</td><td></td><td>7</td><td>8</td><td>9</td><td>Clear</td></tr> <tr><td>H</td><td>I</td><td>J</td><td>K</td><td>L</td><td>M</td><td>N</td><td></td><td>4</td><td>5</td><td>6</td><td>Set</td></tr> <tr><td>O</td><td>P</td><td>Q</td><td>R</td><td>S</td><td>T</td><td>U</td><td></td><td>1</td><td>2</td><td>3</td><td>.</td></tr> <tr><td>V</td><td>W</td><td>X</td><td>Y</td><td>Z</td><td>SP</td><td>SP</td><td></td><td></td><td>0</td><td></td><td>GO</td></tr> </table> <p style="text-align: center;"><b>A8GT-TK numeric keypad panel</b></p> <div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p>Arrangement of input signal</p> <table border="1"> <tr><td colspan="3">MELSEC/A8GT-TK</td></tr> <tr><td>X0</td><td>X8</td><td>X10</td></tr> <tr><td>X18</td><td>X20</td><td>X28</td></tr> <tr><td>X30</td><td>X38</td><td>X39</td></tr> <tr><td>X3A</td><td>X15</td><td>X35</td></tr> <tr><td></td><td>XD</td><td></td></tr> <tr><td>X25</td><td></td><td>X5</td></tr> <tr><td></td><td>X2D</td><td></td></tr> <tr><td>X6</td><td>XE</td><td>X16</td></tr> <tr><td>X26</td><td>X2E</td><td>X36</td></tr> <tr><td>X7</td><td>XF</td><td>X17</td></tr> <tr><td>X2F</td><td>X1F</td><td>X27</td></tr> <tr><td>X2C</td><td>X37</td><td>X3F</td></tr> </table> </div> <div style="text-align: center;"> <p>Key arrangement</p> <table border="1"> <tr><td colspan="3">MELSEC/A8GT-TK</td></tr> <tr><td>F1</td><td>F2</td><td>F3</td></tr> <tr><td>F4</td><td>F5</td><td>F6</td></tr> <tr><td>F7</td><td>F8</td><td>F9</td></tr> <tr><td>F10</td><td>SCROLL UP</td><td>SCROLL DOWN</td></tr> <tr><td></td><td>↑</td><td></td></tr> <tr><td>←</td><td></td><td>→</td></tr> <tr><td></td><td>↓</td><td></td></tr> <tr><td>7</td><td>8</td><td>9</td></tr> <tr><td>4</td><td>5</td><td>6</td></tr> <tr><td>1</td><td>2</td><td>3</td></tr> <tr><td>0</td><td>.</td><td>-</td></tr> <tr><td>SP</td><td>BS</td><td>↵</td></tr> </table> </div> </div>	X0	X8	X10	X18	X20	X28	X30	X38	X5	XD	X15	X1D									X25	X20	X35	X3D	X1	X9	X11	X19	X21	X29	X31	X39	X6	XE	X16	X1E	X2	XA	X12	X1A	X22	X2A	X32	X3A	X26	X2E	X36	X3E	X3	XB	X13	X1B	X23	X2B	X33	X3B	X7	XF	X17	X1F	X4	XC	X14	X1C	X24	X2C	X34	X3C	X27	X2F	X37	X3F	F1	F2	F3	F4	F5	F6	F7		→	↑	Scroll up	Pre.									←	↓	Scroll down	Next	A	B	C	D	E	F	G		7	8	9	Clear	H	I	J	K	L	M	N		4	5	6	Set	O	P	Q	R	S	T	U		1	2	3	. ### 3) [Function Key Setting]

Appears when GT SoftGOT2000 is selected in the GOT type setting.

Item	Description
[Use Function Key]	Enables the setting of the function keys used for GT SoftGOT2000.

Item	Description
[Display Type]	<p>Select the display type.</p> <ul style="list-style-type: none"> <li>• [Key Code] button Displays the key codes on the key buttons where the key codes are assigned. Example) [0042]</li> <li>• [Action] button Displays [*] on the key buttons where the actions are assigned.</li> <li>• [Clear] button Clears the setting.</li> </ul>
[Function Key Setting]	<p>To the function keys, assign the actions when the keys turn on and the key codes. Clicking the function key button displays the [Action/Key Code Setting] dialog. Set the actions, trigger conditions, and key code. The buttons correspond to keys F1 to F8 of the keyboard. In combination with the Shift key and the Ctrl key, up to 32 patterns are available. Make sure to configure the proper action setting for each function key. →10.9.5 [Action/Key Code Setting] dialog</p>

### 10.9.5 [Action/Key Code Setting] dialog

Not available to GT25-W, GT2505-V, and GT25HS-V.

Configure the operation setting and the trigger conditions for the operation panel keys or function keys.

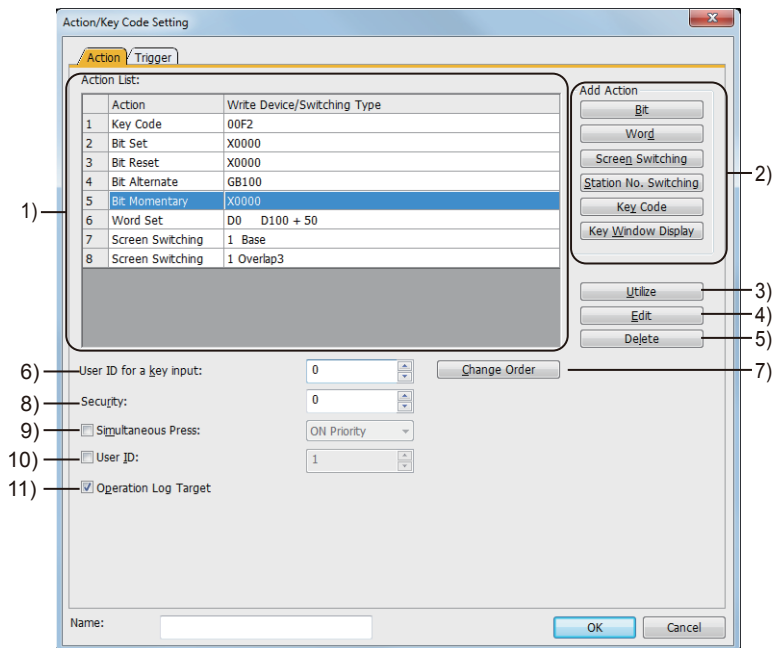

- ■ 1 [Action] tab
- 2 [Trigger] tab

#### ■ 1 [Action] tab

Configure the operation setting (actions and key codes).

For the details of the operation setting, refer to the following.

- 8.2 Placing a Touch Switch

#### 1) [Action List]

Assign the actions to the operation panel key or function key.

The set action details are listed.

The setting method and action details (including bit and word) are the same as those for the touch switch.

#### 2) [Add Action]

Item	Description
[Bit] button	Set the ON and OFF operations of the bit device.
[Word] button	Change the word device value.
[Screen Switching] button	Configure the setting of switching base screens and window screens for the operation panel key or function key.

Item	Description
[Station No. Switching] button	Configure the setting of the station No. switching function for the operation panel key or function key.
[Key Code] button	Configure the setting of the key code for the operation panel key or function key.
[Key Window Display] button	Set the display position of the key window.

### 3) [Utilize] button

Select an action from [Action List] and then click the [Utilize] button to copy the action to [Action List].

### 4) [Edit] button

Select an action from [Action List] and then click the [Edit] button to enable you to edit the action setting.

### 5) [Delete] button

Select an action from [Action List] and click the [Delete] button to delete the action.

### 6) [User ID for a key input]

Set the ID to specify the object for the key code input.  
The setting range is [0] to [65535].

### 7) [Change Order] button

Change the order of the actions.

### 8) [Security]

When using the security function, set the security level.

The setting range is [1] to [15].

When not using the security level, set the level to 0.

⇒5.2.6 Configuring the security settings for displaying screen data on the GOT ([Screen Security])

### 9) [Simultaneous Press]

Select this item to disable the simultaneous press and to set the key status having a higher priority.

The following shows the setting items to be selected.

- [ON Priority]
- [OFF Priority]

### 10) [User ID]

Enables the user ID setting.

The setting range is [0] to [65535].

When the user ID is set, you can identify the used operation panel key with the operation log.

⇒5.2.11 Configuring the settings for creating the operation history of the GOT ([Operation Log])

When multiple objects are set on the same screen editor, the target object may not operate.

To make sure that the target object operates, match the user ID with the user ID of the target object.

### 11) [Operation Log Target]

Targets the object for the operation log.

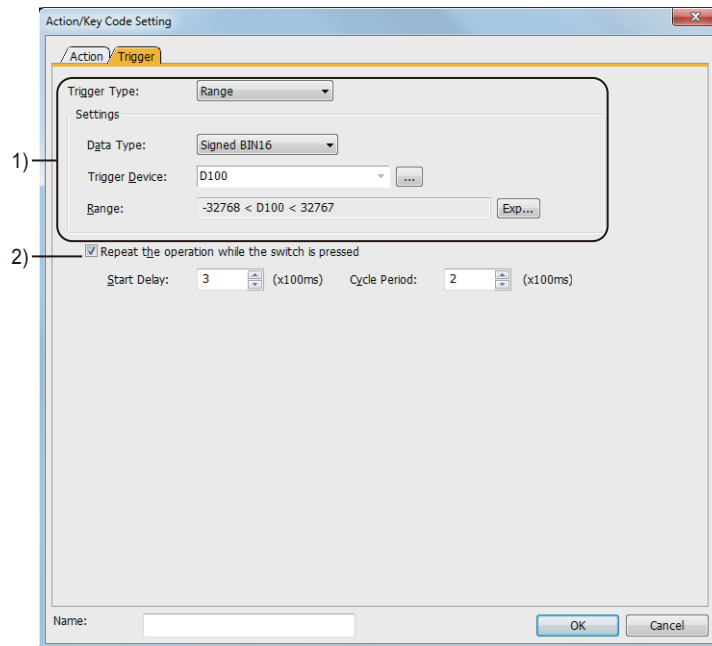

⇒5.2.11 Configuring the settings for creating the operation history of the GOT ([Operation Log])

## ■2 [Trigger] tab

Set the trigger conditions so that the operation panel keys or the function keys operate.  
For the details of the trigger conditions, refer to the following.

→5.3Setting the Utility Function ([GOT Setup])

### 1) [Trigger Type]

Select a trigger condition for the operation panel key or function key.  
The following shows the items to be selected.

- [Ordinary]
- [ON]
- [OFF]
- [Range]
- [Bit Trigger]

For the details of each item, refer to the following.

→6.2.2 Setting Trigger Types

### 2) [Repeat the operation while the switch is pressed]

Repeats the set actions while the operation panel key or the function key is pressed.

## 10.9.6 Relevant settings

Not available to GT25-W, GT2505-V, and GT25HS-V.

Set the relevant settings other than the specific settings for the external I/O function and the operation panel function as required.

The following shows the functions that are available by the relevant settings.

### ■ 1 GOT environmental settings [Screen Switching/Windows]

Select [Common] → [GOT Environmental Setting] → [Screen Switching/Windows] from the menu.

⇒ 5.2.1 Setting for switching screens to be displayed on the GOT ([Screen Switching/Window])

Function	Setting item
Setting the screen switching timing when touching the Go To Screen switch (OFF synchronous, ON synchronous)	[Operation Timing]

### ■ 2 GOT environmental settings (System information)

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu.

⇒ 5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Outputting signals to the external device when the external I/O function is used. (Read device)	[External I/O Function Output Information]
Notifying the input signals from the external device or no power supply when the external I/O function is used. (Write device)	[External I/O Function Input Information1], [External I/O Function Input Information2]

### ■ 3 GOT Internal Device

⇒ 12.1.3 GOT special register (GS)

Function	Setting item
Notifying the input signals from the external device or outputting the signals to the external device when the external I/O function is used.	GB10 to GB25, GB30 to GB37, GB50 to GB57
Notifying the input status when 128 signals are enabled to be input with the external I/O function	GS658 to GS665
Enabling or disabling 128 signals to be input with the external I/O function.	GS517

## 10.10 Displaying the GOT Screen on an External Display (Video Output Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### 10.10.1 Overview of the video output function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

This function enables you to output the GOT screen to a commercially available display.

You can monitor the PLC status on the GOT and display the monitoring result on a big screen in a factory for displaying production status.

### 10.10.2 Specifications of the video output function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

#### ■1 Required version of BootOS

To use GT27-ROUT, install BootOS version N or later on the GOT.

To use GT27-VHOUT, install BootOS version AK or later on the GOT.

→4.3.2 Transferring data

#### ■2 Behavior of the external display when the GOT enters screen saver mode

Even if the GOT enters screen saver mode, the external display will not enter screen saver mode.

## 10.10.3 How to use the video output function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

### 1 System configuration

Signal type	External display	Connection cable	Maximum cable length	GOT		Number of connectable monitors
	Model			Option	GOT model	
TMDS	HDMI-certified display	HDMI-certified cable	*3	GT27-VHOUT	GT27 <sup>*2</sup>	One monitor for one GOT
Analog RGB	Display with an analog RGB input interface For the supported scanning frequency, refer to the following. →GOT2000 Series RGB Output Unit User's Manual	GT15-C50VG (5m) or Preparing connection cables by each user <sup>*1</sup>	*1	GT27-ROUT, GT27-ROUT-Z		

\*1 The cable and its maximum length vary depending on the external display specifications.  
For details, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

\*2 Not available to GT2705-V.

\*3 The maximum cable length varies depending on the cable specifications.

### 2 Setting procedure

**Step 1** Connect an external display to the GOT.

→ 1 System configuration

**Step 2** In the [HDMI/RGB Output] dialog, set [Destination I/F].

→ 10.10.4 [HDMI/RGB Output] dialog

**Step 3** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→ 4. COMMUNICATING WITH GOT

**Step 4** Display the GOT screen on the external display.

## 10.10.4 [HDMI/RGB Output] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

Select [Common] → [Peripheral Setting] → [HDMI/RGB Output] from the menu to display the setting dialog.

### 1) [Destination I/F]

Set the interface of the GOT.

The following shows the items to be selected.

- [Extend I/F(1st)]
- [Not connected]

## 10.11 Outputting the Collected Data as a Report (Report Function)

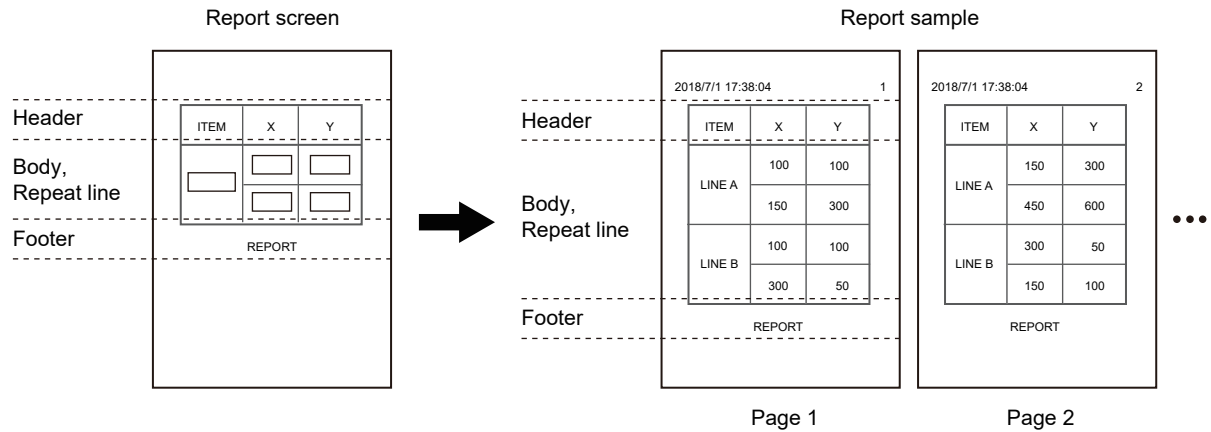

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 10.11.1 Overview of the report function

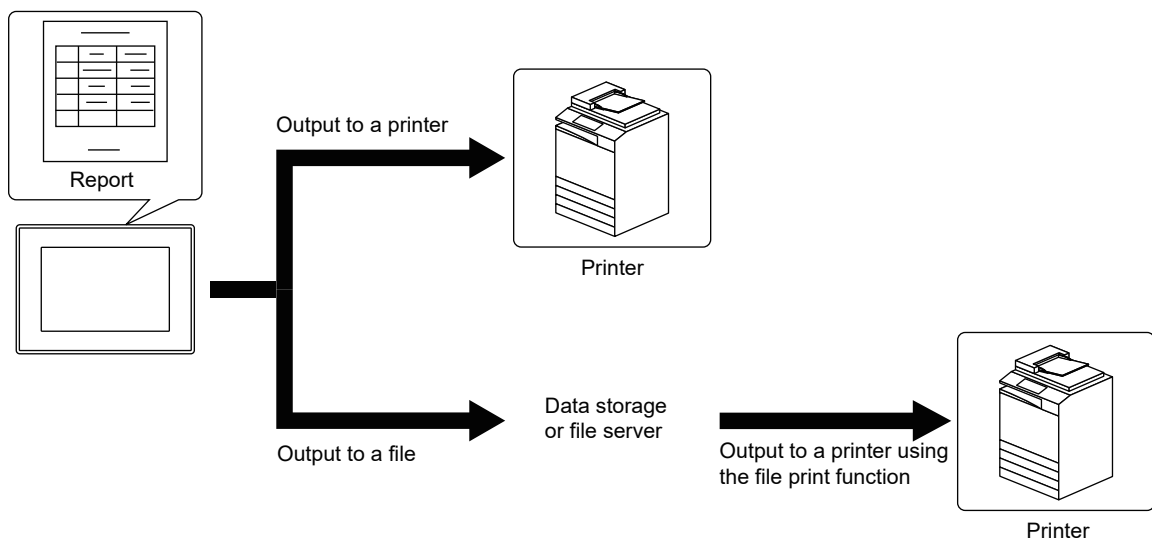

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The report function outputs the collected data as a report.

The settings of a report screen determine the data to be collected and the page layout of a report.

A report is output to a printer or file.

- 10.11.2 Specifications of the report function
- 10.11.3 How to use the report function
- 10.11.4 Precautions
- 10.11.5 [Report Setting] dialog
- 10.11.6 [Edit Page Header/Page Footer] dialog
- 10.11.7 [Header/Footer/Repeat] dialog
- 10.11.8 [Printer] dialog
- 10.11.9 Relevant settings

## 10.11.2 Specifications of the report function

### ■ 1 System application (extended function)

To use the report function, the following system applications are required.

System application (extended function)	Description
[Report]	This system application will be incorporated into the package data automatically if a report screen is created.
[Printer(PictBridge)] [Printer(Serial)] [Printer(ESC/P-R)]	One of the system applications will be incorporated into the package data automatically according to the setting of [Printer Type] in the [Printer] dialog.
[File Print]	<p>This system application is required to perform the following operations.</p> <ul style="list-style-type: none"> <li>• Printing a report file with the file print function</li> <li>• Outputting operation log lines</li> </ul> <p>To incorporate the system application into the package data, select it in the [Application Selection] dialog.</p> <p>⇒4.8.4 [Application Selection] dialog</p> <p>If one of the following settings is configured, the system application will be incorporated into the package data automatically.</p> <ul style="list-style-type: none"> <li>• [File Print] is selected for [Switch Action] on the [SP Function] tab in the [Special Function Switch] dialog.</li> <li>• [Output operation logs to a report screen] is selected on the [Report Setting] tab in [Operation Log] in the [Environmental Setting] window.</li> </ul>

GT SoftGOT2000 does not require the above system applications.

### ■ 2 Required version of BootOS

To use an Ethernet printer, install version AJ or later of BootOS on the GOT.

⇒4.3.2 Transferring data

### ■ 3 Hardware

Whether a data storage or file server must be connected to the GOT depends on the settings made in the [Screen Property] dialog for a report screen.

⇒2.7.3 ■ 2 [Action] tab

○ : Required, ×: Not required

[Output Destination] in the [Action] tab	[Output Timing] in the [Action] tab	Data storage or file server
[Printer]	[At the time of data collection]	×
	[When trigger condition is satisfied]	○ *1
[File]	[At the time of data collection]	○
	[When trigger condition is satisfied]	○ *1

\*1 A temporary file is saved only into the data storage.

## ■4 Specifications of a report screen

The following shows the specifications of a report screen.

For report samples and the items to be output, refer to the following.

→ 10.11.2 ■ 5 Report samples and the items to be output to a report

### (1) Maximum number of report screens in one project

Up to 32 report screens are settable for one project.

### (2) Maximum number of devices specified for one report screen

Up to 260 devices can be specified for one report screen.

The object devices, collection trigger device, output trigger device, and other devices set for a report screen are included.

### (3) Figures and objects on a report screen

The following shows the figures and objects that can be placed on a report screen.

Item	Description
Figure	Line, text
Object	Numerical print, text print, bit comment print, word comment print

### (4) KANJI region for a report screen

The KANJI region of the figure, object, or header at the top leftmost corner of a report screen applies to the text on the screen.

If a report screen does not have any figure or object with a KANJI region setting, the KANJI region will be set to [Japan].

If an alarm line is output ahead of a repeat line, the KANJI region of the basic alarm comment in the alarm line will apply to the text on the screen.

For printer output, a KANJI region applies to a page.

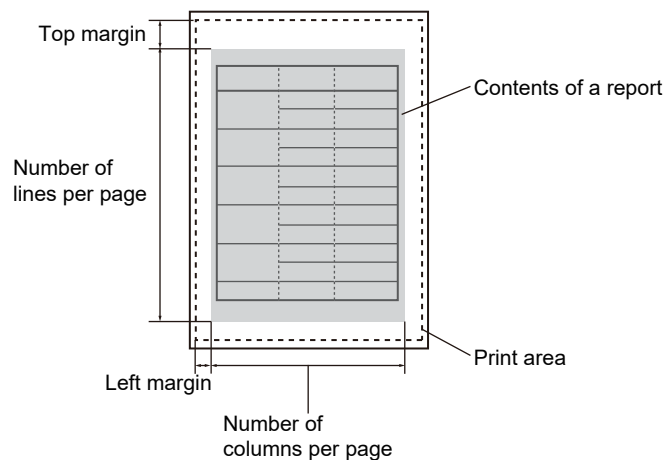

For file output, a KANJI region applies to a report file.

### (5) Page layout

The margins of a page and the maximum numbers of lines and columns per page are common to all report screens.

For serial printers, the print area varies by printer model.

Set the page layout according to the size of the print area.

Item	PictBridge-compatible printer	Serial printer	Ethernet printer
Paper size *1	A4 (portrait)	Depending on the printer specifications	A4 (portrait) or letter
Top margin *2	0 lines to 31 lines	0 lines to 31 lines	0 lines to 31 lines
Number of lines per page *2	1 line to 70 lines	1 line to 127 lines	1 line to 70 lines
Left margin *2	0 columns to 123 columns	0 columns to 254 columns	0 columns to 123 columns
Number of columns per page *2	1 column to 124 columns	1 column to 255 columns	1 column to 124 columns

\*1 As GT SoftGOT2000 outputs a report to a CSV file in a virtual drive instead of to a printer, the paper size setting is nonexistent accordingly.

\*2 The setting range for PictBridge-compatible printers applies to GT SoftGOT2000.

## 5 Report samples and the items to be output to a report

The following shows report samples and the items to be output to a report.

2018/7/1 17:38:04			1

Sample of a report file to be printed

Item	Description
Date and time, page number	<p>These items are available for printer output.</p> <p>The printing date and time and page numbers are printed.</p> <p>They are printed in one line above the header of each page.</p> <p>Configure the settings in the [Screen Property] dialog of a report screen.</p> <p>→2.7.3 Property of report screens</p> <ul style="list-style-type: none"> <li>• Date and time           <ul style="list-style-type: none"> <li>Select [Output date/time] in the [Format] tab.</li> <li>Specify 4 or more for [Page Columns] in the [Report Setting] dialog.</li> </ul> </li> <li>• Page number           <ul style="list-style-type: none"> <li>Select [Output page No.] in the [Format] tab.</li> <li>Specify 17 or more for [Page Columns] in the [Report Setting] dialog.</li> </ul> </li> </ul>
Page header	<p>This item is available for file output.</p> <p>When a report file is printed using the file print function, the printing date and time and the operator name are printed.</p> <p>They are printed in one line per page.</p> <p>They appear at the top line of the area that is specified with [Page Lines] in the [Report Setting] dialog.</p> <p>Set the contents of the page header in the [Edit Page Header/Page Footer] dialog.</p> <p>→10.11.6 [Edit Page Header/Page Footer] dialog</p> <p>Enable the output of the page header in the [Screen Property] dialog of each report screen.</p> <p>→2.7.3 Property of report screens</p> <p>The following shows an example of the page header that has the date and time on the left and the operator name on the right.</p>
Header	<p>The header is output above the body.</p> <p>The header lines specified in a report screen are output.</p> <p>For the setting method, refer to the following.</p> <p>→10.11.3 ■ 3 Creating a report screen</p> <p>The following shows an example of the header in a report.</p>

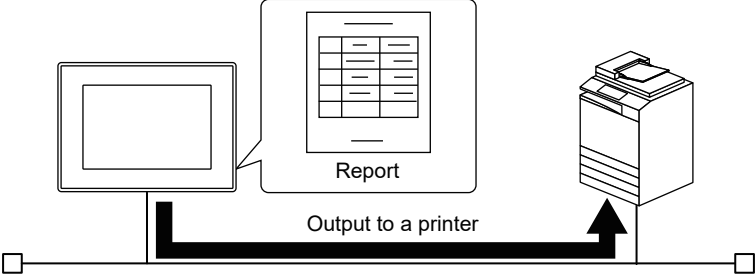

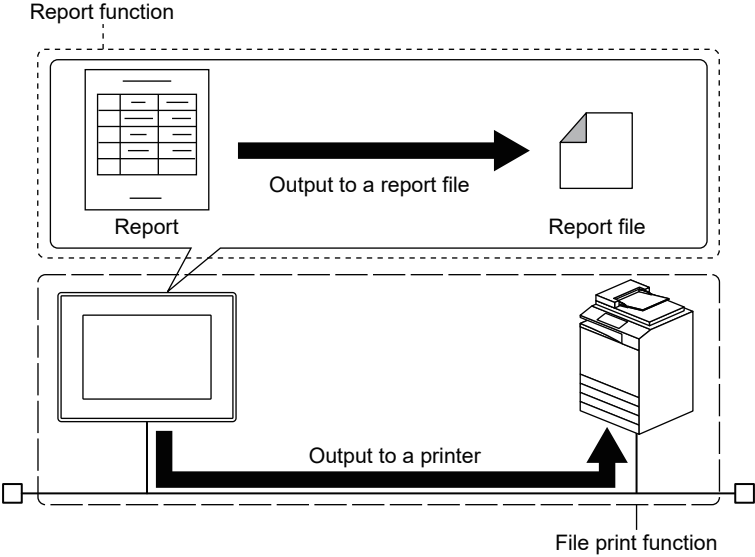

Item	Description												
Body (repeat line)	<p>A repeat line specified in a report screen is output. The following shows the output timing.</p> <ul style="list-style-type: none"> <li>When the output trigger condition is satisfied The line is output the specified number of times. Number of outputs: Number of repeats + 1</li> <li>When data are collected The line is output simultaneously with data collection.</li> </ul> <p>If the number of lines of all types exceeds the set value of [Page Lines] in the [Report Setting] dialog, a page break will be inserted between iterations of repeat lines. For specifying a repeat line, refer to the following. →10.11.3 ■ 3 Creating a report screen The following shows an example of the report where a repeat line having a numerical print object is output three times.</p> <div style="text-align: center; margin-bottom: 10px;">Numerical print object</div> <table border="1" style="border-collapse: collapse; width: 100%;"> <tr> <td style="padding: 5px;">TEST</td> <td style="padding: 5px; border: 1px dashed black;">100</td> <td style="padding: 5px;">Body (repeat line)</td> <td style="padding: 5px;"></td> </tr> <tr> <td style="padding: 5px;">TEST</td> <td style="padding: 5px; border: 1px dashed black;">50</td> <td style="padding: 5px;">Body (repeat line)</td> <td style="padding: 5px;">First repetition</td> </tr> <tr> <td style="padding: 5px;">TEST</td> <td style="padding: 5px; border: 1px dashed black;">200</td> <td style="padding: 5px;">Body (repeat line)</td> <td style="padding: 5px;">Second repetition</td> </tr> </table>	TEST	100	Body (repeat line)		TEST	50	Body (repeat line)	First repetition	TEST	200	Body (repeat line)	Second repetition
TEST	100	Body (repeat line)											
TEST	50	Body (repeat line)	First repetition										
TEST	200	Body (repeat line)	Second repetition										
Body (alarm line)	<p>The set items are output when the user alarm observation function detects the occurrence or reset of an alarm. For the items to be output, refer to the following. →9.1.2 ■ 7 (2) [Device] tab The following shows the output timing.</p> <ul style="list-style-type: none"> <li>When the output trigger condition is satisfied The line is output the specified number of times. Number of outputs: Number of repeats + 1</li> <li>When data are collected The line is output when an alarm occurs or is reset. Each alarm event is output in one line.</li> </ul> <p>If the number of digits output in an alarm line exceeds the set value of [Page Columns] in the [Report Setting] dialog, only the digits within the limit will be output. For the settings to output an alarm line, refer to the following. →10.11.3 ■ 4 Settings to output alarm lines The following shows an example of alarm lines in a report.</p> <table border="1" style="border-collapse: collapse; width: 100%;"> <tr> <td style="padding: 5px;">18/07/01 20:13 alarm1 Ocr</td> <td style="padding: 5px;">Body (alarm line)</td> <td style="padding: 5px;">Occurrence of an alarm</td> </tr> <tr> <td style="padding: 5px;">18/07/01 20:35 alarm2 Ocr</td> <td style="padding: 5px;">Body (alarm line)</td> <td style="padding: 5px;">Occurrence of an alarm</td> </tr> <tr> <td style="padding: 5px;">18/07/01 22:05 alarm1 Rstr</td> <td style="padding: 5px;">Body (alarm line)</td> <td style="padding: 5px;">Reset of an alarm</td> </tr> </table> <p>For the user alarm observation, refer to the following. →9.1.2 Collecting alarms by monitoring devices</p>	18/07/01 20:13 alarm1 Ocr	Body (alarm line)	Occurrence of an alarm	18/07/01 20:35 alarm2 Ocr	Body (alarm line)	Occurrence of an alarm	18/07/01 22:05 alarm1 Rstr	Body (alarm line)	Reset of an alarm			
18/07/01 20:13 alarm1 Ocr	Body (alarm line)	Occurrence of an alarm											
18/07/01 20:35 alarm2 Ocr	Body (alarm line)	Occurrence of an alarm											
18/07/01 22:05 alarm1 Rstr	Body (alarm line)	Reset of an alarm											

Item	Description									
<p>Body (operation log line)</p>	<p>The set items are output when the operation log function records an operation event.  For the items to be output, refer to the following.  →5.2.11 ■ 4 (4) [Report Setting] tab  The following shows the output timing.</p> <ul style="list-style-type: none"> <li>• When the output trigger condition is satisfied  The line is output the specified number of times.  Number of outputs: Number of repeats + 1</li> <li>• When data are collected  The line is output when an operation event is recorded.</li> </ul> <p>Each operation event is output in the specified number of lines.  For the settings to output an operation log line, refer to the following.  →10.11.3 ■ 5 Settings to output operation log lines  The following shows an example of operation log lines in a report.</p> <table border="1" data-bbox="467 521 1355 790"> <tr> <td data-bbox="467 521 877 622">18/07/01 14:53 OFF user1 1 0</td> <td data-bbox="877 521 1085 622">Body (operation log line)</td> <td data-bbox="1085 521 1355 622">Operation of a touch switch</td> </tr> <tr> <td data-bbox="467 622 877 689">18/07/01 14:54 Speed user1 100 50</td> <td data-bbox="877 622 1085 689">Body (operation log line)</td> <td data-bbox="1085 622 1355 689">Operation of a numerical input object</td> </tr> <tr> <td data-bbox="467 689 877 790">18/07/01 14:55 ON user1 0 1</td> <td data-bbox="877 689 1085 790">Body (operation log line)</td> <td data-bbox="1085 689 1355 790">Operation of a touch switch</td> </tr> </table> <p>For the operation log function, refer to the following.  →5.2.11 Configuring the settings for creating the operation history of the GOT ([Operation Log])</p>	18/07/01 14:53 OFF user1 1 0	Body (operation log line)	Operation of a touch switch	18/07/01 14:54 Speed user1 100 50	Body (operation log line)	Operation of a numerical input object	18/07/01 14:55 ON user1 0 1	Body (operation log line)	Operation of a touch switch
18/07/01 14:53 OFF user1 1 0	Body (operation log line)	Operation of a touch switch								
18/07/01 14:54 Speed user1 100 50	Body (operation log line)	Operation of a numerical input object								
18/07/01 14:55 ON user1 0 1	Body (operation log line)	Operation of a touch switch								
<p>Footer</p>	<p>The footer is output below the body.  The footer lines specified in a report screen are output.  For the setting method, refer to the following.  →10.11.3 ■ 3 Creating a report screen  The following shows an example of the footer in a report.</p> 									
<p>Page footer</p>	<p>This item is available for file output.  When a report file is printed using the file print function, the printing date and time and the operator name are printed.  They are printed in one line per page.  They appear at the bottom line of the area that is specified with [Page Lines] in the [Report Setting] dialog.  Set the contents of the page footer in the [Edit Page Header/Page Footer] dialog.  →10.11.6 [Edit Page Header/Page Footer] dialog  Enable the output of the page footer in the [Screen Property] dialog of each report screen.  →2.7.3 Property of report screens  The following shows an example of the page footer that has a page number and the total number of pages in the center.</p> <p>Page number/Total number of pages</p> 									

## 6 Output destination of a report

The following shows the output destinations selectable for a report.

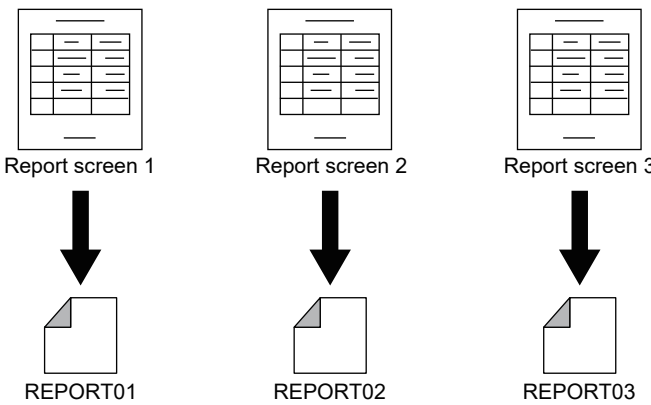

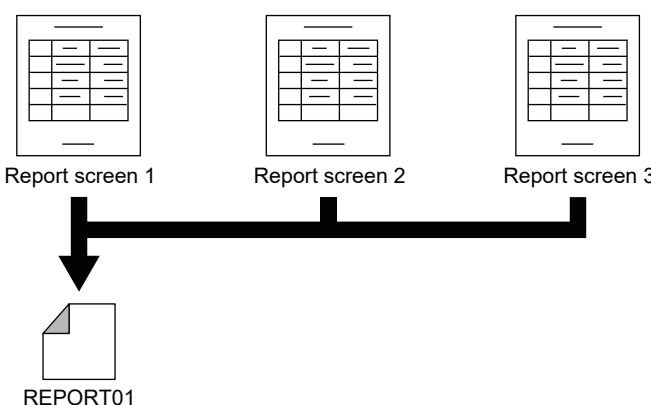

Output destination	Description	Supported models
Printer	<p>A report is output to a printer.</p>  <p>GT SoftGOT2000 outputs a report to a CSV file in a virtual drive instead of to a printer. Output the CSV file to a printer from the personal computer. For the specifications of the report function on GT SoftGOT2000, refer to the following. →GT SoftGOT2000 Version1 Operating Manual</p>	<p>GT27 GT25 GT23 GT21 GS SoftGOT2000</p>
File	<p>A report is output to a report file. To output the report file to a printer, use the file print function. For the file print function, refer to the following. →GOT2000 Series User's Manual (Utility)</p>  <p>For the specifications related to a report file, refer to the following. →10.11.2 ■ 7 Specifications related to a report file</p>	<p>GT27 GT25 GT23 GT21 GS SoftGOT2000</p>

## 7 Specifications related to a report file

The following shows the specifications related to a report file.

### (1) Specifying a report file

The following shows how to specify a report file to which a report will be output. Specify a destination report file per report screen.

Item	Description
<p>Outputting screen data to a new report file</p>	<p>The data of a report screen is output to a new report file. Example) Outputting the data of report screens 1 to 3 to new report files respectively</p> 
<p>Adding screen data to the report file created for another report screen</p>	<p>The data of a report screen is added to the report file created for another report screen. You can output the data of multiple report screens to one report file. Example) Adding the data of report screens 2 and 3 to the report file created for report screen 1</p> 

### (2) Switching report files

You can switch a destination report file to a new one at your preferred timing.

Once the destination report file is switched, the file will be write-protected.

The destination report file is switched under the following conditions.

- The data of a report screen is output when [Switch files after an output] is enabled for the screen.
- The screen data is output while bit 0 of the notification device is turned off by turning on bit 0 of the control device.
- In the case where a destination report file is specified with devices, the screen data is output to another new report file.

Note that restarting the GOT write-protects all report files.

When you specify a destination report file directly, a sequential number is appended to the report file name.

Example) REPORT01\_0000.G2R

The sequential number starts from 0000. When REPORT01\_0000.G2R is switched to a new report file, the new file is named REPORT01\_0001.G2R.

After sequential number 9999 is used, sequential number 0000 will be used.

**(3) Report file's sequential number and management file**

The sequential number of a report file is managed with a management file (\*.G2G).  
 When a report file is created in a folder, its management file with the same name (excluding the sequential number) is also created in the folder.

Example) For REPORT01\_\*\*\*\*.G2R, its management file is REPORT01.G2G.

To change the sequential number of a report file, perform one of the following operations.

- Change the setting of [File Name] on the [File Save] tab in the [Screen Property] dialog for a report screen.
- Delete the report file and its management file.

**■8 Report output timing**

The following shows the timing for outputting data as a report.

- When the output trigger condition is satisfied
- When data are collected

Set the output timing per report screen.

**(1) When the output trigger condition is satisfied**

The collected data is stored into a temporary file, and is collectively output as a report when the output trigger condition is satisfied.

The data in the temporary file is deleted when the delete trigger condition is satisfied.

Set the following items per report screen: the data collection trigger, the data output trigger, the maximum number of collections of data to be stored into a temporary file, and the number of collections of data to be output when the output trigger condition is satisfied.

⇒2.7.3 Property of report screens

Example) Outputting three collections of data when the output trigger condition is satisfied

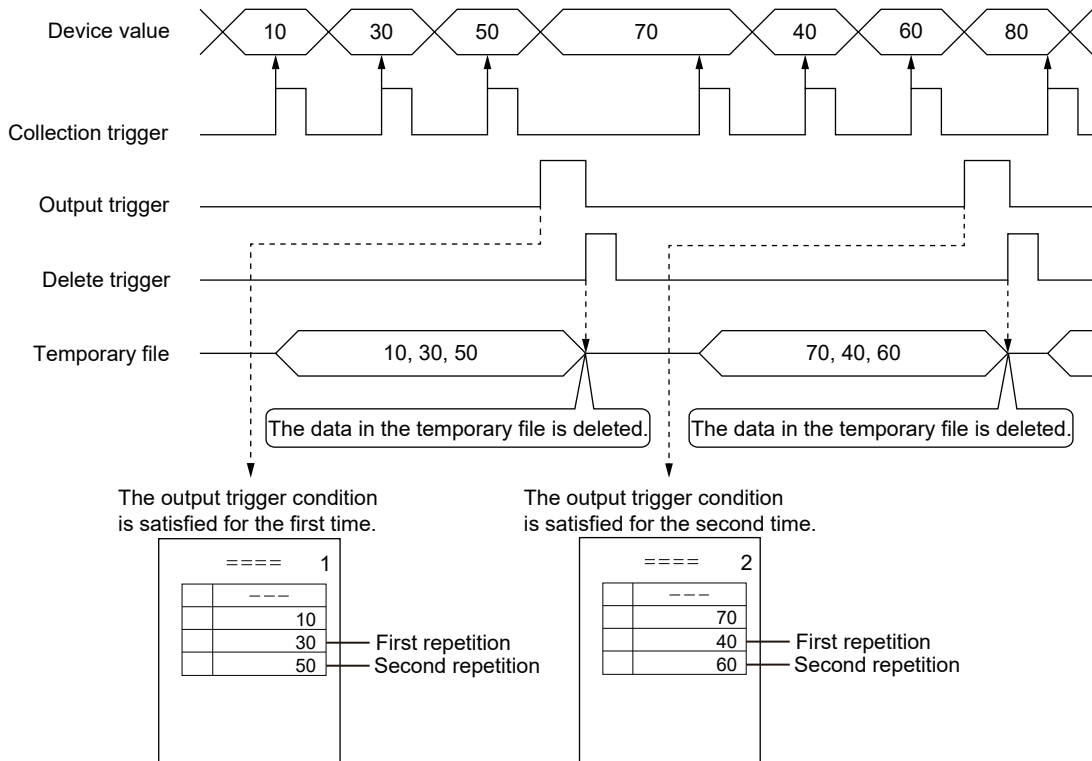

The following shows how the data is output when the following settings are configured in the [Screen Property] dialog of a report screen.

- [Limit of Collection] in the [Action] tab: 3
- [Number of repeats] in the [Format] tab: 2

When the collection trigger condition is satisfied, data is stored into a temporary file.

Up to three collections of data are stored into the temporary file.

When the output trigger condition is satisfied, the stored data is output. (Number of collections of output data: Number of repeats + 1).

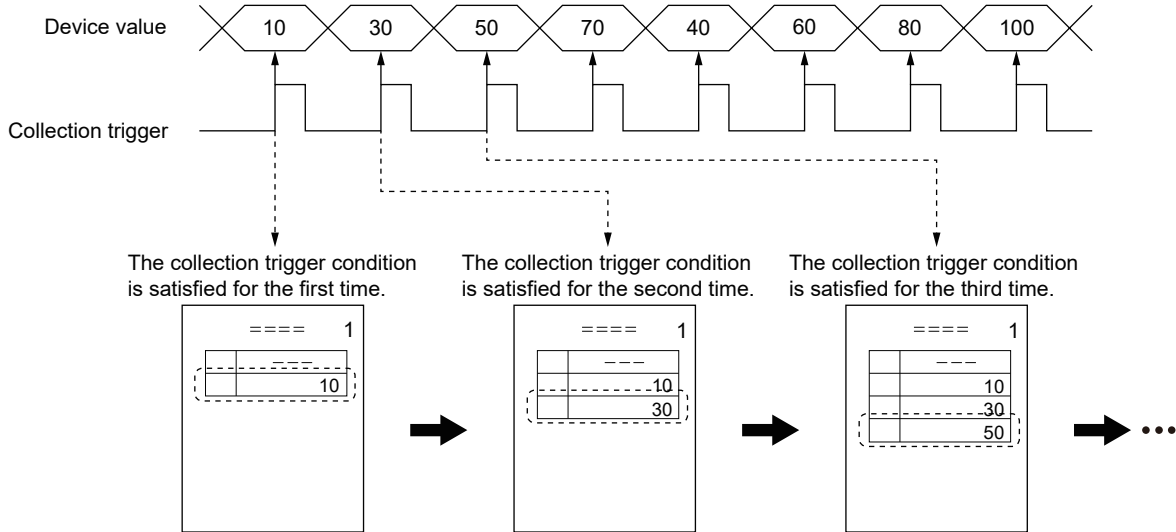

(2) When data are collected

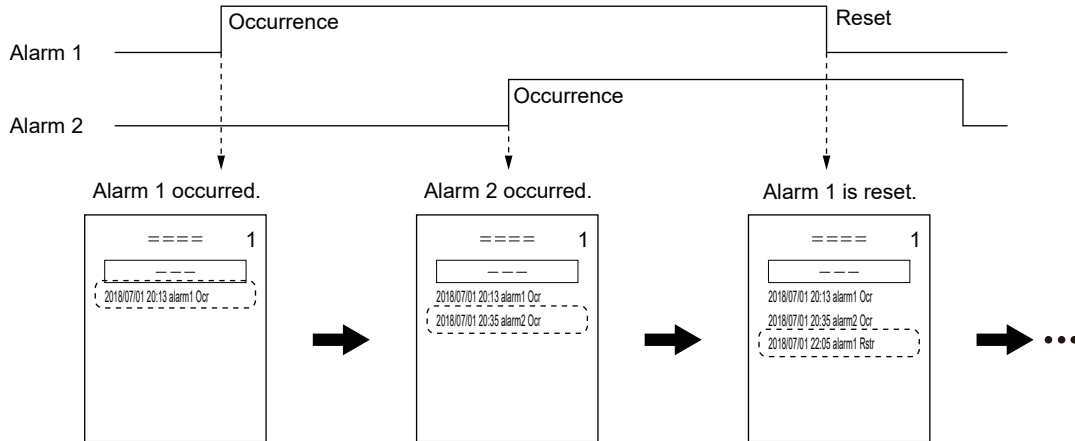

The collected data is output simultaneously with data collection.  
 This is available only when a serial printer is used.  
 The trigger to collect data varies depending on the item to be output.

Item to be output	Trigger to collect data
Repeat line	The collection trigger condition is satisfied.
Alarm line	The user alarm observation function detects the occurrence or reset of an alarm.
Operation log line	An operation event is recorded.

Example) Repeat lines in a report

Example) Alarm lines in a report

### 10.11.3 How to use the report function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1 System configuration

The following shows the system configuration when a printer is used.

For connecting a printer to the GOT, refer to the following.

→ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

GT SoftGOT2000 outputs a report to a CSV file in a virtual drive instead of to a printer.

For the specifications of the report function on GT SoftGOT2000, refer to the following.

→ GT SoftGOT2000 Version1 Operating Manual

##### (1) When connecting with a PictBridge-compatible printer

Available cables differ depending on the connection type.

Printer Model	Connection cable Model	GOT		PLC	Number of connectable printers
		Option	GOT model		
For the connectable printers and system devices, refer to the following Technical News. → List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	GT09-C30USB-5P (3m) (included in the printer unit)	GT15-PRN <sup>*1</sup>	GT27, GT25 <sup>*2</sup>	For the system configuration between the GOT and the PLC, refer to each connection manual.	One printer for one GOT

\*1 The unit for the communication between the GOT and the PictBridge-compatible printer.

Some PictBridge-compatible printers may not be able to print data properly.

For the precautions for the printer connection, refer to the following Technical News.

→ List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)

\*2 GT25-W, GT2505-V, and GT25HS-V are excluded.

##### (2) When connecting with a serial printer

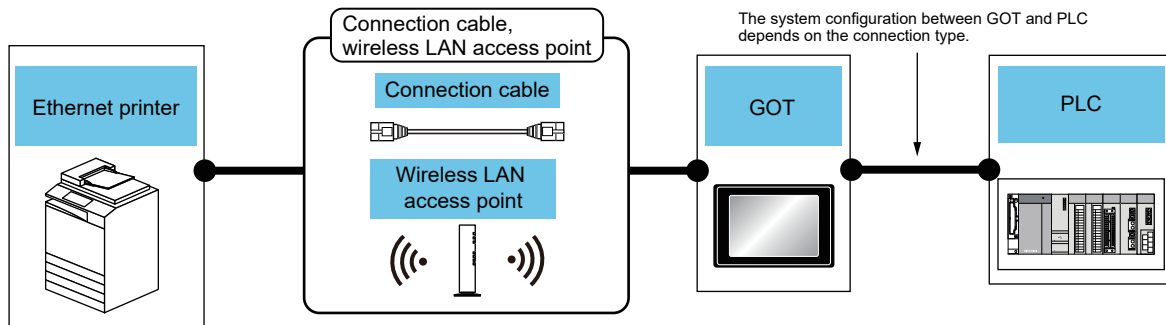

Available cables differ depending on the connection type.

Printer Model	Connection cable Model	GOT		PLC	Number of connectable printers
		Option	GOT model		
For the connectable printers and system devices, refer to the following Technical News. → List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	RS-232 cable <sup>*1</sup>	-(Built into GOT)	GT27	For the system configuration between the GOT and the PLC, refer to each connection manual.	One printer for one GOT
			GT25 <sup>*2</sup>		
			GT23		
			GT21		
		GT15-RS2-9P	GT27		
			GT25 <sup>*3</sup>		

- \*1 Available RS-232 cables differ according to the printer used.  
Prepare a RS-232 cable that is suitable for the specifications of the printer to be used.
- \*2 GT25HS-V is excluded.
- \*3 GT25-W, GT2505-V, and GT25HS-V are excluded.

### (3) When connecting with an Ethernet printer

Printer	Connection cable <sup>*1,2</sup> , wireless LAN access point	Maximum segment length <sup>*3</sup>	GOT		PLC	Number of connectable personal computers
			Option	GOT model		
Select by each user →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)	<ul style="list-style-type: none"> <li>• 100BASE-TX Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 5 or higher</li> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP) of category 3 or higher</li> </ul>	100m	- (Built into GOT)	GT27 GT25 <sup>*8</sup> GT23	For the system configuration between the GOT and the PLC, refer to each connection manual.	One personal computer for one GOT
	-	-	GT25-J71E71-100	GT27 GT25 <sup>*6</sup>		
	<ul style="list-style-type: none"> <li>• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*4</sup> GT25 <sup>*4,7</sup> GT27 <sup>*5</sup> GT25 <sup>*5,7</sup>		

- \*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system.  
Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard.  
For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.
- \*2 When a hub is used, use a straight cable.  
To connect the GOT and the printer directly with an Ethernet cable, use a straight or cross cable.  
For the cables usable for your printer, check the printer specifications.
- \*3 The length between the hub and node.  
The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.
  - 10BASE-T: Up to 4 personal computers for a cascade connection (500m)
  - 100BASE-TX: Up to 2 personal computers for a cascade connection (205m)
For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.  
For the limit, contact the switching hub manufacturer.
- \*4 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.  
→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*5 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.  
→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*6 GT25-W, GT2505-V, and GT25HS-V are excluded.
- \*7 GT2505-V and GT25HS-V are excluded.
- \*8 For GT2505HS-V, one built-in interface is usable.  
An Ethernet printer is connectable only when the GOT is connected to a controller by Ethernet.

## ■2 Setting procedure

### (1) For GT27, GT25, GT23, and GT21

- Step 1** Connect the GOT and a printer.  
 ⇒ GOT2000 Series Connection Manual (Microcomputer, MODBUS/Fieldbus Products, Peripherals) for GT Works3 Version1
- Step 2** Select [Common] → [Peripheral Setting] → [Printer] from the menu to display the [Printer] dialog.
- Step 3** In the [Printer] dialog, set a printer to be connected to the GOT.  
 ⇒ 10.11.8 [Printer] dialog
- Step 4** Create a report screen.  
 ⇒ ■ 3 Creating a report screen  
 To output alarm lines, configure the output settings of the user alarm observation function.  
 ⇒ ■ 4 Settings to output alarm lines  
 To output operation log lines, configure the output settings of the operation log function.  
 ⇒ ■ 5 Settings to output operation log lines
- Step 5** In the [Report Setting] dialog, set the cycle of monitoring trigger devices and set the page layout of a report.  
 ⇒ ■ 6 Settings common to report screens

### (2) For GT SoftGOT2000

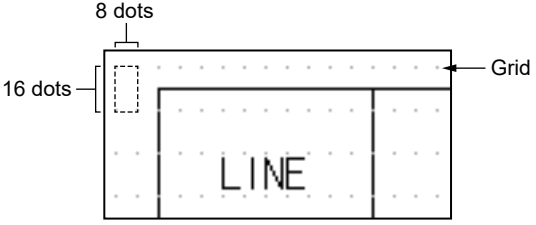

- Step 1** Create a report screen.  
 ⇒ ■ 3 Creating a report screen  
 To output alarm lines, configure the output settings of the user alarm observation function.  
 ⇒ ■ 4 Settings to output alarm lines  
 To output operation log lines, configure the output settings of the operation log function.  
 ⇒ ■ 5 Settings to output operation log lines
- Step 2** In the [Report Setting] dialog, set the cycle of monitoring trigger devices and set the page layout of a report.  
 ⇒ ■ 6 Settings common to report screens
- Step 3** On GT SoftGOT2000, select the [Project] menu and configure the print settings.  
 ⇒ GT SoftGOT2000 Version1 Operating Manual

## ■3 Creating a report screen

For the procedure for creating a report screen, refer to the following.

⇒ 2.5.1 ■ 3 Creating a report screen

The following shows the space between figures or objects when they are placed or moved.

Item		Space between figures or objects
Figure	Line	Place or move this item in units of 16 dots vertically or horizontally.
	Text	Place or move this item in units of 16 dots vertically or in units of 8 dots horizontally. Use the grid as a reference. The vertical and horizontal spacing between dots in the grid on a report screen are fixed to 16 dots and 8 dots respectively.
Object		

The grid color can be changed in the [View] tab of the [Options] tab.

⇒ 11.10.5 Customizing the display

### (1) Drawing lines and squares

#### (a) How to draw

Place each line and square not to overlap each other.

- Step 1** Select [Figure] → [Line] from the menu.
- Step 2** Drag the pointer from the start point to the end point and release the left button on the mouse to draw a line

or a square.

- Drawing a line Drag the pointer from the start point horizontally or vertically to draw a line.

- Drawing a square Drag the pointer from the start point diagonally to draw a square.

## (b) Precautions

The property of the line is fixed as follows.

- Line style: Solid line
- Line width: 1 dot
- Line color: Black

## (2) Placing text

### (a) How to place text

**Step 1** Select [Figure] → [Text] from the menu.

**Step 2** Click the position where you place the text. The [Text] dialog appears.

**Step 3** Input character strings you want to display and then click the [OK] button.

Set the KANJI region as required.

**Step 4** The input text is displayed on the screen.

## (b) Precautions

- Line feeds cannot be inserted to the text on the report screen.
- The character property (character effect, character color, and others) cannot be changed.
- Two-byte characters are placed by 16 dots × 16 dots. One-byte characters are placed by 16 dots × 8 dots.

- For PictBridge-compatible printers or Ethernet printers, up to 62 two-byte or 124 one-byte characters can be output.
- For serial printers, up to 127 two-byte or 255 one-byte characters can be output.

## (3) Placing an object

For the object placement and setting on a report screen, refer to the following.

→8.32 Placing a Print Object on a Report Screen

#### (4) Setting the header, footer, and repeat lines

Set the items (header, footer, and repeat lines) to be output to a report on a report screen.

If repeat lines are set to be output, specify them.

Make sure that the number of lines to be output to a report does not exceed the set value of [Page Lines] in the [Report Setting] dialog. The header lines, footer lines, repeat lines, page header lines, and alarm lines are included.

For the number of lines to be output to a report, refer to the following.

→ 10.11.2 ■ 5 Report samples and the items to be output to a report

The following shows the setting procedure.

- Step 1** Open a report screen, and perform one of the following operations.
- Select [Edit] → [Object of Selection] → [Report Line] from the menu.
  - Click the [Object of Selection:Report Line] button on the [Report] toolbar.  
→ 2.2.2 ■ 13 [Report]
- Step 2** On the report screen, select a line to be a header, footer, or repeat line.  
To select multiple lines, drag the target lines.

Line	Model	Operation condition	Production vol.	
			Expected	Result
1120			010	020
1121			011	021
1122			012	022
1123			013	023

- Step 3** Click an appropriate button on the [Report] toolbar according to the target to be set.

- Sets the selected line as a repeat line.
- Sets the selected line as a footer line.
- Sets the selected line as a header line.

- Step 4** The selected line is set as a header, footer, or repeat line, and is enclosed in a colored frame.
- Header: Cyan frame
  - Footer: Red frame
  - Repeat row: Yellow frame

#### Point

##### Alternative setting methods

The header, footer, repeat lines are also settable in the following dialogs.

- [Format] tab in the [Screen Property] dialog of a report screen  
→ 2.7.3 ■ 3 [Format] tab
- [Header/Footer/Repeat] dialog  
→ 10.11.7 [Header/Footer/Repeat] dialog

## ■4 Settings to output alarm lines

To output the alarm events that are collected by the user alarm observation, configure the settings of a report screen and the user alarm observation as shown below.

### (1) Setting of the report screen

- Step 1** Perform one of the following operations to set a report screen so that alarm lines will be output to a report.
- Click the screen editor.
  - Select a screen in the [Screen] window.
- Step 2** Select [Screen] → [Screen Property] from the menu to display the [Screen Property] dialog for the report screen.
- Step 3** In the [Format] tab, select [Alarm] for [Output Target].  
⇒2.7.3 ■ 3 [Format] tab
- Step 4** Click the [OK] button to apply the setting.

### (2) Setting of the user alarm observation

For the specifications and settings of the user alarm observation, refer to the following.

⇒9.1.2 Collecting alarms by monitoring devices

- Step 1** Select [Common] → [Alarm] → [User Alarm Observation] from the menu to display the [User Alarm Observation List] dialog.  
⇒9.1.2 ■ 6 [User Alarm Observation List] dialog
- Step 2** Perform one of the following operations to display the [User Alarm Observation] dialog.
- Click the [New] button.
  - Select a user alarm observation setting and click the [Edit] button.  
⇒9.1.2 ■ 7 (2) [Device] tab
- Step 3** Click the [Additional Setting] button in the [Device] tab to display the [Additional Setting] dialog.
- Step 4** Select [Alarm Print] and click the [Alarm Print Detail Setting] button to display the [Alarm Print Detail Setting] dialog.
- Step 5** Set necessary items and click the [OK] button.
- Step 6** In the [Additional Setting] dialog, click the [OK] button.
- Step 7** In the [User Alarm Observation] dialog, click the [OK] button to apply the setting.

#### Point

##### Outputting a reset alarm event

When selecting [Print the information of restored alarms] for [Print Target] in the [Alarm Print Detail Setting] dialog, do not configure the following setting.

- In the [User Alarm Observation] dialog, select [Only current alarm] for [Collection Mode] in the [Basic] tab.

Doing so disables the output of reset alarm events.

## ■5 Settings to output operation log lines

To output the operation events that are recorded by the operation log function, configure the settings of a report screen and the operation log function as shown below.

### (1) Setting of the report screen

- Step 1** Perform one of the following operations to set a report screen so that operation log lines will be output to a report.
- Click the screen editor.
  - Select a screen in the [Screen] window.
- Step 2** Select [Screen] → [Screen Property] from the menu to display the [Screen Property] dialog for the report screen.
- Step 3** In the [Format] tab, select [Operation Log] for [Output Target].  
⇒2.7.3 ■ 3 [Format] tab
- Step 4** Click the [OK] button to apply the setting.

## (2) Settings of the operation log function

For the specifications and settings of the operation log function, refer to the following.

⇒5.2.11 Configuring the settings for creating the operation history of the GOT ([Operation Log])

**Step 1** Select [Common] → [GOT Environmental Setting] → [Operation Log] from the menu to display [Operation Log] in the [Environmental Setting] window.

⇒5.2.11 ■ 4 [Operation Log...]

**Step 2** Select [Collect operation logs].

**Step 3** In the [Report Setting] tab, select [Output operation logs to a report screen].

⇒5.2.11 ■ 4 (4) [Report Setting] tab

**Step 4** Configure the settings and click the [OK] button to apply the settings.

## ■6 Settings common to report screens

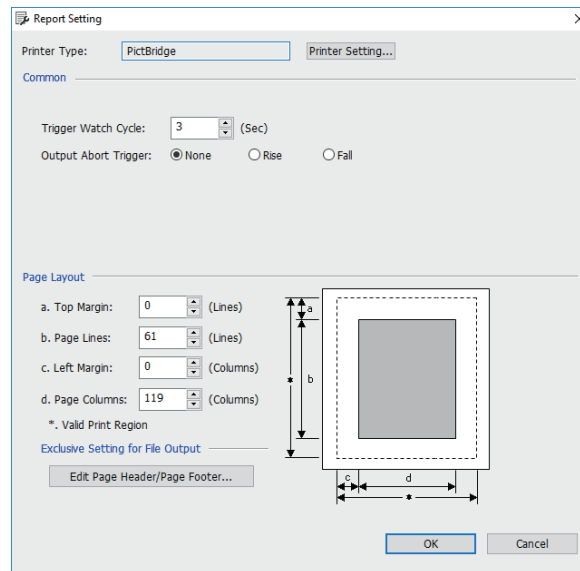

Set the numbers of lines and columns per page and the cycle of monitoring the relevant trigger devices. Create a report screen, and then configure the settings.

⇒2.5.1 ■ 3 Creating a report screen

**Step 1** Select [Screen] → [Report Setting] from the menu to display the [Report Setting] dialog.

**Step 2** Configure the settings, and click the [OK] button.

⇒10.11.5 [Report Setting] dialog

## ■7 Aborting a printer output

If the output destination is set to a printer, you can abort a printer output.

If a printer output is aborted, the paper will be ejected from the printer during printing.

The following shows how to abort an output.

Means of aborting an output	Description
Abort trigger	<p>An abort trigger is set per report screen. Set the abort trigger in the [Screen Property] dialog of a report screen. →2.7.3 ■ 2 [Action] tab</p> <p>If the abort trigger condition is satisfied, the output of one collection of data will be aborted. When [Output Timing] is set to [At the time of data collection] for a report screen, if multiple alarms occur or are reset simultaneously, multiple printer outputs will occur successively. To abort the successive outputs, use system signal 1-2.b15.</p> <p>If the abort trigger condition is satisfied, the output of one alarm event will be aborted only. The outputs of the subsequent alarm events cannot be aborted.</p>
Output abort trigger	<p>The output abort trigger is common to all report screens. Set the output abort trigger in the [Report Setting] dialog. →10.11.5 [Report Setting] dialog</p> <p>If the abort trigger condition is satisfied, the output of one collection of data will be aborted. When [Output Timing] is set to [At the time of data collection] for a report screen, if multiple alarms occur or are reset simultaneously, multiple printer outputs will occur successively. To abort the successive outputs, use system signal 1-2.b15.</p> <p>If the output abort trigger condition is satisfied, the output of one alarm event will be aborted only. The outputs of the subsequent alarm events cannot be aborted.</p>
System signal 1-2.b15	<p>This signal is common to all report screens. Set the signal in [System Information] in the [Environmental Setting] window. →5.2.5 ■ 4 [System Information]</p> <p>While this signal is turned on, a printer output is aborted.</p>

When [Output Timing] is set to [When trigger condition is satisfied] and [Delete Trigger] is set to [Output] for a report screen, the data of a temporary file will not be deleted after a printer output is aborted.

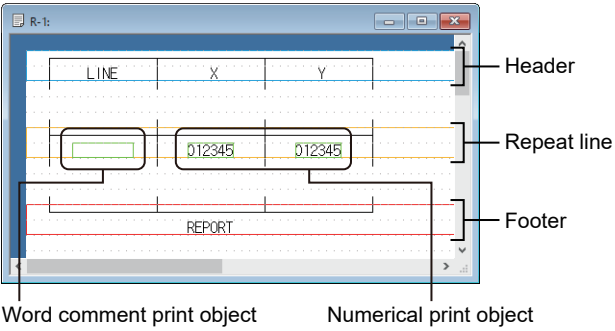

## 8 Examples of report screen settings

The following shows examples of report screen settings and reports.

### (1) Outputting the page numbers, header, repeat lines, and footer (to a printer)

The following shows an example of report screen settings.

The setting items unmentioned below are assumed to be set to their defaults.

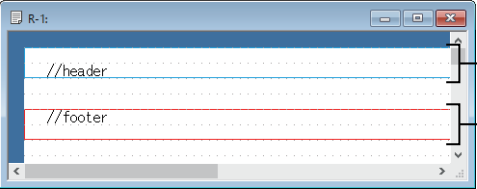

Setting location		Settings
[Printer] dialog		<ul style="list-style-type: none"> <li>• [Use Printer]: Selected</li> <li>• [Connection Type]: [Ethernet]</li> </ul>
[Screen Property] dialog (report screen)	[Action] tab	<ul style="list-style-type: none"> <li>• [Output Destination]: [Printer]</li> <li>• [Output Timing]: [When trigger condition is satisfied]</li> <li>• [Collection Trigger]: [Rise], GB1000</li> <li>• [Output Trigger]: [Rise], GB1001</li> <li>• [Limit of Collection]: 3</li> </ul>
	[Format] tab	<ul style="list-style-type: none"> <li>• [Set header]: Selected</li> <li>• [Start] (header): 1</li> <li>• [End] (header): 2</li> <li>• [Repeat] of [Output Target]: Selected</li> <li>• [Start] (repeat line): 6</li> <li>• [End] (repeat line): 7</li> <li>• [Number of repeats]: 2</li> <li>• [Set footer]: Selected</li> <li>• [Start] (footer): 11</li> <li>• [End] (footer): 12</li> <li>• [Output page No.]: Selected</li> </ul>
	Screen editor	 <p>Word comment print object      Numerical print object</p>
[Report Setting] dialog		<ul style="list-style-type: none"> <li>• All setting items are set to their defaults.</li> </ul>

The following shows an example of a report.

			1	Page number
LINE	X	Y	Header	
LINE_A	100	50		
LINE_B	200	150		
LINE_C	300	250		
LINE_A	1000	500	Repeat line	
LINE_B	2000	350		
LINE_B	800	500		
LINE_C	1500	2500	Footer	
REPORT				

**(2) Outputting the page header, header, alarm lines, footer, and page footer (to a file)**

The following shows an example of report screen settings.  
 The setting items unmentioned below are assumed to be set to their defaults.

Setting location		Settings
[Printer] dialog		<ul style="list-style-type: none"> <li>• [Use Printer]: Selected</li> <li>• [Connection Type]: [Ethernet]</li> </ul>
[Screen Property] dialog (report screen)	[Action] tab	<ul style="list-style-type: none"> <li>• [Output Destination]: [File]</li> <li>• [Output Timing]: [When trigger condition is satisfied]</li> <li>• [Output Trigger]: [Rise], GB1001</li> <li>• [Limit of Collection]: 10000</li> </ul>
	[Format] tab	<ul style="list-style-type: none"> <li>• [Output page header]: Selected</li> <li>• [Set header]: Selected</li> <li>• [Start] (header): 1</li> <li>• [End] (header): 2</li> <li>• [Alarm] of [Output Target]: Selected</li> <li>• [Set footer]: Selected</li> <li>• [Start] (footer): 5</li> <li>• [End] (footer): 6</li> <li>• [Output page footer]: Selected</li> </ul>
	[File Save] tab	<ul style="list-style-type: none"> <li>• [Specification]: [Direct]</li> </ul>
	Screen editor	
[Report Setting] dialog	[Edit Page Header/Page Footer] dialog	<ul style="list-style-type: none"> <li>• [Left section] of [Page Header]: [Date + Time]</li> <li>• [Right section] of [Page Header]: [Operator Name]</li> <li>• [Center section] of [Page Footer]: [Page/Pages]</li> </ul>
[User Alarm Observation] dialog	[Device] tab	<ul style="list-style-type: none"> <li>• [Alarm Points]: 3</li> <li>• [Device]: X1000</li> </ul>
	[Additional Setting] dialog	<ul style="list-style-type: none"> <li>• [Alarm Print]: Selected</li> </ul>
	[Alarm Print Detail Setting] dialog	<ul style="list-style-type: none"> <li>• All setting items are set to their defaults.</li> </ul>

The following shows an example of a report.  
 The page header and page footer are not visible until the report file is printed using the file print function.

### ■ 1 Precautions on the report screen settings

#### (1) Collection cycle and number of devices on the report screen for the monitor display

Note that it takes longer time than usual for the GOT to display the monitor screen when the number of set devices in the report screen is large.

When it takes longer, extend the data collection cycle or reduce the number of devices.

#### (2) Text to be printed when a serial printer is used

When [Serial] is selected for [Printer Type], text is converted into shift JIS code or ASCII code for printing.

If any language other than Japanese and English is used, the text will be printed improperly.

Use Japanese or English for the text to be printed.

#### (3) Page layout settings

Make sure that the number of lines to be output to a report does not exceed the set value of [Page Lines] in the [Report Setting] dialog. The header lines and repeat lines are included.

For the number of lines to be output to a report, refer to the following.

→ 10.11.2 ■ 5 Report samples and the items to be output to a report

If report screen data is added to the report file created for another report screen, the number of lines will include the page header and footer lines of the screen for which the file is created.

The following shows an example where a report cannot be output.

Example 1) When outputting the date and time, page numbers, header, alarm lines, and footer to a report  
When the settings are configured as shown below, the total number of lines to be output is 7.

- Date and time, page number: 1 line
- Header: 3 lines
- Alarm line: 1 line
- Footer: 2 lines

If [Page Lines] is set to 6 or less in the [Report Setting] dialog, no report will be output.

Example 2) When outputting the date and time, page numbers, header, operation log lines, and footer to a report  
When the settings are configured as shown below, the total number of lines to be output is 9.

- Date and time, page number: 1 line
- Header: 3 lines
- Operation log line: 3 lines per event (when line feeds are inserted)
- Footer: 2 lines

If [Page Lines] is set to 8 or less in the [Report Setting] dialog, no operation log line will be output.

#### (4) Precautions for a report screen having an alarm line

There is a limit on the number of report screens where the following settings are configured in the [Screen Property] dialog.

- [Output Timing] is set to [At the time of data collection] in the [Action] tab.
- [Alarm] is selected in the [Format] tab.

The maximum number of such report screens differs depending on the report output destination setting.

- When [Output Destination] is set to [Printer]: 1 screen per project
- When [Output Destination] is set to [File]: 1 screen per report file

#### (5) Precautions for a report screen having an operation log line

There is a limit on the number of report screens where the following settings are configured in the [Screen Property] dialog.

- [Output Timing] is set to [At the time of data collection] in the [Action] tab.
- [Operation Log] is selected in the [Format] tab.

The maximum number of such report screens differs depending on the report output destination setting.

- When [Output Destination] is set to [Printer]: 1 screen per project
- When [Output Destination] is set to [File]: 1 screen per report file

## ■2 Precautions for placing a figure or object on a report screen

### (1) Placing a figure or object

Do not overlap figures and objects on a report screen.

Doing so cannot output the screen data properly.

If an object or figure is tangent to a line or any line of a rectangle, the screen data may not be output properly.

In such a case, make a space between a line and an object or figure.

### (2) Precautions for the numerical print

In the [Numerical Print] dialog, when the print format is set to binary, 0 is always prepended to the value even though [Fill with 0] is deselected.

⇒8.32.4 ■ 1 [Device/Style] tab

### (3) Precautions for the text print

If the set text contains a line feed code, only the first line of the text will be output.

### (4) Character code when a string-type label or tag is set for the device of a text print object

If you set a string-type label or tag for the device of a text print object, set the character code according to the type of the label or tag.

- System label Ver.1: ASCII code or Shift JIS code
- System label Ver.2 and global label: ASCII code, Unicode, or Shift JIS code
- OMRON NJ/NX tag: Unicode
- AB native tag: ASCII code

### (5) Precautions for a comment print object

If the language switching device stores a nonexistent column number of the specified comment group, no comment will be output.

## ■3 Precautions for using the report function

### (1) When the output trigger for a report screen occurs while another report screen data is being output

After the current output is complete, the data of the report screen will be output.

If the output trigger for the report screen occurs again during output, the new output process will not be executed.

To check information on the report function, including the report output status and the output screen number, use specific system signals.

You can use a PLC CPU to control the system signals so that output triggers will not occur simultaneously.

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

- Report Output signal (System signal 2-1.b8)

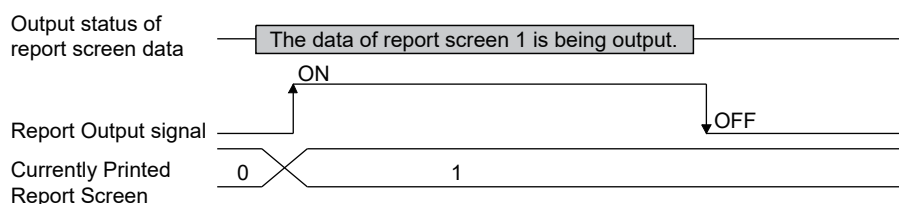

Turns on during output.

- Currently Printed Report Screen (Write device)

Stores the screen number of the report screen data being output.

The stored screen number will not be cleared upon completion of output and will be retained until the next report screen data is output.

The following shows how the above system signals work.

### (2) When multiple collection triggers are satisfied

When a collection trigger of another report screen is satisfied while the data of the current report screen is being collected, the collection trigger will be processed after the data collection of the current report screen is completed.

When another collection trigger for the current report screen is satisfied while the data of the current report screen is being collected, the collecting process by the additional collection trigger will not be executed.

### (3) System signal 2-2 when a serial printer is used

The printer may not print data and a system alarm may not occur even if the Print Output signal (System signal 2-2.b15) is turned on.

In this case, check the following points.

- The printer is powered off.

- The cable of the printer is disconnected.

#### (4) Precautions for restarting the GOT

If the GOT is restarted, all report files created before the restart will be write-protected.

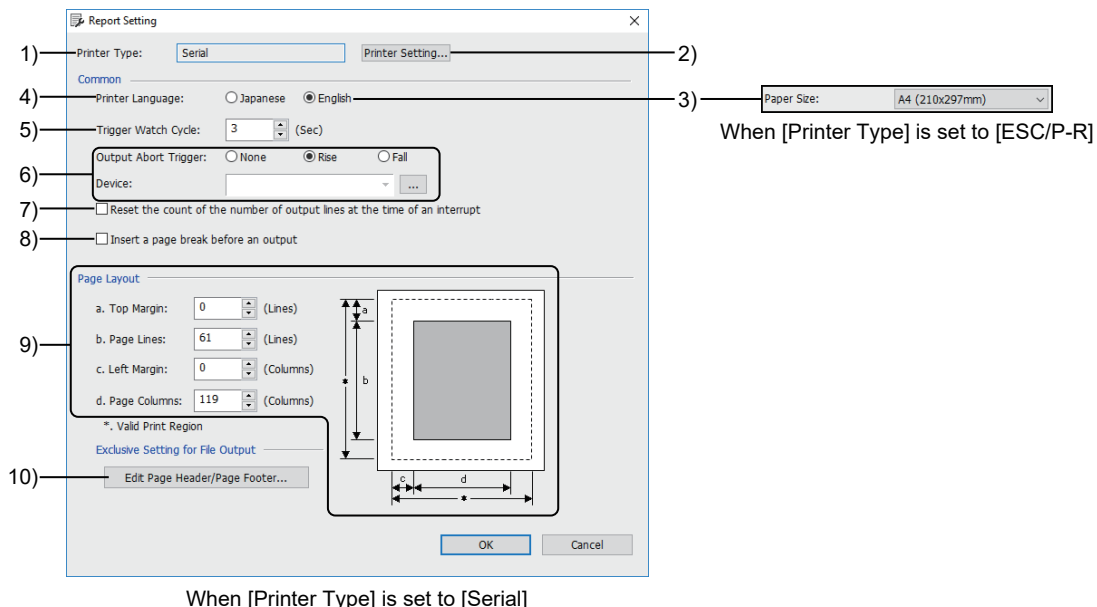

If you have specified a report file with devices before the restart, specify a new file after the restart for the next output.

### 10.11.5 [Report Setting] dialog

Click [Screen] → [Report Setting] from the menu to display the [Report Setting] dialog.

When a report screen has not been created yet, the [Report Setting] dialog is not displayed.

When [Printer Type] is set to [Serial]

When [Printer Type] is set to [ESC/P-R]

#### 1) [Printer Type]

Not available to GT SoftGOT2000.  
The type of the printer set in the [Printer] dialog  
→ 10.11.8 [Printer] dialog

#### 2) [Printer Setting] button

Not available to GT SoftGOT2000.  
Displays the [Printer] dialog.  
Configure the settings to connect a printer to the GOT.  
→ 10.11.8 [Printer] dialog

#### 3) [Paper Size]

Not available to GT21 and GT SoftGOT2000.  
This item appears when [Printer Type] is set to [ESC/P-R].  
Select a paper size.  
The following shows selectable items.

- [A4 (210x297mm)]
- [Letter (8.5"x11")]

#### 4) [Printer Language]

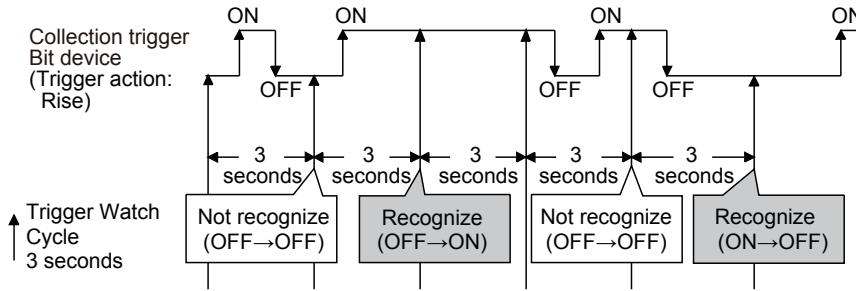

Not available to GT SoftGOT2000.  
This item appears when [Printer Type] is set to [Serial].  
Select the language supported by the printer.  
The following shows the items to be selected.

- [Japanese]
- [English]

#### 5) [Trigger Watch Cycle]

Specify the cycle of monitoring the trigger devices of the report function. The collection trigger device, abort trigger device, output trigger device, and delete trigger device are included.  
The setting range is [1] second to [60] seconds.  
The devices that are set to each trigger should be turned on or off longer than the cycle to be set here.

When the devices are turned on or off within the cycle to be set here, a trigger may not be satisfied.

### 6) [Output Abort Trigger]

Select a trigger to abort an output.  
 This setting is not applied to GT SoftGOT2000.  
 The following shows the items to be selected.

- [None]  
Does not use the abort trigger.
- [Rise]  
Aborts an output on the rising edge of a bit device.  
Specify a bit device.
- [Fall]  
Aborts an output on the falling edge of a bit device.  
Specify a bit device.

### 7) [Reset the count of the number of output lines at the time of an interrupt]

Not available to GT SoftGOT2000.  
 This item appears when [Printer Type] is set to [Serial].  
 Resets the count of output lines when an output is aborted.  
 A page break will be inserted upon resumption of output.  
 This setting is invalid under the following conditions.

- [Output Timing] is set to [When trigger condition is satisfied] in the [Action] tab in the [Screen Property] dialog.
- [Insert a page break before an output] is selected in the [Report Setting] dialog.

### 8) [Insert a page break before an output]

Not available to GT SoftGOT2000.  
 This item appears when [Printer Type] is set to [Serial].  
 This setting applies to the report screens where [Output Timing] is set to [At the time of data collection] in the [Action] tab of the [Screen Property] dialog.  
 Inserts a page break before the output of the current report screen if the previous output was performed as shown below.

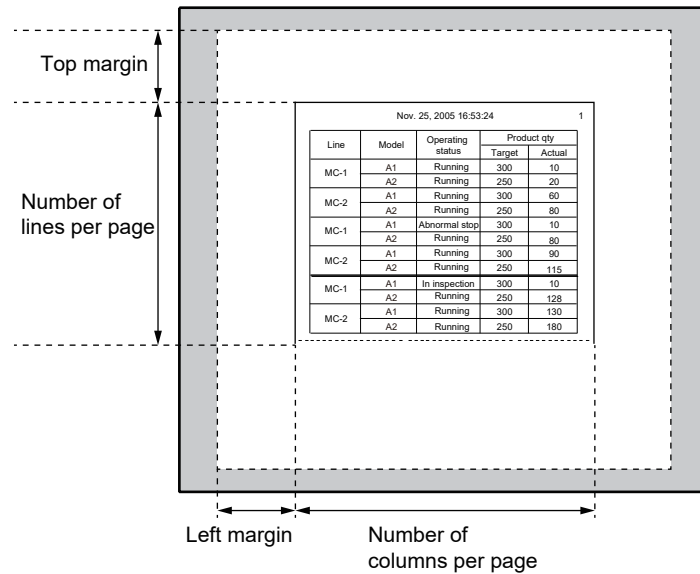

- The data of a different report screen was output.
- An item ([Alarm] or [Operation Log]), which is not set for the current report screen, was output.
- Any function other than the report function performed a printer output.

### 9) [Page Layout]

Set the numbers of lines and columns per page and the margins of a page.

Item	Description
[Top Margin]	Set the top margin. The setting range is [0] lines to [31] lines.
[Page Lines]	Set the number of lines per page. The setting range varies with the setting of [Printer Type] in the [Printer] dialog. The setting range for [PictBridge] applies to GT SoftGOT2000. • [PictBridge] or [ESC/P-R]: [1] line to [70] lines • [Serial]: [1] line to [127] lines
[Left Margin]	Set the left margin. The setting range varies with the setting of [Printer Type] in the [Printer] dialog. The setting range for [PictBridge] applies to GT SoftGOT2000. • [PictBridge] or [ESC/P-R]: [0] lines to [123] lines • [Serial]: [0] lines to [254] lines

Item	Description
[Page Columns]	<p>Set the number of columns per page.</p> <p>The setting range varies with the setting of [Printer Type] in the [Printer] dialog.</p> <p>The setting range for [PictBridge] applies to GT SoftGOT2000.</p> <ul style="list-style-type: none"> <li>• [PictBridge] or [ESC/P-R]: [1] line to [124] lines</li> <li>• [Serial]: [1] line to [255] lines</li> </ul>

#### 10) [Edit Page Header/Page Footer] button

Not available to GT21 and GT SoftGOT2000.

Displays the [Edit Page Header/Page Footer] dialog.

Set the contents of the page header and page footer.

→ 10.11.6 [Edit Page Header/Page Footer] dialog

## 10.11.6 [Edit Page Header/Page Footer] dialog

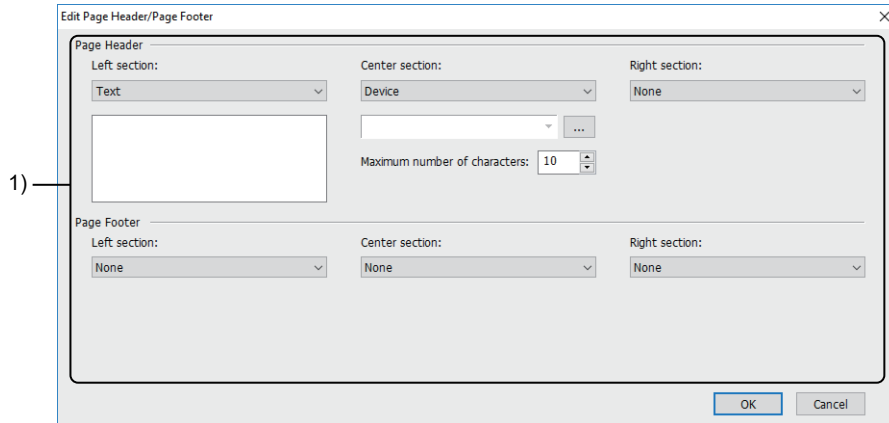

In the [Report Setting] dialog, click the [Edit Page Header/Page Footer] button to display the [Edit Page Header/Page Footer] dialog.

For the page header and page footer, refer to the following.

⇒ 10.11.2 ■ 5 Report samples and the items to be output to a report

The settings made in this dialog apply to the report screens where [Output Destination] is set to [File].

### 1) [Page Header], [Page Footer]

Select an item to be output in [Left section], [Center section], or [Right section] of the page header or page footer. The following shows selectable items.

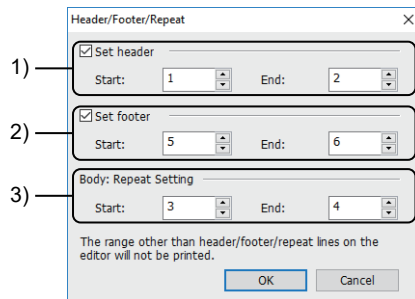

- [None]
- [Text]  
Outputs the entered text.  
The maximum number of characters varies with the setting of [Printer Type] in the [Printer] dialog.  
For [PictBridge] or [ESC/P-R]: Up to 62 two-byte or 124 one-byte characters  
For [Serial]: Up to 127 two-byte or 255 one-byte characters
- [Device]  
Outputs the text that is stored in as many consecutive devices as the set value of [Maximum number of characters]. Specify the start device.  
The setting range of [Maximum number of characters] varies with the setting of [Printer Type] in the [Printer] dialog.  
For [PictBridge] or [ESC/P-R]: [1] to [124]  
For [Serial]: [1] to [255]  
Unicode is supported.  
Data will be read from the specified devices starting from the lower-order bits.  
NULL is supported as the termination character.  
The KANJI region for the report screen applies.
- [Date + Time]  
Outputs the date and time on which a report file is printed using the file print function.  
Example) 18/7/1 17:38:04  
The date and time format varies with the display language.  
⇒ 5.2.2 Setting for switching the language displayed on the GOT ([Language Switching])
- [Date]  
Outputs the date on which a report file is printed using the file print function.  
Example) 18/7/1  
The date and time format varies with the display language.  
⇒ 5.2.2 Setting for switching the language displayed on the GOT ([Language Switching])
- [Time]  
Outputs the time at which a report file is printed using the file print function.  
Example) 17:38:04
- [Page]
- [Page/Pages]
- [Operator Name]

Outputs the name of the operator who has printed a report file using the file print function.

## 10.11.7 [Header/Footer/Repeat] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Open a report screen to set the header, footer, and repeat lines.
- Step 2** Select [Screen] → [Header/Footer/Repeat] from the menu to display the [Header/Footer/Repeat] dialog.

### 1) [Set header]

Set the header on the current report screen.

Item	Description
[Start]	Specify the start line and the end line of the header.
[End]	Specify a value that does not exceed the set value of the [Page Lines] in the [Report Setting] dialog. The header lines cannot be set as the footer or repeat lines.

### 2) [Set footer]

Set the footer on the current report screen.

Item	Description
[Start]	Specify the start line and the end line of the footer.
[End]	Specify a value that does not exceed the set value of the [Page Lines] in the [Report Setting] dialog. The footer lines cannot be set as the header or repeat lines.

### 3) [Body: Repeat Setting]

Set lines to be output repeatedly on the current report screen.

This item appears when [Repeat] is selected for [Output Target] in the [Format] tab in the [Screen Property] dialog of a report screen.

Item	Description
[Start]	Specify the start repeat line and the end repeat line.
[End]	Specify a value that does not exceed the set value of the [Page Lines] in the [Report Setting] dialog. The repeat lines cannot be set as the header or footer lines.

## 10.11.8 [Printer] dialog

Select [Common] → [Peripheral Setting] → [Printer] from the menu to display the [Printer] dialog.

When [Connection Type] is set to [USB]

When [Connection Type] is set to [Ethernet]

### 1) [Use Printer]

Enables the settings to connect a printer.

### 2) [Connection Type]

Select a connection type between the GOT and a printer.

The following shows selectable items.

- [USB] (GT27 and GT25 (excluding GT25-W, GT2505-V, and GT25HS-V))
- [Serial] (Models excluding GT25HS-V)
- [Ethernet] (GT27, GT25, and GT23)

If [Ethernet] is selected, the GOT will use port No. 515 to communicate with a printer.

### 3) [Printer Type]

Printer type corresponding to the setting of [Connection Type].

### 4) [Destination I/F]

This item appears when [Connection Type] is set to [USB] or [Serial].

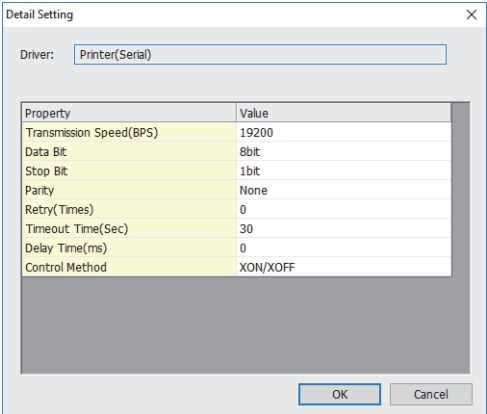

Select a GOT interface to be used.

The following shows selectable items.

- [Standard I/F(RS232)] (For GT21-P: [Standard I/F(RS232(Back))])
- [Extend I/F(1st)]
- [Extend I/F(2nd)]
- [Extend I/F(3rd)]
- [Not connected]

[Extend I/F(1st)], [Extend I/F(2nd)], and [Extend I/F(3rd)] are not available to GT25-W, GT2505-V, GT25HS-V,

Item	Description
<p>[Detail Setting] button</p>	<p>This item appears when [Connection Type] is set to [Serial]. Displaying the [Detail Setting] dialog.</p>  <ul style="list-style-type: none"> <li>• [Transmission Speed(BPS)] Select the transmission speed. The following shows the items to be selected. <ul style="list-style-type: none"> <li>· [4800]</li> <li>· [9600]</li> <li>· [19200]</li> <li>· [38400]</li> <li>· [57600]</li> <li>· [115200]</li> </ul> </li> <li>• [Data Bit] Select the data length. The following shows the items to be selected. <ul style="list-style-type: none"> <li>· [7bit]</li> <li>· [8bit]</li> </ul> </li> <li>• [Stop Bit] Select the stop bit length. The following shows the items to be selected. <ul style="list-style-type: none"> <li>· [1bit]</li> <li>· [2bit]</li> </ul> </li> <li>• [Parity] Select the type for a parity check. The following shows the items to be selected. <ul style="list-style-type: none"> <li>· [None]</li> <li>· [Even]</li> <li>· [Odd]</li> </ul> </li> <li>• [Retry(Times)] Set the number of retries to be performed when a communication error occurs. When no response is received after the retries, the communication times out. The setting range is [0] to [5].</li> <li>• [Timeout Time(Sec)] Set the interval for communication to time out. The setting range is [3] to [90].</li> <li>• [Delay Time(ms)] Set the send delay time to lower the load of the network and the connected PLCs. The setting range is [0] to [300].</li> <li>• [Control Method] Fixed to [XON/XOFF].</li> </ul>

### 5) [Set IP Address]

This item appears when [Connection Type] is set to [Ethernet].

Set the IP address of the printer to be connected by Ethernet.

The setting range is [0].[0].[0].[0] to [255].[255].[255].[255].

The IP address of a printer is settable in the utility as well.

⇒ GOT2000 Series User's Manual (Utility)

## 10.11.9 Relevant settings

Set the relevant settings other than the specific settings for the report function as required.  
The following shows the functions that are available by the relevant settings.

### 1 GOT Environmental Setting [System Information]

Select [Common] → [GOT Environmental Setting] → [System Information] from the menu.

⇒5.2.5 Setting a device which controls the GOT operations or notifies the GOT status ([System Information])

Function	Setting item
Storing the number of the report screen that is being printed. (Write device)	[Currently Printed Report Screen]
Notifying that a report screen is being printed. (Write device: System signal 2-1.b8)	[System Signal 2-1]
Aborting the printing process. (Read device: System signal 1-2.b15)	[System Signal 1-2]
Notifying an error of printer while the printing process is being executed. (Write device: System signal 2-1.b15)	[System Signal 2-1]
Notifying that the printing process is being executed. (Write device: System signal 2-2.b15)	[System Signal 2-2]

### 2 GOT Internal Device

⇒12.1.3 GOT special register (GS)

Function	Setting item
Notifying the connection status between the GOT and a printer. (Write device) The following printers are supported: PictBridge-compatible printers.	GS258.b0 (Not available to GT25-W, GT2505-V, GT25HS-V, GT23, GT21, and GT SoftGOT2000.)
Notifying the occurrence of a warning-level error. (Write device) The following printers are supported: PictBridge-compatible printers.	GS258.b1 (Not available to GT25-W, GT2505-V, GT25HS-V, GT23, GT21, and GT SoftGOT2000.)
Notifying the occurrence of a fatal-level error. (Write device) The following printers are supported: PictBridge-compatible printers.	GS258.b2 (Not available to GT25-W, GT2505-V, GT25HS-V, GT23, GT21, and GT SoftGOT2000.)
Notifying that the printer is ready or not. (Write device) The following printers are supported: PictBridge-compatible printers, serial printers, and Ethernet printers.	GS258.b3 (Not available to GT SoftGOT2000.)
Notifying the error code of the latest error that has occurred in the printer. (Write device) The following printers are supported: Ethernet printers.	GS259 (Not available to GT21 and GT SoftGOT2000.)
Outputting page numbers with a numerical print. (Write device)	GS278
Outputting the date (year) on which a report file has been printed using the file print function. (Write device)	GS1271
Outputting the date (month) on which a report file has been printed using the file print function. (Write device)	GS1272
Outputting the date (day) on which a report file has been printed using the file print function. (Write device)	GS1273
Outputting the time (hour) at which a report file has been printed using the file print function. (Write device)	GS1275
Outputting the time (minute) at which a report file has been printed using the file print function. (Write device)	GS1276
Outputting the time (second) at which a report file is printed using the file print function. (Write device)	GS1277
Outputting the total number of pages to a report file by using a numerical print object. (Write device)	GS1278
Outputting the name of the operator who has printed a report file using the file print function. (Write device)	GS1279

Function	Setting item
Disabling automatic page breaks when the number of output lines reaches the set value of [Page Lines] in the [Report Setting] dialog. (Read device)	GS524.b0 (Not available to GT SoftGOT2000.)
Inserting a page break when GS524.b0 is on. (Read device)	GS524.b1 (Not available to GT SoftGOT2000.)
Disabling the setting of [Number of repeats] in the [Screen Property] dialog for a report screen. (Read device)	GS524.b2

## 10.12 Outputting Sound with the GOT (Sound Output Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2505-V and GT25HS-V.

### 10.12.1 Overview of the sound output function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2505-V and GT25HS-V.

The sound output function outputs sounds through the audio equipment (including loudspeakers) that is connected to the GOT.

Example) Playing a sound when the condition of a trigger action is satisfied

When the set condition is satisfied (M0 is turned on), a specified sound file plays.

#### ■ 1 Playing a sound

A sound plays when the condition of a trigger action or time action is satisfied or when a relevant switch is touched.

#### ■ 2 Stopping the playback

The current playback is stopped when the condition of a trigger action is satisfied or when a relevant switch is touched.

#### ■ 3 Muting or unmuting the sound

The sound is muted or unmuted when the condition of a trigger action is satisfied or when a relevant switch is touched.

### 10.12.2 Specifications of the sound output function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2505-V and GT25HS-V.

#### ■ 1 System application (extended function)

To use the sound output function, a system application (extended function) of [Sound Output] is required.

Selecting [Destination I/F] in the [Sound Output] dialog incorporates the application into the package data automatically.

→ 10.12.5 [Sound Output] dialog

To use the function on GT SoftGOT2000, the application is not required.

#### ■ 2 Number of sound output function settings for one project

One sound output function setting is available for one project.

#### ■ 3 Sound file specifications

The following shows the specifications of the sound files usable for the sound output function.

Item	Specifications
File format	WAV format (8.000 kHz or 16.000 kHz, 16 bits, mono)
Maximum number of registered sound files	500 files for one project
Maximum size of registered sound files in total	128 MB for one project
Maximum playback time	30 seconds for one file The playback is discontinued after 30 seconds. On GT SoftGOT2000, the playback is continued. A sound file of the message type exceeding 30 seconds is not registrable.

## ■4 Registrable sound file types

### (1) Message

The sound files of the message type are generated by converting the entered text into speech. The speaker, speed, pitch, and volume of the voice are settable. To register or update the sound files of the message type, the speech synthesis license must be registered. For registering the speech synthesis license, refer to the following.

→ 10.12.4 Registration of the speech synthesis license

### (2) Sound effect

The sound files of the sound effect type come with GT Designer3.

### (3) Melody

The sound files of the melody type come with GT Designer3.

### (4) File

User-specified WAV sound files are imported to use. The WAV sound files (8.000 kHz or 16.000 kHz, 16 bits, mono) are imported as they are. The WAV sound files in the following conditions are converted automatically at import.

- Sampling frequency: Any
- Number of bits: 8 bits or 16 bits
- Channel: Stereo or mono

The files are automatically converted into the WAV format (16.000 kHz, 16 bits, mono). To import any WAV sound file other than the above, convert the file into an applicable WAV sound file by using general-purpose audio editing software.

## ■5 Playback specifications

One sound file plays at a time. While a sound file is playing, if you specify another sound file to play, operation varies depending on the specified file number.

### (1) When the specified sound file differs from the playing one

The specified sound file is held on standby and plays after the current file has finished playing. If you specify multiple sound files to play, the specified files play in the order in which the files are held on standby. Up to 16 sound files are held on standby.

### (2) When the playing sound file or standby sound file is specified again

The sound file specified again does not play.

## ■6 Functions working together with the sound output function

The sound output function is usable for the relevant functions shown below.

- Trigger action
- Time action
- Action of the switch (Sound output)
- Touch key sound of the touch switch

The following shows the availability of the operations of the sound output function by relevant function.

○: Available, -: Not available

Relevant function	Sound output function			
	Play	Stop	Mute or unmute	Continuous play of a playlist
Trigger action	○	○	○	○
Time action	○	-	-	-
Action of the switch (Sound output)	○	○	○	_*1

\*1 To play the preselected sound files continuously with a corresponding switch, set the playlist in a trigger action setting and execute the trigger action with the switch.

## ■7 Playing the preselected sound files continuously

You can select multiple sound files to play them continuously with one trigger action.

Up to 16 sound files are selectable for one trigger action.

The same sound file numbers can be specified for one trigger action.

For the setting method, refer to the following.

⇒9.5 Operating a Device as a Trigger ([Trigger Action])

Stopping the current playback cancels the other sound files that are selected for the same trigger action.

## 10.12.3 How to use the sound output function

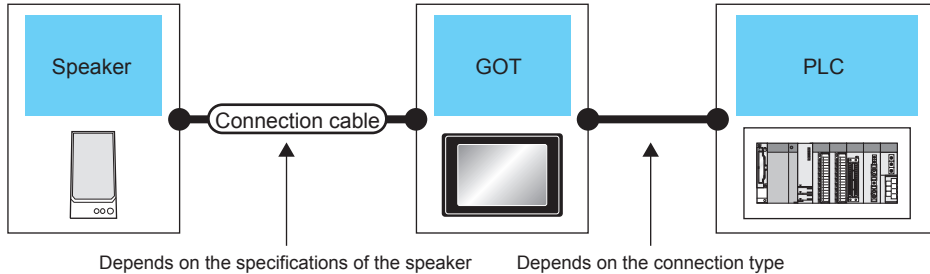

Not available to GT2505-V and GT25HS-V.

### 1 System configuration

The following shows the system configuration of sound output.

For information on how to use the sound output function on GT SoftGOT2000, refer to the following.

→ GT SoftGOT2000 Version1 Operating Manual

Speaker Model	Connection cable	GOT		PLC	Number of connectable speakers
		Option	GOT model		
For connectable speakers, refer to the following Technical News. → List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)		GT15-SOUT	GT27, GT25 (excluding GT25-W)	For the system configuration between the GOT and the PLC, refer to each connection manual.	One speaker for one GOT
		- (Built into GOT)	GT25-W		

### 2 Setting procedure

**Step 1** Connect the GOT and the speaker.

→ 1 System configuration

**Step 2** Configure the settings for the sound output function in the [Sound Output] dialog.

→ 10.12.5 [Sound Output] dialog

This setting is not required for GT25-W and GT SoftGOT2000.

**Step 3** To import a sound file, convert the file as necessary.

To convert the file, use general-purpose audio editing software.

**Step 4** Edit or register a sound file in the [Sound File List] dialog.

→ 10.12.6 [Sound File List] dialog

10.12.7 [Create New Sound File] or [Edit Sound File] dialog

**Step 5** Configure the setting of the relevant function to work with the sound output function.

- Trigger action

Set the sound output for a target action.

→ 9.5.6 [Trigger/Action] dialog

- Time action

Set the sound output for a target action.

→ 9.6.6 [Time Action Attribute] dialog

- Action of the switch (Sound output)

Set the sound output for the action of a target switch.

→ 8.2.4 [Switch] dialog

- Touch key sound of the touch switch

Configure the setting to use a specified sound file for the touch key sound.

→ 10.12.8 [Touch Key Sound Setting] dialog

**Step 6** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→ 4. COMMUNICATING WITH GOT

## 10.12.4 Registration of the speech synthesis license

---

Not available to GT2505-V and GT25HS-V.

To register or update a sound file of the message type in the [Edit Sound File] dialog, purchase and register the speech synthesis license (SW1DND-GTVO-M).

If the speech synthesis license is unregistered, each file is playable only in the [Edit Sound File] dialog.

For purchasing the speech synthesis license, contact your local sales office.

For registering the speech synthesis license, refer to the following.

⇒GT Works Text to Speech License Registration Instructions

## 10.12.5 [Sound Output] dialog

---

Not available to GT2505-V and GT25HS-V.

This setting is not required for GT25-W.

Select [Common] → [Peripheral Setting] → [Sound Output] from the menu to display the setting dialog.

### 1) [Destination I/F]

Set the interface of the GOT.

- [Extend I/F(1st)]
- [Extend I/F(2nd)]
- [Extend I/F(3rd)]
- [Not connected]

For the details of the GOT interface settings, refer to the following.

⇒5.7 Checking the Interface Settings of the GOT ([I/F Communication Setting])

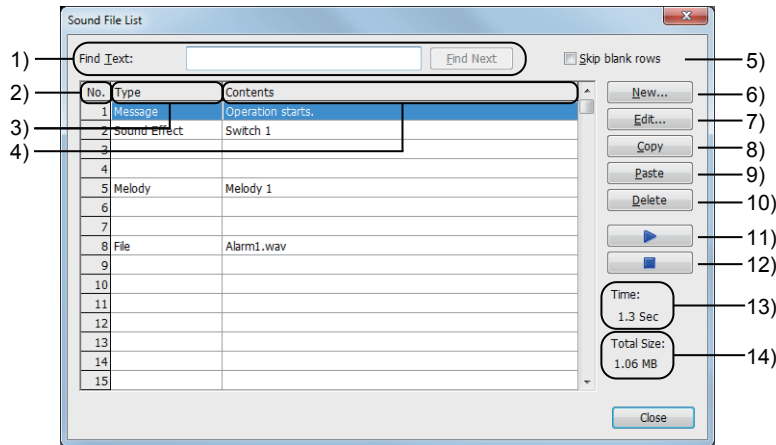

## 10.12.6 [Sound File List] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2505-V and GT25HS-V.

Select [Common] → [Sound] → [Sound File List] from the menu to display the setting dialog.

Register a sound file to play on the GOT.

### 1) [Find Text]

Search the sound file list for a sound file based on the search keyword.

The [Contents] column is searched.

Up to 512 characters can be entered as the search keyword.

Click the [Find Next] button to search for the next occurrence of the keyword.

### 2) [No.]

Registered sound file number.

Up to 500 sound files are registrable.

### 3) [Type]

Sound file type ([Message], [Sound Effect], [Melody], or [File]) that is set in the [Edit Sound File] dialog.

### 4) [Contents]

- When [Type] is set to [Message]  
The contents of a sound file (message) are displayed.
- When [Type] is set to [Sound Effect] or [Melody]  
The title of a sound file is displayed.
- When [Type] is set to [File]  
The file name of a sound file is displayed.

### 5) [Skip blank rows]

Displays only the rows where sound files are set.

### 6) [New] button

Displays the [Create New Sound File] dialog.

⇒ 10.12.7 [Create New Sound File] or [Edit Sound File] dialog

Set a new sound file.

### 7) [Edit] button

Displays the [Edit Sound File] dialog.

⇒ 10.12.7 [Create New Sound File] or [Edit Sound File] dialog

Edit a selected sound file.

### 8) [Copy] button

Copies a selected row.

Multiple rows can be copied at once.

### 9) [Paste] button

Pastes a copied row on a selected row.

Multiple rows are pasted on an equal number of consecutive rows, starting from a selected row.

When [Skip blank rows] is selected, clicking the [Paste] button displays the [Copy Sound File] dialog.

When one row is copied

When multiple rows are copied

- **[File No.]**  
Set the file number of the destination row.  
The setting range is [1] to [500].
- **[First File No.]**  
Set the file number of the first destination row.  
The setting range is [1] to [500].

If the destination row has a sound file setting, the [Confirm Sound Overwrite] dialog appears.

- **[Yes]**  
Overwrites the row where the sound file specified in this dialog is set.
- **[Overwrite All]**  
Overwrites all the rows.
- **[No]**  
Does not overwrite the row where the sound file specified in this dialog is set.
- **[Cancel]**  
Cancels the paste on the rows, starting from the one where the sound file specified in this dialog is set.

10) **[Delete] button**

Deletes a selected sound file.

11) **[Play] button**

Plays a selected sound file.

12) **[Stop] button**

Stops the current playback.

13) **[Time]**

Displays the playback time of a selected sound file.

14) **[Total Size]**

Displays the total size of the registered sound files.

Make sure that the total size of the files is 128 MB or less.

## 10.12.7 [Create New Sound File] or [Edit Sound File] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

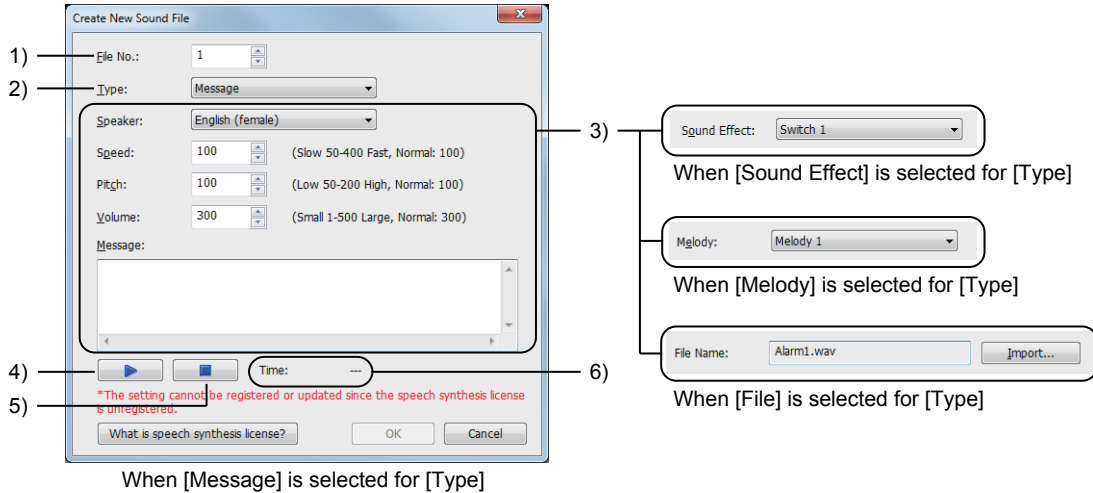

Not available to GT2505-V and GT25HS-V.

Create or edit a sound file.

The dialog name varies with the display method.

To display this dialog, perform one of the following operations.

- In the [Sound File List] dialog, click the [New] button.
- In the [Sound File List] dialog, select a target sound file and click the [Edit] button.
- In the [Sound File List] dialog, double-click a target sound file.

### 1) [File No.]

Set a sound file number.

The setting range is [1] to [500].

### 2) [Type]

Select a sound file type.

The following shows the items to be selected.

- [Message]: Sound file that is generated by converting the entered text into speech
- [Sound Effect]: Sound file that is supplied with GT Designer3
- [Melody]: Sound file that is supplied with GT Designer3
- [File]: User-specified WAV sound file to be imported

To register or update the sound files of the message type, the speech synthesis license must be registered.

For registering the speech synthesis license, refer to the following.

→ 10.12.4 Registration of the speech synthesis license

### 3) Detail setting

Set necessary items according to the selection for [Type].

Item	Description
[Speaker]	Select the speaker to read aloud a message. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Japanese (female)]</li> <li>• [Japanese (male)]</li> <li>• [English (female)]</li> <li>• [English (male)]</li> <li>• [Simplified Chinese (female)]</li> <li>• [Simplified Chinese (male)]</li> <li>• [Traditional Chinese (female)]</li> <li>• [Korean (female)]</li> <li>• [Korean (male)]</li> <li>• [Spanish (female)]</li> <li>• [Spanish (male)]</li> </ul>
[Speed]	Set the speed of the synthesized voice. The setting range is [50] (Slow) to [400] (Fast).

Item	Description
[Pitch]	Set the pitch of the synthesized voice. The setting range is [50] (Low) to [200] (High).
[Volume]	Set the volume of the synthesized voice. The setting range is [1] (Small) to [500] (Large).
[Message]	Enter a message to be read aloud. Up to 1024 characters can be set. A line feed is counted as two characters.
[Sound Effect]	Select a sound effect to play.
[Melody]	Select a melody to play.
[File Name]	Select a sound file to play. Click the [Import] button to display the [Open] dialog. Select a file to be imported to GT Designer3.

#### 4) [Play] button

Plays the sound file being edited.

#### 5) [Stop] button

Stops the current playback.

#### 6) [Time]

Displays the playback time of the sound file being edited.

- When [Type] is set to [Message]

The sound file whose playback time exceeds 30 seconds is not registrable.

The playback time exceeding 30 seconds is displayed in red.

## 10.12.8 [Touch Key Sound Setting] dialog

Not available to GT2505-V and GT25HS-V.

Select [Common] → [Sound] → [Touch Key Sound Setting] from the menu to display the setting dialog.

Configure the setting to play a sound file when a relevant touch switch is touched.

#### 1) [Use a sound file for touch key sound]

Plays a sound file when a relevant touch switch is touched.

Perform one of the following operations to select a sound file.

- Enter a sound file number.
- Click the [Browse] button to display the [Sound File List] dialog, and select a sound file.

#### 2) [Give top priority to touch key sound]

Stops the current playback, cancels all standby sound files and plays the touch key sound when a relevant touch switch is touched.

## 10.12.9 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2505-V and GT25HS-V.

This section explains the precautions for using the sound output function.

### ■1 Precautions for drawing

#### (1) Updating a WAV sound file

The imported WAV sound file in the [Edit Sound File] dialog is not updated when you make a change to the import source file.

In such a case, import the source file again.

#### (2) Using the sound files of the sound effect type or melody type

Do not use the sound files of the sound effect type or melody type that are settable in the [Edit Sound File] dialog for any purpose other than the GOT sound output.

### ■2 Precautions for using GT SoftGOT2000

#### (1) Mute status of GT SoftGOT2000 at its startup

If you select [Unmute when starting GT SoftGOT2000] on the [Auxiliary Setup] tab in the [Environment Setup] dialog on GT SoftGOT2000, the application is unmuted regardless of Windows sound settings.

If you deselect the item, the Windows sound settings are applied.

However, if you mute all sounds on Windows, GT SoftGOT2000 remains mute.

#### (2) Restrictions when using Windows XP

When GT SoftGOT2000 runs on Windows XP, the Mute Sound signal (GS518.b2) is unusable.

To use the Mute Sound signal (GS518.b2), use Windows Vista or later.

## 10.12.10 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2505-V and GT25HS-V.

Set the relevant settings other than the specific settings for the sound output function as required. The following shows the functions that are available by the relevant settings.

→ 12.1.3 GOT special register (GS)

### ■1 GOT Internal Device

Function	Setting item	Supported models
Stopping the current playback. The standby sound file plays subsequently.	GS518.b0	GT27 GT25 GT23
Stopping the current playback and canceling all standby sound files.	GS518.b1	GT21 GS
Muting or unmuting the sound.	GS518.b2	SoftGOT2000
Outputting the sound file number in execution to a device	GS669	
Detecting the jack disconnection of the sound output device	GS668.b15	GT27 GT25 GT23 GT21 GS SoftGOT2000

## 10.12.11 Speech synthesis software license

---

Not available to GT2505-V and GT25HS-V.

## 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 10.13.1 Overview of the server and client functions

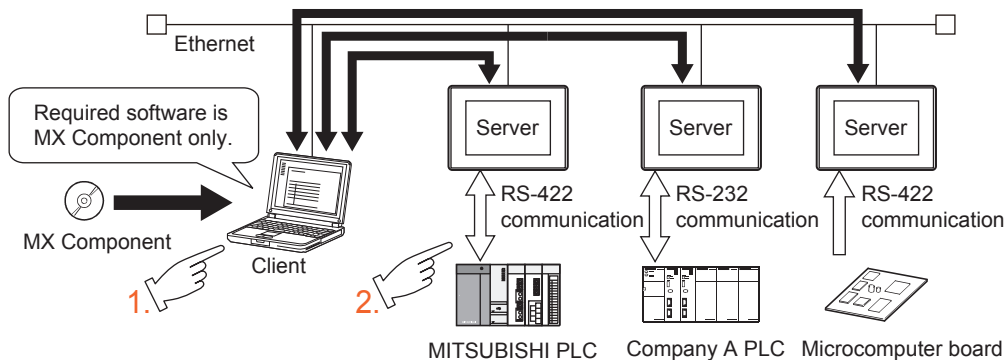

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The server and client functions enable you to perform monitoring and maintenance remotely from an office. To apply the example programs in this section to the actual system, make sure that the programs cause no troubles in the target system.

#### ■1 Collecting data by a personal computer (server function)

Controller devices, monitored by GOTs (server), can be read from/written to indirectly by monitoring the GOTs from a personal computer (MX Component).

Using the server function makes it possible to read or write the devices of the target controllers for monitoring only with MX Component even if the manufacturers of the targets are different. In addition, the communication format can be Ethernet only.

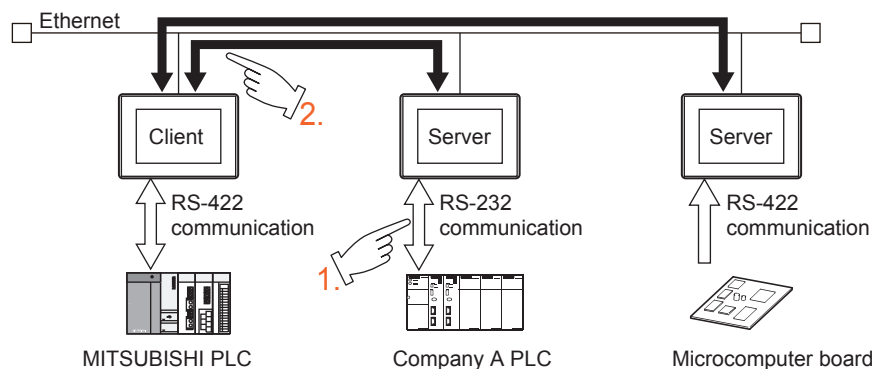

**Step 1** Execute a user program created with MX Component to write to gateway devices in the GOT (server).

**Step 2** Write data to the controller devices assigned to the gateway devices.

#### ■2 Monitoring a GOT from another GOT (Server and client functions)

When a GOT (server) monitors a controller, another GOT (client) is usable to read/write data from/to the devices of the controller through the GOT (server).

Using the client function makes it possible to read or write indirectly the devices of the target controllers for monitoring even if the manufacturers of the targets are different from that of the controller connected to the GOT (client).

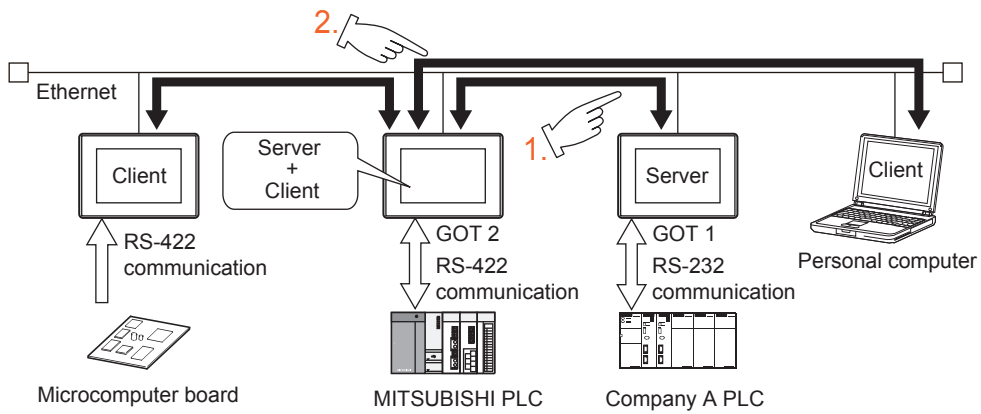

**Step 1** The GOT (server) monitors the devices of the respective controllers.

**Step 2** The GOT (client) indirectly reads the controller devices monitored in procedure 1 by reading the gateway devices of the GOT (server).

### ■3 Using the server function and client function simultaneously

By configuring both the server settings and the client settings to the GOT, the GOT sends data to the personal computer (client) with collecting data from the GOT (server).

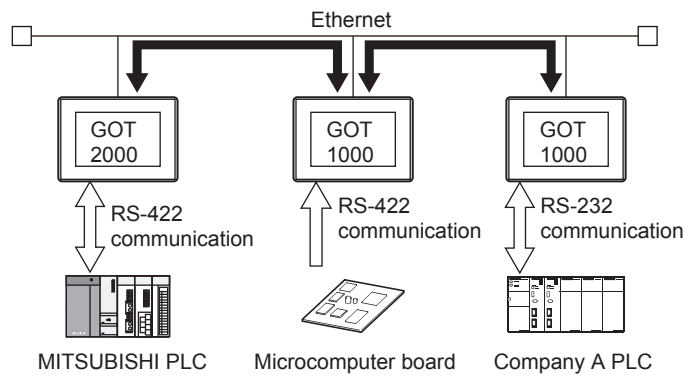

**Step 1** GOT2 collects the data from GOT1 by the client function.

**Step 2** The GOT (client) or the personal computer sends reading request and writing request to GOT2 (server).

### ■4 Communication between the GOT2000 series and GOT1000 series

You can add the GOT2000 series to the existing system configured with the GOT1000 series or replace the GOT1000 series with the GOT2000 series.

## 10.13.2 Specifications of the server/client function

### ■ 1 System application (extended function)

To use the server/client function, a system application (extended function) of [Gateway(Server, Client)] is required. Configuring the following settings incorporates the application into the package data automatically.

- In the [Controller Setting] window, select [Use the function of Gateway] in [Communication Setting].
- Set [Gateway Server] and [Gateway Client].
  - ⇒ 10.13.4 [Communication Setting]
  - 10.13.5 [Gateway-Server]
  - 10.13.6 [Gateway Client]

### ■ 2 Number of server/client functions for one project

One server function setting and one client function setting are available for one project.

### ■ 3 Specifications of the server/client function

The following shows the specifications of the server/client function.

Item		Specifications
Port No.	Server function	5011
	Client function	5012, 5013
Maximum number of nodes		The total number of the following nodes is 64 (recommended). <ul style="list-style-type: none"> <li>• GOTs (server)</li> <li>• GOT (client)</li> <li>• Personal computers that communicate with GOTs</li> </ul>
Number of accessible clients (GOTs and personal computers) to a server (GOT) simultaneously		Up to 5 units *1
Specifying other nodes		Specifying by an IP address, up to 128 nodes
Gateway device		Word device 32768 points: EG0 to EG32767
Compatible MX Component		MX Component of Version 3 or later

\*1 When six or more clients (GOTs and personal computers) access a server (GOT), the scripts of the clients may stop.

### ■ 4 Access range that can be monitored

The following shows the access range for the server/client function.

To monitor controllers via the GOT, monitor the controller devices assigned to gateway devices. (Controller devices on the network are to be also assigned to gateway devices to get monitored.)

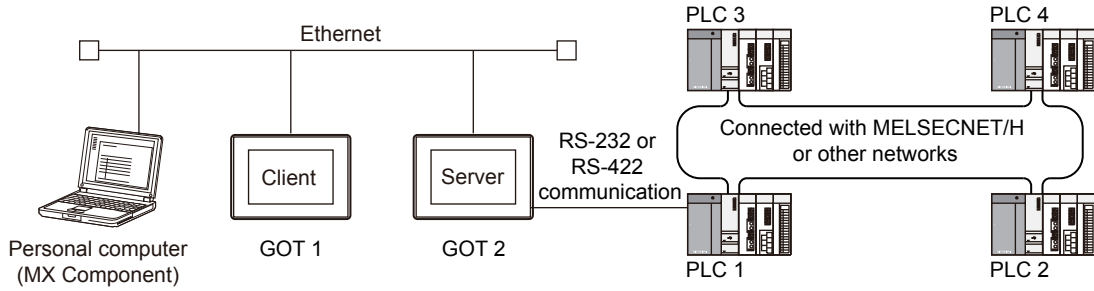

The access range that can be monitored is the same as that which the GOT can monitor.

For the access range that can be monitored by the GOT, refer to the following.

⇒ GOT2000 Series Connection Manual (Mitsubishi Products) for GT Works3 Version1

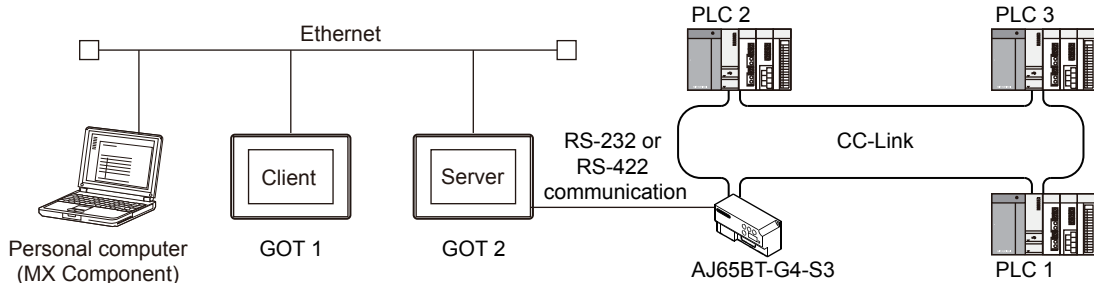

The following shows the accessible configuration of PLC CPU from GOT1 (client) and the personal computer (MX Component).

**(1) When the connection type between GOT2 (server) and PLC1 is the direct CPU connection or serial communication connection**

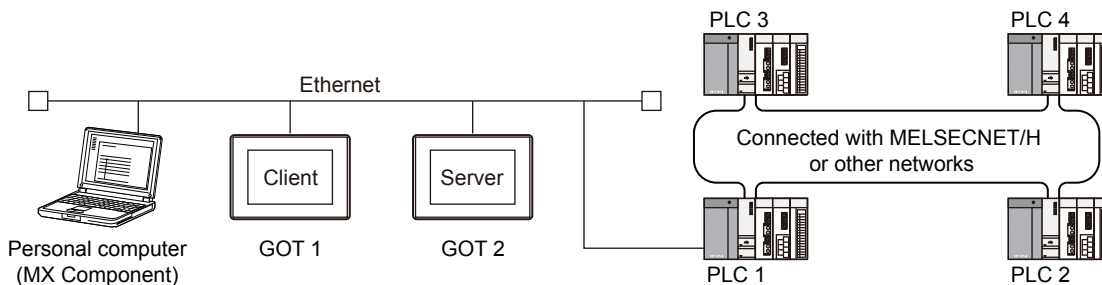

Access source	Access destination	
	GOT2 (server)	PLC1, PLC2, PLC3, PLC4
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices	Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)
GOT1 (client)		

**(2) When the connection type between GOT2 (server) and PLCs is a CC-Link connection (via G4)**

Access source	Access destination	
	GOT2 (server)	PLC1, PLC2, PLC3
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices	Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)
GOT1 (client)		

**(3) When the connection type between GOT2 (server) and PLCs is an Ethernet connection**

Access source	Access destination		
	GOT2 (server)	PLC1	PLC2, PLC3, PLC4
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices		Monitoring the gateway devices or the controller devices from a personal computer (MX Component) and GOT1 (client)
GOT1 (client)			Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)

**(4) When the connection type between GOT2 (server), PLCs, and a temperature controller is another manufacturer's PLC connection**

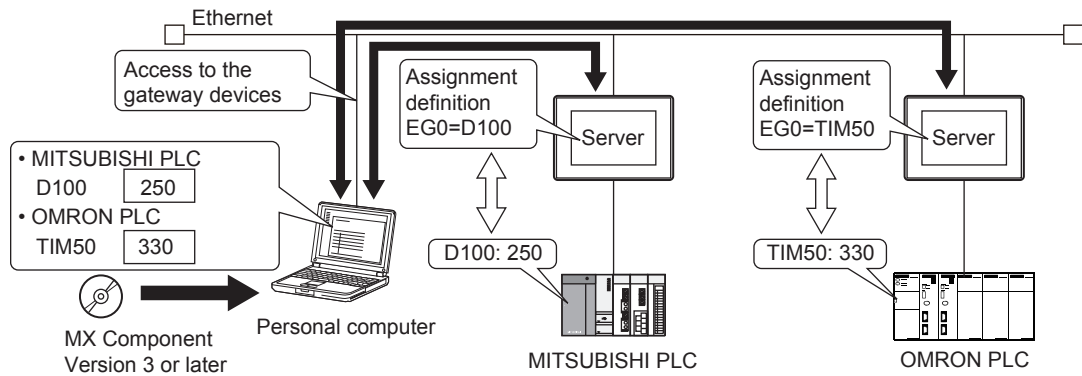

Access source	Access destination	
	GOT2 (server)	PLC, temperature controller
Personal computer (MX Component)	Monitoring the gateway devices or the controller devices	Monitoring the controller devices that are assigned to the gateway devices of GOT2 from the personal computer (MX Component) and GOT1 (client)
GOT1 (client)		

**5 Gateway device**

The gateway device is a virtual device designed exclusively to perform the server/client function on the GOT. Use gateway devices by assigning controller devices or internal devices of the GOT to them.

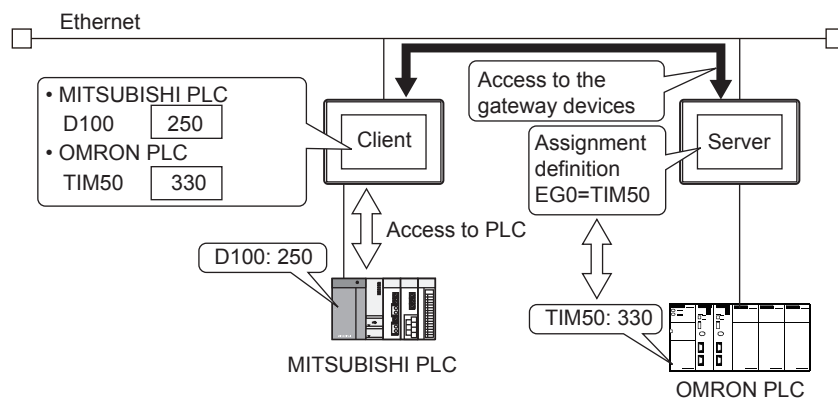

**(1) When accessing PLCs from a personal computer via the GOT**

You can access controller devices indirectly by accessing the gateway devices of a GOT (server) from a personal computer.

**(2) When monitoring different manufacturers' PLCs from one GOT**

You can access the controller devices indirectly by accessing the gateway devices of a GOT (server) from a GOT (client).

**6 Applicable gateway devices**

The following shows the applicable gateway devices.

Device name	Device range	Device No. representation
Word device	EG0 to EG32767	Decimal number
Bit device	Specified bits of above word devices	Decimal number

## 7 Devices that can be assigned

You can assign the following devices to gateway devices (EG).

- Controller devices that can be monitored by the GOT
- GOT internal devices

However, some controller devices cannot be assigned.

For information on which device can be assigned, refer to the following.

→ 12.2 Device Range and Settings of Each Controller

### 10.13.3 How to use the server/client function

#### 1 System configuration

This section explains the system configuration of the server/client function.

##### (1) Wired connection

Client (GOT, personal computer)		Connection cable <sup>*1*2</sup>	Maximum segment length <sup>*3</sup>	Server (GOT)	
GOT model or personal computer	Option			Option	GOT model
GT27,GT25	- (Built in the GOT) or GT25-J71E71-100 <sup>*4</sup>	<ul style="list-style-type: none"> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>• 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built in the GOT) or GT25-J71E71-100 <sup>*4</sup>	GT27, GT25
Personal computers where MX Component is installed	-	<ul style="list-style-type: none"> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>• 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	-	GT27, GT25

<sup>\*1</sup> The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard. For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

<sup>\*2</sup> A straight cable is applicable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

<sup>\*3</sup> The length between the hub and node.

The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

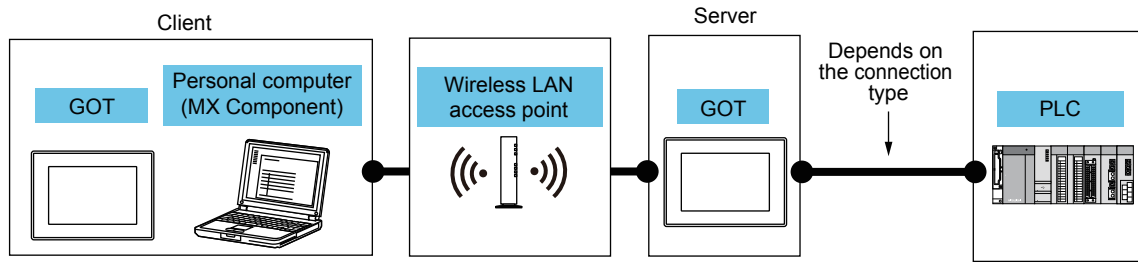

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.

For the limit, contact the switching hub manufacturer.

<sup>\*4</sup> Not available to GT2505-V and GT25HS-V.

## (2) Wireless LAN connection

Not available to GT2505-V and GT25HS-V.

Client (GOT, personal computer)		Wireless LAN access point	GOT (server)	
GOT model or personal computer	Option		Option	GOT model
GT27* <sup>2</sup> , GT25* <sup>2</sup>	GT25-WLAN	-	GT25-WLAN	GT27* <sup>1</sup> , GT25* <sup>1</sup>

\*1 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*2 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

## ■2 Setting procedure

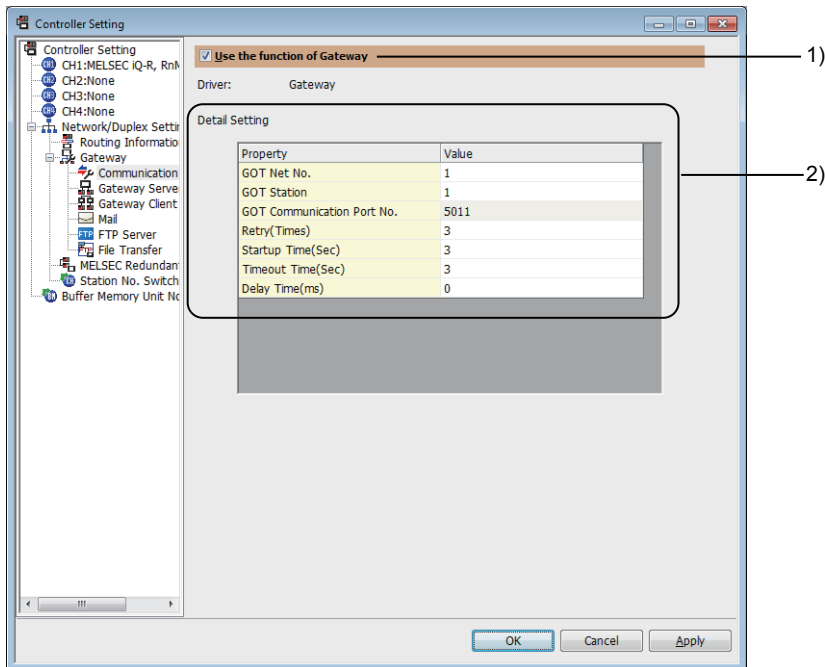

- Step 1** Consider the configuration of the whole system.
- Configuration of the whole system including controllers and GOTs
  - Controller settings (including device assignment)
  - GOT settings (including IP address, network number, and station number)
- Step 2** Connect the GOT and the controllers.
- ■ 1 System configuration
- Step 3** Configure the communication interface settings.
- 10.13.4 [Communication Setting]
- Step 4** Set the IP address of the GOT.
- 5.4.1 ■ 3 [GOT IP Address Setting]
- Step 5** Configure the gateway server setting in the project for the GOT (server) on GT Designer3.
- 10.13.5 [Gateway-Server]
- Step 6** To set the GOT as a client, configure the gateway client setting in the project for the GOT (client) on GT Designer3.
- 10.13.6 [Gateway Client]
- Step 7** Write the package data to the GOT.
- For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.
- 4. COMMUNICATING WITH GOT
- Step 8** Check the GOT operation.
- 10.13.7 Performance of the server/client function

## 10.13.4 [Communication Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows how to configure the communication settings for the use of the gateway function.

- Step 1** Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
- Step 2** Select [Communication Setting] in the [Controller Setting] window and set necessary items.

### 1) [Use the function of Gateway]

Select this item to enable the gateway function.

### 2) [Detail Setting]

Set the detailed communication format.

The setting range depends on controllers.

For the details of the settings, refer to the following.

→GOT2000 Series Connection Manual For GT Works3 Version1 for the GOT used

Item	Description
[GOT Net No.]	Set the network No. of the GOT.
[GOT Station]	Set the GOT's station number.
[GOT Communication Port No.]	Set the port No. used by the GOT for the connection with the Ethernet module. Do not set the port number used for the other settings. Duplication of the port number disables communication.
[Retry(Times)]	Set the number of retries to be performed when a communication error occurs. When no response is received after the retries, the communication times out.
[Startup Time(Sec)]	Set the time period from the GOT startup to the beginning of the communication with the PLC CPU.
[Timeout Time(Sec)]	Set the interval for communication to time out.
[Delay Time(ms)]	Set the send delay time to lower the load of the network and the connected PLCs.

## 10.13.5 [Gateway-Server]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

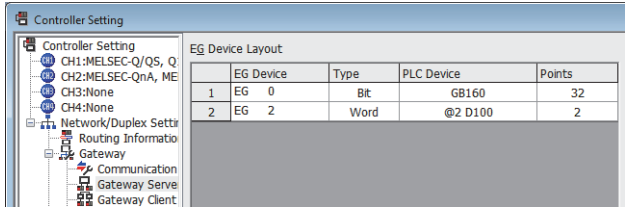

With this function, the gateway devices used in GOTs (server) and the controller devices to be assigned to gateway devices are set.

- Step 1** Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.  
**Step 2** Select [Gateway-Server] in the [Controller Setting] window, and set the necessary items.

### 1) Assignment setting list

Assign PLC CPU devices to gateway devices.

Item	Description
[EG Device]	Set the gateway device. The setting range is [0] to [32766].
[Type]	Select the device type to be assigned. The following shows the items to be selected. • [BIT] • [WORD]
[PLC Device]	Set the controller devices to be assigned to the gateway devices. When the multi-channel function is used, the devices of channel No. 2 to 4 are displayed in a channel No. + Device. 
[Points]	Set the number of the devices to be assigned. The following shows the setting ranges of [BIT] and [WORD] selected in [Type]. • [BIT]: [32] to [32768] • [WORD]: [2] to [32768] A value outside the above ranges cannot be set. ⇒10.13.8 ■ 5 Precautions for assigning devices

### 2) [New] button

Adds a new assignment setting to the list.

### 3) [Duplicate] button

Adds the copy of a selected assignment setting to the list.

### 4) [Delete] button

Deletes a selected assignment setting.

5) **[Delete All] button**

Deletes all assignment settings.

6) **[Check] button**

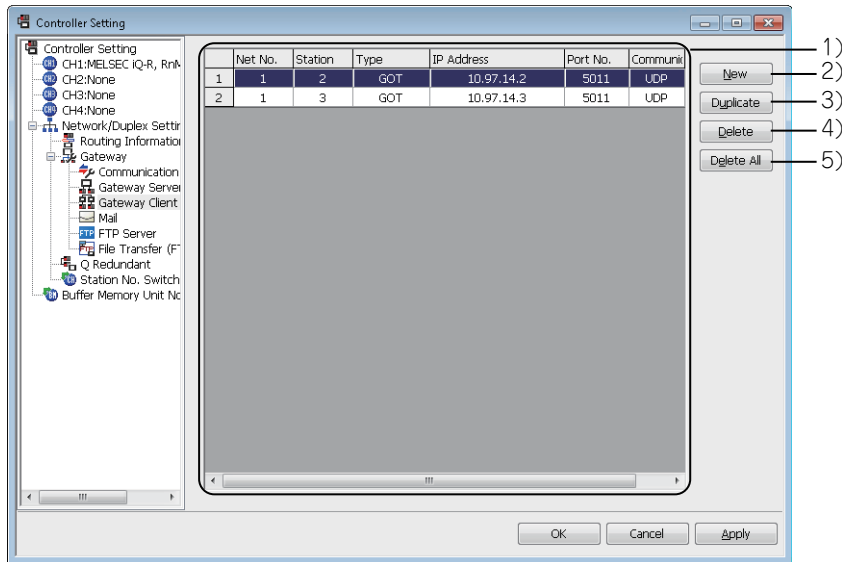

Checks if the settings are correct.

### 10.13.6 [Gateway Client]

With this function, GOTs (server) to be monitored by the GOT (client) are registered.

- Step 1** Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
- Step 2** Select [Gateway Client] in the [Controller Setting] window, and set the necessary items.

1) **GOT list for the server function**

Register the GOTs (server) to be monitored by the GOT (client).

Item	Description
[Net No.]	Register the network No. of each GOT. The setting range is [1] to [239].
[Station No.]	Register the PLC No. (station number) of each GOT. The setting range is [1] to [64].
[Type]	Fixed to GOT.
[IP Address]	Register the IP address of each GOT. The setting range is [0.0.0.0] to [255.255.255.255].
[Port No.]	Fixed to 5011.
[Communication]	Fixed to UDP.

2) **[New] button**

Adds a new GOT (server).

3) **[Duplicate] button**

Adds the copy of a selected GOT (server).

4) **[Delete] button**

Deletes a selected GOT (server).

5) **[Delete All] button**

Deletes all GOTs (server).

## 10.13.7 Performance of the server/client function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

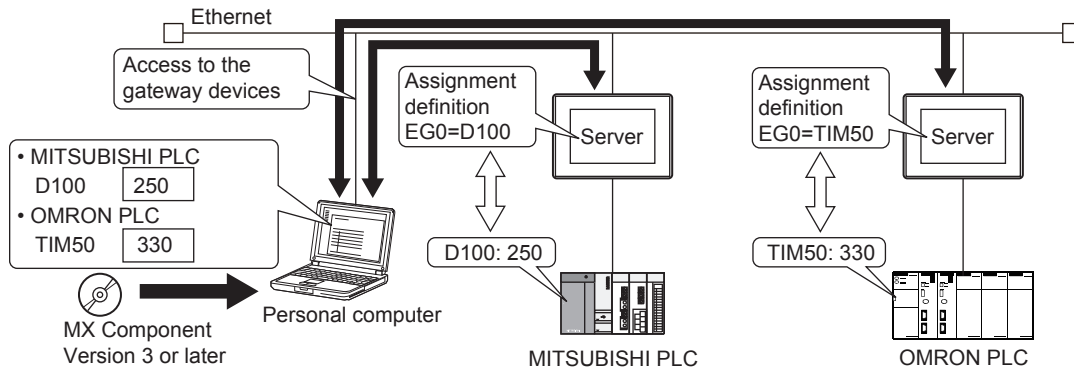

### 1 How to monitor gateway devices

With the server/client function, the GOT (client) or a personal computer (MX Component) can access the data (device) of the GOT (client) or PLCs indirectly by accessing the gateway devices of GOTs (server).

#### (1) When accessing gateway devices from a personal computer

When monitoring different manufacturers' PLCs from one GOT

Access the gateway devices of the GOT by using the functions of MX Component.

For the operation and the programming procedures of MX Component, refer to the following manuals.

→ MX Component Version 3 Operating Manual

MX Component Version 3 Programming Manual

The following shows the functions of MX Component that support the GOT.

Item	Device range
Open	Opens the communication line (starts the communication with the GOT).
Close	Closes the communication line (ends the communication with the GOT).
ReadDeviceBlock	Device batch read
ReadDeviceBlock2	
WriteDeviceBlock	Device batch write
WriteDeviceBlock2	
ReadDeviceRandom	Device random read
ReadDeviceRandom2	
WriteDeviceRandom	Device random write
WriteDeviceRandom2	
EntryDeviceStatus	Device status observation registration
FreeDeviceStatus	Cancels device status observation registration.
OnDeviceStatus	Event notification
SetDevice	Changes device data values.
SetDevice2	
GetDevice	Obtains device data values.
GetDevice2	
GetCpuType	Obtains GOT model information.

#### (2) When accessing gateway devices from the GOT

Gateway devices cannot be assigned to each object.

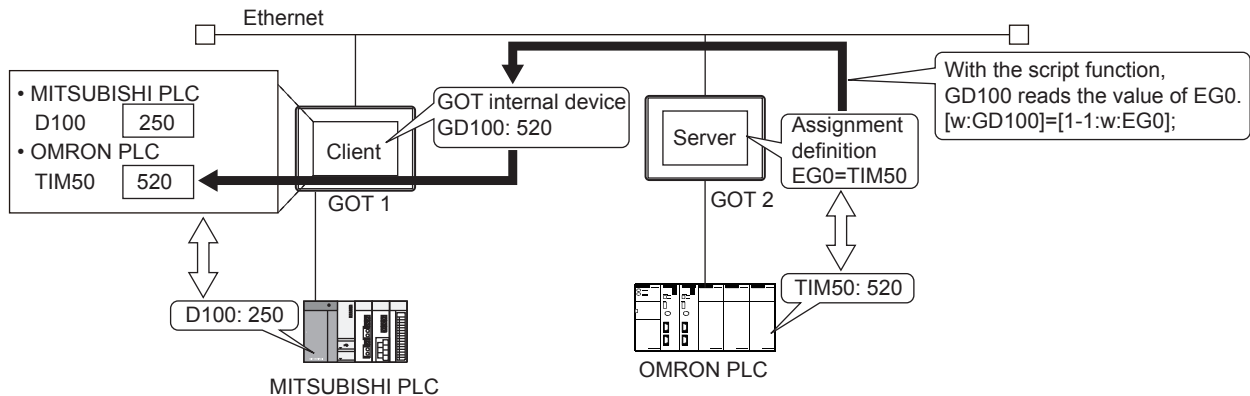

Therefore, using a project script or screen script monitors gateway devices.

Object scripts cannot be used.

The following shows an example of the settings for the access to a gateway device from the GOT.

**(a) When reading the value of a gateway device**

Using a script reads the value of a gateway device of a GOT (server) to an internal device of a GOT (client).  
 The GOT (client) monitors the value read to the internal device in a manner such as numerical display, and can monitor the same value as that of the gateway device of the GOT (server).  
 A device of the Mitsubishi PLC CPU can be also set as a destination for reading by the script.

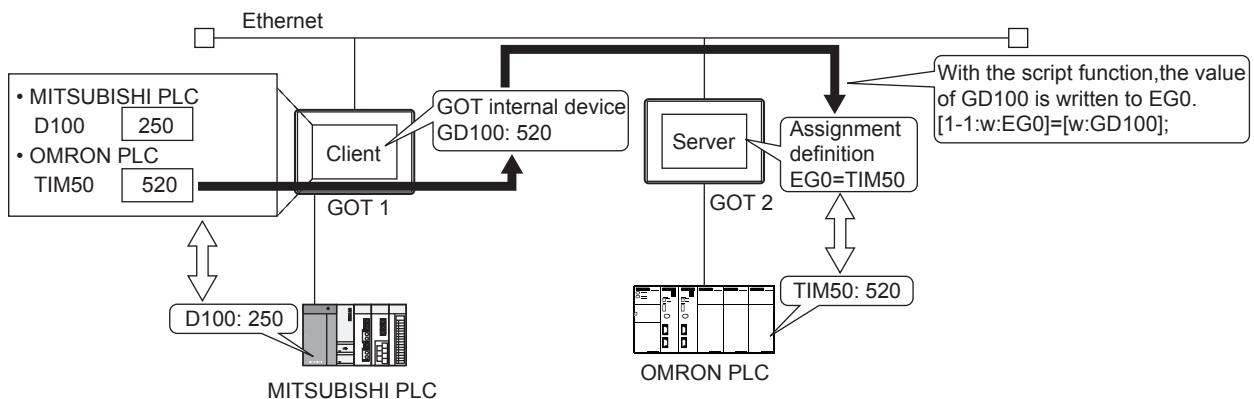

The following shows the setting items of GOT1 (client) and GOT2 (server).

GOT	Setting item	Description
GOT1 (client)	Script	Configures the setting to read the gateway device value of the GOT (server) to internal device of the GOT (client).
	Client setting	Registers the GOT (server) from which the client reads the device value.
	Numerical display 1	Configures the setting for displaying the device value of the Mitsubishi PLC CPU.
	Numerical display 2	Configures the setting for displaying the internal device value of the GOT (client).
GOT2 (server)	Server setting	Configures the setting for assigning the device of the OMRON PLC CPU to the gateway device.

**(b) When writing a value to the gateway device.**

Write a value to an internal device of the GOT (client) in a manner such as numerical input.  
 Write the value of the internal device of the GOT (client) to the gateway device of the GOT (server) by using a script.  
 A device of the GOT (server) can be also set as a destination for writing by the script.  
 For the details of the script, refer to the following.

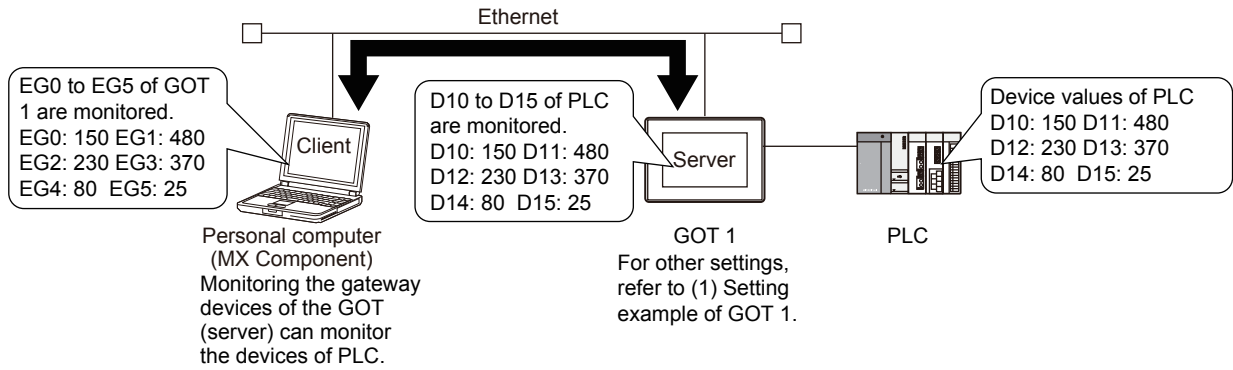

⇒9.8 Controlling Operations with Scripts ([Script])

GOT	Setting item	Description
GOT1 (client)	Script	Configures the setting to write the internal device value of GOT (client) to the gateway device of the GOT (server).
	Client setting	Registers the GOT (server) to which the value is written.
	Numerical display 1	Configures the setting for displaying the device value of the Mitsubishi PLC CPU.
	Numerical display 2	Configures the setting for displaying the internal device value of the GOT (client).
GOT2 (server)	Server setting	Configures the setting for assigning the device of the OMRON PLC CPU to the gateway device.

## ■2 Accessing PLC from the personal computer via the GOT

The MX Component monitors the device values of EG0 to EG5 of GOT1 (server).

### (1) Setting example of GOT1

#### (a) Server setting

EG device	PLC CPU device	Device type	Points
EG0	D10	Word	6

#### (b) Gateway server dialog

Item	Description
Device	D10 to D15
Network setting	Host station

### (2) Personal computer setting

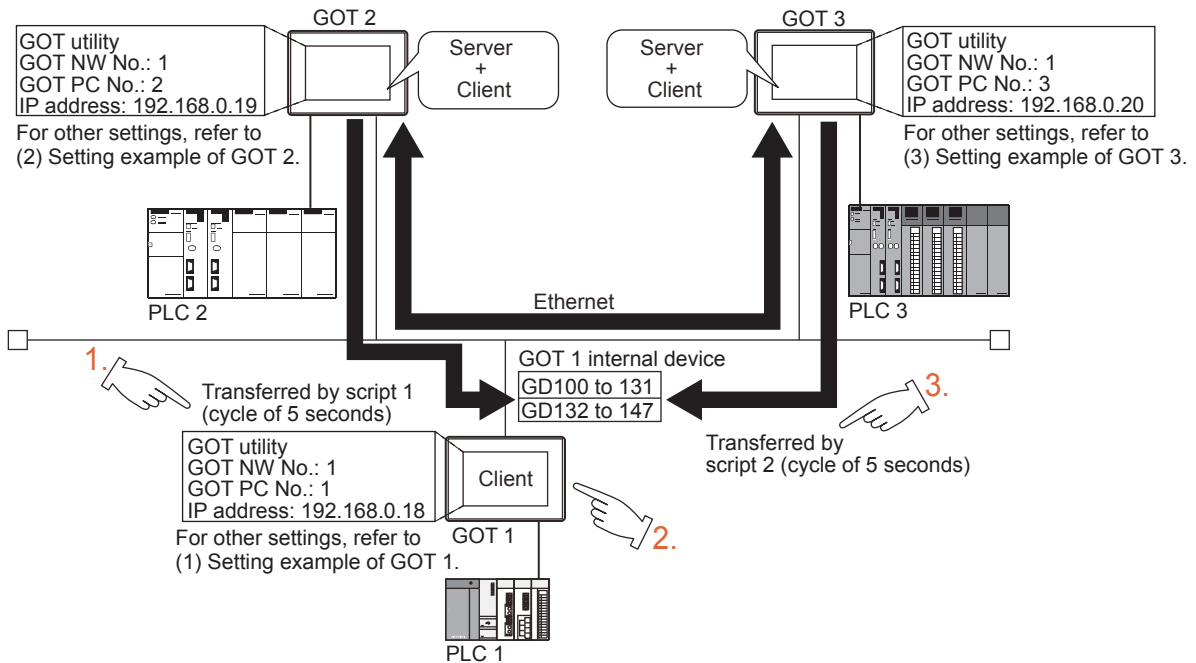

Access GOT1 (server) by using MX Component.

For the details of MX Component, refer to the following.

→ MX Component Version 3 Operating Manual

MX Component Version 3 Programming Manual

## ■3 Displaying alarm caused in multiple PLCs on the GOT (client)

**Step 1** Transfer the device values of PLC2 and PLC3 to the internal devices of GOT1 (GD100 to GD147).

**Step 2** GOT1 monitors its own internal devices and displays the alarm information when an alarm occurs in PLC2 or PLC3.

## (1) Setting example of GOT1

### (a) Client setting

N/W No.	PLC No.	IP address
1	2	192.168.0.19
1	3	192.168.0.20

### (b) Alarm display (alarm display for GOT2)

Set the comments that are displayed in the alarm display in advance.

Item	Description
Device points (number of alarms)	512 points (successive)
Device	GD100.b0

### (c) Alarm display (alarm display for GOT2)

Set the comments that are displayed in the alarm display in advance.

Item	Description
Device points (number of alarms)	256 points (successive)
Device	GD132.b0

### (d) Script (alarm display for GOT2)

Item		Description
Script 1	Type	Screen script
	Trigger type	Cycle: 5 seconds
	Data type	Unsigned BIN 16
	Example of script description	<code>bmov([1-2:w:EG0],[w:GD100],32);</code> //Transfers 32 points from EG0 of GOT2 to GD100 and the following successive devices of GOT1

### (e) Script (alarm display for GOT3)

Item		Description
Script 2	Type	Screen script
	Trigger type	Cycle: 5 seconds
	Data type	Unsigned BIN 16
	Example of script description	<code>bmov([1-3:w:EG0],[w:GD132],16);</code> //Transfers 16 points from EG0 of GOT 3 to GD132 and the following successive devices of GOT1

## (2) Setting example of GOT2

### (a) Server setting

EG device	PLC CPU device	Device type	Points
EG0	IB200	Bit	512

## (3) Setting example of GOT3

### (a) Server setting

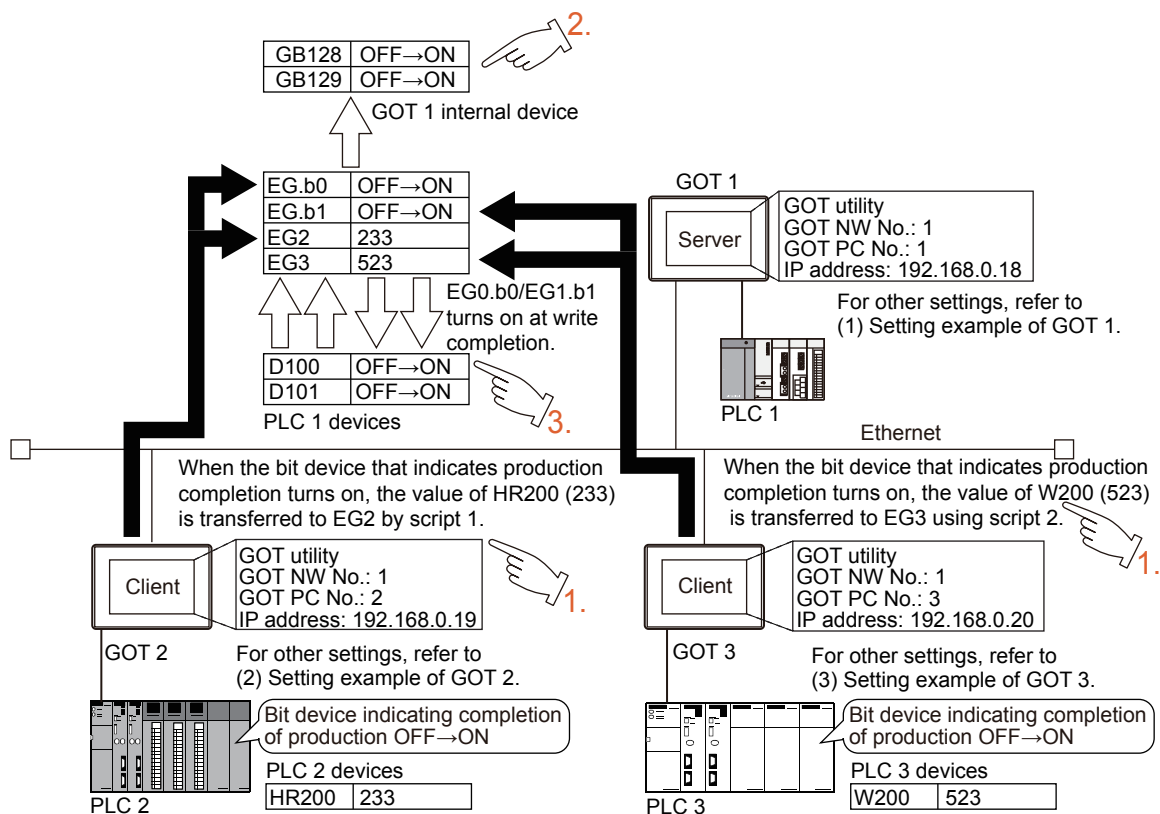

EG device	PLC CPU device	Device type	Points
EG0	..300	Bit	256

### Point

#### Trigger type

Do not set [Ordinary] or [Sampling, 2 sec.] for the trigger type in the script. The setting may affect other monitoring operations.

## ■4 Controlling and monitoring the production status of multiple PLCs by the GOT (server)

- Step 1** Transfer the device values of PLC2 and PLC3 to the EG devices (devices of PLC 1) of GOT1 (server).
- Step 2** After the values are written to PLC1, the EG devices of GOT1 (internal devices (GB128, GB129) of GOT1) turn on. (Check a lamp or other indications to see if the writing is complete.)
- Step 3** GOT1 (server) checks the production status of PLC2 and PLC3 by monitoring the devices of PLC1.

### (1) Setting example of GOT1

#### (a) Server setting

EG device	PLC CPU device	Device type	Points
EG0	GB128	Bit	32
EG2	D100	Word	2

#### (b) Numerical display (setting for 2 devices)

Item	Description
Device	D100 to D101
Network setting	Host station

#### (c) Lamp (setting for 2 devices)

Item	Description
Device	GB128 to GB129
Network setting	Host station

### (2) Setting example of GOT2

#### (a) Client setting

N/W No.	PLC No.	IP address
1	2	192.168.0.19

(b) Script

Item		Description
Script 1	Type	Screen script
	Trigger type	On: Bit device that indicates the production completion
	Data type	Unsigned BIN 16
	Example of script description	[1-1:w:EG2]=[w:HR200]; //Writes the production count to PLC 1. set([1-1:b:EG0.00]); //Turns ON the write completion signal.

(3) Setting example of GOT3

(a) Client setting

N/W No.	PLC No.	IP address
1	3	192.168.0.20

(b) Script

Item		Description
Script 1	Type	Screen script
	Trigger type	On: Bit device that indicates the production completion
	Data type	Unsigned BIN 16
	Example of script description	[1-1:w:EG3]=[w:W200]; // Writes the production count to PLC 1. set([1-1:b:EG0.01]); //Turns ON the write completion signal.

■ 5 Efficient usage

This section explains how to use the server/client function efficiently.

(1) Script setting

If a program using gateway devices directly is executed, the number of times of the access to other stations' GOTs increases and the processing delays.

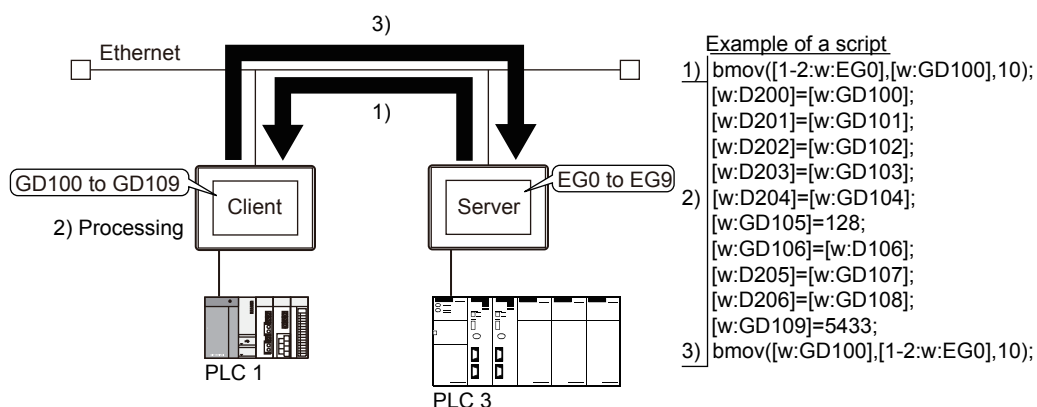

Create the script as in the example (a) so that it executes the batch read to store in the GOT internal devices and executes the batch write after necessary processing. Such a script increases the processing speed as it decreases the number of times of access

(a) When executing batch read to store in the GOT internal device (GD) and executing batch write after processing

Access to the other station's GOT occurs twice (1) and 3)).

Hence, if one access requires 50 ms, about 100 ms is necessary in total.

The gateway devices are accessed in a batch when the execution condition of the script is satisfied. Therefore, the values of the gateway devices when the conditions are satisfied are processed and written.

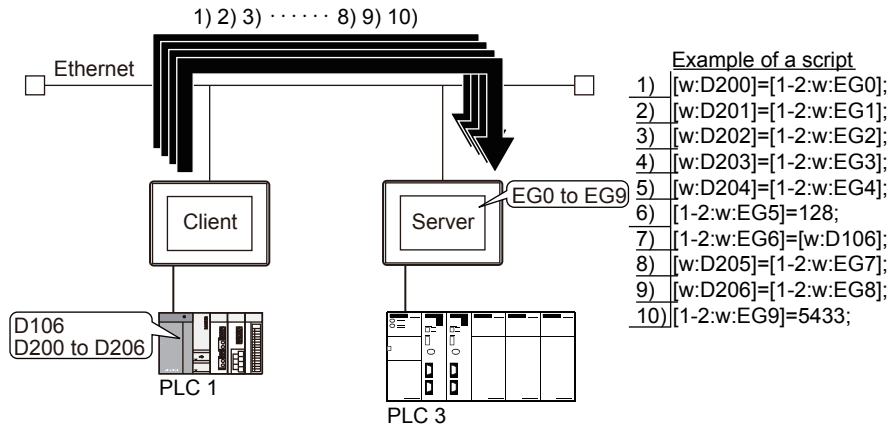

**(b) When using gateway devices directly**

Access to the other station's GOT occurs 10 times (1) to 10)).

Hence, if one access requires 50 ms, about 500 ms is necessary in total.

The gateway devices are accessed sequentially when the execution condition of the script is satisfied. Therefore, values of the gateway devices that differ from themselves when the conditions are satisfied may be written.

**(2) Gateway device setting**

When assigning the devices of PLCs to gateway devices, assign the same type of devices of the same PLC together as far as possible.

Setting the same type of devices of the same PLC together as shown in (b) below can decrease the number of times of access and improve the processing speed.

**(a) When the devices for the host station, other stations, and other PLCs are not set together**

When the GOT (client) accesses the host devices of the GOT (server), program 1), which reads 40 points from EG0 and program 2), which reads 10 points from EG130, are necessary.

EG Device	Type	PLC Device	Points
1 EG 0	Word	D100	40
2 EG 40	Word	D200	20
3 EG 60	Word	D300	40
4 EG 100	Word	D400	30
5 EG 130	Word	D500	10

Example of a script

```

1) bmov([W:GD100],[1-2:w:EG0],40);
2) bmov([w:GD140],[1-2:w:EG130],10);
    
```

**(b) When the devices of the host station, other stations, and other PLCs are set together**

When the GOT (client) accesses the host devices of the GOT (server), only program 1), which reads 50 points from EG0, is necessary.

EG Device	Type	PLC Device	Points
1 EG 0	Word	D100	40
2 EG 40	Word	D500	10
3 EG 60	Word	D300	40
4 EG 100	Word	D200	20
5 EG 130	Word	D600	50

Example of a script

```

1) bmov([W:GD100],[1-2:w:EG0],50);
    
```

- For more efficiency

If the devices of the same PLC, used for the server/client function, are reserved as a set, as shown below, in the system design phase, the GOT (server) needs a smaller number of times of access and thus the processing speed improves.

If the devices of the same PLC are reserved as a set

EG Device	Type	PLC Device	Points
1 EG 0	Word	D200	100

If 100 points of devices are accessed, PLC is accessed just 1 time.

If the devices of the same PLC are reserved separately

EG Device	Type	PLC Device	Points
1 EG 0	Word	D200	30
2 EG 30	Word	D250	20
3 EG 50	Word	D20	10
4 EG 60	Word	D360	20
5 EG 80	Word	D400	20

If 100 points of devices are accessed, PLC is accessed 5 times.

### (3) Performance of the server/client function (reference value)

The following shows the performance (reference values) of the server/client function under the condition that (1) the script is set and that (2) the gateway devices are set as shown above.

The reference values are obtained under the conditions shown below.

- The system is configured with one GOT (server) and one GOT (client).
- GOT (server): Numerical input (64 points) setting
- GOT (client): Numerical input (64 points) setting
- Number of assigned device points: 10 word devices

Combinations for improving the efficiency		Response speed in direct CPU connection
Improving the efficiency of the script	Improving the gateway device setting efficiency	
○ (in the case of (1) Script setting (a) in this section)	○ (in the case of (2) Gateway device setting (b) in this section)	About 260 ms
○ (in the case of (1) Script setting (a) in this section)	× (in the case of (2) Gateway device setting (a) in this section)	
× (in the case of (1) Script setting (b) in this section)	○ (in the case of (2) Gateway device setting (b) in this section)	About 1300 ms
× (in the case of (1) Script setting (b) in this section)	× (in the case of (2) Gateway device setting (a) in this section)	

In a system where multiple GOTs (client) are configured, the number of the GOTs (client) multiplied by the response speed is the total response speed shown in the above table.

## 10.13.8 Precautions

The following shows the precautions for using the server/client function.

### ■ 1 Precautions for system configuration

#### (1) Connection to the intranet

If the system needs keeping secure against unauthorized access to the intranet, consult a network service provider or a network administrator (a person who does network planning, IP address management, and others), and include your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the intranet connection.

#### (2) Countermeasures against access delay

When multiple network devices (including GOTs) are connected to the same segment, the network load increases and therefore the communication performance between the GOT and PLC may be degraded.

The following countermeasures may improve the communication performance.

- Using the switching hub
- Reducing the number of devices the GOT monitors

#### (3) When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the port No. to be protected behind the firewall.

If the system needs keeping secure against unauthorized access in changing the port No. to be protected behind the firewall, consult the network administrator (a person who does network planning, IP address management, and others), and develop your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the change of the port No.

## ■2 Precautions for station No. switching

When you monitor gateway devices, which have been assigned to controller devices, the monitored devices are not switched at station No. switching.

Create the screen for each station.

- Step 1 Execute the station No. switching.
- Step 2 The numerical display on the GOT (server) is changed by the station No. switching.
- Step 3 The station No. switching does not affect the assignment of the gateway devices. Therefore, read the value of EG0 of the PLC (station number 0) to GD100 with the script.
- Step 4 The numerical display of the GOT (client) is not affected by the station No. switching.

## ■3 Precautions on the script setting

### (1) Setting the trigger type

When setting the script, do not set the trigger type to [Ordinary] or [Sampling, 2 sec.]. The setting may affect other monitoring operations.

### (2) Monitoring gateway devices with a script

A script cannot be used to monitor the gateway devices of the GOT itself (GOT) where the script is executed. To monitor the PLC devices assigned to the gateway devices, monitor the PLC devices directly.

### (3) Specifying the network No. and PLC station number in a script

In the script, which accesses the gateway devices of the target GOT, specify the network No. and the PLC station number of the target GOT.

Even if 0-FF (host station) is set for the target, the gateway devices cannot be monitored.

### (4) When using the bmov instruction in a script

A script does not run properly in the following cases.

- A bit device that cannot be specified as a word device is assigned to a gateway device. This gateway device is specified for a command specifying word devices.
- A word device that cannot be specified as a bit device is assigned to a gateway device. This gateway device is specified for a command specifying bit devices.

Do not specify such gateway devices for the commands specifying word devices and bit devices.

The following shows the commands specifying word devices and bit devices.

Item	Command type	Content
Commands specifying word devices	Function (application arithmetic operation)	sin, cos, tan, asin, acos, atan, abs, log, log10, exp, ldexp, sqrt
	Operator (bit device)	&,  , ~, ^, <<, >>
Commands specifying bit devices	Operator (assignment)	=
	Function (device operation)	set, rst alt

For the details of each device, refer to the following.

→12.2 Device Range and Settings of Each Controller

For the details of each command, refer to the following.

→9.9.2 ■ 3 Control structures for a project script, screen script, and script part

9.10.2 ■ 2 Control structure of object scripts

#### ■4 Precautions for monitoring

- If you try to monitor the gateway devices of the GOT (server) in the situation that the server or client function cannot be used due to the power off of either of the GOTs or other possible causes, the error (error code 16) at the execution of the script occurs at the GOT (client) and the script stops

For the errors for the execution of a script, refer to the following.

→9.9.14 Troubleshooting

- When a gateway device to which no PLC device is assigned is monitored, it is monitored as 0 (off if a bit device is specified).

When a write operation on values is executed, the values are invalid.

- During the execution of a script that uses gateway devices, the screen save time may be affected.

Canceling the screen saver (by a screen touch or human sensor) may take longer time than usual.

(When the script processing takes 2 seconds, for example, it takes a maximum of 2 seconds for the screen saver to be canceled after the screen is touched.)

When the automatic screen saver is set, the execution intervals may be longer than the specified interval.

#### ■5 Precautions for assigning devices

The gateway devices are set in a set of two points.

Therefore, the number of assigned devices depends on the controller devices to be set.

##### (1) When assigning bit devices to gateway devices

Bit devices are assigned in a unit of 32 points.

##### (2) When assigning word devices to gateway devices

Word devices are assigned in a unit of 2 points.

##### (3) When assigning double-word devices to gateway devices

Double-word devices are assigned in a unit of 1 point.

##### (4) When assigning 8-bit devices to gateway devices

8-bit devices are assigned in a unit of 4 points.

## 10.13.9 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the server/client function as required. The following shows the functions that are available by the relevant settings.

→ 12.1.3 GOT special register (GS)

### ■ 1 GOT Internal Device

Function	Setting item
Notifies the operation availability status of the server function.	GS200.b3
Notifies the operation availability status of the client function.	GS200.b4
Turns on when an error occurs in the use of the server function.	GS200.b14
Turns on when an error occurs in the use of the client function.	GS200.b15
Stores the number of errors that occur in the use of the server function.	GS210
Stores the error codes of errors that occur in the use of the server function.	GS211
Stores the year (upper byte, two lower digits of year) and the month (lower byte) with BCD code when an error occurs in the use of the server function.	GS212
Stores the year (upper byte) and the hour (lower byte) with BCD code when an error occurs in the use of the server function.	GS213
Stores the minute (upper byte) and the second (lower byte) with BCD code when an error occurs in the use of the server function.	GS214
Stores the lower part of the IP address of the GOT (client), where an error occurs in the use of the server function, with BCD code.	GS215
Stores the upper part of the IP address of the GOT (client), where an error occurs in the use of the server function, with BCD code.	GS216
Stores the number of errors that occur in the use of the client function.	GS220
Stores the error codes of errors that occur in the use of the client function.	GS221
Stores the year (upper byte, two lower digits of year) and the month (lower byte) with BCD code when an error occurs in the use of the client function.	GS222
Stores the day (upper byte, two lower digits of year) and the hour (lower byte) with BCD code when an error occurs in use of the client function.	GS223
Stores the minute (upper byte) and the second (lower byte) with BCD code when an error occurs in the use of the client function.	GS224
Stores the lower part of the IP address of the GOT (server), where an error occurs in the use of the client function, with BCD code.	GS225
Stores the upper part of the IP address of the GOT (server), where an error occurs in the use of the client function, with BCD code.	GS226
Clears the errors (GS200.b14, GS210 to GS216) of the server function.	GS400.b14
Clears the errors (GS200.b15, GS220 to GS226) of the client function.	GS400.b15

## 10.13.10 Troubleshooting

### ■ 1 Troubleshooting for the server/client function

The following shows the troubleshooting for the server/client function.

Symptom		Details of error and cause	Corrective action
The server/client function does not work.	When all the bits of GS200 are off and the GOT does not respond to Ping <sup>*1,2</sup>	The system application (extended function) for the server/client function is not installed on the GOT.	Write the package data, which contains the system application (extended function) for the server/client function, to the GOT. →4. COMMUNICATING WITH GOT
		No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
		The port number of the personal computer (MX Component) is different from that of the GOT (5011).	Set the same port number for the personal computer (MX Component) as that of the GOT (5011).
	If any bit of GS200 is on and the GOT responds to Ping <sup>*1,2</sup>	-	Refer to the troubleshooting for the functions corresponding to the bits which are on, and take the corrective actions.
A gateway device cannot be monitored.		A device that does not exist in the server settings has been monitored.	Check the controller devices that have been assigned to the gateway devices.
		The IP address of the GOT to be monitored has been incorrectly set in the client settings.	Check the IP address of the GOT to be monitored.
		An error has occurred in either of the GOTs (server or client).	Check the GOT special registers GS211 and GS221 and take the corrective actions. → ■ 3 Error code list of the server/client function
		A script function error has occurred.	Check the script function error and take the corrective actions. →9.8 Controlling Operations with Scripts ([Script])

\*1 For the details of the Gateway Common Information (GS200), refer to the following.

→12.1.3 GOT special register (GS)

\*2 To check if the GOT responds to Ping, give the ping command through the personal computer to the GOT.

### ■ 2 Error information of the server/client function

The error information of the server/client function is stored in the GOT special register (GS).

Check the error information of the server/client function by monitoring the following GOT special registers.

For the details of the GOT special register, refer to the following.

→12.1.3 GOT special register (GS)

#### • Write device

Device	Function	Description	
GS210	Server function	Error counter	
GS211		Error code	
GS212		Error date and time	Stores the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time in BCD code.
GS213			Stores the day (upper byte) and the hour (lower byte) of the error occurrence date/time in BCD code.
GS214			Stores the minute (upper byte) and the second (lower byte) of the error occurrence date/time in BCD code.
GS215		Request source	Stores the lower part of the IP address of the GOT (client), where an error has occurred, with BIN code.
GS216			Stores the upper part of the IP address of the GOT (client), where an error has occurred, with BIN code.

Device	Function	Description	
GS220	Client function	Error counter Stores the number of errors that have occurred.	
GS221		Error code Stores the error code. → ■ 3 Error code list of the server/client function	
GS222		Error date and time	Stores the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time in BCD code.
GS223			Stores the day (upper byte) and the hour (lower byte) of the error occurrence date/time in BCD code.
GS224			Stores the minute (upper byte) and the second (lower byte) of the error occurrence date/time in BCD code.
GS225		Request target	Stores the lower part of the IP address of the GOT (server), where an error has occurred, with BIN code.
GS226			Stores the upper part of the IP address of the GOT (server), where an error has occurred, with BIN code.

### ■ 3 Error code list of the server/client function

The following lists the error codes that are stored in the GOT special registers GS211 (Server Function Error Code) and GS221 (Client Function Error Code).

Error code*1	Details of error and cause	Corrective action
490	A script was used for monitoring the gate device that executed the script.	<ul style="list-style-type: none"> <li>• Change the monitor destination GOT specified in the script to another GOT.</li> <li>• Monitor the PLC devices directly without using the script.</li> </ul>
491	A station that does not exist was accessed.	Check the network number, the PLC station number, and the Ethernet settings of the the monitor destination.
492	A communication timeout error has occurred.	<ul style="list-style-type: none"> <li>• Lengthen the value set for the timeout in the utility menu of the GOT.</li> <li>• Check the network. (Check if firewall exists, execute Ping, or take other actions.)</li> <li>• Check for cable disconnection, and check the module mounting status.</li> </ul>
493	A communication error has occurred.	<ul style="list-style-type: none"> <li>• Check for cable disconnection, and check the module mounting status.</li> <li>• Check the network. (Check if firewall exists, execute Ping, or take other actions.)</li> </ul>

\*1 The error caused in the GOT (server) is error code 493 only.

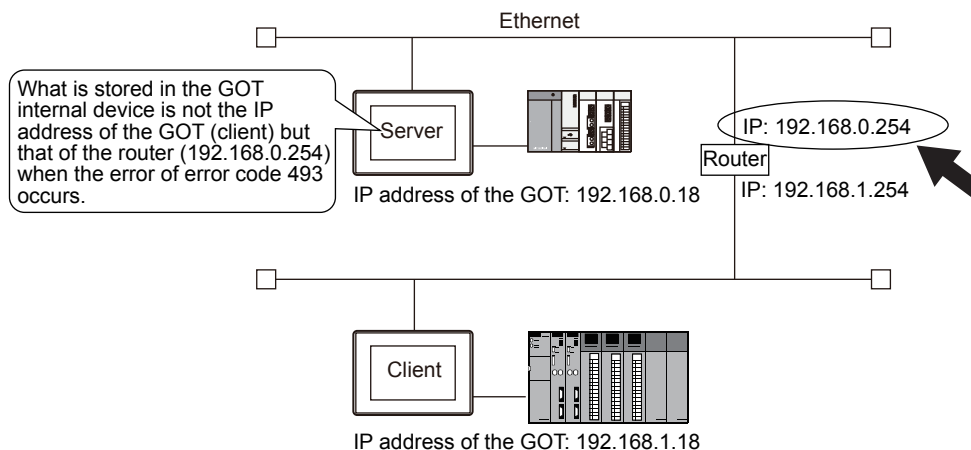

#### (1) Error code 493 has occurred in the GOT (server).

The error may occur in a congested network.

If no error has occurred in the GOT (client), the communication recovers by the retry processing of the GOT (client).

#### (2) A system where a router is used

If error code 493 has occurred in the GOT (server), the router address is taken as the IP address of the target client.

#### (3) An error has occurred in the GOT (client).

When an error occurs in the GOT (client), the script stops its operation.

When an error occurs, execute the script again after taking the corrective actions. For the details of the script, refer to the following.

→ 9.8 Controlling Operations with Scripts ([Script])

#### (4) Error code 492 has occurred in the GOT (client)

The error may occur when multiple GOTs (client) access the GOT (server).

Adjust the value of [Timeout Time].

Refer to the following calculation to set the value.

Timeout time that is already set × Number of GOTs (client) = [Timeout Time] after the adjustment

#### (5) Error code 15 (the script has not completed within Script Monitoring Time) was stored to the script error data (GS16 to GS47) when a script with gateway devices was used.

The error may occur when multiple GOTs (client) access the GOT (server).

Adjust the value of the [script monitoring time](GS385).

Refer to the following calculation to set the value.

Timeout time that is already set × Number of GOTs (client) = [script monitoring time] after the adjustment

For the details of the script, refer to the following.

→9.8 Controlling Operations with Scripts ([Script])

### ■ 4 Error code list of MX Component

The following lists the error codes of the errors which occur when the GOT is accessed from MX Component.

Error code*1	Details of error and cause	Corrective action
0x0180840B	Timeout error Data could not be received within the timeout time.	Corrective action for MX Component • Review the timeout value in the property. • Set the timeout value again in the communication setting utility. • Review the system such as the PLC CPU settings, module settings, and the cable status. • Retry the method. • Perform Close once and execute Open again. • Exit the program and restart the IBM-PC/AT compatible. →Programming Manual for MX Component Corrective action for GOT • Check if the server settings for GT Designer3 are configured. →10.13.5 [Gateway-Server]
0x010F4030	An unavailable device or device that does not exist has been assigned to the accessed gateway device.	Check that the device assignment is correct or the set devices exist in the server settings of GT Designer3.
0x010F4031	A device of PLCs outside the monitor range has been assigned to the accessed gateway device.	Check if the devices that are within the monitor range are assigned in the server settings of GT Designer3.
0x010F4B00	A communication timeout has occurred. A module is not mounted correctly or a cable is not correctly.	• Check for cable disconnection, and check the communication unit mounting status, and the PLC status. • The communication timeout may occur when the load on the PLC increases during the access to another station. In this case, move the data in another station to the PLC of the host station, and monitor the data at the host station. • If the sequence scan time is long, insert the COM instruction. • Check the GOT error codes of the system alarm or system information. When an error has occurred, take the corrective actions.

\*1 When an error other than those listed above occurs, refer to the following.

→MX Component Version 3 Operating Manual  
MX Component Version 3 Programming Manual

\*2 For details of the GOT error codes, refer to the following.

→GOT2000 Series User's Manual (Utility)

## 10.14 Sending a Mail from the GOT (Mail Send Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

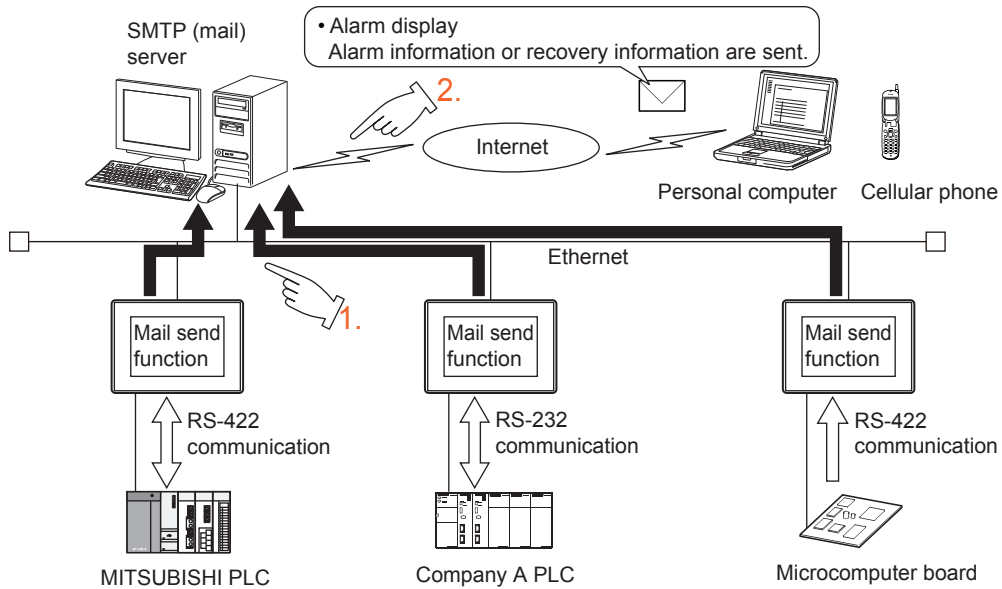

### 10.14.1 Overview of the mail send function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

When an error occurs or is recovered, you can send error information or recovery information to a personal computer or a cellular phone by mail using the alarm display.

For the details of the alarm display, refer to the following.

→9.1.5 Viewing alarm events (Alarm display)

- Step 1 The GOT uses the alarm display to issue an e-mail sending request to the SMTP server.
- Step 2 The SMTP server sends an e-mail in response to the request from the GOT.

## 10.14.2 Specifications of the mail send function

### ■ 1 System application (extended function)

To use the mail send function, a system application (extended function) of [Gateway(Mail)] is required.

Selecting [Use the function of Mail] and configuring the settings in [Mail] in the [Controller Setting] window incorporate the application into the package data automatically.

⇒ 10.13.4 [Communication Setting]

10.14.4 [Mail]

### ■ 2 Number of mail send function settings for one project

One mail send function setting is available for one project.

### ■ 3 Specifications of mail sending

The following shows the specifications of the mail send function.

Item	Specifications	
SMTP server	IP address setting (one server only) <sup>*1</sup>	
	Port	0 to 65535
	Server authentication	SMTP authentication (CRAM-MD5, LOGIN, PLAIN) or POP before SMTP The user name and the password must be set. • User name: Max. 256 characters (one-byte alphanumeric characters and symbols only) • Password: Max. 256 characters (one-byte alphanumeric characters and symbols only) To use a password of 129 or more characters, install version AA or later of BootOS on the GOT. For information on how to install the BootOS, refer to the following. ⇒ 4.3.2 ■ 1 Writing data to one GOT
	Mail sender address	Max. 64 characters (One-byte alphanumeric characters and symbols only)
	Title	Max. 64 characters (One-byte alphanumeric characters and symbols only)
Mail receiver address	To	1 to 32 (Max. 64 characters per address: one-byte alphanumeric characters and symbols only)
	Cc	0 to 32 (Max. 64 characters per address: one-byte alphanumeric characters and symbols only)
	Bcc	
Subject	Max. 128 characters (One-byte alphanumeric characters and symbols only)	
Number of characters	The following two types of comments can be sent. • Comment displayed as an alarm message : Max. 1024 characters (Alphanumeric characters) • Comment displayed in the comment window of the alarm detail display : Max. 1024 characters (Alphanumeric characters)	
Max. number of sending mails	Max. 16 mails can be sent at a time. If 17 or more mails are attempted to be sent, 16 of them are sent.	
Attached file	Not allowed	
Encryption	None	
Compression	None	

<sup>\*1</sup> SMTP servers are unusable if the host name is required to access the servers by their Internet service providers.

The following shows mail software whose operations have been validated by Mitsubishi Electric Corporation.

The GOT (mail sender) does not require the mail software.

Name	Manufacturer
Outlook2010, Outlook2007, Outlook2003, OutlookExpress6	Microsoft Corporation
AL-Mail32 Version1.13 (shareware)	-
Winbiff	Orangesoft Inc.

### ■ 4 Applicable languages for mail sending

Only Japanese and English are applicable.

For the other languages, the mail is sent as [?].

## ■5 Clock setting of the GOT

Depending on the clock setting (time setting and time notification) of the GOT, a problem may occur, such as the clock data set in the GOT or the controller is not reflected.

For the clock setting of the GOT, refer to the following.

→5.3.5 Setting the GOT time setting method ([Time Setting])

## ■6 Date/Time of mail sending

The date and time of the SMTP server at mail sending is attached to the mail.

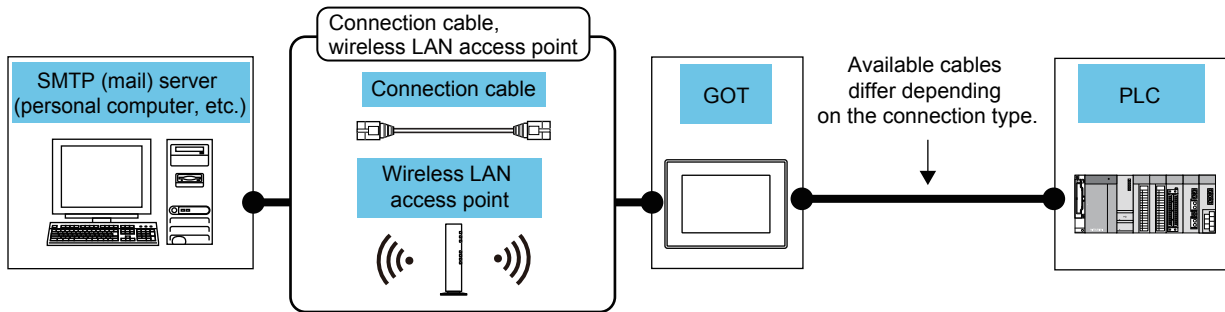

### 10.14.3 How to use the mail send function

#### ■1 System configuration

For the communication interface settings, refer to the following.

→10.13.4 [Communication Setting]

SMTP (mail) server	Connection cable <sup>*1*2</sup> , Wireless access point	Maximum segment length <sup>*3</sup>	GOT	
			Option	GOT model
Personal computer or others	<ul style="list-style-type: none"> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>• 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built into GOT)	GT27, GT25
			GT25-J71E71-100	GT27, GT25 <sup>*6</sup>
Personal computer or others	-	-	GT25-WLAN	GT27 <sup>*4</sup> , GT25 <sup>*4*6</sup>
	<ul style="list-style-type: none"> <li>• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*5</sup> , GT25 <sup>*5*6</sup>

\*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard.

For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*2 A straight cable is applicable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

\*3 The length between the hub and node.

The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades. For the limit, contact the switching hub manufacturer.

\*4 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*5 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*6 Not available to GT2505-V and GT25HS-V.

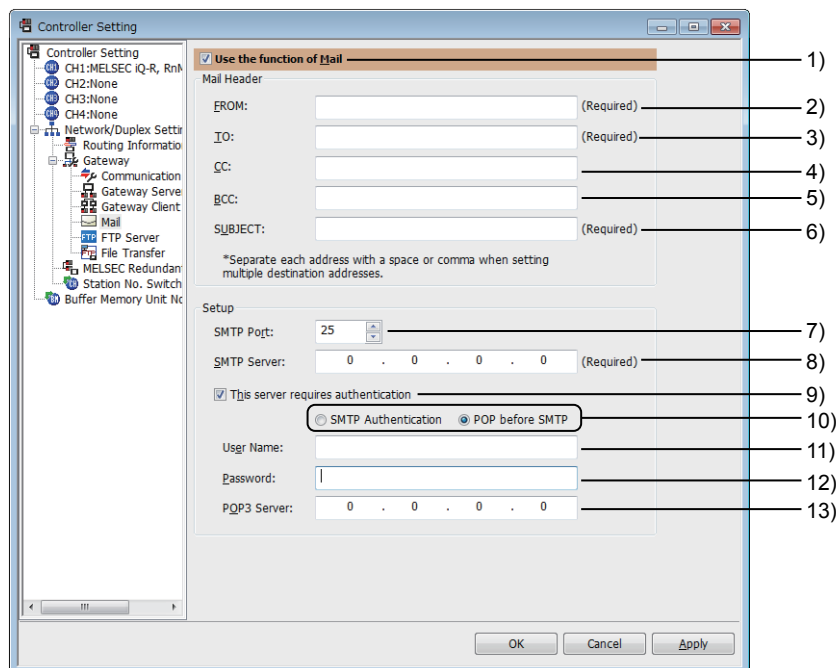

## ■2 Setting procedure

- Step 1** Consider the configuration of the whole system.
- Configuration of the whole system including controllers and GOTs
  - Controller settings (including device assignment)
  - GOT settings (including IP address, network number, and station number)
- Step 2** Connect the GOT and the controllers.
- ⇒ ■ 1 System configuration
- Step 3** Configure the communication interface settings.
- ⇒ 10.13.4 [Communication Setting]
- Step 4** Configure the mail settings with GT Designer3.
- ⇒ 10.14.4 [Mail]
- Step 5** Write the package data to the GOT.
- For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.
- ⇒ 4. COMMUNICATING WITH GOT
- Step 6** Check the GOT operation.
- ⇒ 10.14.5 Procedure of the mail send function

### 10.14.4 [Mail]

- Step 1** Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
- Step 2** Select [Mail] in the [Controller Setting] window and set the required items.

#### 1) [Use the function of Mail]

Select this item to use the mail send function.

#### 2) [FROM]

Set the address of the mail sender.

If no return address is needed to be specified, set the same address as the one in [TO].

One address can be set.

Up to 64 one-byte alphanumeric characters (uppercase or lowercase) and symbols below are usable.

! " # \$ % & ' ( ) \* + , ' - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 3) [TO]

Set the address of the mail receiver.

When setting addresses of multiple mail receivers, separate the addresses by commas or spaces.

Up to 32 addresses can be set.

Up to 64 one-byte alphanumeric characters (uppercase or lowercase) and symbols below are usable.

! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 4) [CC]

Set the address of the mail receiver. (carbon copy). (You can send mails without [CC].)

Up to 32 addresses can be set.

Up to 64 one-byte alphanumeric characters (uppercase or lowercase) and symbols below are usable.

! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 5) [BCC]

Set the address of the mail receiver. (blind carbon copy). (You can send mails without [BCC].)

Up to 32 addresses can be set.

Up to 64 one-byte alphanumeric characters (uppercase or lowercase) and symbols below are usable.

! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 6) [SUBJECT]

Set the title of the mail.

When receiving e-mails from multiple GOTs, set a different subject for each GOT to identify the sender.

Up to 128 one-byte alphanumeric characters (uppercase or lowercase) and symbols below are usable.

! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 7) [SMTP Port]

Set the port number of an SMTP server.

The setting range is [0] to [65535].

#### 8) [SMTP Server]

Set the IP address of an SMTP server.

The setting range is [0.0.0.0] to [255.255.255.255].

#### 9) [This server requires authentication]

Uses the server authentication.

Select this item, and set the relevant items for server authentication.

#### 10) Authentication method

Select a server authentication method.

- [SMTP Authentication]

Uses SMTP authentication.

Select this item, and set [User Name] and [Password].

- [POP before SMTP]

Uses POP before SMTP.

Select this item, and set [User Name], [Password], and [POP3 Server].

#### 11) [User Name]

Set the user name for server authentication.

Up to 256 one-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and symbols below are usable.

! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 12) [Password]

Set the password for server authentication.

Up to 256 one-byte alphanumeric characters (uppercase or lowercase), one-byte spaces, and symbols below are usable.

! " # \$ % & ' ( ) \* + , ` - . / : ; < = > ? @ [ \ ] ^ \_ { | } ~

#### 13) [POP3 Server]

Set this item when the authentication method is set to [POP before SMTP].

Set the IP address of a POP3 server.

The setting range is [0.0.0.0] to [255.255.255.255].

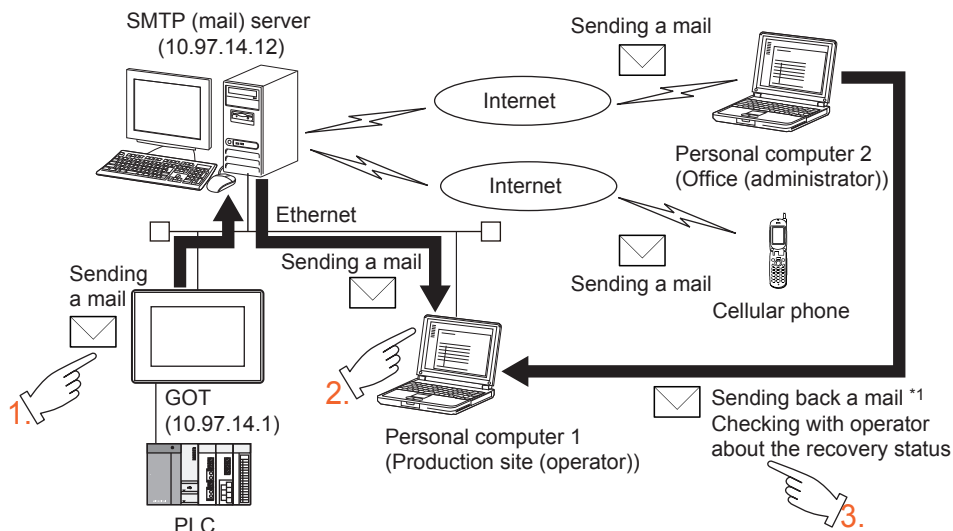

## 10.14.5 Procedure of the mail send function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1 Application examples

The following shows an application example of the mail send function.

#### (1) Sending mails to notify the production site and office of the details of an alarm occurring in the GOT

\*1 GOTs cannot receive mails. Thus, set the mail address of the personal computer at the production site for FROM.

If the mail address of the personal computer at the production site is set for FROM, the office (administrator) can send back a mail to the production site to obtain the information about the latest recovery status.

- Step 1** If the alarm occurs, the GOT sends mails to notify the alarm to personal computer 1 (production site operator), the cellular phone, and personal computer 2 (office administrator).
- Step 2** The production site receives the mail to notify the alarm, and then repairs and recovers the system.
- Step 3** The office sends a mail to request a report about the latest recovery status to the production site.

The following shows the setting example of the GOT.

Set the comments displayed in the alarm display in advance.

Item		Description
Controller setting	GOT IP address	10.97.14.1
	Send delay time	0 (ms)
	Communication timeout time	3 seconds
	Startup time	3 seconds
Mail setting	SMTP	10.97.14.12
	FROM	Mail address of personal computer 1 (production site operator)
	TO	Mail address of personal computer 1 (production site operator)
	CC	Mail addresses of personal computer 2 (office administrator) and cellular phone
	SUBJECT	Module VI - Line A
Alarm display (Alarm display screen)	Device	Controller device to be monitored
	Mail sending	When the error occurs and recovery is completed

## ■2 Sending example

When a target device receives a mail from the GOT, the header of the received mail has a line showing that the GOT has sent the mail as shown below.

The display format and details of the received mail differ depending on the specifications of the mail software installed in the target device.

When a cellular phone receives a mail from the GOT, the display details of the received mail may differ depending on the specifications (screen size) of the cellular phone.

If 17 or more alarms occur or are recovered simultaneously, the details of first 16 alarms are sent.

Display example of the header of the received mail

```

From: *****
To: *****
Cc: *****
Subject:Module VI - Line A
:
X-Mailer:GOT
    
```

### (1) When sending a mail using the alarm display

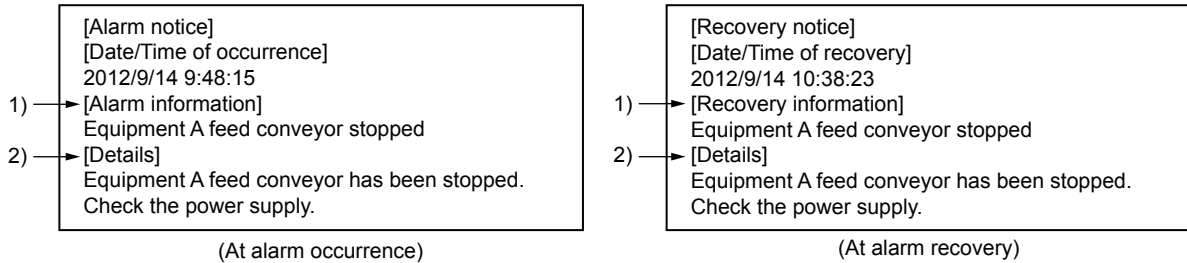

If the alarm occurs, the GOT sends mails to notify the receivers of the details on alarm occurrence.

If the alarm is recovered, the GOT sends mails to notify the receivers of the details on alarm recovery.

For how to set the alarm display, refer to the following.

→9.1.5 Viewing alarm events (Alarm display)

#### (a) Display example of mail at the receiver

1) A basic alarm comment is displayed.

2) The contents of the detail display ([Details]) set for the alarm display are displayed.

If [Not Display], [Base Screen], or [Window Screen] is set for [Details] of the alarm display, [Details] is not displayed.

## 10.14.6 Precautions

### ■ 1 Precautions for system configuration

#### (1) Connection to the intranet

If the system needs keeping secure against unauthorized access to the intranet, consult a network service provider or a network administrator (a person who does network planning, IP address management, and others), and include your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the intranet connection.

#### (2) Countermeasures against access delay

When multiple network devices (including GOTs) are connected to the same segment, the network load increases and therefore the communication performance between the GOT and PLC may be degraded.

The following countermeasures may improve the communication performance.

- Using the switching hub
- Reducing the number of devices the GOT monitors

#### (3) When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the port No. to be protected behind the firewall.

If the system needs keeping secure against unauthorized access in changing the port No. to be protected behind the firewall, consult the network administrator (a person who does network planning, IP address management, and others), and develop your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the change of the port No.

### ■ 2 Precautions for using the mail send function

#### (1) Sending a mail to one mail address from multiple GOTs

To identify the sender of each mail in the multiple GOTs, set an individual SUBJECT for each mail.

Setting the same SUBJECT for each mail from multiple GOTs causes the difficulty in identifying the sender.

## 10.14.7 Relevant settings

Set the relevant settings other than the specific settings for the mail send function as required. The following shows the functions that are available by the relevant settings.

⇒ 12.1.3 GOT special register (GS)

### ■ 1 GOT Internal Device

Function	Setting item
Holding the on status while the mail send function can be used.	GS200.b0
Turning on when the error has occurred in the mail send function.	GS200.b11
Storing the number of the errors that have occurred in the mail send function.	GS201
Storing the codes of the errors that have occurred in the mail send function.	GS202
Storing the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time when the error has occurred in the mail send function in BCD code.	GS203
Storing the day (upper byte) and the hour (lower byte) of the error occurrence date/time when the error has occurred in the mail send function in BCD code.	GS204
Storing the minute (upper byte) and the second (lower byte) of the error occurrence date/time when the error has occurred in the mail send function in BCD code.	GS205
Notifying the type of the function that has caused the error in the mail sending process of the mail send function.	GS206
Clearing the errors (GS200.b11, GS201 to GS206) of the mail send function.	GS400.b11

■ 1 Troubleshooting for the mail send function

The following shows the troubleshooting for the mail send function.

Symptom	Details of error and cause	Corrective action
The mail send function does not work.	The system application (extended function) for the mail send function is not installed on the GOT.	Write the package data, which contains the system application (extended function) for the mail send function, to the GOT. →4. COMMUNICATING WITH GOT
	No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
	The port number of the personal computer (MX Component) is different from that of the GOT (5011).	Set the same port number for the personal computer (MX Component) as that of the GOT (5011).
	If any bit of GS200 is on and the GOT responds to Ping *1*2	-
Mail cannot be sent.	The SMTP server is not working properly.	Check with the network administrator that the SMTP server is working properly.
	Mail sender address is not properly set for FROM.	Set the proper sender address for FROM
	The GOT attempted to send 17 or more mails at a time.	Send 16 or less mails at a time.
Time when the mail has been sent is not correct.	Time of the SMTP server is incorrect. (The GOT sends mails referring to the time of the SMTP server.)	Set the correct time for the SMTP server.
The whole text of the mail is not displayed on the cellular phone.	The number of characters that the cellular phone can send (receive) has been exceeded.	Reduce the number of characters in the mail so that the cellular phone can send (receive).
One-byte katakana is converted to two-byte katakana.	One-byte katakana cannot be used in the body of the mail. One-byte katakana is sent after converted to two-byte katakana.	This symptom is not an error.

\*1 For the details of the Gateway Common Information (GS200), refer to the following.

→12.1.3 GOT special register (GS)

\*2 To check if the GOT responds to Ping, give the ping command through the personal computer to the GOT.

■ 2 Error information of the mail send function

The error information of the mail send function is stored in the GOT special register (GS).

Monitor the following GOT special registers to check the error information of the mail send function.

For the details of the GOT special register, refer to the following.

→12.1.3 GOT special register (GS)

(1) Write device

Device	Function	Description
GS201	Error counter	Stores the number of errors that have occurred.
GS202	Error code	Stores the error code. → ■ 3 Error code and error message of the mail send function
GS203	Error date and time	Stores the year (upper byte, two lower digits of year) and the month (lower byte) of the error occurrence date/time in BCD code.
GS204		Stores the day (upper byte) and the hour (lower byte) of the error occurrence date/time in BCD code.
GS205		Stores the minute (upper byte) and the second (lower byte) of the error occurrence date/time in BCD code.
GS206	Mail sender	Notifies the type of the function that has caused the error in the mail sending process. • 0: 25% 0: No error • 1: 25% 1: User Alarm Observation

### ■ 3 Error code and error message of the mail send function

The following lists the error codes that are stored in the GOT special register GS202 (Mail Send Function Error Code).

Error code	Details of error and cause	Corrective action
2	No sender address is set for FROM.	Set the sender address for FROM. →10.14.4 [Mail]
3	The SMTP server is not set.	Set the SMTP server. →10.14.4 [Mail]
4	No receiver address is set for TO.	Set the receiver address for TO. →10.14.4 [Mail]
5	Mail address is incorrect.	Check that the mail addresses for FROM, TO, CC, and BCC are correct. →10.14.4 [Mail]
6	Alarms may occur exceeding the number of mails that can be sent.	Check the number of alarms that have occurred. (Up to 16 mails can be sent at a time to notify the alarm.)
10	The connection with the SMTP server has been failed.	<ul style="list-style-type: none"> <li>• Check if the SMTP server is functioning normally.</li> <li>• Check if the IP address of the SMTP server is properly set.</li> <li>• Contact the network administrator to check the router address and the subnet mask, and then setup the GOT.</li> <li>• When the network is protected by a firewall, contact the network administrator to check that the specified port number of the SMTP server is allowed to pass through the firewall.</li> </ul>
11	A timeout has occurred in the connection with the SMTP server.	<ul style="list-style-type: none"> <li>• Check if the SMTP server is functioning normally.</li> <li>• Set the longer sending timeout time. (GOT utility)</li> </ul>
12	The SMTP server notifies the error.	<ul style="list-style-type: none"> <li>• Check if the SMTP server is functioning normally.</li> <li>• Contact the network administrator to check that mails can be sent without the authentication including POP3.</li> </ul>
13	The SMTP authentication has failed.	<ul style="list-style-type: none"> <li>• Check that the user name and password for the SMTP authentication are set correctly.</li> </ul> →10.14.4 [Mail]
32	The POP3 server address is not set.	<ul style="list-style-type: none"> <li>• Set the IP address of the POP3 server.</li> </ul> →10.14.4 [Mail]
34	The connection to the POP3 server has failed.	<ul style="list-style-type: none"> <li>• Check that the IP address of the POP3 server is set correctly. →10.14.4 [Mail]</li> <li>• Check that the POP3 server is not down.</li> </ul>
37	Authentication of the POP3 server has failed.	<ul style="list-style-type: none"> <li>• Check that the user name and password for the POP3 server are set correctly.</li> </ul> →10.14.4 [Mail]

## 10.15 Transferring a File between the GOT (FTP Server) and the Peripheral Device (FTP Client) (FTP Server Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 10.15.1 Overview of the FTP server function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

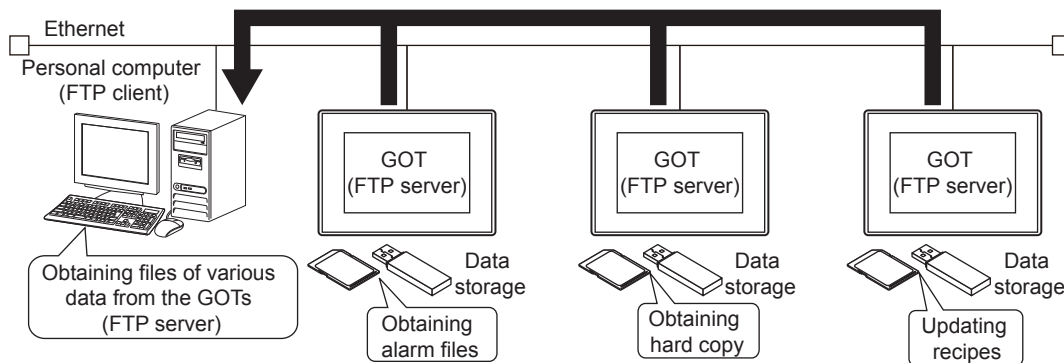

The FTP server function enables you to read and write a file from/to an external FTP client using the GOT as the FTP server.

For GT21, the following models support this function.

- GT2107-W
- GT2104-R
- GT2104-PMBD
- GT2103-PMBD

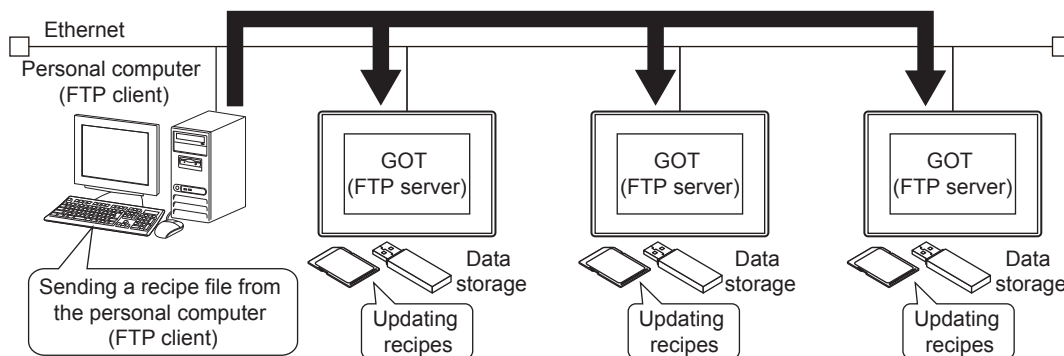

#### ■1 Reading resource data in the GOT using a personal computer

Files including resource data saved in the GOT can be read using a personal computer (FTP client). Use this function to read the resource data from multiple GOTs by Ethernet.

#### ■2 Sending a file from a personal computer to the GOT

Files including resource data can be written to the GOT (FTP server) using a personal computer (FTP client). Use this function to change the resource data of multiple GOTs at once by Ethernet.

### ■3 Connection with Multimedia Interaction Tool

When Multimedia Interaction Tool installed in a personal computer is used, the personal computer receives the video files and the alarm log files sent from the GOT using the FTP server function.

Not available to GT21.

For details of Multimedia Interaction Tool, refer to the following.

- How to use Multimedia Interaction Tool
  - ⇒10.8.5 Multimedia Interaction Tool
- How to connect the multimedia unit
  - ⇒GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

## 10.15.2 Specifications of the FTP server function

### ■1 System application (extended function)

To use the FTP server function, a system application (extended function) of [Gateway(FTP Server)] is required.

Selecting [Use the function of FTP Server] and configuring the settings in [FTP Server] in the [Controller Setting] window incorporate the application into the package data automatically.

⇒10.13.4 [Communication Setting]

10.15.4 [FTP Server]

### ■2 Number of FTP server function settings for one project

One FTP server function setting is available for one project.

### ■3 Specifications of the FTP server

The following shows the specifications of the FTP server function.

Item		Specifications
Setting of the FTP server function		The function can be enabled and disabled. (Default: disabled)
User name		Up to 16 one-byte alphanumeric characters (a to z, A to Z, 0 to 9) can be set. (Default: Admin) (The string "anonymous" is unusable.)
Password		Up to 32 one-byte alphanumeric characters (a to z, A to Z, 0 to 9), one-byte spaces, and symbols below can be set. !"#\$%&'()*+,-./:;<=>?@[\\]^_`{ }~
Port No.		20, 21
Number of simultaneously connectable clients	GT27 GT25 GT23	1 to 4 Use GS404 to specify the number of connectable clients. When GS404 stores 0 or 5 or more, 1 is assumed. ⇒12.1.3 GOT special register (GS)
	GT21	1

Item		Specifications
Command input monitoring cycle	Before logging in <sup>*1</sup>	1 minute
	After logging in <sup>*2</sup>	1 minute to 60 minutes (Default: 15 minutes)
Required devices for the file access		Data storage
Available file size for file reading		Unlimited (The maximum size depends on the capacity of the data storage.)
File name <sup>*3</sup>		One-byte alphanumeric characters only
Access mode		Reference mode: Writing to the data storage is not available. Write mode: Writing to the data storage is available.
Available FTP client		<ul style="list-style-type: none"> <li>• FTP client compliant with RFC 959</li> <li>• FTP client which can be accessed from the Windows command prompt using the FTP command</li> <li>• FTP client which supports the passive mode</li> </ul> For the FTP clients whose operations are confirmed, refer to the following. ⇒(1) FTP clients which have been checked for operation

\*1 If a correct password and login name are not entered within one minute after the FTP client is connected with the GOT, the line is disconnected.

\*2 If commands are not input from the FTP client within the time set as the command input monitoring cycle, the GOT disconnects the line.

\*3 For the details of settable file names, refer to the following.

⇒10.15.5 ■ 2 (2) How to specify files

### (1) FTP clients which have been checked for operation

The following shows the FTP clients whose operations have been validated by Mitsubishi Electric Corporation. For using Microsoft Internet Explorer, the GOT-dedicated commands are unavailable.

FTP client	Target device/OS
FTP client function of GOTs	GT27, GT25, GT23, GT21, GT16, GT15, GT14, and GT12
FTP function of Mitsubishi Electric Data Logging Analyzer MELQIC <sup>*1</sup>	IU2-3M10, IU2-3M10L (firmware version 1.82 or later)
Mitsubishi Electric high speed data logger module <sup>*1*2*4</sup>	QD81DL96
FTP client function of Mitsubishi Electric C Controller module <sup>*1</sup>	Q24DHCCPU-V, Q24DHCCPU-LS, Q12DCCPU-V, Q06CCPU-V, and Q06CCPU-V-B
Mitsubishi Electric MELSEC iQ-R series	RnCPU
Mitsubishi Electric High-speed Universal model QCPU <sup>*3*4</sup>	QnUDVCP
Mitsubishi Electric MELSEC-L series	LCPU
Mitsubishi Electric vision sensor <sup>*5</sup>	VS80, VS70, VS20
FFFTP Ver.1.97b or later (freeware)	Microsoft Windows 8
NextFTP Ver.4.91 (shareware) <sup>*1</sup>	Microsoft Windows 7
Microsoft Internet Explorer Version 8 or later <sup>*1</sup>	Microsoft Windows Vista
	Microsoft Windows XP
Command Prompt	Microsoft Windows Server 2008 R2
	Microsoft Windows Server 2008
	Microsoft Windows Server 2003
FTP client of Cognex vision sensor (In-Sight EZ series) <sup>*1</sup>	Cognex vision sensor (In-Sight EZ series)

\*1 Not available to GT21.

\*2 Available when the GOT is set as the FTP transfer destination server with High Speed Data Logger Module Tool.

\*3 Available when the GOT is set as the FTP transfer destination server with CPU Module Logging Configuration Tool.

\*4 When the FTP client transfers a file to the GOT, the file is always saved to drive A.

\*5 Available to GT27, GT25, GT2107-W, and GT2104-R.

To display image data of a vision sensor on the GOT screen, adapt the image data to the GOT resolution by using the vision sensor.

**(2) Data which can be read and written using the FTP server function**

Files including resource data can be read and written to the GOT (FTP sever) by Ethernet using a personal computer (FTP client).

The following files can be read and written using the FTP server function.

- CSV files
- Unicode text files
- Image data
- Binary format files (\*.G2 □)

**(a) Data that cannot be read from, or written to the GOT**

Files with the following extensions cannot be read or written by using the FTP server function.

- .OUT
- .FON
- .INI
- .G2
- .PRF

**(b) Sending and receiving binary format files (\*.G2 □)**

Binary format files (\*.G2 □) can be read to a personal computer by using the Gateway Common Control (GS400.b8). However, the following files cannot be read.

- \*.G2
- \*.G2D

For the Gateway Common Control (GS400), refer to the following.

- ⇒ 10.15.5 ■ 2 (2) (a) Reading a file specifying the file name
- 12.1.3 GOT special register (GS)

**■ 4 File access range**

The FTP server function allows the FTP client to access the GOTs on the network where the FTP client is connected. (Only one FTP client is allowed to access one GOT.)

When you use the FTP sever function via a relay device such as a router, consult with your network manager.

To simply determine whether a file can be accessed or not, issue a ping command for the GOT.

Examples of the ping commands to be issued (when the Windows command prompt is used)

IP address of the GOT: 192.168.0.18

- When the file can be accessed

```
C:\ping 192.168.0.18
pinging 192.168.0.18 with 32 byte of data:
reply from 10.97.14.10:bytes=32 time<10ms ttl=128
reply from 10.97.14.10:bytes=32 time<10ms ttl=128
reply from 10.97.14.10:bytes=32 time<10ms ttl=128
C:\
```

- When the file cannot be accessed

```
C:\ping 192.168.0.18
pinging 192.168.0.18 with 32 byte of data:
request timed out.
request timed out.
request timed out.
C:\
```

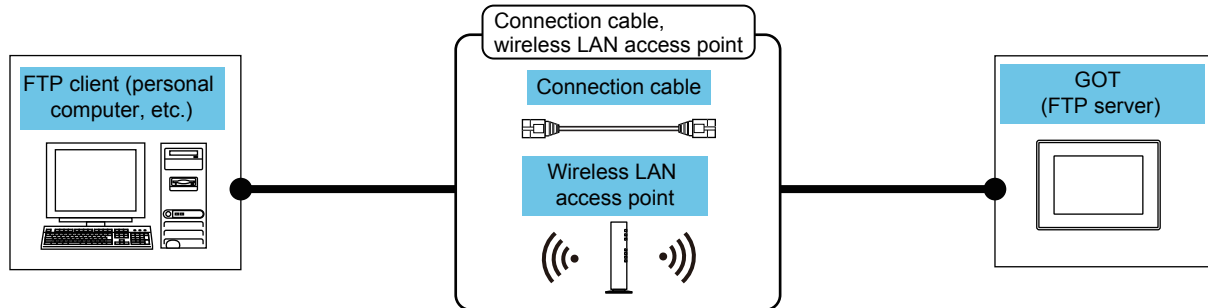

## 10.15.3 How to use the FTP server function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1 System configuration

For the communication interface settings, refer to the following.

→10.13.4 [Communication Setting]

FTP client	Connection cable <sup>*1*2</sup> , Wireless LAN access point	Maximum segment length <sup>*3</sup>	GOT (FTP server)	
			Option	GOT model
Personal computer or others <sup>*4</sup>	<ul style="list-style-type: none"> <li>10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built into GOT)	GT27, GT25, GT23, GT21 <sup>*7</sup>
			GT25-J71E71-100	GT27, GT25 <sup>*8</sup>
	-	-	GT25-WLAN	GT27 <sup>*5</sup> , GT25 <sup>*5*8</sup>
	<ul style="list-style-type: none"> <li>Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. →List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*6</sup> , GT25 <sup>*6*8</sup>

\*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system.

Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system.

Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard.

For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*2 A straight cable is applicable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

\*3 The length between the hub and node.

The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.

For the limit, contact the switching hub manufacturer.

\*4 For the details of applicable FTP clients, refer to the following.

→10.15.2 ■ 3 (1) FTP clients which have been checked for operation

\*5 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*6 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*7 For GT21, the following models support this function.

- GT2107-W
- GT2104-R
- GT2104-PMBD
- GT2103-PMBD

\*8 Not available to GT2505-V and GT25HS-V.

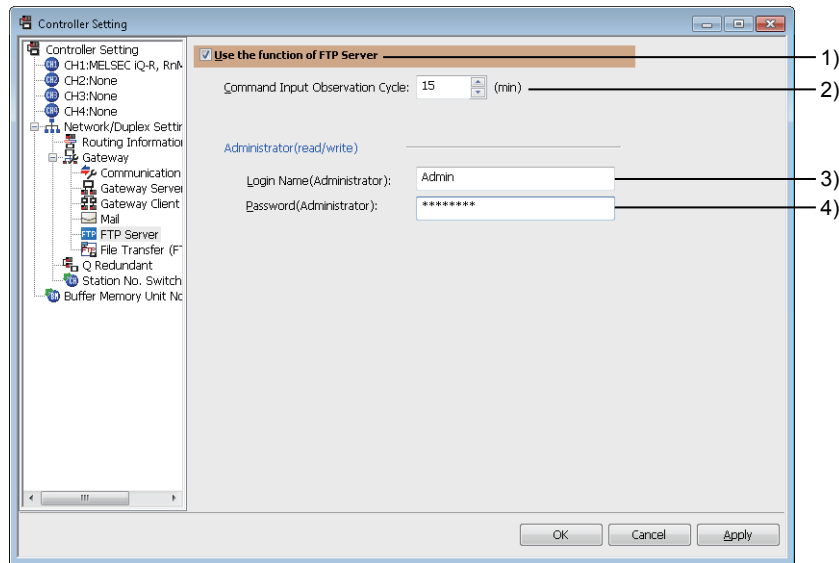

## ■2 Setting procedure

- Step 1** Consider the configuration of the whole system.
- Configuration of the whole system including controllers and GOTs
  - Controller settings (including device assignment)
  - GOT settings (including IP address, network number, and station number)
- Step 2** Connect the GOT and the controllers.
- ⇒ ■ 1 System configuration
- Step 3** Configure the communication interface settings.
- ⇒ 10.13.4 [Communication Setting]
- Step 4** Configure the FTP server setting on GT Designer3.
- ⇒ 10.15.4 [FTP Server]
- Step 5** Write the package data to the GOT.
- For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.
- ⇒ 4. COMMUNICATING WITH GOT
- Step 6** Check the operation of the FTP server function on the GOT.
- ⇒ 10.15.5 Procedures of the FTP server function

## 10.15.4 [FTP Server]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1 Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.
- Step 2 Select [FTP Server] in the [Controller Setting] window and set the necessary items.

### 1) [Use the function of FTP Server]

Select this item to use the FTP server function.

### 2) [Command Input Observation Cycle]

Set the time when the line connection with the GOT will be disconnected if any command is not input from the FTP client.

The setting range is [1] to [60].

Usually, use the default setting (15 minutes).

### 3) [Login Name]

Set a login name for connecting the FTP client with the GOT.

You can set one login name.

Up to 16 one-byte alphanumeric characters (a to z, A to Z, 0 to 9) can be used.

The default login name is Admin.

### 4) [Password]

Set a password for connecting the FTP client with the GOT.

You can set one password. Up to 32 one-byte alphanumeric characters (a to z, A to Z, 0 to 9) can be used.

Alphanumeric characters (a to z, A to Z, 0 to 9) and the following symbols are available.

!"#\$%&'()\*+,-./:;<=>?@[\\]^\_`{|}~

## 10.15.5 Procedures of the FTP server function

---

### ■ 1 Application examples

The following shows application examples of the FTP server function.

For these application examples, the Windows command prompt is used for accessing between the GOT and the FTP client. When using a commercially available FTP client tool, refer to the manual of the FTP client tool used.

#### (1) Outline procedure

The following shows the outline procedure.

For the detailed operating procedure, refer to each item described as follows.

- Step 1** Connect the line between the GOT and the FTP client.
  - ⇒(2) Connecting the line between the GOT and the FTP client
- Step 2** Read files in the GOT (data storage).
  - ⇒(3) Reading the files in the GOT (data storage)
- Step 3** Write files to the GOT (data storage).
  - ⇒(4) Writing files to the GOT (data storage)
- Step 4** Manage the directory in the GOT (data storage).
  - ⇒(5) Managing the directory in the GOT (data storage)
- Step 5** Disconnect the line between the GOT and the FTP client.
  - ⇒(6) Disconnecting the line between the GOT and the FTP client

When writing files to the GOT (data storage) or managing the directory, enable writing to the data storage of the GOT.

#### (2) Connecting the line between the GOT and the FTP client

- Step 1** Starting the FTP client  
Input [ftp] and press the Enter key.
- Step 2** Connecting with the GOT  
Input [open] and input the IP address of the GOT after the [open]. Then, press the Enter key.
- Step 3** Inputting a login name  
Input the login name registered previously in the GOT and press the Enter key.
- Step 4** Inputting a password  
Input the password registered previously in the GOT and press the Enter key.

Login image (When the line is properly connected.)

```
C:\>ftp
ftp>open 192.168.0.18
connected to 192.168.0.18
220 GOT2000 FTP server ready.
user:GOT2000
331 Password required.
Password:****
230 User logged in.
ftp>
```

Login image (If another personal computer has been connected to the GOT)

```
C:\>ftp
ftp>open 192.168.0.18
connected to 192.168.0.18
421 Session limit reached, closing control connection
user:GOT2000
connection closed by remote host
ftp>
```

Login image (When a wrong password is input)

```
C:\>ftp
ftp>open 192.168.0.18
connected to 192.168.0.18
220 GOT2000 FTP server ready.
user:GOT2000
331 Password required.
Password:****
530 Not logged in.
ftp>
```

### (3) Reading the files in the GOT (data storage)

Read the files from the GOT in the following procedure.

- Step 1** Notifying of no file conversion  
Input [binary] and press the Enter key.
- Step 2** Reading files  
Input [get] and the file name, and press the Enter key.  
Example for file reading

```
ftp>binary
200 TYPE is now BINARY.
ftp>get SNAP0001.BMP
200 PORT command successful
150 Opening connection.
226 Closing data connection.
ftp: 63 bytes sent in 0.00 seconds 63000.00
K bytes/sec.
ftp>
```

### (4) Writing files to the GOT (data storage)

Write files to the GOT in the following procedure.

- Step 1** Notifying of no file conversion  
Input [binary] and press the Enter key.
- Step 2** Entering the write mode (if not in the write mode)  
Input [quote gtwr] and press the Enter key.
- Step 3** Display the file name to check that the same file name is not used in the GOT (data storage).  
Input [ls] or [dir] and press the Enter key.
- Step 4** If the same file name is used in the GOT, delete the file.  
Input [delete] and the file name to be deleted, and press the Enter key.
- Step 5** Writing files  
Input [put] and the file name to be written, and press the Enter key.  
Example for file writing

```

ftp>binary
200 TYPE is now BINARY.
ftp>quote gtwr
200 command successful.
ftp>ls
200 PORT command successful.
150 Opening connection.
SNAP0001.BMP
SNAP0002.BMP
226 Closing data connection.
ftp>delete SNAP.0001.BMP
250 File deleted Successfully.
ftp>put SNAP0001.BMP
200 PORT command successful
150 Opening connection.
226 Closing data connection.
ftp: 63 bytes sent in 0.00 seconds 63000.00
K bytes/sec.
ftp>

```

### (5) Managing the directory in the GOT (data storage)

Create a directory and modify it in the following procedure.

- Step 1** Displaying the current directory  
Input [pwd] and press the Enter key.
  - Step 2** Entering the write mode (if not in the write mode)  
Input [quote gtwr] and press the Enter key.
  - Step 3** Creating a directory  
Input [mkdir] and the directory name to be created, and press the Enter key.
  - Step 4** Modifying the current directory  
Input [cd] and the directory name to be modified, and press the Enter key.
- Example for directory management

```

ftp>pwd
257 "A:/snapshot" is current directory.
ftp> quote gtwr
200 command successful.
ftp>mkdir bmpdata
275 MKD command successful.
ftp>cd bmpdata
250 CWD command successful.
ftp>pwd
257 "A:/snapshot/bmpdata" is current directoryftp>cd ..
250 CWD command successful.
ftp>pwd
257 "A:/snapshot" is current directory.
ftp>

```

### (6) Disconnecting the line between the GOT and the FTP client

Disconnect the line between the GOT and the FTP client in the following procedure.

- Step 1** Input [quit] (exit command) and press the Enter key.
- Example for a logout (disconnection of the line)

```

ftp>quit
221 User logged out. Good-Bye.
C:\>

```

### (7) Displaying errors

Errors related to the FTP server function are displayed on the FTP client.

For the error messages to be displayed, refer to the following.

→ 10.15.8 ■ 2 Code and message of the FTP server function

If a non-existent file (snap0010.bmp in this example) is intended to be read

```

ftp>get snap0010.bmp
200 PORT command successful.
550 snap0010.bmp:No such file or directory.
ftp>

```

## ■2 Handling on the FTP client side

### (1) Input commands for the FTP client

#### (a) General commands

The following table shows the general commands available for the Windows command prompt and the FTP client, and their compatibility with the FTP server function of the GOT.

The following commands cannot be used depending on the specifications of the FTP client to be used.

○ : Available, × : Unavailable

Command name	Function	Reference mode	Write mode
append	Writes files additionally to the GOT.	×	○
ascii	Changes the file transfer mode to the ascii mode.	○	○
binary	Changes the file transfer mode to the binary mode.	○	○
bye	Exits the FTP client tool.	○	○
cd	Changes the current directory of the GOT.	○	○
cd	Disconnects the line with the GOT.	○	○
delete	Deletes files in the GOT.	×	○
dir	Reads the file information in the GOT.	○	○
get	Reads files from the GOT.	○	○
ls	Displays file names in the GOT.	○	○
mdelete	Deletes multiple files specified with a wild card.	×	○
mdir	Reads the file information in the GOT to a specified file.	○	○
mget	Reads multiple files specified with a wild card.	○	○
mkdir	Creates a directory in the GOT.	×	○
mls	Reads the file name in the GOT to a specified file.	○	○
mput	Writes multiple files specified with a wild card to the GOT.	×	○
open	Connects the line with the GOT.	○	○
put	Writes files to the GOT.	×	○
pwd	Displays the current directory of the GOT.	○	○
rename	Changes a file name in the GOT.	×	○
rmdir	Deletes a directory in the GOT.	×	○
quit	Disconnects the line with the GOT and exits the FTP client tool.	○	○
quote	Use this command when using the GOT-dedicated commands with the command prompt. (Example: quote gtwr)	○	○
user	Input a user name and a password for logging in the GOT.	○	○

#### (b) GOT-dedicated commands

When the FTP client is connected to the GOT, the FTP client is in the [write mode].

Issue a command for changing modes between the reference mode and the write mode.

○ : Available, × : Unavailable

Command name*1	Function	Reference mode	Write mode
gtwr	Changes the mode of the FTP server function of the GOT to the write mode.	○	○*2
gtrd	Changes the mode of the FTP server function of the GOT to the reference mode.	○*2	○
help	Displays the general commands of the FTP protocol supported by the FTP server function of the GOT.	○	○
gtds	Enables the access to the drive C in the GOT. Not available to GT21.	×	○

\*1 When the GOT-dedicated commands are input with the command prompt, use quote.

To input [gtwr] with the command prompt, input [quote gtwr].

\*2 The setting is disabled. (The command does not cause an error.)

**(2) How to specify files**

The following two methods are provided for specifying files: you can directly specify one file or specify multiple files which satisfy the condition.

**(a) Reading a file specifying the file name**

Specify the file name of the file to be specified and add a period and an extension.

• Drive

Specify drive A, drive B, drive C, drive E, drive F, or drive G.

For GT2107-W, drive A or drive E can be specified.

For GT2105-Q, GT2104-R, GT2104-P, and GT2103-P, drive A can be specified.

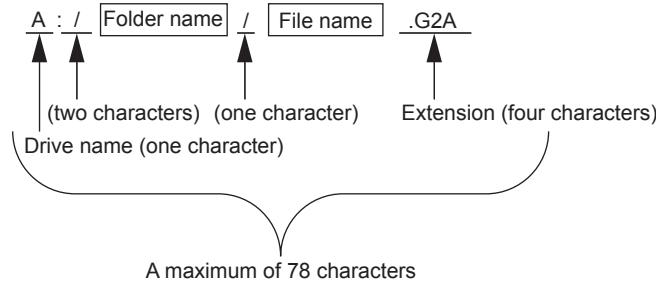

• Number of characters for the folder name and file name

The GOT recognizes the location of the file with the following path.

Set a folder name and file name so that the total number of characters used for the path is 78 or less.

Only the folder name and file name in the path can be set by the user.

(Other part of the path is automatically specified.)

To set a hierarchy to the folder, put / (slash) between folder names. (/ (slash) is counted as one character.)  
(Setting example)

Folder name: Project1/abc

• Unavailable character strings

The use of the following character strings is prohibited. (You cannot use them regardless of capitals or small letters.)

COM1 to COM9, LPT1 to LPT9, AUX, CON, NUL, PRN, CLOCK\$

The use of the following folder and file names is prohibited.

Folder name starting with G2

[.] (period) or [/] (slash) is used at the beginning or the end of the folder or file names.

Folder or file named as only [.] (one period) or [..] (two periods)

• Extension

The following file extensions are mainly used for the FTP server function.

csv:

Alarm file (alarm), operation log file (operation log), logging file (logging), and recipe file (recipe)

txt:

Alarm file (alarm), operation log file (operation log), logging file (logging), and recipe file (recipe)

bmp.jpg:

Image data (hard copy)

3GP:

Video file (multimedia)

### Reading binary format files

When the GOT special register GS400.b8 (bit location: 8) is turned on, the FTP client can read binary format files (\*.G2 □) directly.

However, the following binary format files cannot be read.

- \*.G2
- \*.G2D

You can use the binary format file read to GT Designer3 as backup data.

Some files can be converted to other formats using GT Designer3.

For the file conversion using GT Designer3, refer to the following.

⇒ 2.3.2 Opening a project

### (b) Specifying files which meet the condition (wild card)

To specify multiple files, [\*] and [?] can be used as a wild card.

(Example)

\*.jpg: When only JPEG files are specified

Main\*.csv: When CSV files whose names start with "Main" are specified

\*.b??: When files whose extensions start with b are specified

### (3) Checking the connection status

Check the connection status between the GOT and an FTP client with the following GOT special registers (GS).

Item	GOT special register (GS)	Description
Checking if one FTP client is connected to the GOT	GS200.b2	This device turns on when an FTP client is connected to the GOT. Check if an FTP client is connected to the GOT with this device.
Checking if multiple FTP clients are connected to the GOT	GS208	This device stores the number of the FTP clients connected to the GOT. Not available to GT21. Check that FTP clients are connected to the GOT by checking a change of the stored value.

For the details of the GOT special registers, refer to the following.

⇒ 12.1.3 GOT special register (GS)

The following shows application examples.

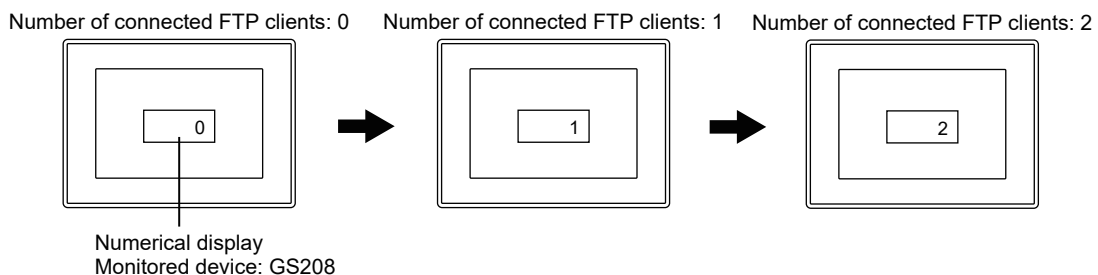

- Notifying the connection status when one FTP client is connected

Specify GS200.b2 for a lamp object to notify whether an FTP client is connected.

- Notifying the connection status when multiple FTP clients are connected

Specify GS208 for a numerical display object to display the number of connected FTP clients.

- Limiting operations

Specify GS200.b2 as the trigger device for a touch switch or numerical input object, and configure the settings to disallow inputs while an FTP client is being connected to the GOT.

Configure the settings with the touch switch function or numerical input function so that input is allowed only when the device (GS200.b2) is off.

#### (4) Disconnecting the line

The following two methods are provided for disconnecting the line: Automatic disconnection and manual disconnection. Since the GOT cannot detect the error status of the FTP client, if you cannot shut down the FTP client properly (for example, if the personal computer is powered off when the line is connected), the GOT does not disconnect the line immediately.

However, the line will be automatically disconnected after a specified time since the command input monitoring cycle is set.

- Automatic disconnection

If commands are not input from the FTP client within the time set as the command input monitoring cycle in the FTP server setting, the GOT disconnects the line automatically.

The command input monitoring cycle must be set.

For the settings of the command input monitoring cycle, refer to the following.

⇒10.15.4 [FTP Server]

- Manual disconnection (The line is forcibly disconnected.)

Use GS400.b2 to forcibly disconnect all the FTP clients.

To disconnect the FTP clients, turn on GS400.b2.

Check that the clients are disconnected, and then make sure to turn off GS400.b2.

For the details of the GOT special register, refer to the following.

⇒12.1.3 GOT special register (GS)

### ■ 1 Precautions for system configuration

#### (1) Connection to the intranet

If the system needs keeping secure against unauthorized access to the intranet, consult a network service provider or a network administrator (a person who does network planning, IP address management, and others), and include your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the intranet connection.

#### (2) Countermeasures against access delay

When multiple network devices (including GOTs) are connected to the same segment, the network load increases and therefore the communication performance between the GOT and PLC may be degraded.

The following countermeasures may improve the communication performance.

- Using the switching hub
- Reducing the number of devices the GOT monitors

#### (3) When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the port No. to be protected behind the firewall.

If the system needs keeping secure against unauthorized access in changing the port No. to be protected behind the firewall, consult the network administrator (a person who does network planning, IP address management, and others), and develop your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the change of the port No.

### ■ 2 Precautions for using the FTP server function

#### (1) Precautions for designing the system including the FTP server function

##### (a) Recipe file format

To write recipe files from the FTP client to the GOT, set the same format of the recipe files as the one set with the recipe of the GOT.

To write recipe files from a personal computer at a distant location, check the procedure with field workers before writing recipe files.

##### (b) Performing a test on the FTP client tool

Before using the FTP client tool, make sure to read the manual for the FTP client tool to check the functions and operating procedure, then conduct the test operation.

Some operations may not be supported by the GOT (FTP server) depending on the FTP client tool to be used.

Also, depending on the FTP client tool used, the FTP server function may not be usable because the GOT cannot support the extended command (quote) and issue GOT-dedicated commands.

##### (c) Reading multiple files using one command

If you read many files at once using one command (if you execute mget or mput specifying a wild card), the processing may be slowed down due to network congestion.

When the processing speed is slow, issue commands separately to divide the processing.

#### (2) Precautions for transferring files

##### (a) Automatically disconnecting the line

If commands are not input from the FTP client within the time set as the command input monitoring cycle, the GOT disconnects the line.

##### (b) Retaining the connection when GOT becomes offline

Even if the GOT transitions to the offline mode (such as when downloading monitor screen data), the line between the GOT and the FTP client is held.

##### (c) Precautions for transferring a recipe file

Do not use the recipe when you transfer recipe files.

If the recipe file in the data storage is deleted while the recipe is processed, the function may not be performed properly.

If the recipe file is deleted even while the recipe is not processed, the error (system alarm: recipe file error) occurs when

the recipe is performed next time.

→10.15.5 ■ 2 (3) Checking the connection status

#### (d) Precautions for overwriting a file in the GOT

When you overwrite files in the GOT using the FTP client, check that the files are properly overwritten.

When an error occurs while files are written, the files which have been written in the GOT are deleted.

Write the files again using the FTP client.

#### (e) Login if an FTP client goes down

If an FTP client (personal computer) goes down, wait a time longer than the command input monitoring interval or turn on GS400.b2 (a forced logout signal), and then log into the GOT again.

Check the connection status between the FTP client and the GOT with GS200.b2 and GS208.

#### (f) Powering off the GOT during access to the files in the data storage

Do not power off the GOT while the FTP client accesses the files in the data storage of the GOT.

Doing so may cause the data corruption in the data storage.

#### (g) Operations of the FTP client at line disconnection

If the GOT is reset or powered off when the line between the GOT and the FTP client is connected, the operations of the FTP client depends on the specification of the FTP client tool to be used.

Use an FTP client tool which detects the FTP server down or properly shuts down the FTP client.

#### (h) If the put command does not write data to the data storage

If the put command does not write data to the data storage, check that the following conditions are satisfied.

- The SD card cover of the GOT is closed.
- The SD card access switch of the GOT is turned on.
- The write-protect switch of the data storage is turned off.

#### (i) Time stamp of a transfer file

The time stamp of a transfer file may differ from that of the file in the GOT data storage depending on the FTP client tool to be used.

When the time stamps differ, check the settings of the FTP client tool.

### (3) Precautions for FTP login

#### (a) In the event of a forgotten password

If you forget the password for FTP login, you cannot connect the FTP client with the GOT.

Check the password set in the project on GT Designer3.

#### (b) Simultaneous logins from multiple FTP clients

Multiple FTP clients cannot log in to the GOT simultaneously.

#### (c) If the login name or password is incorrectly input on the FTP software

When you input a login name or a password for FTP login incorrectly, you may need to exit the FTP client and input them again depending on the FTP software to be used.

#### (d) If Microsoft Internet Explorer does not display the user authentication screen

When you use Microsoft Internet Explorer, the user authentication screen may not be displayed.

Input the address of the GOT in the following format.

ftp://<User name>:<Password>@<The address name or the host name of the GOT>/

Example) When "AdminPass" is set for the password

ftp://Admin:AdminPass@192.168.0.18

### (4) Precautions for accessing files

Deleting certain files may cause any malfunctions to the GOT.

To prevent the GOT from operation errors, do not delete the files in the FTP server by accessing from the FTP client.

### (5) Precautions for using FFFTP

When FFFTP is used with the FTP server function, [501 NLST: Options not supported] may be displayed on the screen and you may not be able to connect to the server.

In this case, conduct the following procedure to avoid errors.

- Step 1** Open the host list on FFFTP.
- Step 2** Select the [Special] tab.
- Step 3** Select [Use LIST command to get file list].
- Step 4** Click the [OK] button to close the dialog.

## 10.15.7 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the FTP server function as required. The following shows the functions that are available by the relevant settings.

→ 12.1.3 GOT special register (GS)

### ■ 1 GOT Internal Device

Function	Setting item
Notifying that the FTP server function is ready (Write device)	GS200.b1
Notifying that an FTP client is connected to the GOT (Write device)	GS200.b2
Notifying the number of the FTP clients connected to the GOT (Write device)	GS208 (Not available to GT21.)
Forcibly disconnecting all FTP clients (Read device)	GS400.b2
Enabling the binary format file (*.G2□) to be read from the FTP client. (Read device)	GS400.b8
Specifying the number of FTP clients connectable to the GOT (Write device)	GS404 (Not available to GT21.)

## 10.15.8 Troubleshooting

### 1 Troubleshooting for the FTP server function

The following shows the troubleshooting for the FTP server function.

Symptom		Details of error and cause	Corrective action
The FTP server function does not work.	When all the bits of GS200 are off and the GOT does not respond to Ping <sup>*1,2</sup>	The system application (extended function) for the FTP server function is not installed on the GOT.	Write the package data, which contains system application (extended function) for the FTP server function, to the GOT. →4. COMMUNICATING WITH GOT
		No IP address has been set for the GOT.	Set the IP address for the GOT in the utility of the GOT.
		The port number of the personal computer (MX Component) is different from that of the GOT (5011).	Set the same port number for the personal computer (MX Component) as that of the GOT (5011).
	If any bit of GS200 is on and the GOT responds to Ping <sup>*1,2</sup>	-	Refer to the troubleshooting for the functions corresponding to the bits which are on, and take the corrective actions.
The FTP client cannot connect to the line.	[Use the function of FTP Server] is not enabled in the FTP server setting of GT Designer3.		Enable [Use the function of FTP Server].
	The number of connected FTP clients has reached the upper limit.		Perform one of the following operations, and then connect the FTP client again. • Disconnect an FTP client. • Change the number of connectable FTP clients with GS404. (Not available to GT21.)
	-		Issue a ping command to the GOT and check if the GOT responds to it.
	-		Consult with a network manager.
The FTP client cannot log in.	The login name or the password is incorrectly input.		Input a correct login name and password. (The difference between capital letters and small letters is distinguished.)
Files cannot be written.	The GOT cannot recognize the file name.		For the details of settable file names, refer to the following. →10.15.5 ■ 2 (2) How to specify files
	The FTP client is in the reference mode.		Change the mode of the function to the write mode.
	Overwriting is prohibited in the FTP client setting.		Change the FTP client setting.
	The FTP client which does not send a file when the same file name exists in the FTP server is used.		Change the setting of the FTP client to enable sending (overwriting) files even when the same file name exists in the FTP server. Delete the file which exists in the FTP server in which the file name is overlapped with the name of the file to be sent.
	The data storage is write-protected.		Cancel the write protection for the data storage.
	The SD card cover of the GOT is open.		Close the SD card cover of the GOT.
	The SD card access switch of the GOT is turned off.		Turn on the SD card access switch of the GOT.
	The SD card is write-protected.		Check that the write protection for the SD card is canceled.
Files cannot be read.	The file to be read does not exist.		Use the dir or ls command to check if the file exists.
	The SD card cover of the GOT is open.		Close the SD card cover of the GOT.
	The SD card access switch of the GOT is turned off.		Turn on the SD card access switch of the GOT.
	The SD card is write-protected.		Check that the write protection for the SD card is canceled.
Files cannot be deleted.	The data storage is write-protected.		Cancel the write protection for the data storage.
	The SD card cover of the GOT is open.		Close the SD card cover of the GOT.
	The SD card access switch of the GOT is turned off.		Turn on the SD card access switch of the GOT.
	The SD card is write-protected.		Check that the write protection for the SD card is canceled.
The GOT was powered off during login.	-		Delete the file being transferred without using it since it may be damaged. (Operation of an FTP client differs depending on the specifications of the FTP client to be used.)

Symptom	Details of error and cause	Corrective action
The FTP client software was forcibly exited during login.	-	Log in to the GOT again after the command input monitoring cycle set in the FTP server setting. (The GOT logs out after the time set with commands elapses.)

\*1 For the details of the Gateway Common Information (GS200), refer to the following.

⇒12.1.3 GOT special register (GS)

\*2 To check if the GOT responds to Ping, give the ping command through the personal computer to the GOT.

## ■2 Code and message of the FTP server function

The codes and messages related to the FTP server function are displayed on the FTP client.

The display of the codes and messages differs depending on the FTP client tool to be used.

The following shows the codes and messages sent from the GOT to the FTP client.

### (1) Codes and messages in normal condition

Code	Message	Description
125	Data Connection already open; transfer starting	Start of transfer
150	Opening connection.	Establishment of connection for transfer
200	TYPE is now BINARY.	Setting to the binary transfer mode is successful.
	TYPE is now ASCII.	Setting to the ASCII transfer mode is successful.
	PORT command successful.	PORT command is successful.
	File structure set to NO RECORD	The data transfer structure type is set to File. (STRU)
	Command Okay.	Normal command
	Command successful.	
	NOOP -- did nothing as requested...hah!	NOOP command response
	File deleted successfully.	The DELE command is successful. (File deletion)
RMD command successful.	The RMD command is successful. (Directory deletion)	
214	The following commands are recognized. (* =>'s not implemented)	List of available commands (Commands marked with * are not available.)
	Help end.	HELP display end
	Syntax: <Command name>...	HELP display of each command
215	GOT2000	SYST command response
220	GOT2000 FTP server ready.	Establishment of connection
221	User logged out. Good-Bye.	Connection end
226	Closing data connection.	End of connection for transfer
227	Entering Passive Mode (%d,%d,%d,%d,%d,%d)	The PASV command is successful. (Socket passive mode)
230	User logged in.	Logging in is successful.
	Guest login ok, access restrictions apply.	Guest user can log in. (Writing is unavailable.)
	Guest login ok, upload directory is %s.	Guest user can log in. (Writing is available.)
250	CWD command successful.	The CWD (change of the current directory) command is successful.
	File deleted successfully.	The DELE command is successful.
	File renamed successfully.	The RNT0 command is successful.
257	"/*****/****/*.*" is current directory.	Displaying the current directory
275	MKD command successful.	The MKD (creation of a directory) command is successful.
331	Password required.	A password is required.
	Guest login ok, send your complete e-mail address as password.	Guest user specification
350	Requested file action pending further information.	The RNFR command (setting of the target to be renamed) is successful.

### (2) Codes and errors in error condition

Error code	Error message	Description	Corrective action
221	You could at least say goodbye.	Command read error	Reading commands has failed. Input a correct command.

Error code	Error message	Description	Corrective action
421	Timeout (%d seconds): closing connection.	Connection timeout	Connect the FTP client to the line again.
	Service not available, closing control connection.	Unavailable client connection	After another device is logged out, connect the FTP client to the line again.
	Session limit reached, closing control connection	Upper limit error of sessions (maximum four sessions)	The number of sessions has exceeded the upper limit. Reduce the number of sessions.
425	Can't open passive connection	PASV command failure	The access from the GOT has been blocked by the firewall of Windows. Allow the FTP server programs through the firewall of Windows.
	Can't open data connection	Data socket connection (accept) failure	Data socket connection has failed. Connect to the data socket again.
	Can't build data connection	Maximum number of retry exceedance error (connect)	Connection has failed within the set number of retry. Check that the FTP server and the FTP client are properly connected.
426	Connection closed; transfer aborted.	Transfer error	The data transfer has failed. Transfer the data again or check the connection status.
	Data connection error	Data socket connection error	Connect the FTP client to the line again.
500	Syntax error, command unrecognized.	Syntax errors and commands cannot be recognized.	Check that syntax and commands are correctly input.
501	Syntax error in parameters or arguments.	CWD, CDUP, XCWD, XCUP command failure (The parameter is not a directory.)	Specify a correct directory for the parameter.
504	Command not implemented for that parameter	Parameter error of the commands	Input a correct value to the parameter of the command.
510	Command not supported.	Unsupported command	The input command is not supported. Input a supported command.
	Port open fails.	Port open failure	Opening the port has failed. Open the port.
	File open fails.	File open failure	Files could not be opened. Check that the files exist and the file name is correct.
530	Not logged in.	Login failure	Check that the login name and password are correct. Check that the login name and password are correctly input.
	USER and PASS required	Command error (The command is executed without logging in.)	Log in and input commands.
	Requested action not taken.	Command execution failure	Check that commands are available.
	Can't access the file or the Directory.	Access unavailable	Check that the connection target can be accessed. Check that the connection target is allowed to be accessed.
	No files found or invalid directory or permission problem	The specified file or directory does not exist.	Check that the specified file or directory exists.
	%s:No such file or directory.	The file does not exist or the required operation is not allowed.	Check that the file exists. Enable the required operation and execute it again.
	Unimplemented TYPE %d	Unsupported transfer mode error	Send data in a supported transfer mode.
551	%s: not a plain file	RETR, SIZE, MDTM command failure (The file is corrupted.)	Access a proper file.
	Requested file action aborted.	Input file transfer error	Transfer the file again.
553	Requested action not taken.	File open failure (STOR)	The file may be damaged. Do not use the file and delete it.

## 10.16 Transferring a File between the GOT (FTP Client) and Peripheral Device (FTP Server) (File Transfer Function (FTP Transfer))

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 10.16.1 Overview of the file transfer function (FTP transfer)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The file transfer function (FTP transfer) enables you to write a file to an external FTP server from the GOT (FTP client). For GT21, the following models support this function.

- GT2107-W
- GT2104-R
- GT2104-PMBD
- GT2103-PMBD

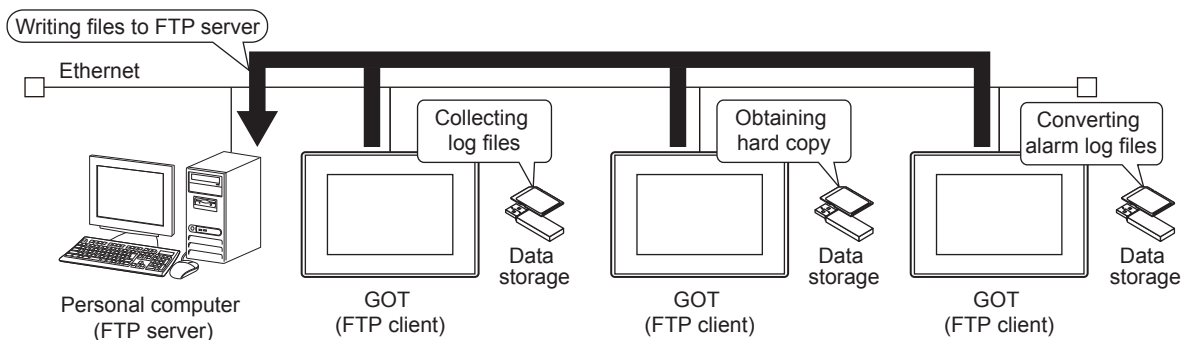

You can write files including resource data to a personal computer (FTP server) by Ethernet in operating the GOT (FTP client).

Files are written to up to 64 FTP servers preregistered.

#### ■1 Sending files from the GOT to the FTP server

You can write various files including the resource data to the personal computer (FTP server) in operating the GOT (FTP client).

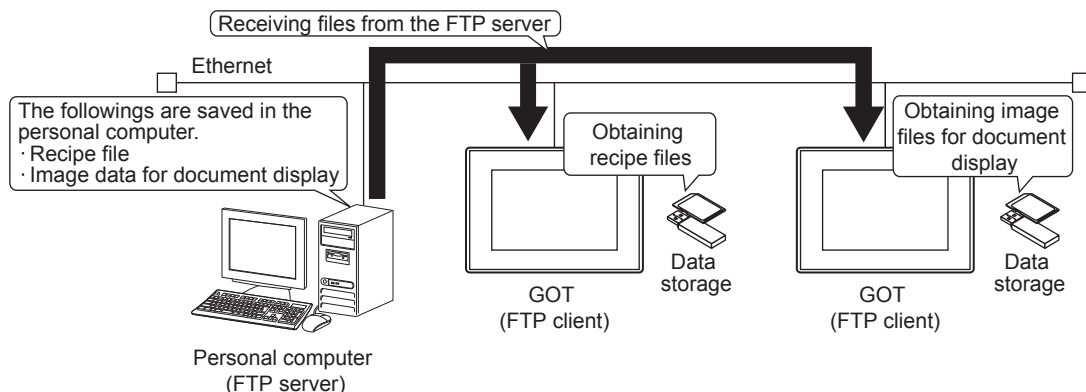

This function is used to update the resource data in the personal computer by using the GOT, or for other purposes.

#### ■2 Obtaining the resource data from the FTP server

You can read files including the resource data saved in the personal computer (FTP server) in operating the GOT.

This function is used to obtain recipe files created with the personal computer and use them with the recipe, to display image data saved in the personal computer on the GOT by the document display, or for other purposes.

## 10.16.2 Specifications of the file transfer function (FTP transfer)

### ■ 1 System application (extended function)

To use the file transfer function (FTP transfer), a system application (extended function) of [File Transfer] is required. To incorporate the application into package data automatically, select [Use the function of File Transfer] and configure the settings in the [Controller Setting] window ([File Transfer]).

⇒ 10.16.4 [File Transfer] (FTP transfer)

### ■ 2 Specifications of the FTP transfer

The following shows the specifications of the file transfer function (FTP transfer).

Item	Specifications
Applicable FTP server	FTP server compliant with RFC 959 ⇒(1) FTP servers whose operations have been validated
Number of connectable FTP servers	Max. 64
Number of file transfer settings	Max. 100 (FTP transfer settings and GOT internal transfer settings in total)
Transfer mode	In the stream mode, the communication is performed with binary data. PORT mode and Passive mode are supported.
Required devices for the file access	Data storage
Number of characters for file path	<ul style="list-style-type: none"> <li>• &lt;GOT folder path&gt;\&lt;Transfer file name&gt;: Up to 78 one-byte alphanumeric characters and symbols in total (including backward slash marks)</li> <li>• &lt;FTP server folder path&gt;\&lt;Transfer file name&gt;: Up to 250 one-byte alphanumeric characters and symbols in total (including backward slash marks)</li> </ul>

#### (1) FTP servers whose operations have been validated

The following shows the FTP servers whose operations have been validated by Mitsubishi Electric Corporation.

FTP server		FTP server type
FTP server function of the GOT2000 series	GT27, GT25, GT23, GT21	General-purpose
FTP server function of the GOT1000 series	GT16, GT15, GT14, GT12	General-purpose
MITSUBISHI web server module <sup>*4</sup>	QJ71WS96	General-purpose
MITSUBISHI PLC CPU <sup>*1</sup>	RCPU <sup>*2*5</sup>	MELSEC
	MELSEC iQ-F <sup>*3</sup>	General-purpose
	QnUDVCP	MELSEC
	QnUDPVCPU	MELSEC
MITSUBISHI C Controller module <sup>*4</sup>	LCPU	MELSEC
	Q24DHCCPU-V	General-purpose
	Q24DHCCPU-VG	General-purpose
	Q12DCCPU-V	General-purpose
MITSUBISHI Data Logging Analyzer MELQIC <sup>*4</sup>	Q06CCPU-V	General-purpose
	Q06CCPU-V-B	General-purpose
	IU2-3M10L (firmware version 1.83 or later)	General-purpose
MITSUBISHI high speed data logger module <sup>*4</sup>	IU2-3M10 (firmware version 1.83 or later)	General-purpose
	IU1-1M20-D	General-purpose
Cognex vision sensor <sup>*4</sup>	QD81DL96	General-purpose
	In-Sight EZ series	General-purpose
	In-Sight 7000 series	General-purpose
FTP service for Windows Server 2008 R2 (included with IIS (Internet Information Service)) <sup>*4</sup>		General-purpose
FTP service for Windows Server 2008 (included with IIS (Internet Information Service)) <sup>*4</sup>		General-purpose
FTP service for Windows Server 2003 (included with IIS (Internet Information Service)) <sup>*4</sup>		General-purpose
FTP service for Microsoft Windows 8 (included with IIS (Internet Information Service))		General-purpose
FTP service for Microsoft Windows 7 (included with IIS (Internet Information Service))		General-purpose

FTP server	FTP server type
FTP service for Microsoft Windows Vista (included with IIS (Internet Information Service)) *4	General-purpose
ProFTPD for Linux (Vine Linux) *4	General-purpose
Quick'n Easy FTP Server Lite (Pablo Software Solutions) (freeware) *4	General-purpose

- \*1 Usable only when the GOT is connected to the Ethernet port built in a PLC.  
Unusable when the GOT is connected to an Ethernet module.  
Only drive 2 (Memory card (ROM)) is accessible.  
If the GOT accesses any of the other drives, an error occurs.
- \*2 RnENCPU is usable only when connected through port CPU P1.
- \*3 The following operations are not available.
  - Remote password authentication
  - Transferring files in the PASV mode
  - Writing files to the FTP server
- \*4 Not available to GT21.
- \*5 R00CPU is not usable.

### ■3 File access range

The GOT (FTP client) can access the FTP servers in the network to which the GOT is connected.  
The GOT (FTP client) also can access GOTs (FTP server).  
To connect to the FTP servers in a different network, the router is required.

### ■4 Required settings for the GOT and personal computer

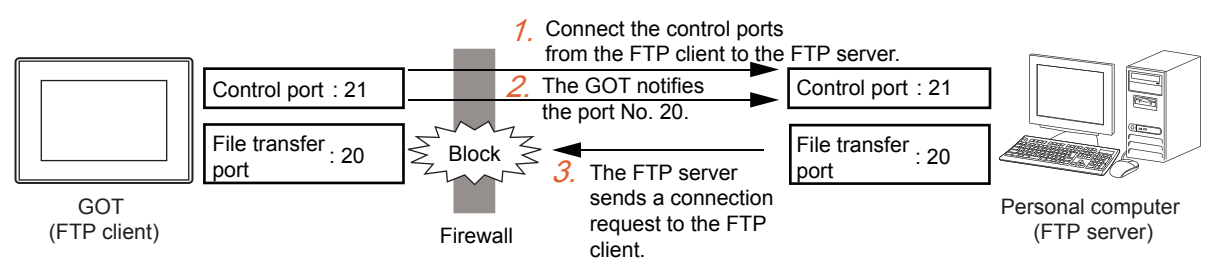

To use the file transfer function (FTP transfer), configure the GOT (FTP client) settings and FTP server settings.  
For the FTP server settings, refer to the following.

- Personal computer or others
  - ⇒ Manual of the FTP server used
- GOT (FTP server)
  - ⇒ 10.15.4 [FTP Server]

### ■5 PORT mode and PASV mode

#### (1) File transfer in the PORT mode

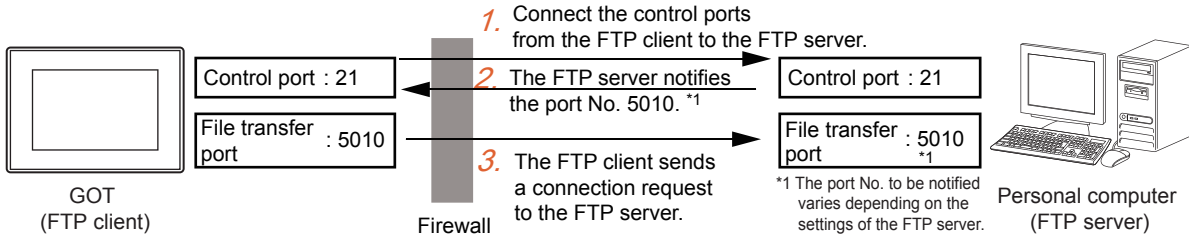

- Step 1** Connect the control ports from the FTP client to the FTP server.
- Step 2** The GOT notifies the file transfer port No. to the FTP server.
- Step 3** The FTP server sends a connection request for sending the data to the FTP client using the notified port No..  
If the network is protected behind the firewall, the request is refused and thus the connection is not established.

**(2) File transfer in the PASV mode**

- Step 1** Connect the control ports from the FTP client to the FTP server.
- Step 2** The FTP server notifies the file transfer port No. to the GOT (FTP client).
- Step 3** The FTP client sends again a connection request for the data communication to the FTP server using the notified port No..

Even if the network is protected behind the firewall, the connection is established.

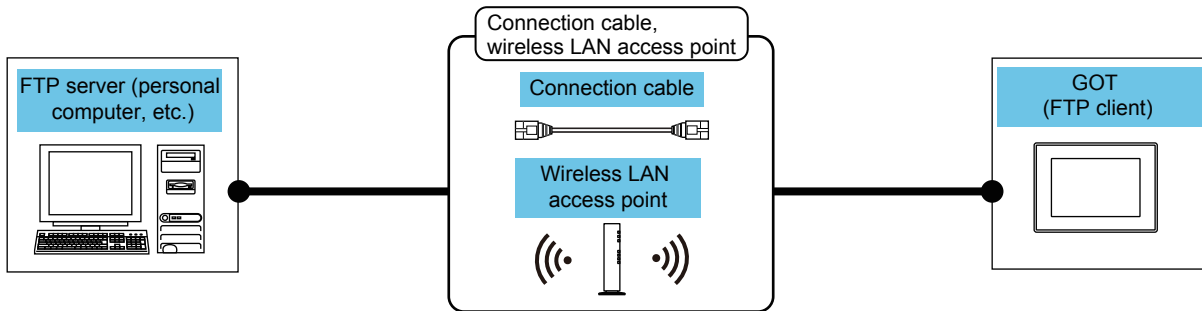

**10.16.3 How to use the file transfer function (FTP transfer)**

**1 System configuration**

For the communication interface settings, refer to the following.

⇒ 10.13.4 [Communication Setting]

FTP server	Connection cable*1*2, Wireless LAN access point	Maximum segment length*3	GOT (FTP client)	
			Option	GOT model
Personal computer or others*4	<ul style="list-style-type: none"> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>• 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built into GOT)	GT27, GT25, GT23, GT21 *7
			GT25-J71E71-100	GT27, GT25 *8
	-	-	-	GT25-WLAN
	<ul style="list-style-type: none"> <li>• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. ⇒List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 *6, GT25 *6*8

\*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard. For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*2 A straight cable is applicable. When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

\*3 The length between the hub and node. The maximum length depends on the Ethernet equipment you use. When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.  
For the limit, contact the switching hub manufacturer.

- \*4 For the details of applicable FTP servers, refer to the following.
  - ⇒ 10.16.2 ■ 2 (1) FTP servers whose operations have been validated
- \*5 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.
  - ⇒ 5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*6 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.
  - ⇒ 5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- \*7 For GT21, the following models support this function.
  - GT2107-W
  - GT2104-R
  - GT2104-PMBD
  - GT2103-PMBD
- \*8 Not available to GT2505-V and GT25HS-V.

## ■ 2 Setting procedure

- Step 1** Consider the configuration of the whole system.
  - Configuration of the whole system including controllers and GOTs
  - Controller settings (including device assignment)
  - GOT settings (including IP address, network number, and station number)
- Step 2** Connect the GOT and the controllers.
  - ⇒ ■ 1 System configuration
- Step 3** Configure the communication interface settings.
  - ⇒ 10.13.4 [Communication Setting]
- Step 4** Configure the settings for the file transfer function (FTP transfer) with GT Designer3.
  - ⇒ 10.16.4 [File Transfer] (FTP transfer)
  - 10.16.5 [Destination FTP Server Setting] dialog
  - 10.16.6 [File Transfer Setting] dialog
- Step 5** Write the package data to the GOT.
 

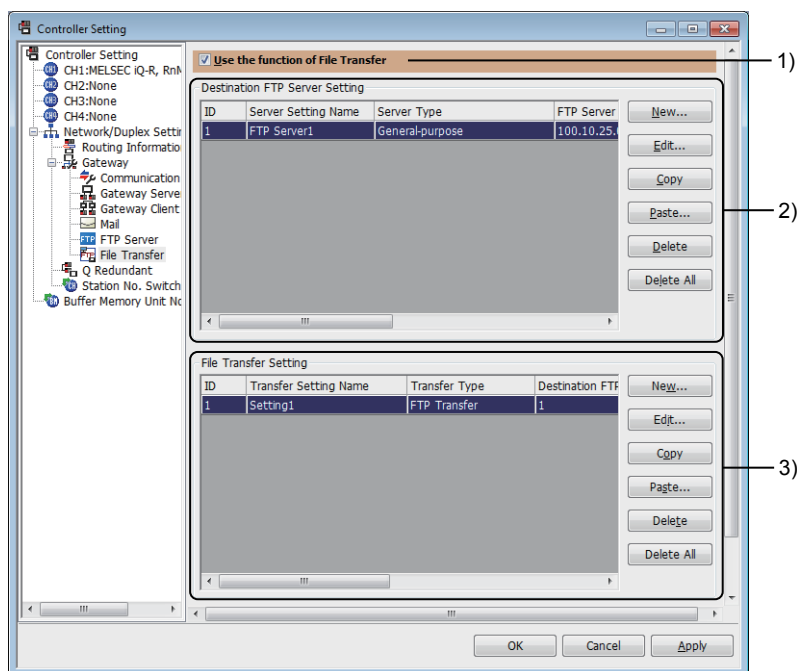

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

  - ⇒ 4. COMMUNICATING WITH GOT
- Step 6** Check the operation of the file transfer function (FTP transfer).
  - ⇒ 10.16.7 Operation of the file transfer function (FTP transfer)

## 10.16.4 [File Transfer] (FTP transfer)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.  
**Step 2** Select [File Transfer] in the [Controller Setting] window, and set the items.

### 1) [Use the function of File Transfer]

Enables the file transfer function.

### 2) [Destination FTP Server Setting]

The connection settings between the client and FTP servers are displayed in a list.  
 Up to 64 FTP servers can be registered.

Item	Description
[New] button	Click this button to add a destination FTP server setting. When the button is clicked, the [Destination FTP Server Setting] dialog appears. Add a new destination FTP server setting. →10.16.5 [Destination FTP Server Setting] dialog
[Edit] button	Click this button to change the contents of the selected destination FTP server setting. When the button is clicked, the [Destination FTP Server Setting] dialog appears. Edit the contents of the selected destination FTP server setting. →10.16.5 [Destination FTP Server Setting] dialog
[Copy] button	Click this button to copy the contents of the selected destination FTP server setting.
[Paste] button	Click this button to paste the copied contents of the destination FTP server setting. When the button is clicked, the dialog appears on which you can specify the FTP server setting ID for copying. Specify the FTP server setting ID.
[Delete] button	Click this button to delete the contents of the selected destination FTP server setting.
[Delete All] button	Click this button to delete the contents of all the destination FTP server settings.

### 3) [File Transfer Setting]

Lists the file transfer settings.

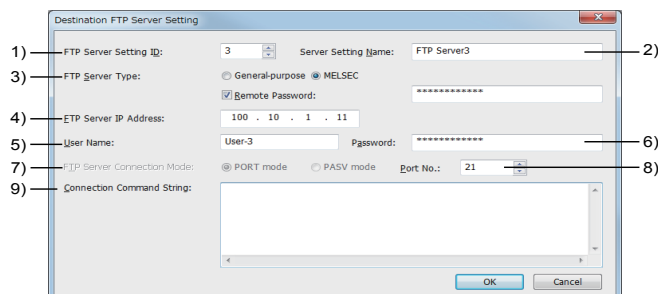

Up to 100 file transfer settings can be configured.

Item	Description
[New] button	Displays the [File Transfer Setting] dialog to add a new file transfer setting. →10.16.6 [File Transfer Setting] dialog
[Edit] button	Displays the [File Transfer Setting] dialog to edit the selected file transfer setting. →10.16.6 [File Transfer Setting] dialog
[Copy] button	Copies the selected file transfer setting.

Item	Description
[Paste] button	Displays a dialog to specify the destination file transfer ID, and pastes the copied file transfer setting to the specified destination.
[Delete] button	Deletes the selected file transfer setting.
[Delete All] button	Deletes all the file transfer settings.

## 10.16.5 [Destination FTP Server Setting] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [FTP Server Setting ID]

Set the ID to specify the destination FTP server setting.  
Set the number which does not overlap with that of other FTP server settings.  
The setting range is [1] to [32767].

### 2) [Server Setting Name]

Set the name of the destination FTP server setting.  
A maximum of 32 characters can be set.

### 3) [FTP Server Type]

Select the type of the accessed FTP server.

- [General-purpose]: Accesses a FTP server other than a PLC.
- [MELSEC]: Accesses the FTP server function of a MITSUBISHI PLC.  
To access MELSEC iQ-F, select [General-purpose].  
→ 10.16.2 ■ 2 (1) FTP servers whose operations have been validated

Item	Description
[Remote Password]	This item appears when [MELSEC] is selected for [FTP Server Type]. Enter the remote password for the accessed PLC (FTP server).

### 4) [FTP Server IP Address]

Set the IP address of the destination FTP server.  
The setting range is [0.0.0.0] to [255.255.255.255].

### 5) [User Name]

Set the user name to login to the FTP server.  
Up to 32 alphanumeric characters or symbols can be set.

### 6) [Password]

Set the password to login to the FTP server.  
Up to 32 alphanumeric characters or symbols can be set.

### 7) [FTP Server Connection Mode]

Set the connection mode of the FTP server.

- [PORT mode]: Establishes connection in the PORT mode.  
To access MELSEC iQ-F, select [PORT mode].
- [PASV mode]: Establishes connection in the PASV mode.  
This item is not selectable when [MELSEC] is selected for [FTP Server Type].

### 8) [Port No.]

Set the control port No. of the FTP server.  
The following shows the setting range.

- [21]
- [1024] to [65535]

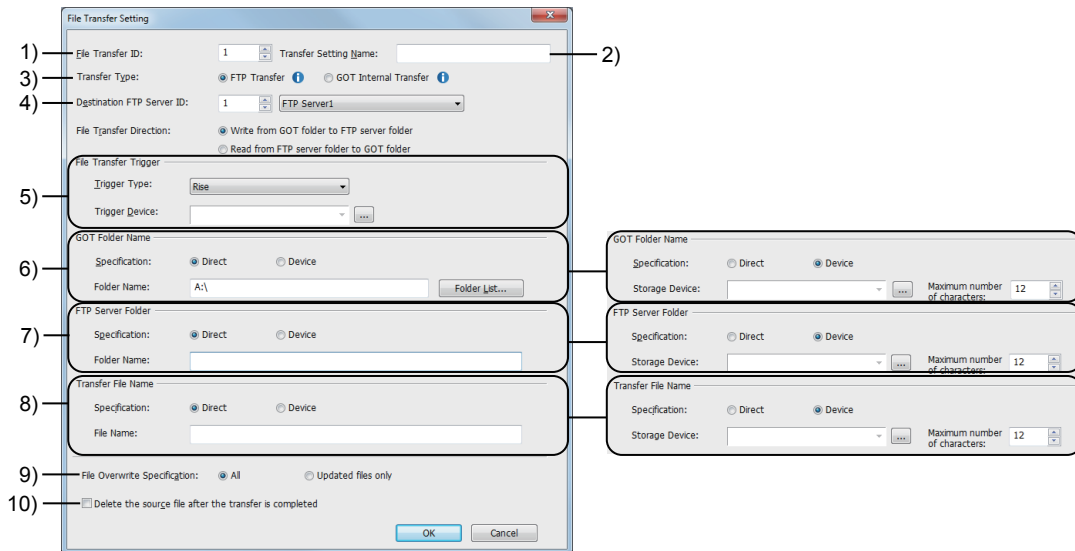

Use the following port No. for the file transfer port of the FTP server.

- In PORT mode: 20
- In PASV mode: Differs depending on the settings of the FTP server.

### 9) [Connection Command String]

Set the command issued when the FTP server is connected.  
 Specify the command with one-byte alphanumeric characters and symbols.  
 Up to 10 lines with a maximum of 255 characters per line can be specified.  
 The available commands differ depending on FTP servers.  
 For details, check the manual for the FTP server.

## 10.16.6 [File Transfer Setting] dialog

### 1) [File Transfer ID]

Set the ID to specify the file transfer setting.  
 Set the number which does not overlap with that of other file transfer settings.  
 The setting range is [1] to [32767].

### 2) [Transfer Setting Name]

Set the name of the file transfer setting.  
 Up to 32 characters can be set.

### 3) [Transfer Type]

Not available to GT21.  
 Select [FTP Transfer].

### 4) [Destination FTP Server ID]

Set the destination FTP server setting ID for the file transfer.  
 → 10.16.5 [Destination FTP Server Setting] dialog

### 5) [File Transfer Direction]

Set the direction of the file transfer.  
 The following shows the items to be selected.

- [Write from GOT folder to FTP server folder]
- [Read from FTP server folder to GOT folder]

### 6) [File Transfer Trigger]

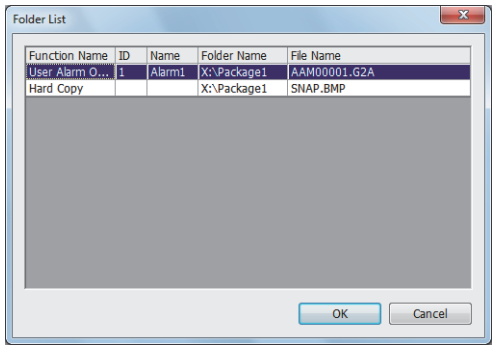

Set the trigger to execute the file transfer.

Item	Description
[Trigger Type]	Set the trigger type. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Rise]</li> <li>• [Fall]</li> <li>• [Sampling]</li> <li>• [ON Sampling]</li> <li>• [OFF Sampling]</li> </ul> → 10.16.7 ■ 4 Operation when the conditions of file transfer triggers are satisfied

Item	Description
[Trigger device]	When selecting [Rise], [Fall], [ON Sampling], or [OFF Sampling] for the trigger type, set the bit device as the trigger device. →6.2.2 Setting Trigger Types

### 7) [GOT Folder Name]

Set the folder path for the GOT (FTP client) to send and receive files.  
 Up to 76 one-byte alphanumeric characters and symbols are settable for the folder path.  
 The folder division symbol "\" is not required at the end.  
 Drive A, B, E, F, G, or X (current drive) is settable.  
 For the available drives by GOT model, refer to the following.  
 →1.2.7 Drive configuration of the target GOT for data transfer  
 For the restrictions on the folder name used in the GOT, refer to the following.  
 →12.4 Restrictions for Folder Names and File Names used in GOT

Item	Description
[Specification]	Select the method of specifying the GOT folder name. <ul style="list-style-type: none"> <li>• [Direct]: Select this item to enter the GOT folder name directly.</li> <li>• [Device]: Select this item to specify the GOT folder indirectly with a device.</li> </ul> →10.16.7 ■ 3 Indirect specification of the folder name and file name
[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly. To select a GOT (FTP client) folder from the folders set in GT Designer3, click the [Folder List] button. Clicking this button displays the [Folder List] dialog. Select the save destination folder name from the list. Only [GOT Folder Name] reflects an item selected in the [Folder List] dialog. [Transfer File Name] does not reflect.
[Folder List] button	When the following functions are set in the project, the [Folder List] dialog lists the names of the save destination folders set for each function. <ul style="list-style-type: none"> <li>• [Comment]</li> <li>• [User Alarm Observation]</li> <li>• [System Alarm Observation]</li> <li>• [Logging]</li> <li>• [Recipe]</li> <li>• [Operation Log]</li> <li>• [Hard Copy]</li> </ul> <div style="text-align: center;">  </div> <ul style="list-style-type: none"> <li>• [Function Name] Displays the name of the function for which the file save settings have been configured.</li> <li>• [ID] Displays the setting ID set for each function. (Example: Alarm ID is displayed for the user alarm observation.) This space is blank when the function has no setting ID.</li> <li>• [Name] Displays the setting name set for each function. (Example: Alarm name is displayed for the user alarm observation.) This space is blank when the function has no setting name.</li> <li>• [Folder Name] Displays the name of the save destination folder for the file.</li> <li>• [File Name] Displays the name of the file stored in the save destination folder.</li> </ul>
[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the GOT folder name. The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.) →10.16.7 ■ 3 Indirect specification of the folder name and file name
[Maximum number of characters]	Set the maximum number of characters for the GOT folder name. The setting range is [8] to [76].

### 8) [FTP Server Folder]

Set the folder path for the FTP server to send and receive files.

To access the default folder of the FTP server, do not specify a folder.

Example) When the default folder of the FTP server is set to \root\ftp\file\

- If no folder is specified, the GOT will access the default folder (\root\ftp\file\).
- If \hoge\ is specified, the GOT will access the specified folder (\root\ftp\file\hoge\).

Up to 250 one-byte alphanumeric characters and symbols are settable for the folder path.

The maximum number of characters and available characters differ depending on the specifications of the FTP server.

Check the manual of the FTP server before setting.

The folder division symbol "\" is not required at the end.

For the restrictions on the folder name used in the GOT, refer to the following.

→ 12.4 Restrictions for Folder Names and File Names used in GOT

Item	Description
[Specification]	Select the method of specifying the FTP server folder. <ul style="list-style-type: none"> <li>• [Direct]: Select this item to enter the FTP server folder directly.</li> <li>• [Device]: Select this item to specify the FTP server folder indirectly with a device.</li> </ul> → 10.16.7 ■ 3 Indirect specification of the folder name and file name
[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly.
[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the FTP server folder name. The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.) → 10.16.7 ■ 3 Indirect specification of the folder name and file name
[Maximum number of characters]	Set the maximum number of characters for the FTP server folder name. The setting range is [8] to [250].

## 9) [Transfer File Name]

Set a transfer file name.

Up to 75 one-byte alphanumeric characters and symbols are settable for the file name.

A wildcard character can be used in the transfer file name.

→ 10.16.7 ■ 5 Specifying the transfer file with the wild card

For the restrictions of the file name used in the GOT, refer to the following.

→ 12.4 Restrictions for Folder Names and File Names used in GOT

Item	Description
[Specification]	Select the method of specifying the transfer file name. <ul style="list-style-type: none"> <li>• [Direct]: Select this item to enter the transfer file name directly.</li> <li>• [Device]: Select this item to specify the transfer file name with specific devices.</li> </ul> → 10.16.7 ■ 3 Indirect specification of the folder name and file name
[File Name]	When selecting [Direct] for [Specification], enter the transfer file name directly.
[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the transfer file name. The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.) → 10.16.7 ■ 3 Indirect specification of the folder name and file name
[Maximum number of characters]	Set the maximum number of characters for the transfer file name. The setting range is [8] to [75].

## 10) [File Overwrite Specification]

Set the behavior to be performed when the transfer destination folder has a file with the same name as the transfer file.

- [All]: Overwrites files each time.
- [Updated files only]: Overwrites an existing file in the transfer destination folder only when the time stamp of the transfer file is equal to or newer than that of the existing file.

In other cases, files are not transferred.

## 11) [Delete the source file after the transfer is completed]

Select this item to delete the source file after the transfer is completed.

**Selection for [File Overwrite Specification]**

To transfer only the logging files that are updated by the logging function, select [Updated files only]. Since the transferred files are not resent, the file transfer efficiency is increased.

**10.16.7 Operation of the file transfer function (FTP transfer)**

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**1 Application examples**

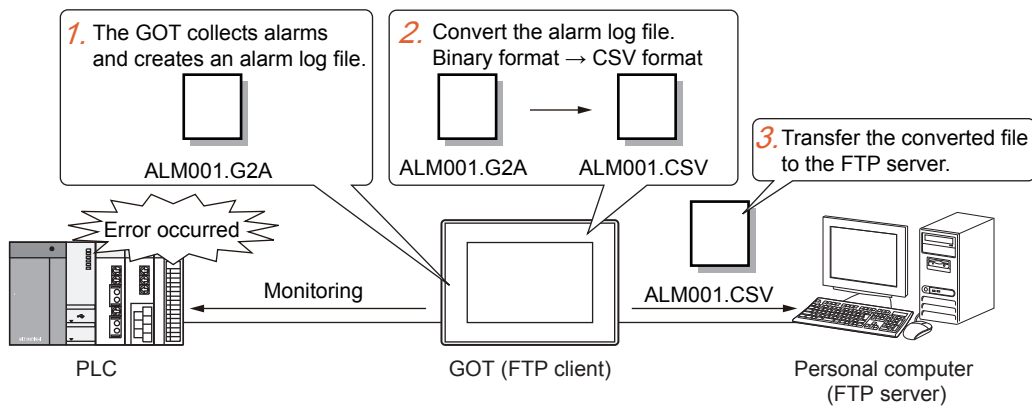

The following shows application examples of the file transfer function (FTP transfer).

**(1) Sending an alarm log file**

The alarm log file created by the GOT is converted to a CSV file and transferred to the FTP server. The file conversion is optional.

For the details of alarms, refer to the following.

⇒9.1 Collecting Alarms by Monitoring Devices or the System ([Alarm])

- Step 1** The GOT creates the alarm log file based on the collected alarm data.
- Step 2** Convert the alarm log file from the binary format to the CSV format by using the convert trigger device for the file.
- Step 3** Transfer the converted file to the FTP server.

**(a) Settings**

This application example requires the following settings.

- Alarm settings

Setting	Description	Reference	
[Alarm Common Setting]	[Convert trigger device]	Set any bit device.	
	[Convert-in-motion notification device]		
[User Alarm Observation]	[Basic] tab	Set the method of collecting the history. Select [Historical] or [Cumulative].	
	[Device] tab		Set the target device for observation.
	[File Save] tab		Select [Save alarm log files] and set the save destination for the log file and the storage trigger. Select [Rise] for the trigger type of the storage trigger.

- Settings of the file transfer function (FTP transfer)

Setting	Description	Reference
[Destination FTP Server Setting]	Set any FTP server.	⇒10.16.5 [Destination FTP Server Setting] dialog

Setting	Description		Reference
[File Transfer Setting]	[Transfer Type]	Select [FTP Transfer].	→10.16.6 [File Transfer Setting] dialog
	[File Transfer Trigger]	Set [Rise].	
	[Transfer File Name]	Set the name of the alarm log file specified in the alarm observation.	

• GOT special register (GS)

Setting	Description	Reference
GS990.b0	File Writing signal	→10.16.7 ■ 2 (2) Write device

## (b) Action

The following shows an example of converting and transferring an alarm log file.

**Step 1** Turn on the convert trigger device for the alarm log file.

The GOT starts the file conversion and the Convert-in-motion Notification device turns on.

**Step 2** Turn off the convert trigger device after the start of the file conversion.

Upon completion of the file conversion, the Convert-in-motion Notification device turns off.

**Step 3** Turn on the file transfer trigger.

The GOT starts the file transfer and the File Writing signal (GS990.b0) turns on.

**Step 4** Turn off the file transfer trigger after the start of the file transfer.

Upon completion of the file transfer, the File Writing signal (GS990.b0) turns off.

For the convert trigger device for the alarm log file, refer to the following.

→9.1.2 ■ 5 [Alarm Common Setting] dialog

## Point

### Turning on the file transfer trigger automatically

In the example above, the user needs to turn on the file transfer trigger after the file conversion.

The user also needs to turn off the convert trigger device for the alarm log file and file transfer trigger after the start of the processing.

Using two project scripts enables these operations to be performed automatically.

The following shows an example of settings.

#### (1) Device

Device name	Device No.	Script which uses the device
Convert-in-motion Notification device for the alarm log file	GB100	Script No.1
Trigger device for script No.1		
Convert trigger device for the alarm log file	GB105	Script No.1
File transfer trigger	GB110	Script No.1, script No.2
File Writing signal	GS990.b0	Script No.2
Trigger device for script No.2		

#### (2) Project script setting

(a) Script No.1 Set [Rise] for the trigger type. Use the Convert-in-motion Notification device for the alarm

log file as the trigger device.

(b) Script No.2 Set [Rise] for the trigger type. Use the File Writing signal (GS990.b0) as the trigger device.

(3) Script

(a) Script No.1 set([b: GB110]); //File transfer trigger ON rst([b: GB105]); //Alarm log file convert trigger OFF

(b) Script No.2 rst ([b: GB110]); //File transfer trigger OFF

■2 Checking the processing status

With the file transfer function (FTP transfer), you can check the file transfer status, errors, and other relevant information by using GOT special registers (GS).

(1) Read device

⇒12.1.3 GOT special register (GS)

Device	Name		Description
GS401	File Transfer Control		Controls the file transfer.
	b0	Clear File Transfer Error signal	Turn on this signal to clear an error that occurred in the file transfer. When GS401.b0 is turned on, the following signal turns off. <ul style="list-style-type: none"> <li>Warning signal (GS990.b14)</li> <li>File Transfer Error signal (GS990.b15)</li> </ul>
GS402	File Transfer Timeout Time		Set the timeout period for the file transfer. The default is 3 seconds. The setting range is [1] to [300] second(s). When the device value is set to 0, or 301 or more, [3] seconds is applied.

(2) Write device

⇒12.1.3 GOT special register (GS)

Device	Name		Description
GS987	Executing File Transfer ID Notification		Stores the file transfer ID of the file transfer in execution.
GS988	Communicating FTP Server ID Notification		Stores the FTP server setting ID of the currently connected destination FTP server.
GS989	File Transfer Error No.		Stores the error code of an error that occurred in the file transfer. ⇒10.16.10 ■2 Error codes for the file transfer function
GS990	File Transfer Status		Notifies the file transfer processing status.
	b0	File Writing signal	Turns on when the GOT (FTP client) writes files to the FTP server.
	b1	File Reading signal	Turns on when the GOT (FTP client) reads files from the FTP server.
	b2	FTP Server Connection Mode signal	Notifies the connection mode of the GOT (FTP client) and the FTP server. ON: PASV mode OFF: PORT mode
	b14	Warning signal	Turns on when the error with which the processing can be continued occurs during the file transfer. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
	b15	File Transfer Error signal	Turns on when the error with which the processing cannot be continued occurs during the file transfer. Files cannot be transferred while this signal is on. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
GS991	Number of Transfer Target Files		Stores the total number of files to be transferred. When the transfer file name is specified with the wild card, the total count includes the files which are not transferred due to an invalid number of characters for the folder name or other causes. (However, the total count does not include only the files which have invalid names consisting of such as two-byte characters.) Holds the device value until the processing for the next file transfer ID is started.
GS992	Number of Transferred Files		Stores the total number of the files already transferred. The total count includes the files which are not transferred due to the error or other causes. Holds the device value until the processing for the next file transfer ID is started.

■3 Indirect specification of the folder name and file name

When [Device] is selected for [Specification] in the folder name or file name setting, consecutive word devices starting from a specified device store the folder name or file name.

The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.)

In the ASCII code, store the folder name or file name in order from the lower to the upper bit of each device.

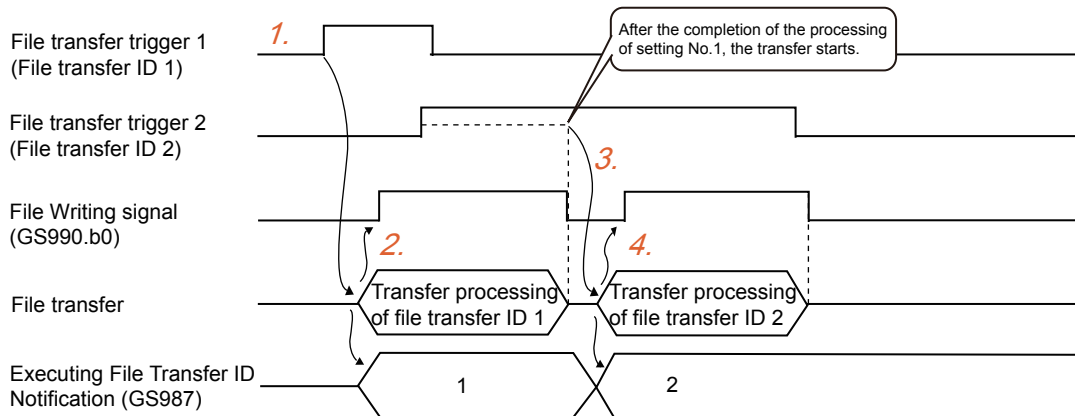

Store Null (0x00) at the end of the folder name.

Example) Specifying the [ftpclient1] folder in drive A

#### ■ 4 Operation when the conditions of file transfer triggers are satisfied

The following shows an operation example of the file transfer function when the conditions of two file transfer triggers are satisfied sequentially.

- Step 1** When the condition of file transfer trigger 1 is satisfied, the GOT starts the file transfer for file transfer ID 1.
- Step 2** The File Writing signal (GS990.b0) turns on, and the Executing File Transfer ID Notification device (GS987) stores 1.
- Step 3** While the File Writing signal (GS990.b0) is on, even if the condition of file transfer trigger 2 is satisfied, the GOT does not start the file transfer for file transfer ID 2. Upon completion of the file transfer for file transfer ID 1, the File Writing signal (GS990.b0) turns off. Then, the GOT starts the file transfer for file transfer ID 2.
- Step 4** The File Writing signal (GS990.b0) turns on, and the Executing File Transfer ID Notification device (GS987) stores 2. Upon completion of the file transfer for file transfer ID 2, the File Writing signal (GS990.b0) turns off.

##### (1) File transfer trigger at GOT startup

When the trigger type of the file transfer trigger is [Rise] and the trigger device is on at GOT startup, the trigger condition is satisfied.

When the trigger type is [Rise] and the trigger device is off, the trigger condition is also satisfied.

##### (2) File transfer trigger condition satisfied during file transfer

A file transfer trigger condition satisfied during file transfer is processed as shown below.

- Trigger for the same file transfer setting: The file transfer trigger does not start the transfer even if the condition is satisfied.
- Trigger for a different file transfer setting: When the file transfer trigger condition is satisfied, the GOT (FTP client) transfers the file after the transfer of the previous file is completed. When multiple trigger conditions are satisfied during the file transfer, the files are transferred in order of the file transfer setting ID.

#### ■ 5 Specifying the transfer file with the wild card

Use the wild card under the following conditions.

- Only [\*] can be used as the wild card. Example of valid use: [ARP\*.DAT] DATE Example of invalid use: [ARP?????.DAT]
- Only one [\*] can be used. However, only [\*.\*] is an exception. Example of valid use: [\*.\*.DAT] DATE Example of invalid use: [ARP\*.\*]
- You can use [\*] only immediately before [.] (period) for the file name. Example of valid use: [ARP\*.DAT] Example of invalid use: [ARP\*01.DAT]
- When you use [\*] in the extension part of the file name, the extension must consist of the wild card only. Example of valid use: ARP00001.\* Example of invalid use: [ARP00001.\*AT]

■ 1 Precautions for system configuration

(1) Connection to the intranet

If the system needs keeping secure against unauthorized access to the intranet, consult a network service provider or a network administrator (a person who does network planning, IP address management, and others), and include your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the intranet connection.

(2) Countermeasures against access delay

When multiple network devices (including GOTs) are connected to the same segment, the network load increases and therefore the communication performance between the GOT and PLC may be degraded.

The following countermeasures may improve the communication performance.

- Using the switching hub
- Reducing the number of devices the GOT monitors

(3) When a firewall is used

If a firewall disconnects the communication of the gateway function, take countermeasures such as changing the port No. to be protected behind the firewall.

If the system needs keeping secure against unauthorized access in changing the port No. to be protected behind the firewall, consult the network administrator (a person who does network planning, IP address management, and others), and develop your own countermeasures.

Mitsubishi Electric Corporation assumes no responsibility for consequences that may arise from system troubles due to the change of the port No.

■ 2 Precautions for using the file transfer function (FTP transfer)

(1) Precautions for system design

(a) Port No. overlap

Check if the port No. for FTP communication is not used in the connection with other equipment.

If an overlapped port No. is set, the communication with the FTP server may fail, or unexpected operation may occur in other equipment.

(b) Time stamp of the transfer file

The time stamp of the transfer file indicates the time taken from the destination FTP server when the file transfer to the destination folder is completed.

Depending on the destination FTP server, the time stamp of the transfer file may not be obtained.

In this case, the transfer file is overwritten each time regardless of the setting of [File Overwrite Specification].

(c) GOT (FTP client) time and FTP server time

When selecting [Updated files only] for [File Overwrite Specification], set the GOT (FTP client) time and FTP server time to be the same.

The time stamp of the transfer file indicates the time taken from the destination FTP server when the file transfer to the destination folder is completed.

Therefore, when the GOT (FTP client) time and FTP server time are different, the latest file may be regarded as older than the file transferred last time.

In this case, the file is not transferred.

Example) When the time difference is 20 minutes between the GOT (FTP client) and personal computer (FTP server)

Step 1 The GOT (FTP client) transfers the file created at 10:00.

Step 2 The time stamps of the file created at 10:10 and the file at the FTP server are compared.

**Step 3** Since the latest file is recognized as being older than that at the FTP server, the GOT (FTP client) does not transfer the file.

Select [All] for [File Overwrite Specification] if the time difference between the installation locations of the GOT (FTP client) and FTP server exists.

If the time difference between the installation locations exists, the GOT time and FTP server time may differ even the both time are set correctly. Therefore the time stamps cannot be compared properly.

#### (d) Indication in the file list of the FTP server

The GOT (FTP client) is compatible with the FTP servers that use alphanumerics to show the date and time information of the files in the file list.

If an FTP server uses characters other than alphanumerics such as Japanese kanji in the file list, the files cannot be transferred.

Configure the settings including the OS setting on the FTP server so that the FTP server uses alphanumerics to show the information in the file list.

To check the file list of the FTP server, issue a dir command or a list command in the command prompt on a personal computer that is connected to the FTP server.

Example 1) When the FTP server uses alphanumerics in the file list

The FTP server is compatible with the GOT (FTP client).

```
02-08-14 05:30PM          348000 sample1.txt
11-02-15 10:30AM          234000 sample2.txt
:
```

Example 2) When the FTP server uses alphanumerics in the file list

The FTP server is compatible with the GOT (FTP client).

```
-rwxrwxrwx 1 owner  group    348000 Feb 8 17:30 sample1.txt
-rwxrwxrwx 1 owner  group    234000 Nov 2 10:30 sample2.txt
:
```

Example 3) When the FTP server uses Japanese kanji characters in the file list

The FTP server is incompatible with the GOT (FTP client).

```
-rwxrwxrwx 1 owner  group    348000 2月 8日 17:30 sample1.txt
-rwxrwxrwx 1 owner  group    234000 11月 2日 10:30 sample2.txt
:
```

## (2) Precautions for transferring files

### (a) Folder path and transfer file name

The total number of characters of the folder path and transfer file name must be set as shown below.

- <GOT folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)
- <FTP server folder path>\<Transfer file name>: 250 characters or less (including backward slash marks)

If the total number of the characters exceeds the limits, an error occurs.

Specify the folder path and transfer file name by using one-byte alphanumeric characters and symbols.

If you use two-byte characters, the specified file cannot be transferred.

### (b) Warning possibly given if the file name is specified with a wildcard character

If the file name is specified with a wildcard character, a warning may be given at a file transfer.

Even if a warning is given, the file transfer process does not stop.

However, the file transfer may fail due to other causes, such as an invalid transfer file name or write-protect transfer destination folder.

Check the error code stored in the File Transfer Error No. (GS989), eliminate the cause, and then perform the file transfer again.

→10.16.10 ■ 2 Error codes for the file transfer function

**(c) Offline status of the GOT**

When the GOT becomes offline during the file transfer, the file transfer is interrupted.

During the file transfer, do not perform the operation that causes the GOT to be offline, such as establishing the communication with GT Designer3.

**(d) Deleting source files after the file transfer has completed**

When you make a selection to delete source files after the file transfer is complete in [File Transfer Setting], note the following.

- Deleting files to which the GOT refers Do not delete the files to which the GOT refers, such as a logging file, from the GOT folder. Otherwise, you cannot view such data on the GOT.
- Specifying the transfer file name with a wildcard character When specifying the transfer file name with a wildcard character, you may delete a required file unintentionally. If the transfer source folder has a required file, take one of the following measures. · Deselect [Delete the source file after the transfer is completed]. · When specifying the transfer file name with a wildcard character, check in advance that only the transfer target files are narrowed down.

**(e) Handling of a file transfer error**

If an error occurs in the file transfer, turn on the Clear File Transfer Error signal (GS401.b0) to turn off the File Transfer Error signal (GS990.b15).

While the File Transfer Error signal (GS990.b15) is on, the GOT does not start transferring the subsequent files because the file transfer is recognized to have an error.

**(f) Using a recipe while a recipe file is transferred**

Do not use the recipe while you transfer the recipe file to the GOT.

If the recipe file in the data storage is deleted while the recipe is processed, the function may not be performed properly.

If the recipe file is deleted even while the recipe is not processed, the error (system alarm: recipe file error) occurs when the recipe is performed next time.

**(g) Power off during the access to the data storage**

Do not power off the GOT while the FTP server is accessing the file in the data storage of the GOT.

Doing so may cause the data corruption in the data storage.

**(h) File password when the FTP server function of a MITSUBISHI PLC is used**

When the FTP server function of a MITSUBISHI PLC is used, the GOT cannot transfer a password-protected file.

Do not set a password for the file to be transferred with the file transfer function (FTP transfer).

**(i) Creating a folder when the FTP server function of a MITSUBISHI PLC is used**

When you use the FTP server function of a MITSUBISHI PLC, the GOT cannot create a folder in the PLC by using the file transfer function (FTP transfer).

Create a file transfer destination folder in advance.

**■ 3 Restrictions on accessing MELSEC iQ-F**

When using MELSEC iQ-F as an FTP server, note the following restrictions.

**(1) Setting the FTP server type**

Select [General-purpose] for [FTP Server Type] in the [Destination FTP Server Setting] dialog.

If you select [MELSEC], the GOT cannot communicate with the FTP server.

For the settings of the [Destination FTP Server Setting] dialog, refer to the following.

→10.16.6 [File Transfer Setting] dialog

**(2) Remote password authentication**

Do not set a remote password on the FTP server.

The GOT cannot access the FTP server that uses the remote password authentication.

**(3) Access in the PASV mode**

Set [FTP Server Connection Mode] to [PORT mode] in the [Destination FTP Server Setting] dialog.

The GOT cannot access the FTP server in the PASV mode.

For the settings of the [Destination FTP Server Setting] dialog, refer to the following.

→10.16.6 [File Transfer Setting] dialog

**(4) Writing files to the FTP server**

Do not write files to the FTP server.

This operation is not available.

(Only reading files is available.)

## 10.16.9 Relevant settings

---

Set the relevant settings other than the specific settings for the file transfer function (FTP transfer) as required. The following shows the functions that are available by the relevant settings.

→ 12.1.3 GOT special register (GS)

### ■ 1 GOT Internal Device

Function	Setting item
Turning on when the FTP server function is enabled	GS200.b1
Turning on when the FTP client is logged in	GS200.b2
Notifying the forced logout of the FTP server function to the GOT	GS400.b2
Enabling the reading of binary format files (*.G2 □) from the FTP client	GS400.b8
Turning on this signal to clear an error that occurred in the file transfer	GS401.b0
Setting the timeout period for FTP communication	GS402
Storing the file transfer ID of the file transfer in execution	GS987
Storing the FTP server setting ID of the connected FTP server	GS988
Storing the error code of an error that occurred in the file transfer	GS989
Notifying the file transfer processing status	GS990
Storing the total number of files to be transferred	GS991
Storing the total number of transferred files	GS992

■ 1 Troubleshooting for the file transfer function (FTP transfer)

The following shows the troubleshooting for the file transfer function (FTP transfer).

Symptom	Details of error and cause	Corrective action
The file transfer function (FTP transfer) does not work.	When all the bits of GS200 are off and the GOT does not respond to Ping *1*2	The system application (extended function) for the file transfer function is not installed on the GOT. Write the package data that contains the system application (extended function) for the file transfer function to the GOT. →4. COMMUNICATING WITH GOT
		No IP address has been set for the GOT. Set the IP address for the GOT in the utility of the GOT.
		The port number of the personal computer (MX Component) is different from that of the GOT (5011). Set the same port number for the personal computer (MX Component) as that of the GOT (5011).
	If any bit of GS200 is on and the GOT responds to Ping *1*2	- Refer to the troubleshooting for the functions corresponding to the bits which are on, and take the corrective actions.
File cannot be transferred.	The system application (extended function) for the file transfer function is not installed on the GOT.	Write the package data that contains the system application (extended function) for the file transfer function to the GOT. →4. COMMUNICATING WITH GOT
	The connection setting with the FTP server is not configured properly.	Check the followings in [Destination FTP Server Setting]. • FTP server IP address, connection mode, and port No. • User name and password
	The FTP server is not working.	Check if the FTP server has stopped.

\*1 For the details of the Gateway Common Information (GS200), refer to the following.

→12.1.3 GOT special register (GS)

\*2 To check if the GOT responds to Ping, give the ping command through the personal computer to the GOT.

■ 2 Error codes for the file transfer function

The following lists the error codes that are stored in the GOT special register, GS989 (File Transfer Error No.).

Error code	Details of error and cause	Corrective action
1	The connection to the FTP server has failed.	<ul style="list-style-type: none"> <li>• Check the IP address of the FTP server.</li> <li>• Check if a cable is connected.</li> <li>• Check the connection status of the HUB.</li> <li>• Check if the FTP server is working on the target device.</li> <li>• Check if the setting in [Destination FTP Server Setting] is configured properly.</li> </ul>
2	Authentication of the FTP server has failed.	Check if the login username and the password for the accessed FTP server are correct.
	The authentication using the remote password has failed.	Check if the remote password for the PLC is correct.
3	FTP server Busy	Wait until the FTP server recovers from the busy status*1.
4	FTP communication timeout	<ul style="list-style-type: none"> <li>• Check if the communication line has not been physically interrupted.</li> <li>• Check the communication congestion.</li> </ul>
5	Access to the target file to be written has failed.	<ul style="list-style-type: none"> <li>• Check if the write destination drive is enabled.</li> <li>• Check if the write destination drive has enough available space.</li> <li>• Check if the file is not write-prohibited.</li> <li>• When using the GOT as the FTP server, check if the GOT is in the write enable mode.</li> <li>• When using the FTP server function of the PLC, check if a write destination folder exists. If no write destination folder exists, create one.</li> <li>• When using the FTP server function of the PLC, check if a password is set for the file to be transferred. If a password is set, cancel the password protection.</li> </ul>

Error code	Details of error and cause	Corrective action
6	Access to the target file to be read has failed.	<ul style="list-style-type: none"> <li>• Check if the target file exists.</li> <li>• Check if the file name specified in [File Transfer Setting] is correct.</li> <li>• Check if the data storage has been installed on the GOT.</li> <li>• Check if the SD card cover has been closed.</li> <li>• Check that the SD card access switch is turned on.</li> <li>• Check that the write protection for the SD card is canceled.</li> <li>• When using the FTP server function of the PLC, check if a password is set for the file to be transferred. If a password is set, cancel the password protection.</li> </ul>
7	The file whose size is the file supported by the GOT or more was attempted to be transferred.	Check if the size of the transfer file is less than 2GB.
10	<ul style="list-style-type: none"> <li>• For the FTP transfer The GOT folder name is invalid.</li> <li>• For the GOT internal transfer The transfer source folder name is invalid.</li> </ul>	Check that the GOT folder name or the transfer source folder name does not contain invalid characters, such as two-byte characters.
11	The transfer file name is invalid.	Check if the transfer file name does not include invalid characters such as two-byte characters.
12	The transfer source folder and destination folder have the same path.	Set different paths to the transfer source folder and the transfer destination folder.
50	The drive specification on the PLC side is incorrect.	When a PLC is used as a FTP server, only drive 2 (Memory card (ROM)) is accessible. Check if the setting of [FTP Server Folder] specified in the [File Transfer Setting] dialog is correct.
100	The destination FTP server setting ID which does not exist has been specified.	<ul style="list-style-type: none"> <li>• Check if the destination FTP server setting ID specified in [File Transfer Setting] is correct.</li> <li>• Add the required destination FTP server setting.</li> </ul>
200	Access to the storage device has failed when the file name or folder name is specified indirectly.	Check if the device setting used for the indirect specification is correct.
507	The total number of characters of the folder path and transfer file name exceeds the limit.	Check that the total number of the characters does not exceed the limit as shown below.
600* <sup>2</sup>	The file transfer has been skipped because the total number of characters of the folder path and transfer file name exceeds the limit. (Only when the file is specified with a wildcard character)	<ul style="list-style-type: none"> <li>• &lt;GOT folder path&gt;\&lt;Transfer file name&gt;: 78 characters or less (including backward slash marks)</li> <li>• &lt;FTP server folder path&gt;\&lt;Transfer file name&gt;: 250 characters or less (including backward slash marks)</li> <li>• &lt;Transfer source folder path&gt;\&lt;Transfer file name&gt;: 78 characters or less (including backward slash marks)</li> <li>• &lt;Transfer destination folder path&gt;\&lt;Transfer file name&gt;: 78 characters or less (including backward slash marks)</li> </ul>
601* <sup>2</sup>	Since invalid characters had been used for the transfer file name, the transfer processing was skipped. (only when the file is specified with the wild card)	Check if the transfer file name does not include invalid characters such as two-byte characters.
602* <sup>2</sup>	Since the write operation for the file had failed, the transfer processing was skipped. (only when the file is specified with the wild card)	<ul style="list-style-type: none"> <li>• Another function might have been using the transfer file. Transfer the file again.</li> <li>• Check if the write destination drive has enough available space.</li> </ul>
603* <sup>2</sup>	Since the read operation for the file had failed, the transfer processing was skipped. (only when the file is specified with the wild card)	<ul style="list-style-type: none"> <li>• The file might have been deleted before being transferred. Check if all the files have been transferred to the destination folder.</li> <li>• Check if the data storage has been installed on the GOT.</li> <li>• Check if the SD card cover has been closed.</li> <li>• Check that the SD card access switch is turned on.</li> <li>• Check that the write protection for the SD card is canceled.</li> </ul>
606* <sup>2</sup>	Since the file specified with the wild card had not existed, the file was not transferred. (only when the file is specified with the wild card)	Check if the specified file name is correct.
607* <sup>2</sup>	The file whose size is the file supported by the GOT or more was attempted to be transferred. (only when the file is specified with the wild card)	Check if the size of the transfer file is less than 2GB.
610* <sup>2</sup>	Deleting the source file has failed.	Check if the source file is in the deletable status.

\*1 The status in which a request from the client cannot be accepted

\*2 Even if a warning is given, the file transfer process does not stop.

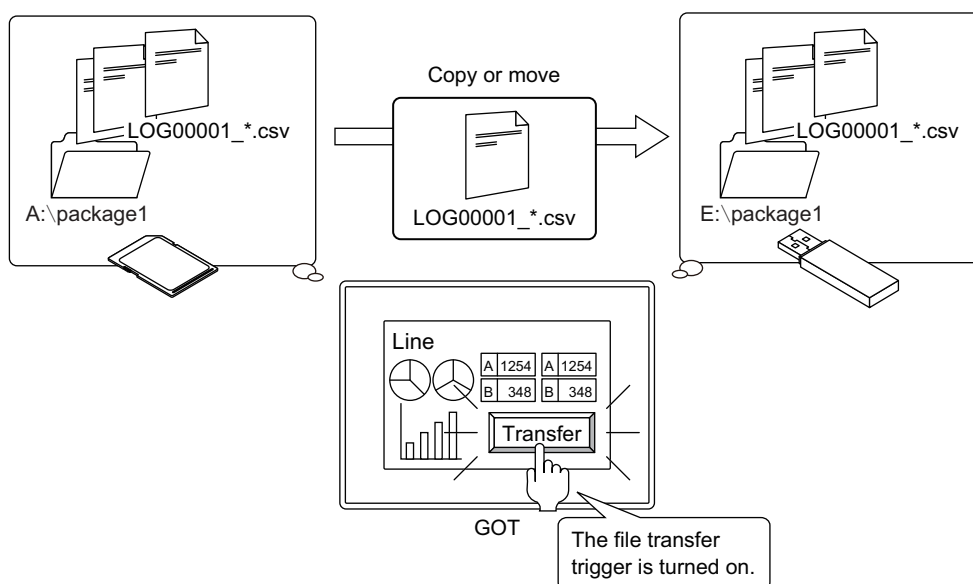

## 10.17 Transferring a File between the GOT Drives (File Transfer Function (GOT Internal Transfer))

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 10.17.1 Overview of the file transfer function (GOT internal transfer)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The file transfer function (GOT internal transfer) enables you to copy or move a file to another drive or folder within the GOT.

### 10.17.2 Specifications of the file transfer function (GOT internal transfer)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■1 System application (extended function)

To use the file transfer function (GOT internal transfer), a system application (extended function) of [File Transfer] is required.

To incorporate the application into package data automatically, select [Use the function of File Transfer] and configure the settings in the [Controller Setting] window ([File Transfer]).

→10.17.4 [File Transfer] (GOT internal transfer)

#### ■2 Specifications of the GOT internal transfer

The following shows the specifications of the file transfer function (GOT internal transfer).

Item	Specifications
Number of file transfer settings	Max. 100 (FTP transfer settings and GOT internal transfer settings in total)
Required devices for the file access	Data storage
Transfer target	Files in the transfer source folder (The files in the sub folders are excluded.)
Number of characters for file path	<ul style="list-style-type: none"> <li>&lt;Transfer source folder path&gt;\&lt;Transfer file name&gt;: Up to 78 one-byte alphanumeric characters and symbols in total (including backward slash marks)</li> <li>&lt;Transfer destination folder path&gt;\&lt;Transfer file name&gt;: Up to 78 one-byte alphanumeric characters and symbols in total (including backward slash marks)</li> </ul>

## 10.17.3 How to use the file transfer function (GOT internal transfer)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1 Setting procedure

**Step 4** Set the file transfer function (GOT internal transfer) with GT Designer3.

→ 10.17.4 [File Transfer] (GOT internal transfer)  
10.17.5 [File Transfer Setting] dialog

**Step 5** Write the package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→ 4. COMMUNICATING WITH GOT

**Step 6** Check the operation of the file transfer function (GOT internal transfer) on the GOT.

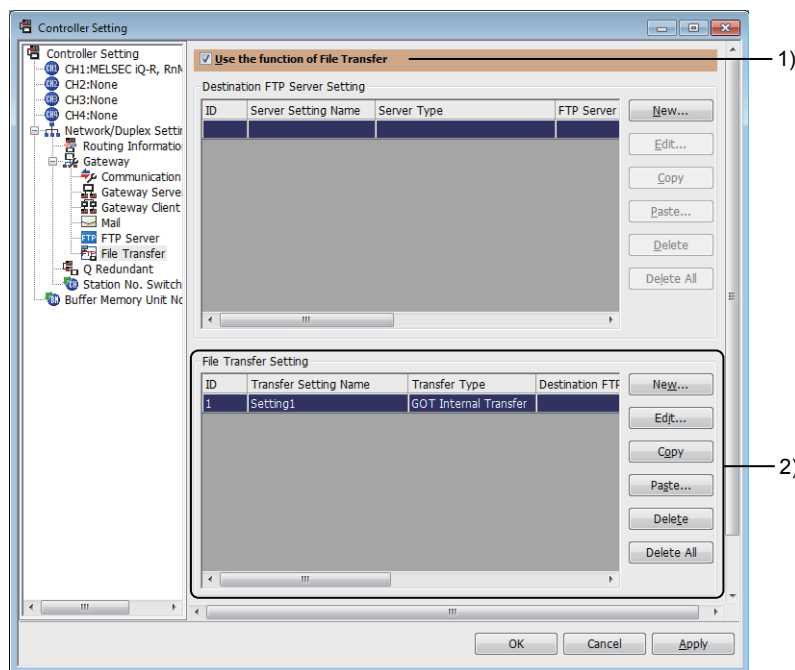

→ 10.17.6 Operation of the file transfer function (GOT internal transfer)

## 10.17.4 [File Transfer] (GOT internal transfer)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select [Common] → [Controller Setting] from the menu to display the [Controller Setting] window.

**Step 2** Select [File Transfer] in the [Controller Setting] window, and set the items.

#### 1) [Use the function of File Transfer]

Enables the file transfer function.

#### 2) [File Transfer Setting]

Lists the file transfer settings.

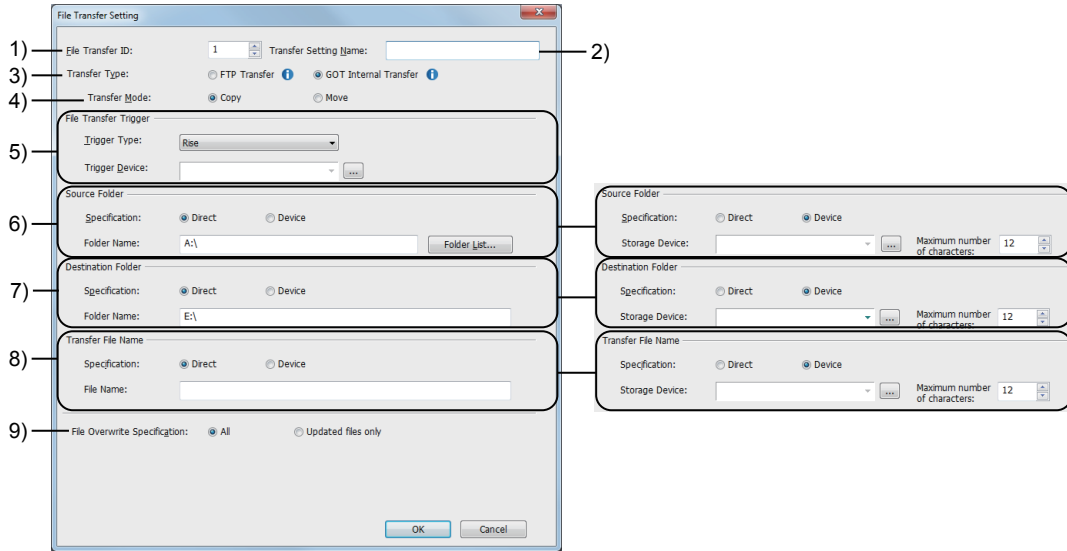

Up to 100 file transfer settings can be configured.

Item	Description
[New] button	Displays the [File Transfer Setting] dialog to add a new file transfer setting. → 10.17.5 [File Transfer Setting] dialog
[Edit] button	Displays the [File Transfer Setting] dialog to edit the selected file transfer setting. → 10.17.5 [File Transfer Setting] dialog
[Copy] button	Copies the selected file transfer setting.
[Paste] button	Displays a dialog to specify the destination file transfer ID, and pastes the copied file transfer setting to the specified destination.

Item	Description
[Delete] button	Deletes the selected file transfer setting.
[Delete All] button	Deletes all the file transfer settings.

### 10.17.5 [File Transfer Setting] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 1) **[File Transfer ID]**  
Set the ID to specify the file transfer setting.  
Set the number which does not overlap with that of other file transfer settings.  
The setting range is [1] to [32767].
- 2) **[Transfer Setting Name]**  
Set the name of the file transfer setting.  
Up to 32 characters can be set.
- 3) **[Transfer Type]**  
Select [GOT Internal Transfer].
- 4) **[Transfer Mode]**  
Select the method of transferring a file.  
The following shows the items to be selected.
  - [Copy]
  - [Move]
- 5) **[File Transfer Trigger]**  
Set the trigger to execute the file transfer.

Item	Description
[Trigger Type]	Set the trigger type. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Rise]</li> <li>• [Fall]</li> <li>• [Sampling]</li> <li>• [ON Sampling]</li> <li>• [OFF Sampling]</li> </ul> ⇒10.17.6 ■ 4 Operation after file transfer trigger conditions being satisfied
[Trigger device]	When selecting [Rise], [Fall], [ON Sampling], or [OFF Sampling] for the trigger type, set the bit device as the trigger device. ⇒6.2.2 Setting Trigger Types

- 6) **[Source Folder]**  
Specify the transfer source folder path.  
Up to 76 one-byte alphanumeric characters and symbols are settable for the folder path.  
The folder division symbol "\" is not required at the end.  
Drive A, B, E, F, G, or X (current drive) is settable.  
For the available drives by GOT model, refer to the following.

⇒ 1.2.7 Drive configuration of the target GOT for data transfer

For the restrictions on the folder name used in the GOT, refer to the following.

⇒ 12.4 Restrictions for Folder Names and File Names used in GOT

Item	Description
[Specification]	Select the method of specifying the transfer source folder name. <ul style="list-style-type: none"> <li>• [Direct]: Select this item to enter the transfer source folder name directly.</li> <li>• [Device]: Select this item to specify the transfer source folder name with specific devices.</li> </ul> ⇒ 10.17.6 ■ 3 Indirect specification of the folder name and file name
[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly. To select a folder from the existing ones that are set with GT Designer3, click the [Folder List] button to display the [Folder List] dialog. Select the transfer source folder from the folder list. The folder selected in the [Folder List] dialog is reflected in [Source Folder] only. (The folder is not reflected in [File Name].)
[Folder List] button	When the following functions are set in the project, the [Folder List] dialog lists the names of the save destination folders set for each function. <ul style="list-style-type: none"> <li>• [Comment]</li> <li>• [User Alarm Observation]</li> <li>• [System Alarm Observation]</li> <li>• [Logging]</li> <li>• [Recipe]</li> <li>• [Operation Log]</li> <li>• [Hard Copy]</li> </ul> <div data-bbox="730 792 1219 1133" style="text-align: center;"> </div> <ul style="list-style-type: none"> <li>• [Function Name] Displays the name of the function for which the file save settings have been configured.</li> <li>• [ID] Displays the setting ID set for each function. (Example: Alarm ID is displayed for the user alarm observation.) This space is blank when the function has no setting ID.</li> <li>• [Name] Displays the setting name set for each function. (Example: Alarm name is displayed for the user alarm observation.) This space is blank when the function has no setting name.</li> <li>• [Folder Name] Displays the name of the save destination folder for the file.</li> <li>• [File Name] Displays the name of the file stored in the save destination folder.</li> </ul>
[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the transfer source folder name. The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.) ⇒ 10.17.6 ■ 3 Indirect specification of the folder name and file name
[Maximum number of characters]	Set the maximum number of characters for the transfer source folder name. The setting range is [8] to [76].

7) [Destination Folder]

Specify the transfer destination folder path.

Up to 76 one-byte alphanumeric characters and symbols are settable for the folder path.

The folder division symbol "\" is not required at the end.

Drive A, B, E, F, G, or X (current drive) is settable.

For the available drives by GOT model, refer to the following.

⇒ 1.2.7 Drive configuration of the target GOT for data transfer

For the restrictions on the folder name used in the GOT, refer to the following.

⇒ 12.4 Restrictions for Folder Names and File Names used in GOT

Item	Description
[Specification]	Select the method of specifying the transfer destination folder name. <ul style="list-style-type: none"> <li>• [Direct]: Select this item to enter the transfer destination folder name directly.</li> <li>• [Device]: Select this item to specify the transfer destination folder name with specific devices.</li> </ul> ⇒ 10.17.6 ■ 3 Indirect specification of the folder name and file name
[Folder Name]	When selecting [Direct] for [Specification], enter the folder name directly.
[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the transfer destination folder name. The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.) ⇒ 10.17.6 ■ 3 Indirect specification of the folder name and file name
[Maximum number of characters]	Set the maximum number of characters for the transfer destination folder name. The setting range is [8] to [76].

8) [Transfer File Name]

Set a transfer file name.

Up to 75 one-byte alphanumeric characters and symbols are settable for the file name.

A wildcard character can be used in the transfer file name.

⇒ 10.17.6 ■ 5 Specifying the transfer file with the wild card

For the restrictions of the file name used in the GOT, refer to the following.

⇒ 12.4 Restrictions for Folder Names and File Names used in GOT

Item	Description
[Specification]	Select the method of specifying the transfer file name. <ul style="list-style-type: none"> <li>• [Direct]: Select this item to enter the transfer file name directly.</li> <li>• [Device]: Select this item to specify the transfer file name with specific devices.</li> </ul> ⇒ 10.17.6 ■ 3 Indirect specification of the folder name and file name
[File Name]	When selecting [Direct] for [Specification], enter the transfer file name directly.
[Storage Device]	When selecting [Device] for [Specification], set the start device of consecutive word devices that store the transfer file name. The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.) ⇒ 10.17.6 ■ 3 Indirect specification of the folder name and file name
[Maximum number of characters]	Set the maximum number of characters for the transfer file name. The setting range is [8] to [75].

9) [File Overwrite Specification]

Set the behavior to be performed when the transfer destination folder has a file with the same name as the transfer file.

- [All]: Overwrites files each time.
  - [Updated files only]: Overwrites an existing file in the transfer destination folder only when the time stamp of the transfer file is equal to or newer than that of the existing file.
- In other cases, files are not transferred.

**Point** 

**Selection for [File Overwrite Specification]**

To transfer only the logging files that are updated by the logging function, select [Updated files only]. Since the transferred files are not resent, the file transfer efficiency is increased.

## 10.17.6 Operation of the file transfer function (GOT internal transfer)

### 1 Application examples

The following shows an application example of the file transfer function (GOT internal transfer).

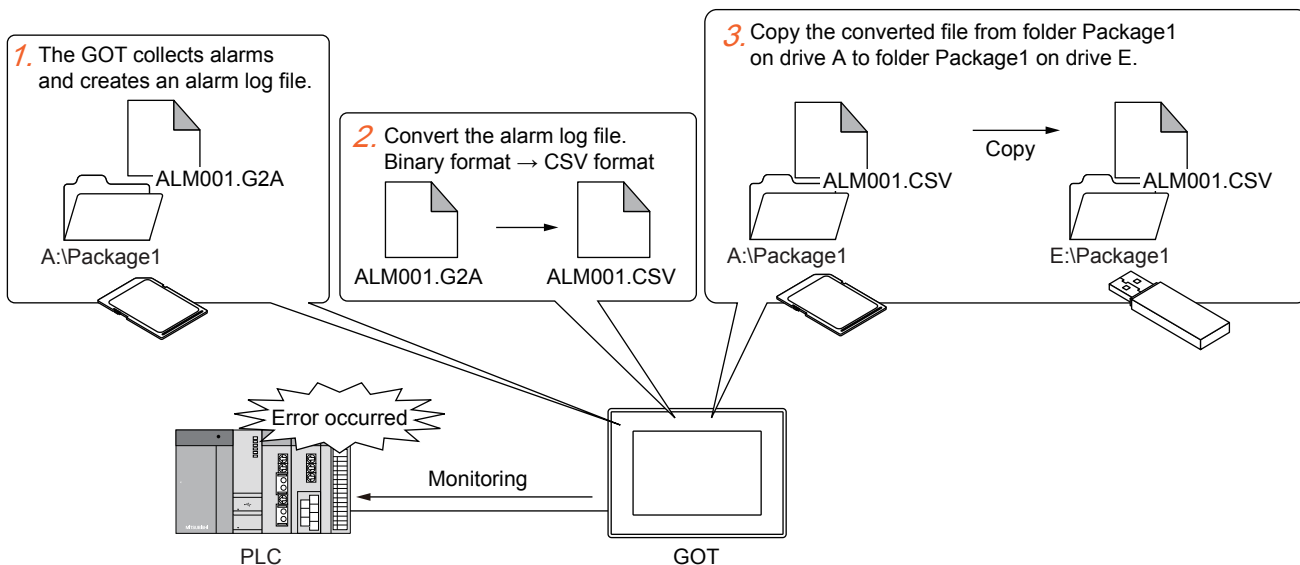

#### (1) Copying an alarm log file to another drive

The following shows an example of copying an alarm log file from folder Package1 on drive A to folder Package1 on drive E. The alarm log file is converted to the CSV format in advance.

The file conversion is optional.

For the details of alarms, refer to the following.

→9.1 Collecting Alarms by Monitoring Devices or the System ([Alarm])

**Step 1** The GOT collects alarm data and creates an alarm log file in folder Package1 on drive A.

**Step 2** Convert the alarm log file from the binary format to the CSV format by using the convert trigger device for the file.

**Step 3** Copy the converted file from folder Package1 on drive A to folder Package1 on drive E.

#### (a) Settings

This application example requires the following settings.

##### • Alarm settings

Setting	Description	Reference	
[Alarm Common Setting]	[Convert trigger device]	Set any bit device.	
	[Convert-in-motion notification device]		
[User Alarm Observation]	[Basic] tab	Set the method of collecting the history. Select [Historical] or [Cumulative].	
	[Device] tab		Set the target device for observation.
	[File Save] tab		

→9.1 Collecting Alarms by Monitoring Devices or the System ([Alarm])

##### • Settings of the file transfer function (GOT internal transfer)

Setting	Description	Reference
[File Transfer Setting]	[Transfer Type]	Select [GOT Internal Transfer].
	[Transfer Mode]	Select [Copy].
	[File Transfer Trigger]	Set [Rise].
	[Transfer File Name]	Set the name of the alarm log file specified in the alarm observation. Example) ALM001.CSV

→10.17.5 [File Transfer Setting] dialog

- GOT special register (GS)

Setting	Description	Reference
GS990.b0	File Writing signal	→10.17.6 ■ 2 (2) Write device

### (b) Action

The following shows an example of converting and transferring an alarm log file.

- Step 1** Turn on the convert trigger device for the alarm log file.  
The GOT starts the file conversion and the Convert-in-motion Notification device turns on.
- Step 2** Turn off the convert trigger device after the start of the file conversion.  
Upon completion of the file conversion, the Convert-in-motion Notification device turns off.
- Step 3** Turn on the file transfer trigger.  
The GOT starts the file transfer and the File Writing signal (GS990.b0) turns on.
- Step 4** Turn off the file transfer trigger after the start of the file transfer.  
Upon completion of the file transfer, the File Writing signal (GS990.b0) turns off.

For the convert trigger device for the alarm log file, refer to the following.

→9.1.2 ■ 5 [Alarm Common Setting] dialog

### Point

#### Turning on the file transfer trigger automatically

In the example above, the user needs to turn on the file transfer trigger after the file conversion. The user also needs to turn off the convert trigger device for the alarm log file and file transfer trigger after the start of the processing.

Using two project scripts enables these operations to be performed automatically.

The following shows an example of settings.

#### (1) Device

Device name	Device No.	Script which uses the device
Convert-in-motion Notification device for the alarm log file	GB100	Script No.1
Trigger device for script No.1		
Convert trigger device for the alarm log file	GB105	Script No.1
File transfer trigger	GB110	Script No.1, script No.2
File Writing signal	GS990.b0	Script No.2
Trigger device for script No.2		

#### (2) Project script setting

- (a) Script No.1 Set [Rise] for the trigger type. Use the Convert-in-motion Notification device for the alarm log file as the trigger device.
- (b) Script No.2 Set [Rise] for the trigger type. Use the File Writing signal (GS990.b0) as the trigger device.

#### (3) Script

- (a) Script No.1 set([b: GB110]); //File transfer trigger ON rst([b: GB105]); //Alarm log file convert trigger OFF
- (b) Script No.2 rst ([b: GB110]); //File transfer trigger OFF

## ■2 Checking the processing status

With the file transfer function (GOT internal transfer), you can check the file transfer status, errors, and other relevant information by using GOT special registers (GS).

### (1) Read device

⇒ 12.1.3 GOT special register (GS)

Device	Name		Description
GS401	File Transfer Control		Controls the file transfer.
	b0	Clear File Transfer Error signal	Turn on this signal to clear an error that occurred in the file transfer. When GS401.b0 is turned on, the following signal turns off. <ul style="list-style-type: none"> <li>Warning signal (GS990.b14)</li> <li>File Transfer Error signal (GS990.b15)</li> </ul>

### (2) Write device

⇒ 12.1.3 GOT special register (GS)

Device	Name		Description
GS987	Executing File Transfer ID Notification		Stores the file transfer ID of the file transfer in execution.
GS989	File Transfer Error No.		Stores the error code of an error that occurred in the file transfer. ⇒ 10.16.10 ■ 2 Error codes for the file transfer function
GS990	File Transfer Status		Notifies the file transfer processing status.
	b0	File Writing signal	Turns on during the file transfer.
	b14	Warning signal	Turns on when the error with which the processing can be continued occurs during the file transfer. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
GS991	b15	File Transfer Error signal	Turns on when the error with which the processing cannot be continued occurs during the file transfer. Files cannot be transferred while this signal is on. Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
	Number of Transfer Target Files		Stores the total number of files to be transferred. When the transfer file name is specified with the wild card, the total count includes the files which are not transferred due to an invalid number of characters for the folder name or other causes. (However, the total count does not include only the files which have invalid names consisting of such as two-byte characters.) Holds the device value until the processing for the next file transfer ID is started.
GS992	Number of Transferred Files		Stores the total number of the files already transferred. The total count includes the files which are not transferred due to the error or other causes. Holds the device value until the processing for the next file transfer ID is started.

## ■3 Indirect specification of the folder name and file name

When [Device] is selected for [Specification] in the folder name or file name setting, consecutive word devices starting from a specified device store the folder name or file name.

The number of the consecutive word devices equals half of the set value of [Maximum number of characters]. (Fractions are rounded up.)

In the ASCII code, store the folder name or file name in order from the lower to the upper bit of each device.

Store Null (0x00) at the end of the folder name.

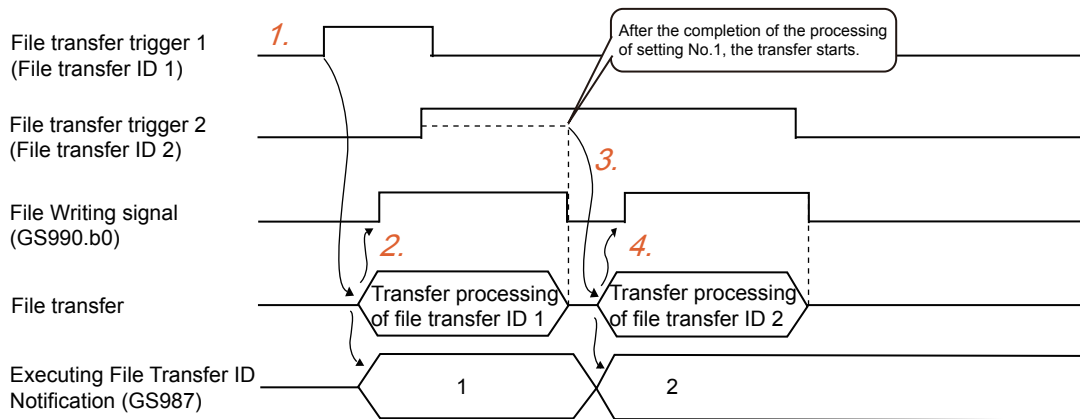

Example) Specifying the [ftpclient1] folder in drive A

#### ■4 Operation after file transfer trigger conditions being satisfied

The following shows an operation example of the file transfer function when the conditions of two file transfer triggers are satisfied sequentially.

- Step 1** When the condition of file transfer trigger 1 is satisfied, the GOT starts the file transfer for file transfer ID 1.
- Step 2** The File Writing signal (GS990.b0) turns on, and the Executing File Transfer ID Notification device (GS987) stores 1.
- Step 3** While the File Writing signal (GS990.b0) is on, even if the condition of file transfer trigger 2 is satisfied, the GOT does not start the file transfer for file transfer ID 2.  
Upon completion of the file transfer for file transfer ID 1, the File Writing signal (GS990.b0) turns off. Then, the GOT starts the file transfer for file transfer ID 2.
- Step 4** The File Writing signal (GS990.b0) turns on, and the Executing File Transfer ID Notification device (GS987) stores 2.  
Upon completion of the file transfer for file transfer ID 2, the File Writing signal (GS990.b0) turns off.

##### (1) File transfer trigger at GOT startup

When the trigger type of the file transfer trigger is [Rise] and the trigger device is on at GOT startup, the trigger condition is satisfied.

When the trigger type is [Rise] and the trigger device is off, the trigger condition is also satisfied.

##### (2) File transfer trigger condition satisfied during file transfer

A file transfer trigger condition satisfied during file transfer is processed as shown below.

- Trigger for the same file transfer setting: The file transfer trigger does not start the transfer even if the condition is satisfied.
- Trigger for a different file transfer setting: When the file transfer trigger condition is satisfied, the GOT (FTP client) transfers the file after the transfer of the previous file is completed. When multiple trigger conditions are satisfied during the file transfer, the files are transferred in order of the file transfer setting ID.

#### ■5 Specifying the transfer file with the wild card

Use the wild card under the following conditions.

- Only [\*] can be used as the wild card. Example of valid use: [ARP\*.DAT] DATE Example of invalid use: [ARP?????.DAT]
- Only one [\*] can be used. However, only [\*.\*] is an exception. Example of valid use: [\*.\*.DAT] DATE Example of invalid use: [ARP\*.\*]
- You can use [\*] only immediately before [.] (period) for the file name. Example of valid use: [ARP\*.DAT] Example of invalid use: [ARP\*01.DAT]
- When you use [\*] in the extension part of the file name, the extension must consist of the wild card only. Example of valid use: ARP00001.\* Example of invalid use: [ARP00001.\*AT]

## 10.17.7 Precautions

---

### ■ 1 Folder path and transfer file name

The total number of characters of the folder path and transfer file name must be set as shown below.

- <Transfer source folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)
- <Transfer destination folder path>\<Transfer file name>: 78 characters or less (including backward slash marks)

If the total number of the characters exceeds the limits, an error occurs.

Specify the folder path and transfer file name by using one-byte alphanumeric characters and symbols.

If you use two-byte characters, the specified file cannot be transferred.

### ■ 2 Warning possibly given if the file name is specified with a wildcard character

If the file name is specified with a wildcard character, a warning may be given at a file transfer.

Even if a warning is given, the file transfer process does not stop.

However, the file transfer may fail due to other causes, such as an invalid transfer file name or write-protect transfer destination folder.

Check the error code stored in the File Transfer Error No. (GS989), eliminate the cause, and then perform the file transfer again.

⇒ 10.16.10 ■ 2 Error codes for the file transfer function

### ■ 3 Offline status of the GOT

When the GOT becomes offline during the file transfer, the file transfer is interrupted.

During the file transfer, do not perform the operation that causes the GOT to be offline, such as establishing the communication with GT Designer3.

### ■ 4 Moving a file

When selecting [Move] for [Transfer Mode], note the following.

- Moving a file to which the GOT refers For a file (such as a logging file) to which the GOT refers, copy the file to another location instead of moving it. Otherwise, you cannot view the file on the GOT because the file is deleted from the source folder after the file transfer is complete.
- Specifying the transfer file name with a wildcard character When specifying the transfer file name with a wildcard character, you may delete a required file unintentionally. If the transfer source folder has a required file, take one of the following measures. · Select [Copy] for [Transfer Mode]. · When specifying the transfer file name with a wildcard character, check in advance that only the transfer target files are narrowed down.

### ■ 5 Transferring files in the sub folders

The files in the sub folders of the transfer source folder are not transferred.

### ■ 6 Handling of a file transfer error

If an error occurs in the file transfer, turn on the Clear File Transfer Error signal (GS401.b0) to turn off the File Transfer Error signal (GS990.b15).

While the File Transfer Error signal (GS990.b15) is on, the GOT does not start transferring the subsequent files because the file transfer is recognized to have an error.

## 10.17.8 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the file transfer function (GOT internal transfer) as required. The following shows the functions that are available by the relevant settings.

→ 12.1.3 GOT special register (GS)

### ■ 1 GOT Internal Device

Function	Setting item
Turning on this signal to clear an error that occurred in the file transfer	GS401.b0
Storing the file transfer ID of the file transfer in execution	GS987
Storing the error code of an error that occurred in the file transfer	GS989
Notifying the file transfer processing status	GS990
Storing the total number of files to be transferred	GS991
Storing the total number of transferred files	GS992

## 10.17.9 Troubleshooting

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 Troubleshooting for the file transfer function (GOT internal transfer)

The following shows the troubleshooting for the file transfer function (GOT internal transfer).

Symptom	Details of error and cause	Corrective action
File cannot be transferred.	The system application (extended function) for the file transfer function is not installed on the GOT.	Write the package data that contains the system application (extended function) for the file transfer function to the GOT. → 4. COMMUNICATING WITH GOT

### ■ 2 Error codes for the file transfer function

For the error codes that are stored in the GOT special register, GS989 (File Transfer Error No.), refer to the following.

→ 10.16.10 ■ 2 Error codes for the file transfer function

## 10.18 Monitoring a Controller from Tablets or Other Clients (GOT Mobile Function)

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 10.18.1 Overview of the GOT Mobile function

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### WARNING

- Remote control is available through a network by using GOT functions, including the SoftGOT-GOT link function, the remote personal computer operation function, the VNC server function, and the GOT Mobile function.  
If these functions are used to perform remote control of control equipment, the field operator may not notice the remote control, possibly leading to an accident.  
In addition, a communication delay or interruption may occur depending on the network environment, and remote control of control equipment cannot be performed normally in some cases.  
Before using the above functions to perform remote control, fully grasp the circumstances of the field site and ensure safety.
- When operating the server (GOT) of the GOT Mobile function to disconnect a client, notify the operator of the client about the disconnection beforehand.  
Not doing so may cause an accident.
- Make sure to fully understand the GOT network interaction function before using this function to control the authorization among pieces of equipment to prevent simultaneous operations.  
The exclusive authorization control of the GOT network interaction function can be enabled or disabled for each screen. (For all screens, the exclusive authorization control is disabled by default.)  
Properly determine the screens for which the exclusive authorization control is required, and set the control by screen.  
A screen for which the exclusive authorization control is disabled can be operated simultaneously from pieces of equipment. Make sure to determine the operation period for each operator, fully grasp the circumstances of the field site, and ensure safety to perform operations.

By using the GOT Mobile function, you can monitor a controller through the GOT from an information device, such as a tablet.

In the GOT Mobile function, the GOT operates as a server to provide mobile screens for clients.

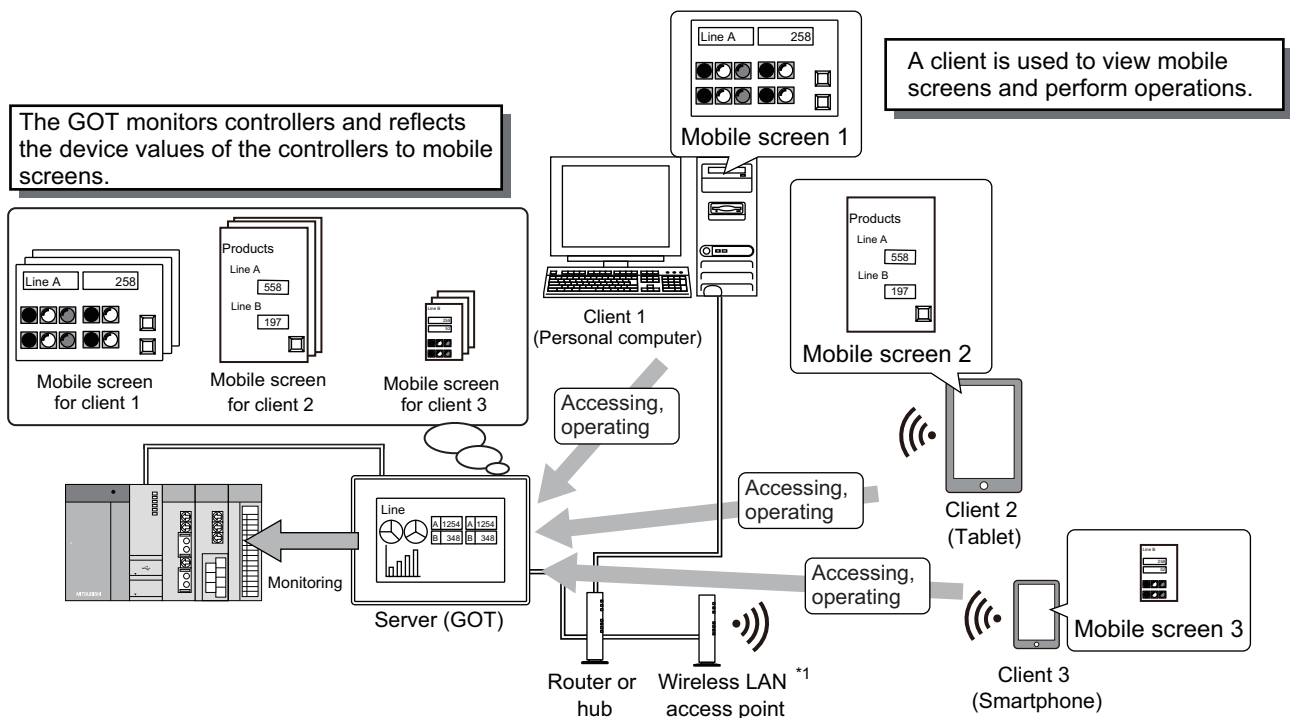

Information devices, such as a tablet, use a browser as the GOT Mobile function client to access mobile screens in the server (GOT).

Access to a mobile screen in the server (GOT) from a tablet

After the client accesses a mobile screen, you can perform operations on the mobile screen to monitor a controller through the GOT.

Up to five clients can access the server (GOT) simultaneously.

\*1 This is an example when a wireless LAN access point is used.

The wireless LAN access point is unnecessary if [Operation Mode] is set to [Access Point] in the GOT wireless LAN function.

→5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

The following shows the methods of connecting the server (GOT) and clients.

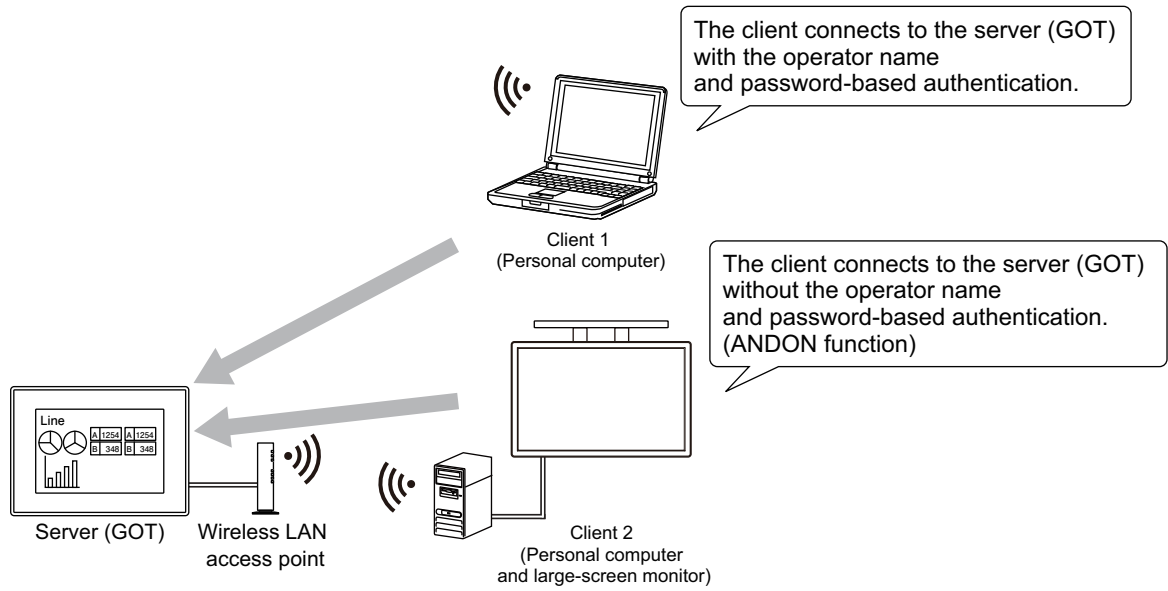

- Connection with the operator name and password-based authentication (The authentication screen appears.)
- Connection without the operator name and password-based authentication—ANDON function (The authentication screen does not appear.)

For the authentication, refer to the following.

→10.18.2 ■ 5 Authentication

For the ANDON function, refer to the following.

→10.18.4 ANDON function

In this section, the "server" and "client" refer to the GOT Mobile function server and client.

## 10.18.2 Specifications of the GOT Mobile function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ➔ ■ 1 Operating environment
  - 2 Usable functions
  - 3 Mobile screen
  - 4 GOT Mobile device (VGB and VGD)
  - 5 Authentication
  - 6 Authorization control
  - 7 Public folder
  - 8 File manager
  - 9 Hard copy function
  - 10 Differences between the functions to remotely operate the GOT

### ■ 1 Operating environment

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### (1) System application (extended function)

To use the GOT Mobile function, a system application (extended function) of [GOT Mobile Setting] is required. Selecting [Use GOT Mobile function] in [Basic Setting] in the [GOT Mobile Setting] dialog incorporates the application into package data automatically.

#### (2) CoreOS version

To use the GOT Mobile function, install version L or later of CoreOS on the GOT.

#### (3) License number registration

To use the GOT Mobile function, register a license number in the GOT.

For how to register the license number, refer to the following.

➔ GOT2000 Series User's Manual (Utility)

If the license number is unregistered, you can try the GOT mobile function for a cumulative amount of 30 minutes starting from the GOT startup.

During the trial, the mobile screen displays a watermark saying [License unregistration.] and the remaining trial time.

Up to two clients can access the server (GOT) simultaneously.

#### (4) Server specifications

The following shows the server specifications.

Item	Description
Http port No.	No.80 (standard), No.1024 to No. 65535 (user-definable)
Maximum number of clients connectable simultaneously*1	5
Http timeout time (Time limit to respond to a request from a browser)	30 seconds

\*1 Indicates the number of clients (browsers), not the number of information devices, which are connectable to the server simultaneously.

Example) When you use five browsers on a tablet to access the server (GOT), the number of clients being connected is counted as five.

#### (5) Client operating environment

The following shows the client operating environment.

Item	Description	
OS	Tablet, smartphone	Android 4.1 or later iOS 8 or later
	Personal computer	<ul style="list-style-type: none"> <li>• Microsoft Windows 10</li> <li>• Microsoft Windows 8.1</li> <li>• Microsoft Windows 8</li> <li>• Microsoft Windows 7 Service Pack 1 or later</li> </ul>

Item		Description
Browser	Tablet, smartphone	Browser that supports HTML5, CSS3, JavaScript, and WebSocket Protocol (RFC 6455) The following shows the recommended browsers. *1 • Google Chrome for Android (version 43 or later) • Safari 8.0 or later
	Personal computer	Browser that supports HTML5, CSS3, JavaScript, and WebSocket Protocol (RFC 6455) The following shows the recommended browsers. *1*2 • Google Chrome for Windows (version 43 or later)
Others		Network environment

\*1 Make sure to validate the operations of your browser.

\*2 Internet Explorer is not supported.

## ■ 2 Usable functions

The following shows the functions that can be used on a client.

### (1) Common functions

○ : Available, ×: Not available

Function	Availability	Remarks
System font display	×	• The standard font of each client is used.
Option font display	×	-
Superimposition of objects	○	-
Base screen display	○	• A mobile screen is used as a base screen on a client.
Overlap window display	×	-
Superimpose window display	×	-
Key window display	○	• The standard key window for mobile screens is used. For the details, refer to the following. →(a) Key window
Screen switching	○	• The screen switching setting for mobile screens is used. For the details, refer to the following. →(b) Screen switching
Station No. switching	×	• The GOT monitoring target cannot be switched for each mobile screen independently. Although the station No. switching can be performed on a client, the change is applied to all the clients.
Buffer memory unit No. switching	×	• The GOT monitoring target cannot be switched for each mobile screen independently. Although the buffer memory unit No. switching can be performed on a client, the change is applied to all the clients.
Language switching	○	• The language switching setting for mobile screens is used. For the details, refer to the following. →(c) Language switching
System information	○	• The GOT system information can be used on a client. However, the monitoring target cannot be switched on a per-client basis.
Security authentication	○	-
Alarm observation	○	• The operation results of the function on the GOT can be used on a client.
Alarm popup display	○	• The alarm popup display setting for mobile screens is used. For the details, refer to the following. →(d) Alarm popup display
Trigger action (project)	○	• The operation results of the function on the GOT can be used on a client.
Trigger action (screen)	×	• The operation results of the trigger action (screen) on the GOT can be used on a client.
Time action	○	• The operation results of the function on the GOT can be used on a client.
Hard copy function	×	-
Comment	○	-
Figure	○	• For the details, refer to the following. →(4) Figures that can be placed

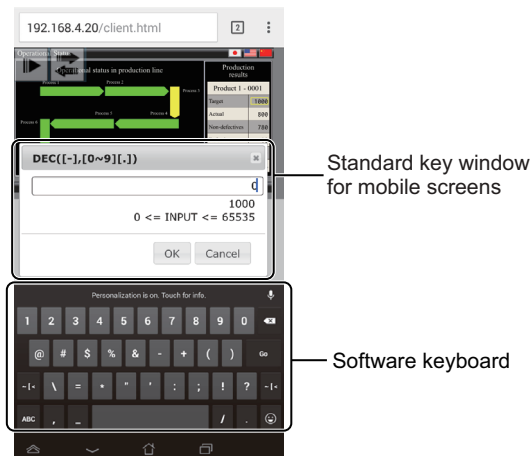

Function	Availability	Remarks
Object	○	• For the details, refer to the following. →(5) Objects that can be placed
GOT internal device	○	• The GOT internal devices can be used for clients through the GOT Mobile devices (VGB and VGD). For the details, refer to the following. → ■ 4 GOT Mobile device (VGB and VGD) • The GOT internal devices (GB and GD) can also be specified for clients without using the GOT Mobile devices (VGB and VGD).
Cursor movement	×	-
Operation Log	○	• The operation results of the function on the GOT can be used on a client.
Logging	○	
Recipe	○	
Project script	○	
Screen script	×	
Object script	×	• No object script is settable for an object on a mobile screen. However, script operating results on the GOT can be used on a client.
Multi-channel connection	×	-
Vertical display	○	• The size of a mobile screen is settable in the screen property.

**(a) Key window**

The standard key window for mobile screens is supported.

User-created windows are not supported.

When using a tablet or smartphone, input characters with the software keyboard.

The following shows the setting items of the standard key window for mobile screens.

**1) Input value display**

Displays the input value.

**2) Current value display**

Displays the current value of the device.

**3) Input range display**

Displays the valid input range.

(This item is not displayed for the text input.)

The displayed input range depends on the number of displayed digits which is set for the numerical input.

The following shows the meaning of displayed symbols.

- [INPUT]: Value to be input

- [ $<$ ]: The left side of the symbol is less than the right side.
- [ $<=$ ]: The left side of the symbols is less than or equal to the right side.
- [ $=$ ]: The left side of the symbols is equal to the right side.
- [ $\neq$ ]: The left side of the symbols differs from the right side.

#### 4) [OK] key (Enter key)

Confirms the input value.

#### 5) [CANCEL] key

Cancels the input value.

### (b) Screen switching

You can switch between mobile screens with the screen switching device dedicated to mobile screens.

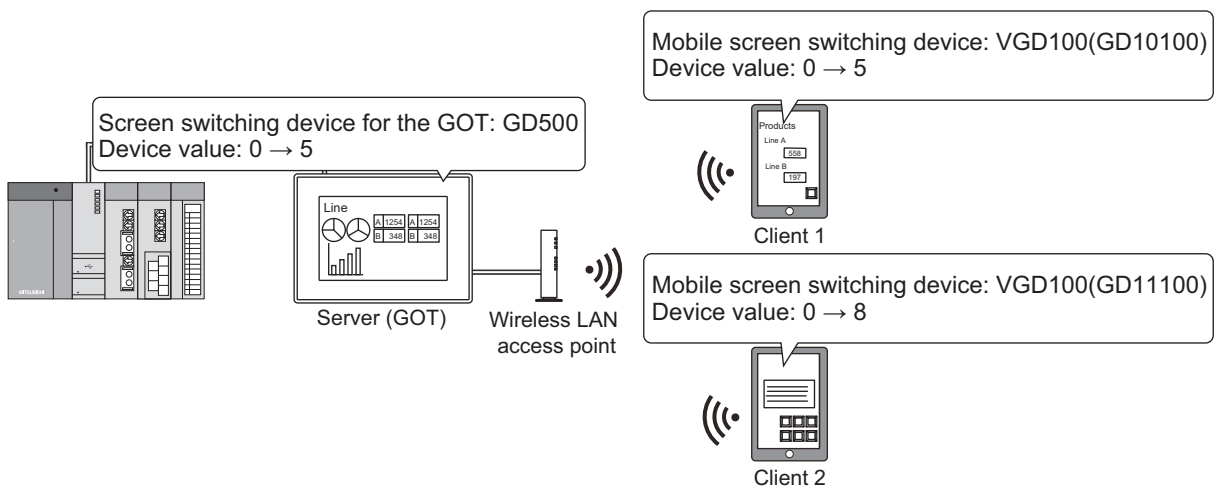

This device is set independently of the GOT environmental setting.

Therefore, when you switch between mobile screens on a client, the screen displayed on the GOT is not switched coincidentally.

To display different mobile screens on each client simultaneously, set a GOT Mobile device (VGB or VGD) for the screen switching device dedicated to mobile screens.

⇒ ■ 4 GOT Mobile device (VGB and VGD)

Example) When [Points] is set to 1000 and [First Device] is set to GD1000 in the device (VGD) allocation setting

Only the mobile screen is settable as the destination screen for the mobile screen switching.

For the screen switching setting for mobile screens, refer to the following.

⇒ 10.18.6 ■ 4 [Screen Switching]

### (c) Language switching

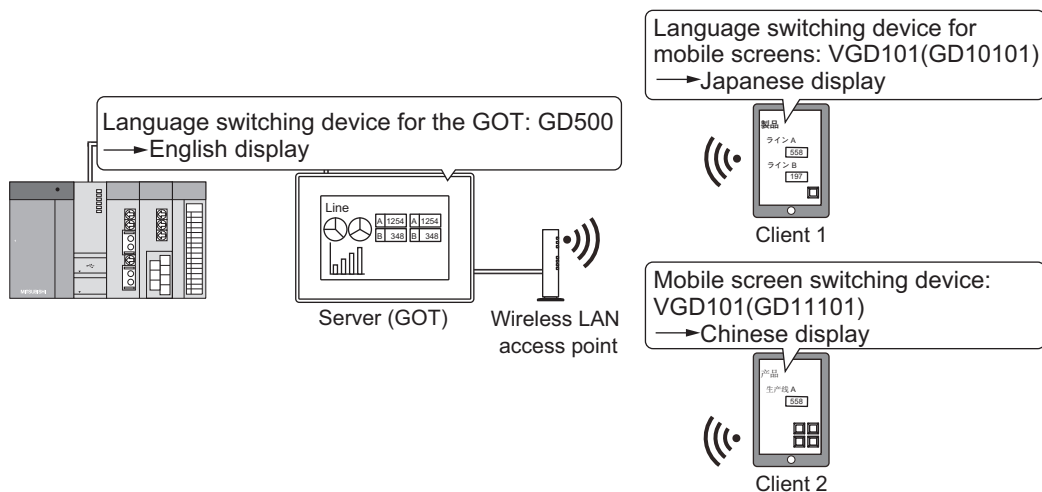

You can switch the languages of mobile screens with the language switching device dedicated to mobile screens.

Therefore, when you switch the languages of mobile screens on a client, the display language on the GOT is not switched coincidentally.

To switch between languages on a per-client basis, set a GOT Mobile device (VGB or VGD) for the language switching device dedicated to mobile screens.

⇒ ■ 4 GOT Mobile device (VGB and VGD)

Example) When [Points] is set to 1000 and [First Device] is set to GD1000 in the device (VGD) allocation setting

Except for the language switching device dedicated to mobile screens, the language switching settings configured in the [Environmental Setting] window are applied to the clients.

(The language switching settings are common to the GOT and the clients.)

The language switching device dedicated to mobile screens is settable when the language switching is enabled in the [Environmental Setting] window.

For the setting of the language switching device for mobile screens, refer to the following.

⇒ 10.18.6 ■ 5 [Language Switching]

#### (d) Alarm popup display

You can use the alarm popup display dedicated to mobile screens.

The alarm popup display settings are not common to the GOT and the clients.

To use the alarm popup display on both the GOT and the clients, configure the alarm popup settings for the GOT and the mobile screens independently.

For the alarm popup display for mobile screens, some setting items have restrictions as shown below.

- [Basic] tab
  - [Close up the space between alarm comments] is not settable.
  - [Touch Mode] can be set to [None] or [Stage Hierarchy Switching] only.
- [Text Style] tab
  - [Font] is not settable.

For the alarm popup display settings, refer to the following.

⇒ 10.18.6 ■ 8 [Alarm Popup Display]

#### **GOT Graphic Ver.2**

For the alarm popup display for mobile screens, an opaque popup window appears in a user-specified background color.

#### (2) Utility function

The utility function cannot be used on clients.

#### (3) Extended functions

The following extended functions are usable.

- GOT network interaction
- Operator authentication

#### (a) Screen security (level authentication and operator authentication)

For the screen security on clients, the authentication method set in [Security] in the [Environmental Setting] window is applied.

(The authentication method is common to the GOT and the clients.)

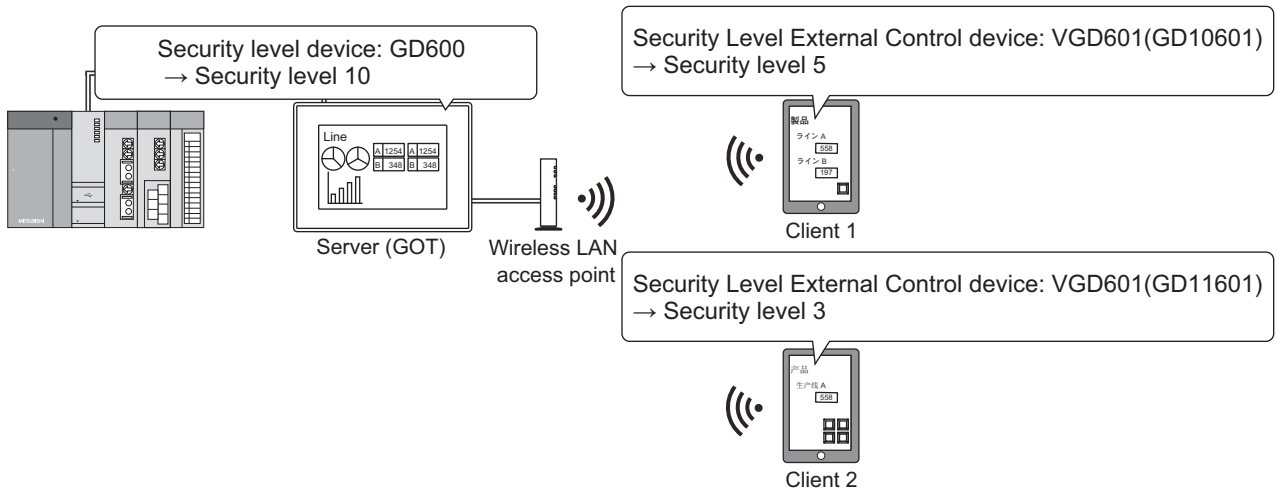

When the level authentication is used, the GOT and each client can display a screen according to their security levels.

For the clients, the security level device (Security Level External Control device) dedicated to mobile screens is used for the level authentication.

To display a screen with different security levels on each client, set a GOT Mobile device (VGB or VGD) for the Security Level External Control device.

Except for the Security Level External Control device dedicated to mobile screens, the screen security settings configured in [Security] in the [Environmental Setting] windows are applied to the clients.

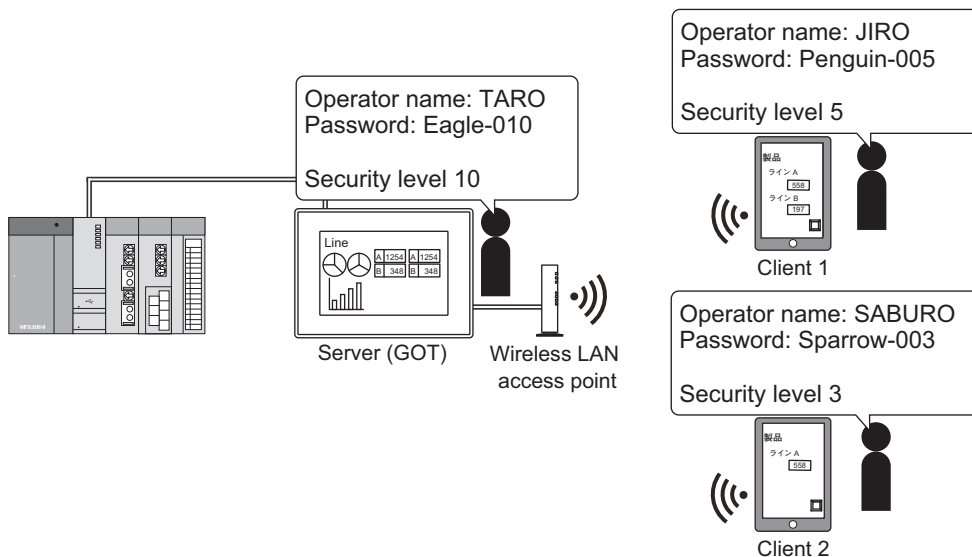

Example) When [Points] is set to 1000 and [First Device] is set to GD10000 in the device (VGD) allocation setting

When the operator authentication is used, you can log in or out from the GOT and each client with different operator accounts.

Configure the operator authentication settings for the GOT and the clients independently.

On the clients, the operator authentication through an external authentication device (such as a barcode reader or RFID controller) is not available.

For the screen security setting for clients, refer to the following.

→10.18.6 ■ 7 [Security]

For the screen security setting for the GOT, refer to the following.

→5.2.6 Configuring the security settings for displaying screen data on the GOT ([Screen Security])

#### (4) Figures that can be placed

The following shows the figures that can be placed on mobile screens.

○ : Available, ×: Not available

Figure	Availability	Restrictions
Text	○	• [Font], [Direction], and [KANJI Region] are not settable.
Logo text	○	-
Line	○	• The [Lamp Feature] and [Trigger] tabs are not settable.
Line freeform	○	
Rectangle	○	
Polygon	○	
Circle	○	
Arc, sector	○	-
Table	○	-
Scale	○	-
Piping	○	• The [Lamp Feature] and [Trigger] tabs are not settable. • [Layer] is not settable.
Paint	×	-
Import image data	○	-
Import DXF data	○	-
Import IGES data	○	-

For the figures on mobile screens, some setting items have restrictions.

##### (a) [Lamp Feature] tab and [Trigger] tab

The lamp feature and trigger settings are not available.

Therefore, a figure cannot be displayed in different styles according to the conditions. In this case, use a lamp object instead.

##### (b) [Font], [Direction], and [KANJI Region]

Each client displays characters in its standard font.

Therefore, the font, orientation of characters, and KANJI region are not settable with GT Designer3.

To change the font or KANJI region, change the standard font of the client used.

The orientation of characters cannot be changed.

##### (c) [Layer]

For mobile screens, the layer setting is not available.

Figures and objects are always displayed in the order specified with GT Designer3.

## (5) Objects that can be placed

The following shows the objects that can be placed on mobile screens.

○ : Available, ×: Not available

Object	Availability	Restrictions
Touch switch	Switch	○ <ul style="list-style-type: none"> <li>In [Action List] of the [Action] tab, [Station No. Switching] and [Key Window Display] are not selectable.</li> <li>In the [Style] tab, [Reverse Switch Area] is not settable.</li> <li>In the [Text] tab, [Font] is not settable.</li> <li>The [Script] tab is not settable.</li> <li>In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.</li> </ul>
	Bit switch	○ <ul style="list-style-type: none"> <li>In the [Text] tab, [Font] is not settable.</li> </ul>
	Word switch	○ <ul style="list-style-type: none"> <li>In the [Extended] tab, [KANJI Region] and [Layer] are not settable.</li> </ul>
	Go to screen switch	○ <ul style="list-style-type: none"> <li>In the [Next Screen] tab, [Screen Type] is fixed to [Mobile].</li> <li>In the [Text] tab, [Font] is not settable.</li> <li>In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.</li> </ul>
	Change station No. switch	× -
	Special function switch	○ <ul style="list-style-type: none"> <li>In the [SP Function] tab, items other than the following ones are not selectable for [Switch Action].            [Password (Security Level)]            [Login/Logout (Operator)]            [Password Change (Operator)]</li> <li>In the [Text] tab, [Font] is not settable.</li> <li>In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.</li> </ul>
	Key window display switch	× -
Lamp	Key code switch	○ <ul style="list-style-type: none"> <li>In the [Key Code] tab, items other than the following ones are not selectable for [Key Code Type].            [Numerical/Text Input]            [Alarm]            [Historical Trend Graph/Historical Data List]</li> <li>In the [Text] tab, [Font] is not settable.</li> <li>In the [Extended] tab, [Buzzer], [KANJI Region], and [Layer] are not settable.</li> </ul>
	Bit lamp	○ <ul style="list-style-type: none"> <li>In the [Text] tab, [Font] is not settable.</li> <li>In the [Extended] tab, [KANJI Region] and [Layer] are not settable.</li> <li>The [Script] tab is not settable.</li> </ul>
	Word lamp	○ <ul style="list-style-type: none"> <li>In the [Text] tab, [Font] is not settable.</li> <li>In the [Extended] tab, [KANJI Region] and [Layer] are not settable.</li> <li>The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.</li> </ul>
Lamp area	× -	
Numerical display	○ <ul style="list-style-type: none"> <li>In the [Device] tab, [Font] is not settable.</li> <li>In the [Extended] tab, [Display Mode], [KANJI Region], and [Layer] are not settable.</li> <li>The [Operation] tab is displayed instead of the [Operation/Script] tab. The object script settings are not available.</li> </ul>	
Numerical input	○ <ul style="list-style-type: none"> <li>In the [Device] tab, [Font] is not settable.</li> <li>In the [Extended] tab, the following items are not settable.            [Display Mode], [Move Destination ID], [Display input value on destination object location], [Input data using Bar Code/RFID], [KANJI Region], and [Layer]</li> <li>The [Operation] tab is displayed instead of the [Operation/Script] tab. Window position		×	-
Key window object		×	-
Hyperlink		○	-

For the objects on mobile screens, some setting items have restrictions.

(a) **Setting of [Go To Screen Switch]**

Since clients can display mobile screens only, [Screen Type] is fixed to [Mobile] in the [Go To Screen Switch] dialog.

(b) **Object script**

No object script is settable for an object on a mobile screen.

Create a mobile screen without object scripts.

**(c) Font and KANJI region**

Each client displays characters in its standard font.  
 Therefore, the font and KANJI region are not settable with GT Designer3.  
 To change the font or KANJI region, change the standard font of the client used.

**(d) Layers and display mode**

For mobile screens, the layer settings are not available.  
 Therefore, the display mode ([Transparent] or [XOR]) of an object is not settable.  
 Figures and objects are always displayed in the order specified with GT Designer3.

**(e) Set overlay screen object**

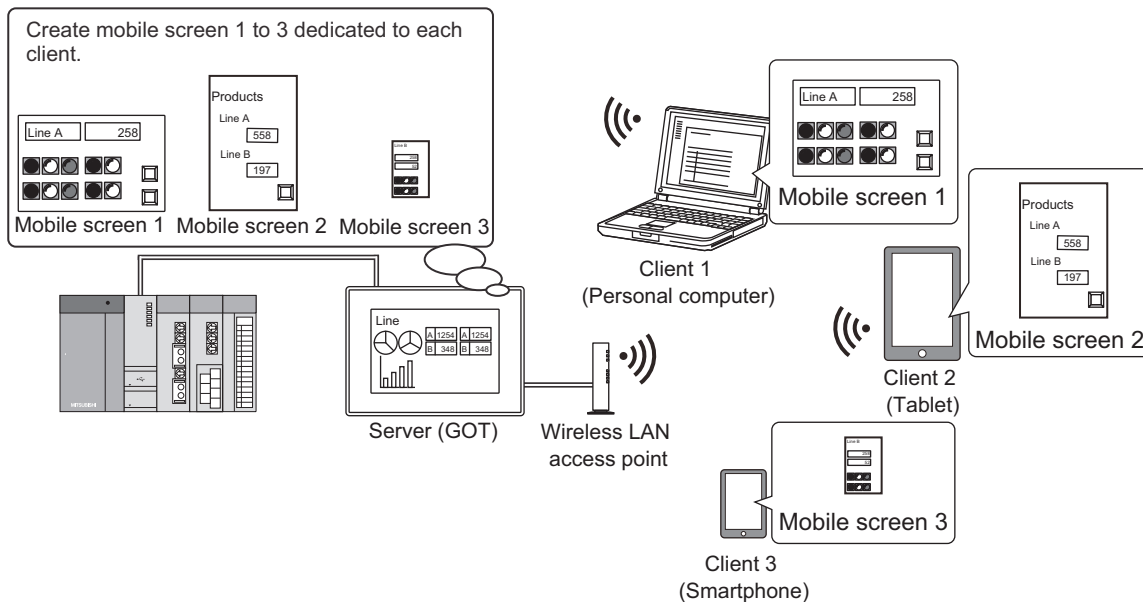

Only mobile screens can be called.  
 You cannot call another mobile screen from a called mobile screen.

**3 Mobile screen**

The mobile screen is a monitor screen dedicated to clients.  
 (The GOT cannot display mobile screens.)

Since the screen size is settable for each mobile screen, you can create mobile screens for each client according to the client display size.

For the functions, figures, and objects available on mobile screens, refer to the following.

⇒ 2 Usable functions

Mobile screens are created with GT Designer3, and the mobile screen data is contained in the GOT project.

For information on how to create a mobile screen, refer to the following.

⇒ 10.18.3 3 Usage

**(1) Mobile screen specifications**

Equipment	Screen size (width × height) (dots)	Number of screens registrable	Registrable screen number	Number of simultaneously displayable screens
Personal computer, tablet, or smartphone (client)	480 to 3000 × 480 to 3000	4096	0 to 32767	5

**(a) Font and KANJI region**

Each client displays characters in its standard font. Therefore, the font and KANJI region are not settable with GT Designer3.  
 To change the font or KANJI region, change the standard font of the client used.

**(b) Layers and display mode**

For mobile screens, the layer settings are not available.  
 Figures and objects are always displayed in the order specified with GT Designer3.

#### 4 GOT Mobile device (VGB and VGD)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The GOT Mobile device (VGB and VGD) is a virtual device usable for a client.

Assign GOT internal devices (GB and GD) to GOT Mobile devices for a client. Thus, the GOT Mobile devices are used as internal devices for the client.

Multiple clients are controllable individually by assigning different GOT internal devices for each client.

Example) When the screen switching is performed simultaneously on multiple clients

##### (1) Setting range and settable devices

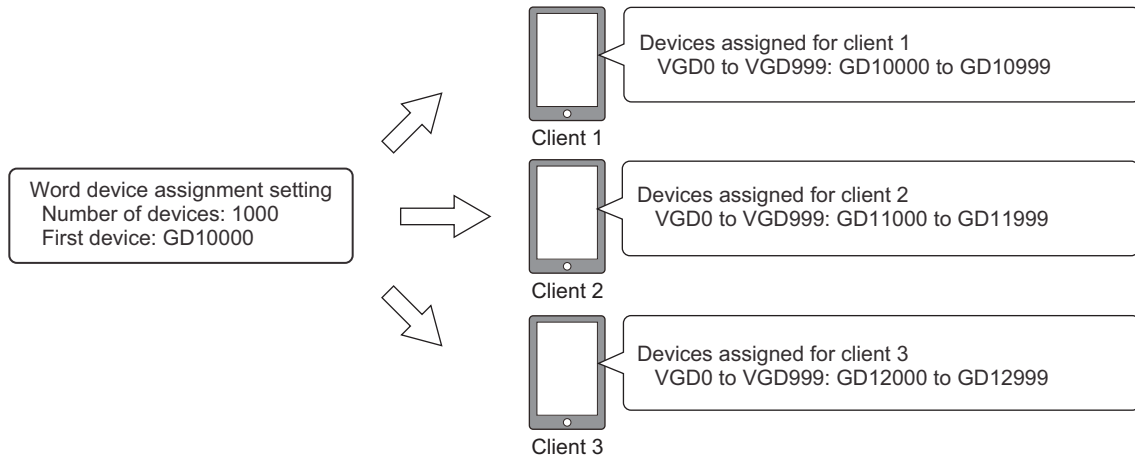

Target device	Setting range of the GOT Mobile device	GOT Mobile device No. representation	Number of the GOT internal devices that can be assigned	GOT internal device that can be assigned
GOT Mobile bit register (VGB)	VGB0 to VGB32767	Decimal number	32 to 32768 (in 32-point units)	GB64 to GB65535 <sup>*1</sup>
GOT Mobile data register (VGD)	VGD0 to VGD32767	Decimal number	2 to 32768 (in 2-point units)	GD0 to GD65535

\*1 Do not assign GB0 to GB63 to the GOT Mobile device because these internal devices (GB0 to GB63) are already assigned for the GOT system.

##### (2) How to assign a GOT internal device

Set the number of devices to be assigned, and specify the first device assigned for client 1. Then, the set number of consecutive devices (starting from the specified first device) are automatically assigned to the GOT Mobile devices for each client.

Example) Assigning 1000 GOT internal devices (GD) to the GOT Mobile devices (VGD) for client 1, client 2, and client 3

For the GOT Mobile device setting, refer to the following.

→10.18.6 ■ 3 [Device Allocation Setting]

### (3) Clearing the values of the GOT Mobile devices

If you select [Initialize the devices (VGD, VGB) at the time of client connection] in the [GOT Mobile Setting] window ([Device Allocation Setting]), the values of the GOT Mobile devices assigned to a client are cleared when the client connects to the GOT.

If you deselect the item, the assigned devices retain the values stored in the last session.

→10.18.6 ■ 3 [Device Allocation Setting]

## ■5 Authentication

The following shows the methods of connecting the GOT and clients.

- Connection with the operator name and password-based authentication (The authentication screen appears.)
- Connection without the operator name and password-based authentication—ANDON function (The authentication screen does not appear.)

For the ANDON function, refer to the following.

→10.18.4 ANDON function

For the connection with the operator name and password-based authentication, a target client displays mobile screens upon being authenticated.

The authentication method is selectable between the GOT Mobile exclusive authentication and the operator authentication.

For the authentication setting, refer to the following.

→10.18.6 ■ 2 [Authentication Setting]

### (1) GOT Mobile exclusive authentication

This authentication method is dedicated to the GOT Mobile function.

The account dedicated to the GOT mobile function is used for the authentication.

The operator management information is not used.

After the GOT Mobile authentication succeeds, you can log in using the operator authentication or the level authentication.

Two types of accounts are used in the GOT Mobile authentication: administrative operator account and guest operator account.

When authenticated with the administrative operator account, the client can obtain the authorization of the GOT network interaction function.

You can view a mobile screen in which the authorization control is enabled, and operate the objects on the mobile screen.

When authenticated with the guest operator account, the client cannot obtain the authorization of the GOT network interaction function.

You can view a mobile screen in which the authorization control is enabled, but cannot operate the objects on the mobile screen.

One administrative operator account and one guest operator account are settable for each project.

For the setting method, refer to the following.

→10.18.6 ■ 2 [Authentication Setting]

## (2) Operator authentication

This authentication needs an operator account in the operator management information file.

Make sure to preconfigure the operator authentication setting in [Security] in the [Environmental Setting] window.

Otherwise, the authentication method of the GOT Mobile function is fixed to the GOT Mobile exclusive authentication.

After the operator authentication succeeds, you can view mobile screens according to the operator account security level.

The authenticated client can obtain the authorization of the GOT network interaction function, regardless of the operator account security level.

If the operator account is logged out, the GOT automatically disconnects the client.

Even if the operator account is logged out because of the automatic logout time, the client becomes disconnected from the GOT.

The operator switching is not available on a client that is connected to the GOT.

To switch between operators, disconnect the target client from the GOT, and then perform the authentication with another operator account.

For the details of the operator authentication, refer to the following.

→5.2.6 Configuring the security settings for displaying screen data on the GOT ([Screen Security])

## ■6 Authorization control

You can prevent simultaneous operations from multiple clients and the GOT by enabling the authorization control.

To control the authorization among clients and the GOT, use the GOT network interaction function in combination.

For the details of the GOT network interaction function, refer to the following.

→5.6 Setting the Interaction Function for Equipment on Ethernet ([GOT Network Interaction])

You can check the authorization status of each client and control the authorization with the following devices.

### (1) Operational Authority Status Notification device

This device notifies the authorization status of each client in a control group.

Specify this device using the GOT Mobile device (VGD) or the word-specified GOT Mobile device (VGB).

→10.18.6 ■9 [Exclusive Control of Operational Authority]

Bit number	Function	Description
b0	Notifies whether the equipment obtains the authorization.	Turns on when the equipment obtains the authorization.
b1	Notifies whether the authorization control is enabled in the screen being displayed.	Turns on when the authorization control is enabled in the screen being displayed.
b2 to b15	-	Use prohibited

### (2) Operational Authority Status Control device

This device controls the authorization among the clients and the GOT in a control group.

Specify this device using the GOT Mobile device (VGD) or the word-specified GOT Mobile device (VGB).

→10.18.6 ■9 [Exclusive Control of Operational Authority]

Bit number	Function	Description
b0	Disables the automatic acquisition of the authorization.	When this bit turns on, the automatic acquisition of the authorization becomes disabled. On unauthorized equipment, even if you switch a screen to another screen in which the authorization control is enabled, the equipment cannot automatically obtain the authorization.
b1 to b15	-	Use prohibited

## 7 Public folder

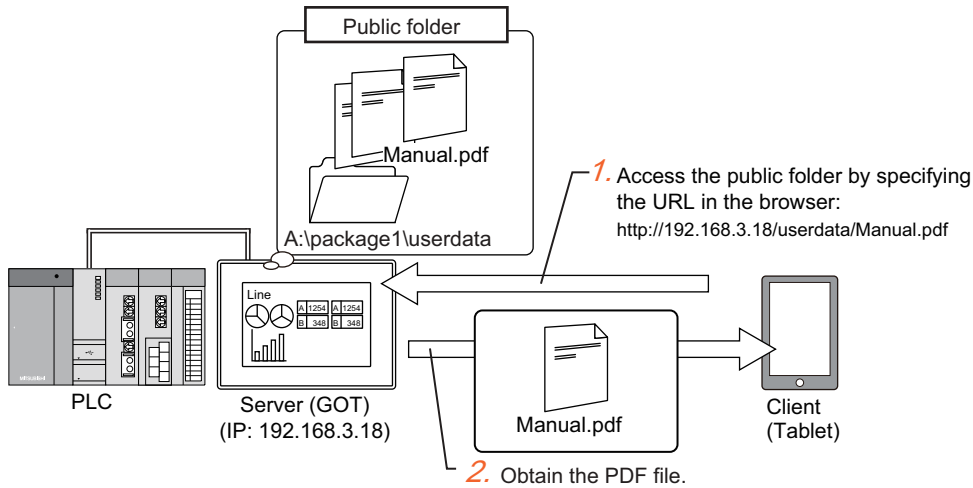

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The server (GOT) uses the public folder to provide files for clients.

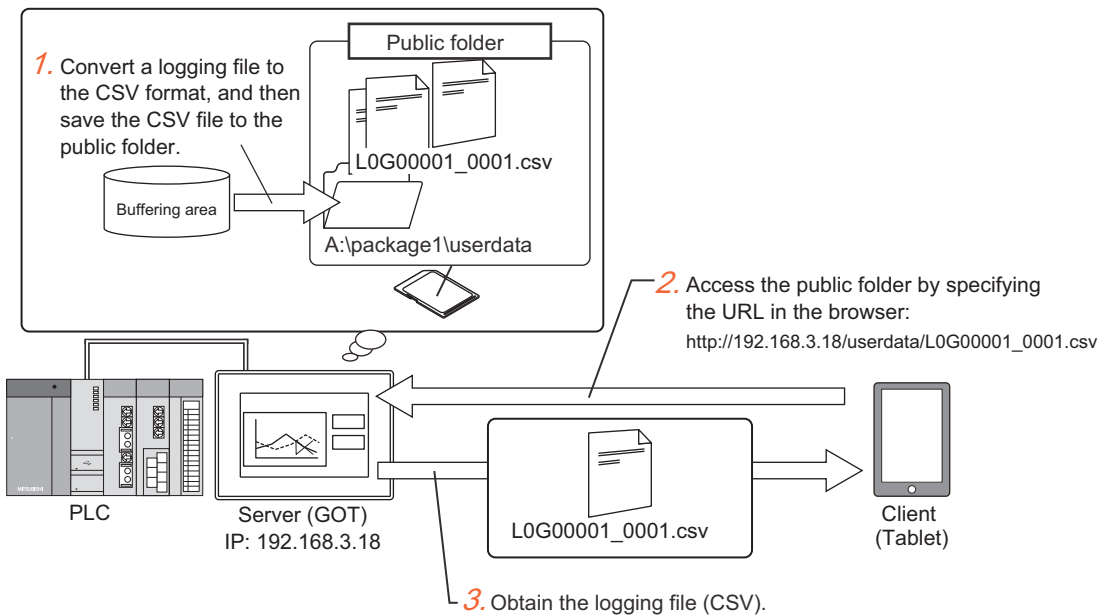

To access a file in the public folder on the server (GOT), specify the URL of the file in your browser.

No authentication is performed to access the public folder.

Application example 1) Accessing a manual PDF file in the public folder from a client

Application example 2) Saving a logging file to the public folder and accessing the file from a client

### (1) Enabling the public folder

To allow clients to access the public folder, select [Allow external access to GOT public folder] in [Basic Setting] in the [GOT Mobile Setting] window.

⇒ 10.18.6 ■ 1 [Basic Setting]

### (2) Creating the public folder

The public folder is created by the user.

Under the package folder of the GOT, create the public folder named "userdata".

The package folder is in the current drive.

For the details of the current drive, refer to the following.

⇒ 1.2.7 Drive configuration of the target GOT for data transfer

If a sub folder is created under the public folder, files in the sub folder are also accessible.

Create sub folders when necessary.

**(3) Accessing a file in the public folder from a client**

To access a file in the public folder, enter the URL of the file in the address bar of the browser in the following format.  
 http://GOT IP address/userdata/sub folder name/file name  
 (Enter the sub folder name only when the sub folder is created.)

Example) http://192.168.3.18/userdata/subfolder1/AAM00001.csv

When you place a hyperlink object on a mobile screen and specify the URL of a file in the public folder in the object setting, touch the object to access the file.

For the detail of the hyperlink object, refer to the following.

→ 8.33 Placing a Hyperlink on a Mobile Screen

**■ 8 File manager**

On the file manager screen, you can view the folders and files in the public folder, or perform manipulations on them such as copying.

Item	Description
Viewing	The folders and files in the public folder are viewable.
Manipulations	The following manipulations are supported. <ul style="list-style-type: none"> <li>• Copy</li> <li>• Cut</li> <li>• Paste</li> <li>• Rename</li> <li>• New folder</li> <li>• Delete</li> </ul> Folders and files cannot be moved between the public folder and the other folders.

For the public folder, refer to the following.

→ ■ 7 Public folder

To manipulate the folders and files in the public folder, turn on GS1896.b1.

To limit users to perform the manipulations, specify a security level with GS1892.

When a security level (0 to 15) is specified with GS1892, the users with the specified security level and higher are allowed to perform the manipulations.

→ 12.1.3 GOT special register (GS)

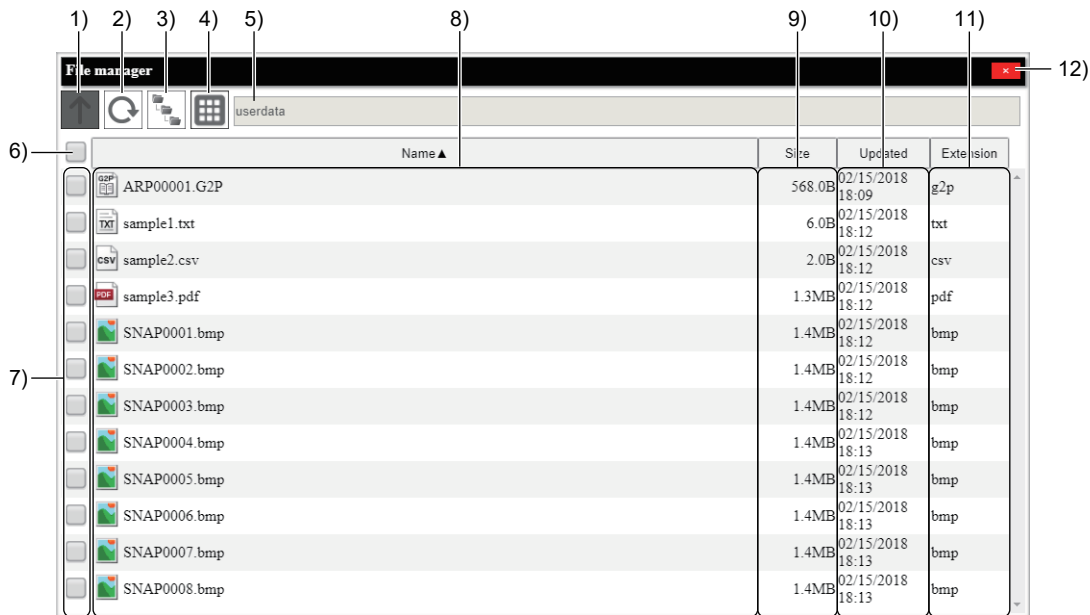

## (1) File manager screen

To display the file manager screen, touch the extended function button on the operation menu bar on a mobile screen, and select [File manager] from the displayed menu.

⇒ 10.18.3 ■ 3 (2) Operation menu bar on the mobile screen

The mobile screen is not operable while the file manager screen is being displayed.

Touch a row to open the corresponding folder or file.

### 1) Return button

Moves to the parent folder.

### 2) Update button

Updates the contents of the file manager screen.

### 3) Directory button

Displays the directory tree to the open folder.

Touch the folder to move to in the tree structure.

### 4) Manipulation button

Displays the menu for manipulating the folders and files listed.

Item	Description
[Copy]	Copies the selected folder or file.
[Cut]	Cuts the selected folder or file.
[Paste]	Pastes the copied or cut folder or file in the open folder.
[Rename]	Renames the selected folder or file. For restrictions on the folder name and file name, refer to the following. ⇒ 12.4 Restrictions for Folder Names and File Names used in GOT
[New folder]	Creates a folder.
[Delete]	Deletes the selected folder or file. If you delete a folder, the files in the folder will also be deleted even though they are in use.

### 5) Address bar

Displays the path to the open folder.

### 6) Select all checkbox

Selects all folders and files.

### 7) Select checkbox

Selects a folder or file to be manipulated.

### 8) [Name]

Displays the folder and file names.

### 9) [Size]

Displays the size of files.

10) **[Updated]**

Displays the updated date and time of folders and files.

11) **[Extension]**

Displays the filename extensions.

12) **Close button**

Closes the file manager screen.

■ **9 Hard copy function**

The hard copy function captures the current mobile screen in PNG format and outputs it to a new tab in the browser. To execute the hard copy function, touch the extended function button on the operation menu bar on a mobile screen, and select [Hard Copy] from the displayed menu.

→ 10.18.3 ■ 3 (2) Operation menu bar on the mobile screen

The image is displayed in full size (100%) that is set on GT Designer3. Save the displayed image as necessary.

The following items are not captured in the screenshot by the hard copy function.

- Mouse pointer
- Operation menu bar on the mobile screen
- Authorization popup display
- Alarm popup display
- Key window
- Dialog

■ **10 Differences between the functions to remotely operate the GOT**

For the differences between the functions to remotely operate the GOT, refer to the following.

→ 10.5.2 ■ 7 Differences between the functions to remotely operate the GOT

## 10.18.3 How to use the GOT Mobile function

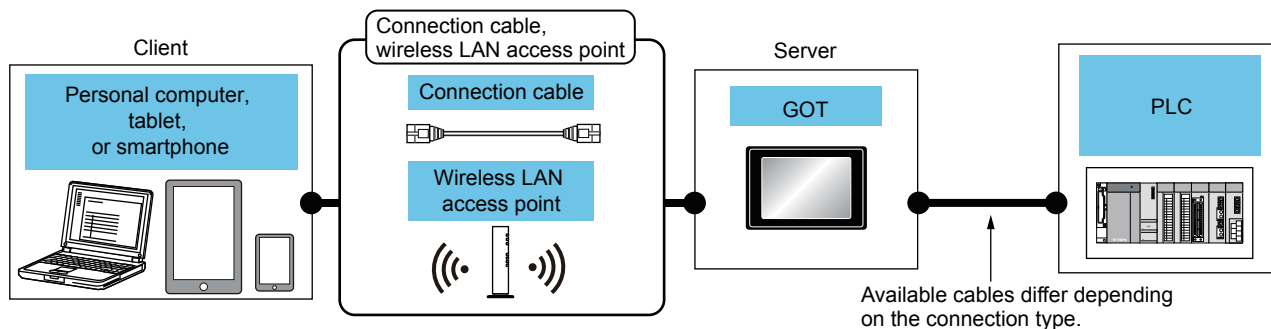

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ➔ ■ 1 System configuration
- 2 Setting procedure
- 3 Usage

### ■ 1 System configuration

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the system configuration of the GOT Mobile function.

Client (Personal computer, tablet, or smartphone)	Connection cable <sup>*1,2</sup> , wireless LAN access point	Maximum segment length <sup>*3</sup>	Server (GOT)		PLC	Number of connectable barcode readers
			Option	GOT model		
Select by each user	<ul style="list-style-type: none"> <li>• 10BASE-T Shielded twisted pair cable (STP) or unshielded twisted pair cable (UTP): Category 3, 4, and 5</li> <li>• 100BASE-TX Shielded twisted pair cable (STP): Category 5 and 5e</li> </ul>	100m	- (Built into GOT)	GT27, GT25	For the system configuration between the GOT and the PLC, refer to each connection manual.	Five clients for one GOT
	-	-	GT25-J71E71-100	GT27, GT25 <sup>*6</sup>		
	<ul style="list-style-type: none"> <li>• Wireless LAN access point For the connectable wireless LAN access points and system devices, refer to the following Technical News. ➔List of Valid Devices Applicable for GOT2000 Series (GOT-A-0064)</li> </ul>	-	GT25-WLAN	GT27 <sup>*4</sup> , GT25 <sup>*4*6</sup>		
			GT25-WLAN	GT27 <sup>*5</sup> , GT25 <sup>*5*6</sup>		

\*1 The applicable destination to connect the twisted pair cable depends on the configuration of the Ethernet network system. Connect to the applicable Ethernet module, hub, transceiver, wireless LAN adapter (NZ2WL-JPA or NZ2WL-JPS), or other system equipment according to the Ethernet network system. Use the cable, connector, or hub that meets the IEEE802.3 10BASE-T/100BASE-TX standard. For the controller to which the wireless LAN adapter can be connected and how to configure the settings for the wireless LAN adapter, refer to the manual of the wireless LAN adapter you use.

\*2 A straight cable is applicable.

When the GOT is directly connected to the personal computer via Ethernet cable, a cross cable is applicable.

\*3 The length between the hub and node.

The maximum length depends on the Ethernet equipment you use.

When a repeater hub is used, the number of connectable personal computers is as follows.

- 10BASE-T: Up to 4 cascade-connected hubs (within 500 m)
- 100BASE-TX: Up to 2 cascade-connected hubs (within 205 m)

For the cascade connection between the switching hubs, there is no theoretical limit to the number of cascades.

For the limit, contact the switching hub manufacturer.

\*4 Set [Operation Mode] to [Access Point] in [Wireless LAN Setting] in the [GOT Setup] window.

➔5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*5 Set [Operation Mode] to [Station] in [Wireless LAN Setting] in the [GOT Setup] window.

➔5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])

\*6 Not available to GT2505-V and GT25HS-V.

## ■ 2 Setting procedure

The following shows the outline procedure for using the GOT mobile function.

### (1) Setting on GT Designer3

- Step 1** Set the GOT Ethernet interface.  
 ⇒ 5.4 Setting the GOT Ethernet Interface ([GOT Ethernet Setting])
- Step 2** To use the GOT wireless LAN function, configure the wireless LAN connection setting.  
 ⇒ 5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
- Step 3** Configure the GOT Mobile function setting.  
 Select [Common] → [GOT Mobile Setting] from the menu to display the [GOT Mobile Setting] window. In [Basic Setting], select [Use GOT Mobile function].  
 For the GOT Mobile function setting, refer to the following.  
 ⇒ 10.18.6 [GOT Mobile Setting] window
- Step 4** Create a mobile screen.  
 Perform one of the following operations to display the [Screen Property] dialog.  
 • Select [Screen] → [New] → [Mobile Screen] from the menu.  
 • Double-click [New] under [Mobile Screen] in the tree in the [Screen] window.  
 In the displayed dialog, configure the setting and click the [OK] button.  
 ⇒ 10.18.7 Mobile screen properties
- Step 5** A mobile screen is created and a screen editor appears in the work window.  
 Place figures and objects on the mobile screen.  
 ⇒ 6.5 Placing and Editing Figures and Objects
- Step 6** If you have enabled the external access to the GOT public folder, create the public folder under the package folder.  
 Create the package folder in the data storage to be installed in the current drive of the GOT.  
 Store the public folder (folder name: userdata) in the package folder.  
 ⇒ 10.18.2 ■ 7 Public folder  
 After the public folder is created, install the data storage to the GOT.
- Step 7** To use the file manager, refer to the following.  
 ⇒ 10.18.2 ■ 8 File manager
- Step 8** To connect the GOT and clients without the operator name and password-based authentication, configure the setting in the [GOT Mobile Setting] window ([ANDON Setting]).  
 ⇒ 10.18.6 [GOT Mobile Setting] window  
 For the ANDON function, refer to the following.  
 ⇒ 10.18.4 ANDON function
- Step 9** Connect the personal computer to the GOT, and write the project to the GOT.  
 ⇒ 4.3 Transferring the Data between the Personal Computer and the GOT

### (2) Setting on the GOT

- Register the license number to the GOT.  
 For information on how to register the license number, refer to the following.  
 ⇒ GOT2000 Series User's Manual (Utility)

### (3) Setting on the client

- Enable JavaScript and Cookie in the browser.  
 The method to enable JavaScript or Cookie differs depending on the browser.  
 The setting items may also differ depending on the information device and the browser version.  
 For the setting method, refer to the following.
- For using Google Chrome (for Android or Windows)  
 ⇒ Google Help website
  - For using Safari (for iOS)  
 ⇒ Apple Support website

### 3 Usage

#### (1) Connecting a client

To connect a client to the GOT, enter the URL of the destination GOT on the address bar in the browser.

- GOT URL

· When connecting a client to the standard HTTP port No. 80

`http://192.168.3.18/index.html`

└──────────┘ └──────────┘  
 GOT IP address                      Optional

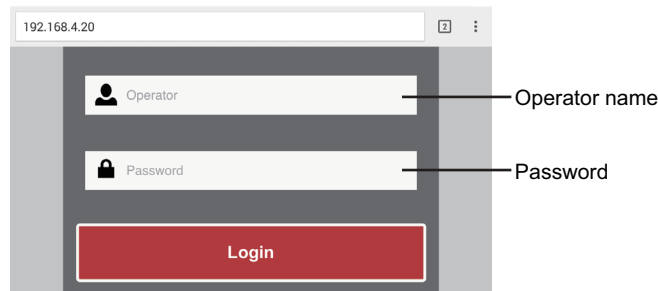

· When connecting a client to a user-specified HTTP port (Example: port No. 8080)

`http://192.168.3.18:8080/index.html`

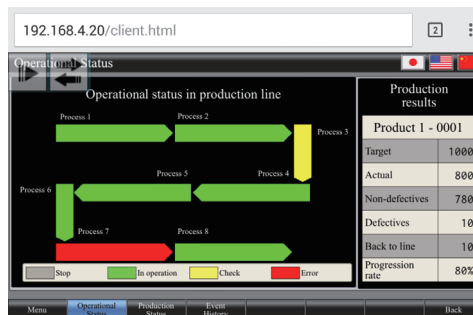

└──────────┘ └──┘ └──────────┘  
 GOT IP address    User-specified port No.    Optional

The following shows the procedure for connecting a client using Google Chrome (for Android).

- Step 1** Start Google Chrome.
- Step 2** Touch the address bar, and enter the URL of the destination GOT with the software keyboard.
- Step 3** In the authentication screen, enter an operator name and its password, and touch the [Login] button.

- Step 4** If the client becomes authenticated to the GOT, an applicable mobile screen appears in the browser.

You can specify the mobile screen appearing after the client is authenticated to the GOT in the [GOT Mobile Setting] window. In [Screen Switching], select [Specify the No. of a screen to be displayed at the time of client connection] and specify a screen number.

If you do not specify the mobile screen, the smallest-numbered mobile screen appears.

⇒ 10.18.6 ■ 4 [Screen Switching]

#### (a) URL parameters

The behavior of the client is customizable by appending specific parameters to the URL of the destination GOT. The following shows available parameters.

Function	Parameter name	Setting value	Behavior without the target parameter	Remarks
Always fitting the mobile screen display on the width of the browser window	autofit	true	Same as for specifying "false" (The target function is disabled.)	-
		false		

Function	Parameter name	Setting value	Behavior without the target parameter	Remarks
Hiding the operation menu bar on the mobile screen	hiddenmenu	true false	Same as for specifying "false" (The target function is disabled.)	When this function is enabled, zooming and scrolling the mobile screen display are not available.
Specifying a client number to connect to the GOT	clientno	1 to 5	A client number is automatically assigned.	The following client numbers cannot be specified. <ul style="list-style-type: none"> <li>Client number that is higher than the set value of [Simultaneous Client Connection] in the [GOT Mobile Setting] window ([Basic Setting])</li> <li>Client number of a client being connected to the GOT</li> </ul> If you specify the client number set for [Target Client No.] in [ANDON Setting] of the [GOT Mobile Setting] window, also add the parameter for enabling the ANDON function (andon=true).
Enabling the ANDON function (Connecting to the GOT without the operator name and password-based authentication)	andon	true false	Same as for specifying "false" (The target function is disabled.)	When this function is enabled, the target client is not disconnected automatically even if no operation is performed on the client for a certain time. To use the ANDON function, the settings must be configured on GT Designer3 and the utility as well. For the details, refer to the following. →10.18.4 ■ 1 Settings required for the ANDON function
Specifying the screen number of the initial mobile screen appearing after the client connects to the GOT with authentication	initscreen	0 to 32767	The corresponding setting made on GT Designer3 is applied.	To enable this function, turn on the Enable Initial Screen Specification with URL Parameter signal (GS1896.b0). This parameter setting overrides the setting of [Specify the No. of a screen to be displayed at the time of client connection] in the [GOT Mobile Setting] window ([Screen Switching]).

To use a parameter, append "?<Parameter name>=<Setting value>" to the URL of the destination GOT.

Delimit parameters with single ampersands (&).

The used parameters must be different.

One-byte alphanumeric characters are usable for the parameters.

The parameters are case-sensitive.

`http://192.168.3.18/index.html?<Parameter name 1>=<Setting value 1>&<Parameter name 2>=<Setting value 2>`

URL of the destination GOT
Parameter 1
Parameter 2

Example 1) When specifying client No. 3

`http://192.168.3.18/index.html?clientno=3`

Example 2) When setting the following functions

- Enabling the ANDON function
- Always fitting the mobile screen display on the width of the browser window
- Hiding the operation menu bar on the mobile screen

`http://192.168.3.18/index.html?andon=true&autofit=true&hiddenmenu=true`

## (2) Operation menu bar on the mobile screen

The operation menu bar is displayed in the upper-left corner of a mobile screen to control the display.

### 1) Expand/collapse button

Expands or collapses the operation menu bar.

While the operation menu bar is expanded, you cannot touch the objects on the mobile screen.

However, you can scroll the screen by a swipe or flick operation on a tablet or smartphone.

### 2) Button to move the operation menu bar

Moves the operation menu bar from side to side.

### 3) [Fit Width] button

Adjusts the mobile screen display to fit on the width of the browser window.

While the [Fit Width] button is held down, the mobile screen display is fit on the width of the browser window automatically in the following timing.

- When the screen is switched
- When the width of the browser window is changed

### 4) [100%] button

Displays the mobile screen display at its original magnification (100%).

### 5) Disconnect button

Disconnects the client from the GOT.

### 6) Extended function button

Displays a pull-down menu.

- [File manager]  
Displays the file manager screen where you can view the folders and files in the public folder, or perform manipulations on them such as copying.  
→ 10.18.2 ■ 8 File manager
- [Hard Copy]  
Captures the current mobile screen in PNG format and outputs it to a new tab in the browser.  
→ 10.18.2 ■ 9 Hard copy function

### 7) Zoom slider

Zooms in or out the mobile screen display.

Move the slider control to the right to zoom in the display, and move the slider control to the left to zoom out the display.

The setting range is [10]% to [500]%.

## (3) Zooming the mobile screen display

When the operation menu bar is expanded on the mobile screen, you can pinch in or out to zoom the screen display (10% to 500%).

The screen display is zoomed by moving fingers toward or away from each other.

#### (4) Disconnecting a client

If you perform any of the following operations, the client becomes disconnected from the GOT.

- Close an applicable browser.
- Perform a logout when the authentication method of the GOT Mobile function is set to the operator authentication.
- Touch the Disconnect button on the operation menu bar in the mobile screen.
- Turn on b0 of the client control device that is specified in [Client Information] of the [GOT Mobile Setting] window.
- Touch the [Disconnect] button on the [GOT Mobile information] screen in the utility.

The client becomes disconnected in the following timing as well.

- When a communication timeout occurs on the GOT
- When the GOT is turned off
- When the GOT enters the offline mode because of package data writing or others
- When no operation is performed on the client for a certain time  
(When [Automatically disconnect clients with no operation] is selected in [Basic Setting] of [GOT Mobile Setting] window)
- When the ANDON function is used, the client does not become disconnected.
- When the authentication method of the GOT Mobile function is set to the operator authentication, and the automatic logout is performed
- When the connection time exceeds 30 minutes without license registration

Once the client is disconnected from the GOT, the client is not automatically reconnected.

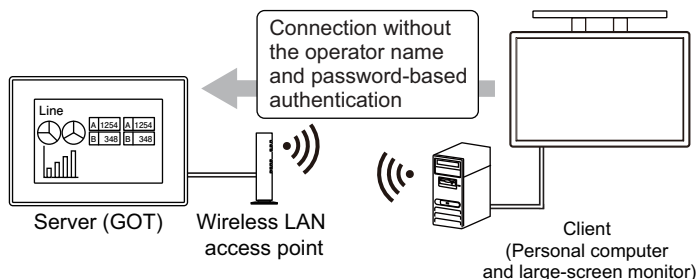

In such a case, reconnect the client to the GOT.

## 10.18.4 ANDON function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The ANDON function enables a specific client to connect to the GOT without the operator name and password-based authentication. (The authentication screen does not appear.)

This function is usable for applications, such as an andon display. You can specify a set of a personal computer and a large-screen monitor as a client to display mobile screens.

For information on how to use the ANDON function, refer to the following.

⇒ ■ 1 Settings required for the ANDON function

By configuring the above setting and the client side setting in combination, the target client can display a mobile screen upon its power-on.

For the details, refer to the following.

⇒ ■ 2 Displaying a mobile screen on the client upon power-on

### ■ 1 Settings required for the ANDON function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To use the ANDON function, configure all the following settings (1) to (3).

#### (1) Setting on GT Designer3

**Step 1** Select [Common] → [GOT Mobile Setting] from the menu to display the [GOT Mobile Setting] window. In [ANDON Setting], select [Use ANDON function].

**Step 2** Select a client number targeted for the ANDON function.

⇒ 10.18.6 [GOT Mobile Setting] window

#### (2) Setting on GOT

In [ANDON connection] of the utility, set the IP address of a client targeted for the ANDON function.

For the setting, refer to the following.

⇒ GOT2000 Series User's Manual (Utility)

#### (3) URL parameter setting

When you enter the URL of the destination GOT on the address bar in the browser, add the parameter for enabling the ANDON function.

`http://192.168.3.18/index.html?andon=true`

URL of the destination GOT      Parameter enabling the ANDON function

For the details of the URL parameters, refer to the following.

⇒ 10.18.3 ■ 3 (1) (a) URL parameters

## ■2 Displaying a mobile screen on the client upon power-on

GT27 GT25 GT23 GT21 SoftGOT2000 GS

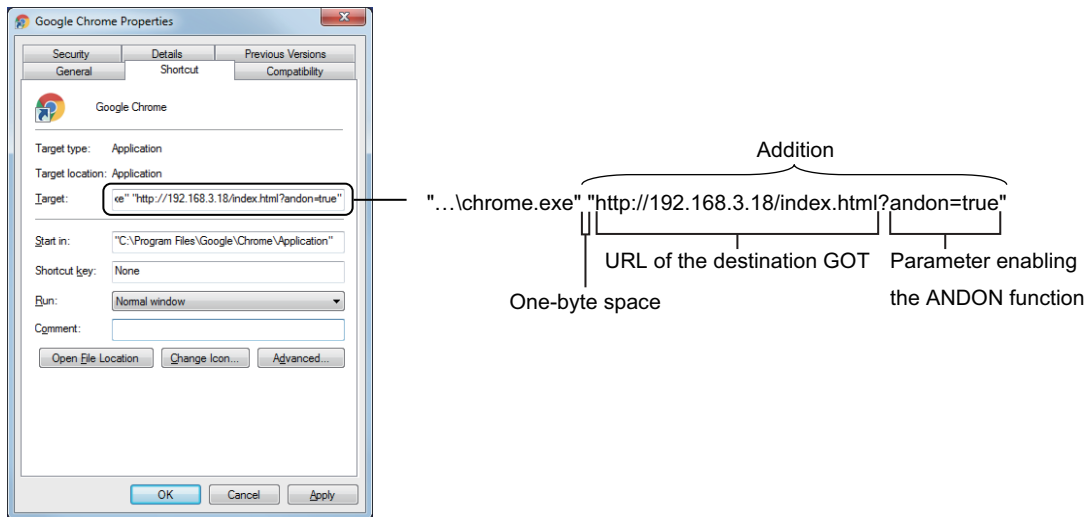

A client can display a mobile screen upon power-on without specific operations, such as logging into the OS, starting a browser, and entering a URL on the address bar.

The following shows the setting method to achieve this behavior by using Windows 7 and Google Chrome (for Windows) as an example.

**Step 1** Set the destination of a Google Chrome shortcut by specifying the URL of the destination GOT and the parameter for enabling the ANDON function.

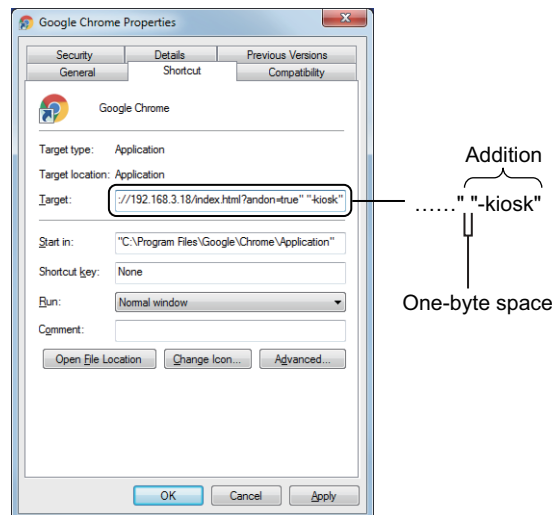

Create a Google Chrome shortcut, and select [Properties] from the right-click context menu.

In the [Shortcut] tab of the [Google Chrome Properties] dialog, add the URL and parameter to [Target] as shown below.

**Step 2** Configure the setting to open a browser in full screen mode.

In the [Shortcut] tab of the [Google Chrome Properties] dialog, add a one-byte space and "-kiosk" to [Target] as shown below.

**Step 3** Configure the setting to open the browser automatically upon startup of Windows.

Place the Google Chrome shortcut set as above in the directory below.

[\\Users(User name)\\AppData\\Roaming\\Microsoft\\Windows\\Start Menu\\Programs\\Startup]

**Step 4** Configure the setting to log into Windows automatically upon power-on of the client.

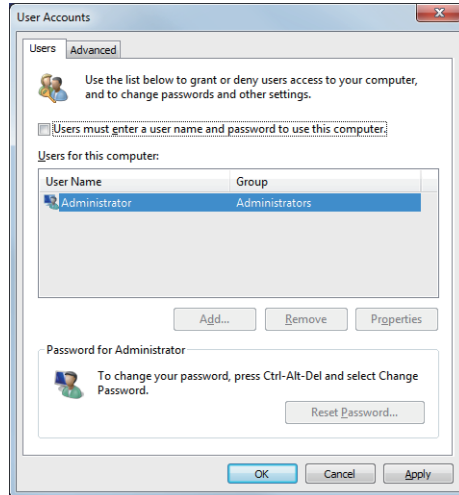

On the Windows start menu, use [Search programs and files] to display the [Run] dialog.

Enter "netplwiz" in [Open] and click the [OK] button to display the [User Accounts] dialog.

In the [Users] tab, select a user to log into Windows automatically, and clear [Users must enter a user name and password to use this computer].

Click the [OK] button to display the [Automatically Log On] dialog.

Enter the target user name and its password, and click the [OK] button.

### ■ 1 Precautions for drawing

#### (1) User area in the operation memory (RAM)

A portion of the user area is reserved for the GOT Mobile function, and another portion of the area is reserved for clients according to the setting of [Simultaneous Client Connection].

Consider the available space in the user area, and set [Simultaneous Client Connection].

The GOT reserves 2 MB space for each client.

For the available space in the GOT user area, refer to the following.

→ 12.6.1 Data transferred to the GOT and capacity of the destination drive

#### (2) Mobile screen size

To determine the mobile screen size, consider the screen resolution and OS of the information device, and the browser characteristics.

If you set the mobile screen size the same as the resolution of the information device, a portion of the screen may not be displayed depending on the location of the OS status bar, browser tabs, or other conditions.

#### (3) Mobile screen switching device

When you use multiple clients simultaneously, specify a GOT Mobile device as the mobile screen switching device.

If any device other than GOT Mobile devices is specified as the screen switching device, all clients display the same screen upon screen switching.

#### (4) Values of the GOT Mobile devices at the start of accessing the GOT

If you deselect [Initialize the devices (VGD, VGB) at the time of client connection] in the [GOT Mobile Setting] window ([Device Allocation Setting]), the values of the GOT Mobile devices assigned to a client are not cleared automatically when the client starts accessing the GOT.

(The values stored before the access are retained.)

Configure the settings so that the values of the GOT mobile devices are cleared when a client starts accessing the GOT or becomes disconnected from the GOT.

Note that restarting the GOT clears the values of the GOT Mobile devices that are assigned to each client.

#### (5) Placing an object in the location of the operation menu bar on a mobile screen

When you place an object, make sure that the object and the operation menu bar do not overlap each other.

Otherwise, the object is hidden under the menu bar and you cannot touch the object.

#### (6) Data size of the project containing a BMP image

When the GOT Mobile function is enabled, if a BMP image is used in a mobile screen or is registered as a part, the image is automatically converted to the PNG format and saved as a new file.

(Even if you do not use the BMP image registered as a part in a mobile screen, the image is converted to the PNG format and saved as a new file.)

Since the project contains both the BMP image and the PNG image, the project size becomes larger.

#### (7) Using the GOT Mobile devices (VGB and VGD) for the GOT

Use the GOT Mobile devices (VGB and VGD) in the following settings only.

- Setting for an object on a mobile screen
- Setting in the [GOT Mobile Setting] window
- Setting in the [Alarm Popup Display(GOT Mobile Setting)] dialog

If you set the GOT Mobile devices for objects on screens other than mobile screens and for functions configured in the project, these objects and functions do not operate properly.

#### (8) Exclusive authorization control

To enable the exclusive authorization control, select all the setting items below.

- [Enable the exclusive control of operational authority] in the [GOT Mobile Setting] window ([Exclusive Control of Operational Authority])
- [Target for exclusive control of operational authority] in the [Screen Property] dialog for each target mobile screen

If you select only one of the items, the exclusive authorization control is disabled in the project.

## ■2 Precautions for use

### (1) Precautions for the license

When you incorporate the GOT into your product, if the GOT Mobile function is enabled in the GOT, make sure to register the license to the GOT.

If the license is unregistered, the GOT Mobile function is usable for 30 minutes only.

Upon the lapse of a cumulative amount of 30 minutes, the GOT forcibly disconnects the client.

The disconnection is performed even while you are operating the client. Therefore, the target controller may exhibit unintended behavior.

### (2) [Back], [Forward], and [Refresh] buttons on the browser

While a mobile screen is being displayed, do not use the [Back] button, [Forward] button, and [Refresh] button on the browser.

Doing so disconnects the client from the GOT and returns you to the authentication screen.

### (3) Zoom function of the browser

While a mobile screen is being displayed, do not use the zoom function of the browser.

Doing so may cause an unintended display, such as an enlarged or reduced operation menu bar.

### (4) Files in the public folder

Each file in the public folder is accessible without authentication by specifying the URL of the file in the browser.

Once equipment is connected to the GOT by Ethernet, anyone can obtain the files in the public folder. Therefore, do not store your important data in the folder.

### (5) Precautions for using the file manager

You cannot move to the destination folder with the Return button in the file manager screen if you manipulate an open folder or file or its parent folders on the GOT.

In such a case, use the Directory button to display the directory tree, and select the folder to move to.

### (6) GOT Mobile device information indicated by the system alarm

If a system alarm occurs in the process using GOT Mobile device data, the system alarm indicates the relevant GOT Mobile device as supplementary information.

The GOT internal device assigned to the GOT Mobile device is not indicated.

### (7) Displaying the mobile screens in multiple languages

The display language of the mobile screens depends on the client OS.

To display the mobile screens in multiple languages, check that the client OS supports relevant languages.

### (8) Long time use of the browser

If you use a browser for a long time, the connection with the GOT may be disconnected depending on the browser.

In such a case, perform authentication again to connect to the GOT.

### (9) Forcibly turning off a touch switch if the communication is lost

If a touch switch is released on a client after the client loses communication with the GOT, the GOT does not recognize the release.

After a specified time (default: 3 seconds) elapses, the GOT forcibly turns off the touch switch.

Use the Time to Force Mobile Momentary Switch OFF device (GS1899) to set the time from when communication is lost until when the GOT forcibly turns off the touch switch.

For the details of the Time to Force Mobile Momentary Switch OFF device (GS1899), refer to the following.

⇒ 12.1.3 ■ 6 (21) Time to Force Mobile Momentary Switch OFF (GS1899)

## ■3 Precautions for using the ANDON function

### (1) Connection without the operator name and password-based authentication

If you only configure the settings required to use the ANDON function, anyone can access the GOT from the client using the ANDON function without an operator name and a password.

Take security measures for such a client, including limiting displayable screens.

### (2) Login using the operator authentication

Even if [GOT Mobile Authentication Method] is set to [Operator] in [Authentication Setting] of the [GOT Mobile Setting] window, the operator authentication is not performed.

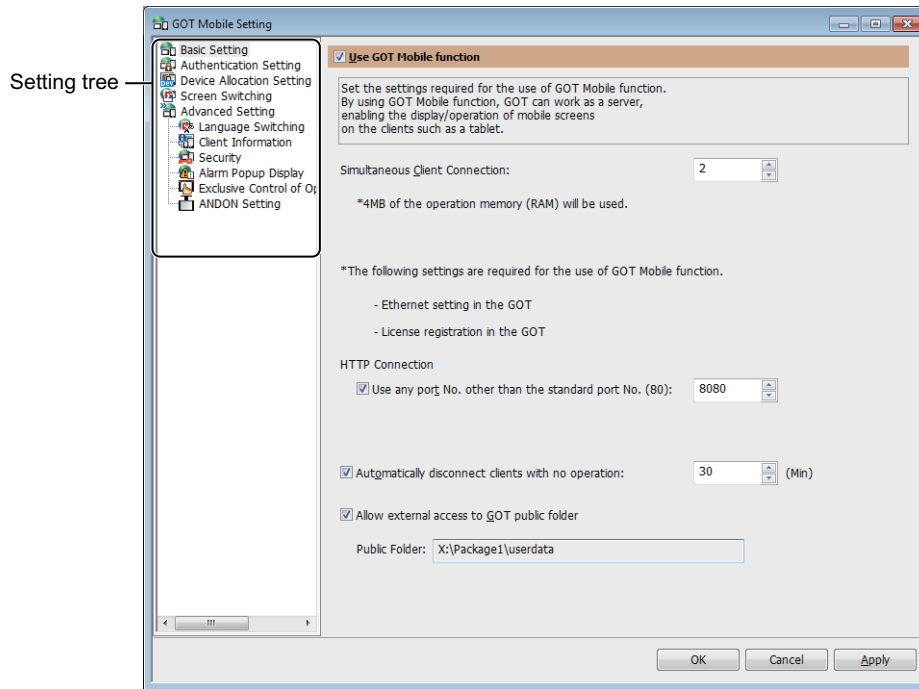

## 10.18.6 [GOT Mobile Setting] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Configure the GOT Mobile function setting.

Select [Common] → [GOT Mobile Setting] from the menu to display this window.

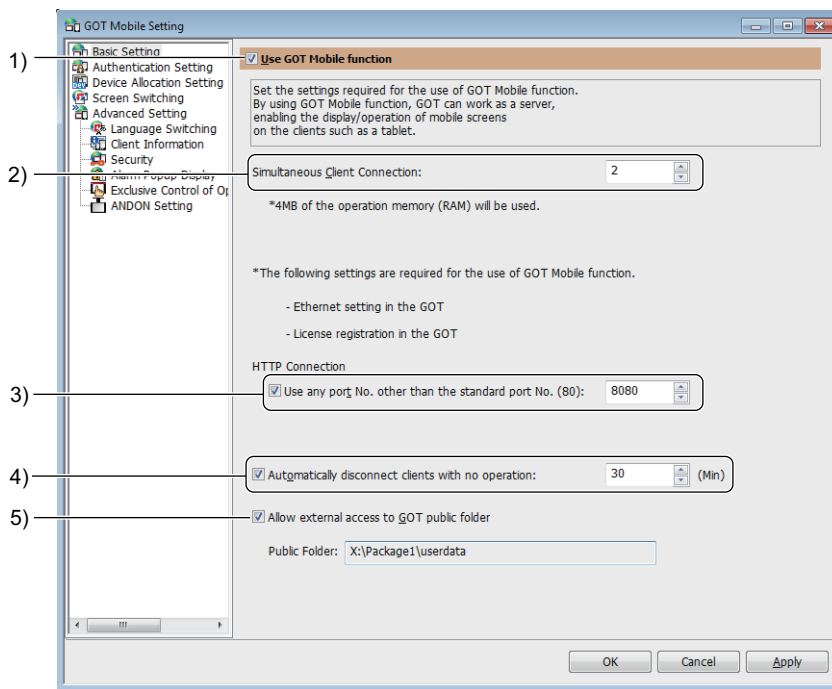

The display contents are changeable by selecting an item in the setting tree on the left of the window.

- ■ 1 [Basic Setting]
- 2 [Authentication Setting]
- 3 [Device Allocation Setting]
- 4 [Screen Switching]
- 5 [Language Switching]
- 6 [Client Information]
- 7 [Security]
- 8 [Alarm Popup Display]
- 9 [Exclusive Control of Operational Authority]
- 10 [ANDON Setting]

## ■ 1 [Basic Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Use GOT Mobile function]

Enables the GOT Mobile function.

### 2) [Simultaneous Client Connection]

Set the maximum number of clients connectable to the GOT simultaneously.

The GOT reserves 2 MB space of the user area in the operation memory (RAM) for each client.

The setting range is [1] to [5].

### 3) [Use any port No. other than the standard port No. (80)]

Connects a client to the GOT through a port other than the standard port No. 80.

Select this item, and specify the port number.

The setting range is [1024] to [65535].

### 4) [Automatically disconnect clients with no operation]

Disconnects a client from the server (GOT) if no operation is performed on the client for a specified time period.

Select this item, and specify the time period until disconnection is performed.

The setting range is [1] minute to [60] minutes.

### 5) [Allow external access to GOT public folder]

Allows clients to access the files in the GOT public folder.

For the details of the public folder, refer to the following.

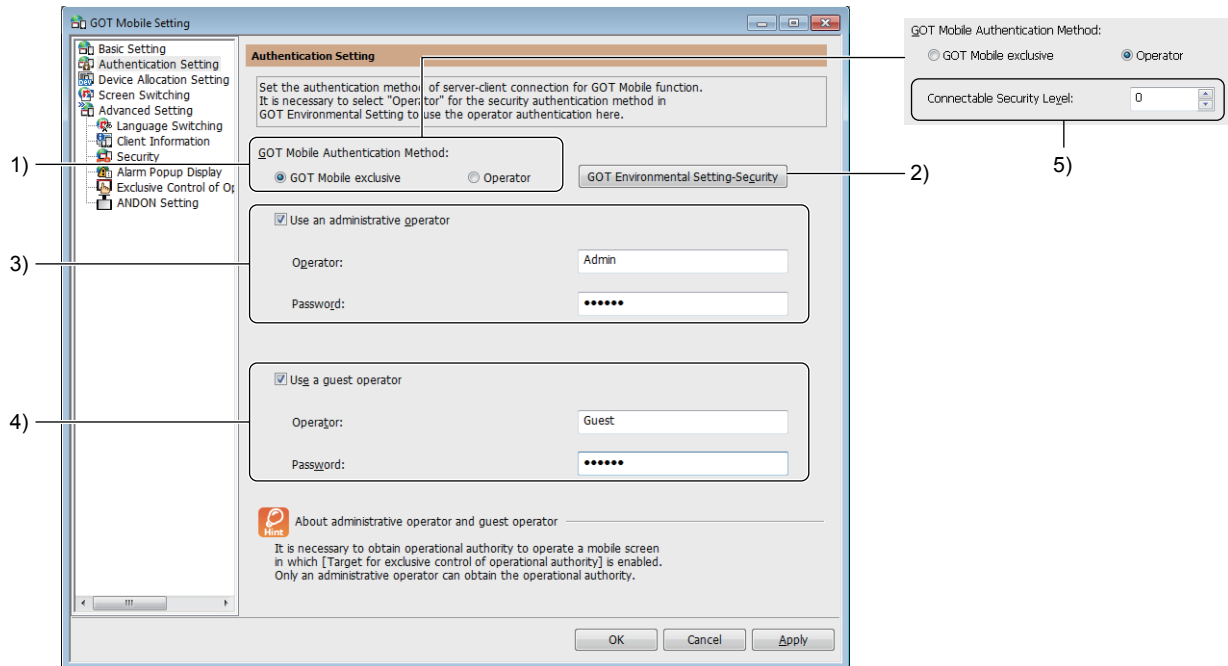

⇒ 10.18.2 ■ 7 Public folder

## ■2 [Authentication Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For the details of the authentication, refer to the following.

⇒ 10.18.2 ■ 5 Authentication

### 1) [GOT Mobile Authentication Method]

Select an authentication method for connecting a client to the GOT.

The following shows the items to be selected.

- [GOT Mobile exclusive]
- [Operator]

### 2) [GOT Environmental Setting-Security] button

Displays the [Environmental Setting] window ([Security]).

For the settings in the [Environmental Setting] window ([Security]), refer to the following.

⇒ 5.2.6 Configuring the security settings for displaying screen data on the GOT ([Screen Security])

### 3) [Use an administrative operator]

Set an administrator operator account for authentication.

When authenticated with the administrative operator account, the client can obtain the authorization of the GOT network interaction function.

This item is settable when [GOT Mobile Authentication Method] is set to [GOT Mobile exclusive].

Select this item, and set [Operator] and [Password].

Specify the operator name and password with one-byte upper- and lowercase alphabets and numbers, one-byte spaces, and the symbols below within 32 characters.

! " # \$ % & ' ( ) \* + , - . / : ; < = > ? @ [ \ ] ^ \_ { | }`

Note that the operator name or password cannot end in a one-byte space.

### 4) [Use a guest operator]

Set a guest operator account for authentication.

When authenticated with the guest operator account, the client cannot obtain the authorization of the GOT network interaction function.

This item is settable when [GOT Mobile Authentication Method] is set to [GOT Mobile exclusive].

Select this item, and set [Operator] and [Password].

Specify the operator name and password with one-byte upper- and lowercase alphabets and numbers, one-byte spaces, and the symbols below within 32 characters.

! " # \$ % & ' ( ) \* + , - . / : ; < = > ? @ [ \ ] ^ \_ { | }`

Note that the operator name or password cannot end in a one-byte space.

### 5) [Connectable Security Level]

Set the security level of the operator allowed to access the GOT.

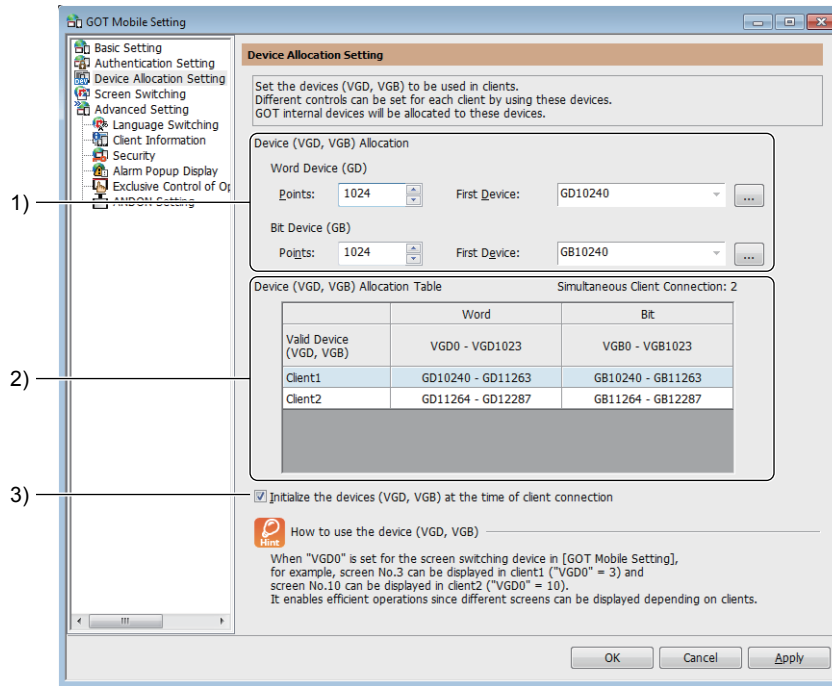

This item is settable when [GOT Mobile Authentication Method] is set to [Operator].  
The setting range is [0] to [15].

### ■ 3 [Device Allocation Setting]

For the details of the GOT Mobile devices, refer to the following.

⇒ 10.18.2 ■ 4 GOT Mobile device (VGB and VGD)

#### 1) [Device (VGD, VGB) Allocation]

Set GOT internal devices to be assigned to the GOT Mobile devices (VGD and VGB).

The number of GOT internal devices (GD and GB) to be assigned is obtained by the following formula: [Points] × [Simultaneous Client Connection].

Item	Description
[Word Device (GD)]	Set the number of GOT internal devices (GD) to be assigned for one client. The value is settable in 2-point units. The setting range is [2] to [32768].
[First Device]	Set the first GOT internal device (GD) to be assigned for client 1. The consecutive devices starting from [First Device] are assigned for clients. The total number of assigned devices is obtained by the following formula: [Points] × [Simultaneous Client Connection]. The setting range is [GD0] to [GD65535].
[Bit Device (GB)]	Set the number of GOT internal devices (GB) to be assigned for one client. The value is settable in 32-point units. The setting range is [32] to [32768].
[First Device]	Set the first GOT internal device (GB) to be assigned for client 1. The consecutive devices starting from [First Device] are assigned for clients. The total number of assigned devices is obtained by the following formula: [Points] × [Simultaneous Client Connection]. The setting range is [GB0] to [GB65520].

#### 2) [Device (VGD, VGB) Allocation Table]

Shows the correspondence between the GOT Mobile devices and the assigned GOT internal devices by client number.

Item	Description
[Simultaneous Client Connection]	Maximum number of clients connectable to the GOT simultaneously. The value set in [Basic Setting] is displayed.
[Valid Device (VGD, VGB)]	Setting range of GOT Mobile devices usable in clients
[Client1] to [Client5]	GOT internal devices that are assigned for each client

#### 3) [Initialize the devices (VGD, VGB) at the time of client connection]

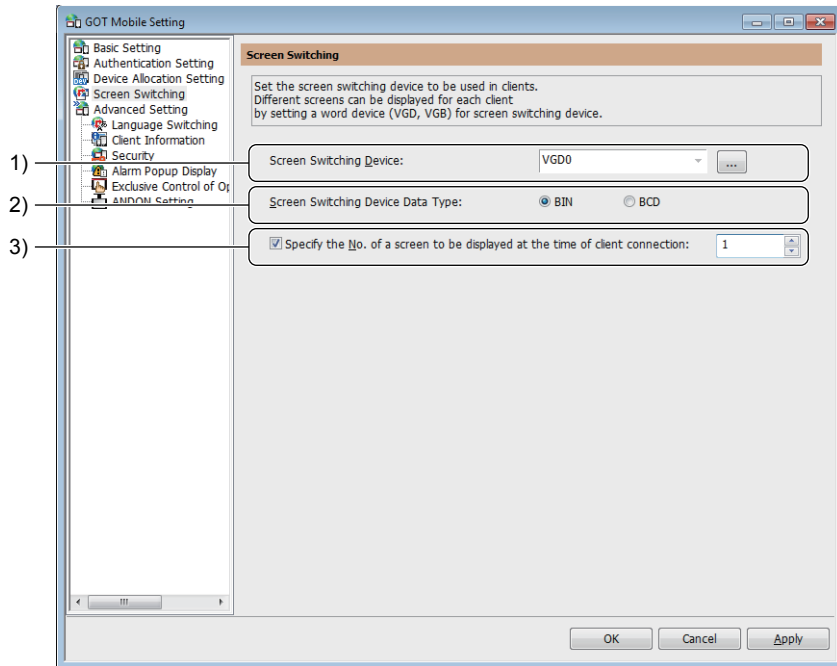

Clears the values of the GOT Mobile devices assigned to a client when the client connects to the GOT.

#### ■ 4 [Screen Switching]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For the details of screen switching on a client, refer to the following.

⇒ 10.18.2 ■ 2 (1) (b) Screen switching

##### 1) [Screen Switching Device]

Set the screen switching device for clients.

You can specify a word device or word-specified bit device.

##### 2) [Screen Switching Device Data Type]

Select the data type of the screen switching device for clients.

The following shows the items to be selected.

- [BIN]: Signed 16-bit binary or unsigned 16-bit binary
- [BCD]: 16-bit binary coded decimal

##### 3) [Specify the No. of a screen to be displayed at the time of client connection]

Set the screen number of the mobile screen to be displayed immediately after the client becomes authenticated to the GOT.

The setting range varies depending on the setting of [Screen Switching Device Data Type].

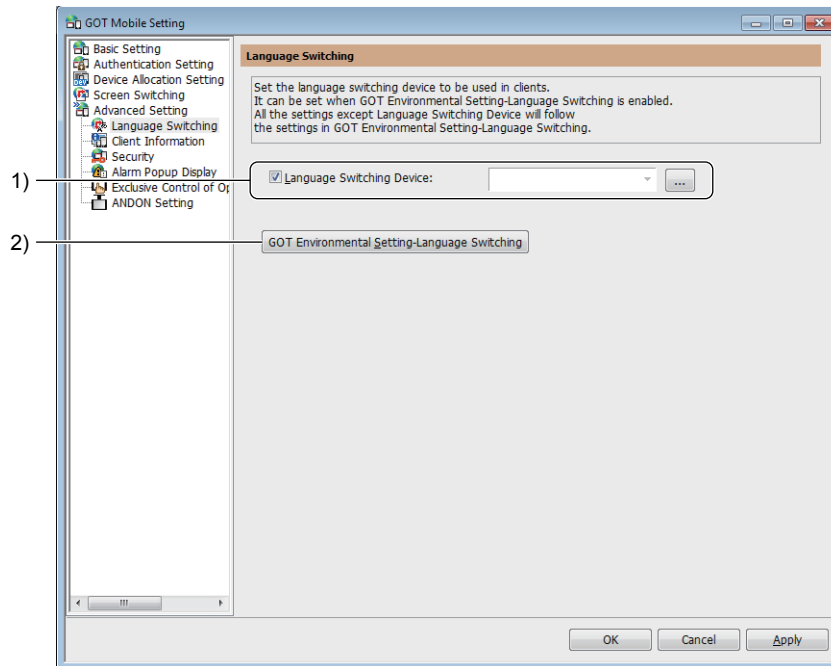

- For [BIN]: [0] to [32767]
- For [BCN]: [0] to [9999]

## ■ 5 [Language Switching]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For the details of language switching on the mobile screen, refer to the following.

→ 10.18.2 ■ 2 (1) (c) Language switching

### 1) [Language Switching Device]

Set the language switching device for clients.

You can specify a word device or word-specified bit device.

### 2) [GOT Environmental Setting-Language Switching] button

Displays the [Environmental Setting] window ([Language Switching]).

For language switching on the mobile screen, the GOT environmental settings are applied except the setting of [Language Switching Device].

For the settings in the [Environmental Setting] window ([Language Switching]), refer to the following.

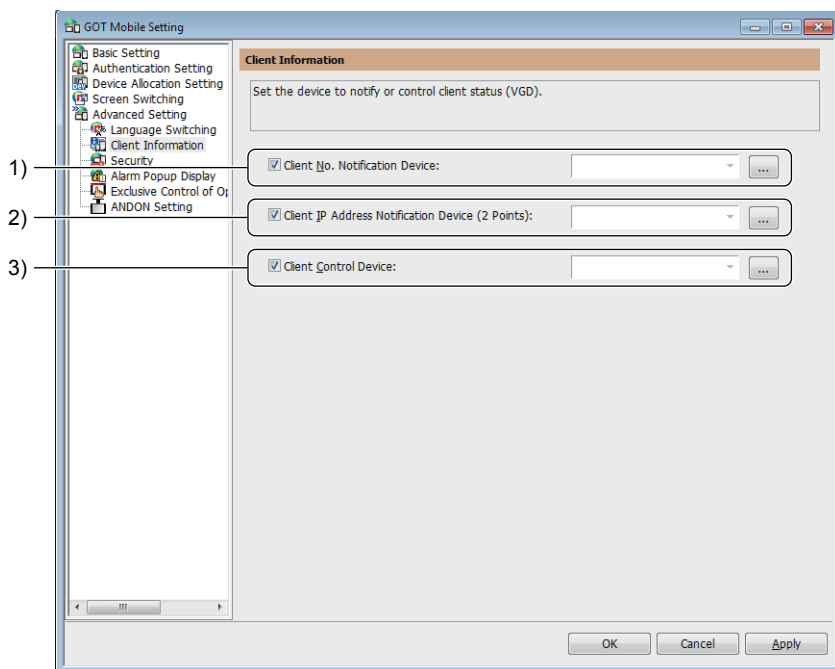

→ 5.2.2 ■ 4 [Language Switching]

## 6 [Client Information]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the devices to notify the information on the client being connected or to control the state of the client.

### 1) [Client No. Notification Device]

Set a device to store the client number of the client being connected.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) only.

The data type of the device is unsigned 16-bit binary.

### 2) [Client IP Address Notification Device (2 Points)]

Set a device to store the IP address of the client.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) only.

Two consecutive word devices are reserved, starting from the specified device.

The data type of the device is unsigned 32-bit binary.

The IP address is stored as shown below.

Example) When the IP address is 192.168.3.18 (decimal)

### 3) [Client Control Device]

Set a device to control the state of the client being connected.

Select this item, and set the device.

Turning on b0 of the set device disconnects the client from the GOT.

You can specify a GOT Mobile device (VGD) only.

The data type of the device is unsigned 16-bit binary.

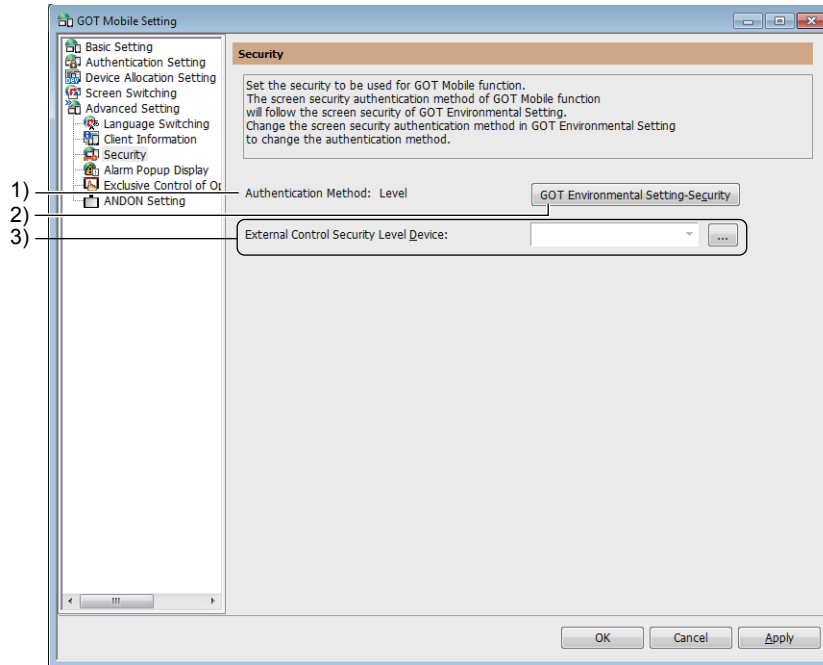

## ■ 7 [Security]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The setting items differ according to the authentication method of the screen security.  
For the details of the mobile screen security authentication, refer to the following.

→ 10.18.2 ■ 2 (3) (a) Screen security (level authentication and operator authentication)

### (1) For the level authentication

#### 1) [Authentication Method]

Displays the security authentication method set in the [Environmental Setting] window ([Security]).

#### 2) [GOT Environmental Setting-Security] button

Displays the [Environmental Setting] window ([Security]).

For the mobile screen, the authentication method set in the GOT environmental setting is applied.

The security level password is common to the clients and the GOT.

In the displayed window, set the authentication method and security level password for the GOT as necessary.

For the settings in the [Environmental Setting] window ([Security]), refer to the following.

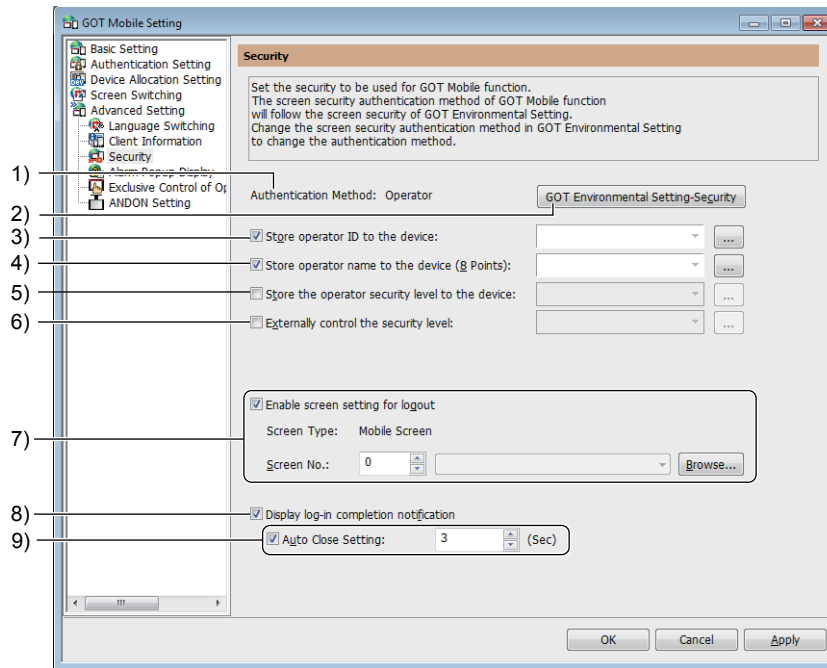

→ 5.2.8 Configuring the security settings for displaying screen data on the GOT ([Screen Security] (Level authentication))

#### 3) [External Control Security Level Device]

Set a device to store the security level of a client.

You can specify a word device or word-specified bit device.

## (2) For the operator authentication

### 1) [Authentication Method]

Displays the security authentication method set in the [Environmental Setting] window ([Security]).

### 2) [GOT Environmental Setting-Security] button

Displays the [Environmental Setting] window ([Security]).

For the mobile screen, the authentication method set in the GOT environmental setting is applied.

In the displayed window, set the authentication method for the GOT as necessary.

For the settings in the [Environmental Setting] window ([Security]), refer to the following.

⇒5.2.7 Configuring the security settings for displaying screen data on the GOT ([Screen Security] (Operator authentication))

### 3) [Store operator ID to the device]

Set the Operator ID External Notification device for clients.

This device stores the ID number of the operator who logged in from a client.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) only.

### 4) [Store operator name to the device (8 Points)]

Set the Operator Name External Notification device for clients.

This device stores the name of the operator who logged in from a client.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) only.

Eight consecutive word devices are reserved, starting from the specified device.

### 5) [Store the operator security level to the device]

Set the Operator Level External Notification device for clients.

This device stores the security level of the operator who logged in from a client.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) only.

### 6) [Externally control the security level]

Set the Security Level External Control device for clients.

This device is used to externally control the operator authentication on a client.

This setting disables the security level of the operator management information.

Select this item, and set the device.

You can specify a word device or word-specified bit device.

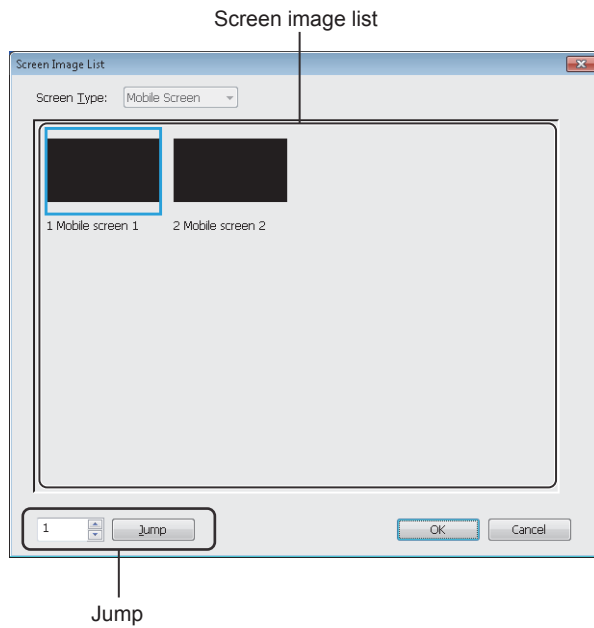

For the details of the security level control from an external device, refer to the following.

⇒5.2.7 ■ 1 (7) Security level control from an external device

### 7) [Enable screen setting for logout]

Set a screen to be displayed at logout.

Select this item, and specify the screen number of a mobile screen to be displayed.  
Click the [Browse] button to select a mobile screen in thumbnail view in the [Screen Image List] dialog.

- **[Screen Type]**  
Displays the screen type.
- **Screen image list**  
Displays mobile screen images.  
Select a screen to be displayed at logout.
- **Jump**  
Specify a screen number and click the [Jump] button to select the screen in the screen image list.

When [GOT Mobile Authentication Method] is set to [Operator] in [Authentication Setting], the GOT disconnects the client at logout, and therefore the specified screen does not appear.

⇒ ■ 2 [Authentication Setting]

#### 8) [Display log-in completion notification]

Displays a login completion notification dialog upon login.

#### 9) [Auto Close Setting]

Closes the login completion notification dialog automatically.

Select this item, and specify the time period from when the login completion notification dialog appears until it closes.

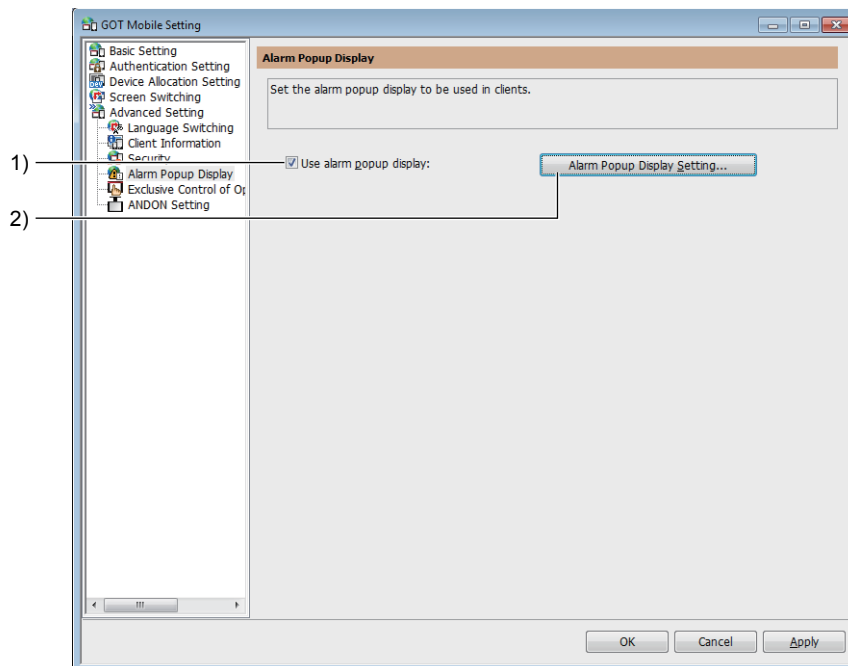

The setting range is [1] second to [60] seconds.

## ■ 8 [Alarm Popup Display]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For the details of the alarm popup display on mobile screens, refer to the following.

→ 10.18.2 ■ 2 (d) Alarm popup display

### 1) [Use alarm popup display]

Uses the alarm popup display on mobile screens.

### 2) [Alarm Popup Display Setting] button

Displays the following dialog to configure the alarm popup display setting for mobile screens.

To utilize the alarm popup display setting for the GOT, click the [Yes] button to display the [Alarm Popup Display(GOT Mobile Setting)] dialog.

To not to utilize the alarm popup display setting for the GOT, click the [No] button to display the [Alarm Popup Display(GOT Mobile Setting)] dialog.

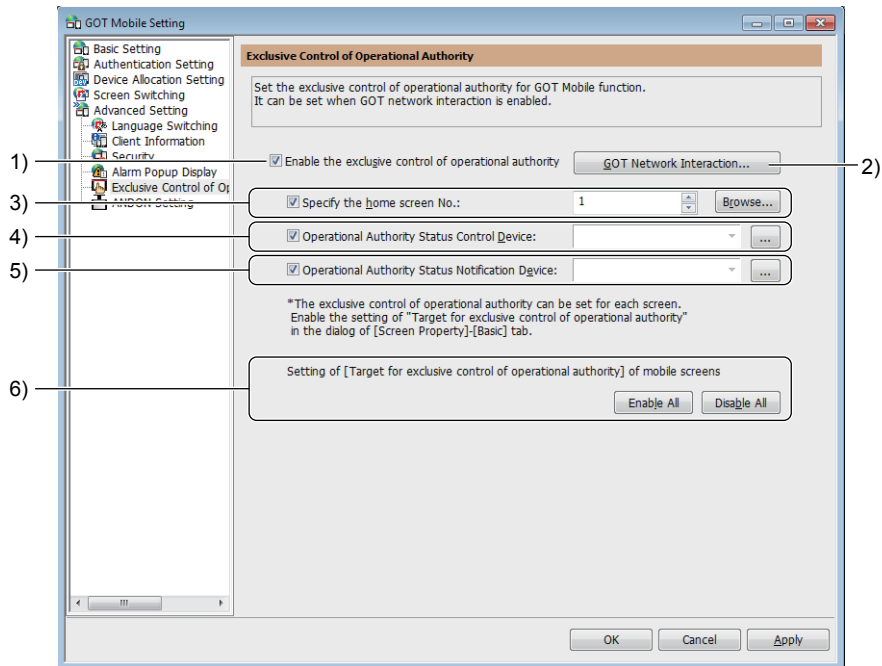

→ 9.1.4 Enabling the popup display for when an alarm occurs

## ■ 9 [Exclusive Control of Operational Authority]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For the details of the GOT network interaction function, refer to the following.

⇒5.6 Setting the Interaction Function for Equipment on Ethernet ([GOT Network Interaction])

### 1) [Enable the exclusive control of operational authority]

Enables the authorization control of the GOT network interaction function in the GOT Mobile function.

This item is settable only when the GOT network interaction function is enabled.

To enable the authorization control for a screen, select [Target for exclusive control of operational authority] in the [Basic] tab in the [Screen Property] dialog.

⇒10.18.7 ■ 1 [Basic] tab

### 2) [GOT Network Interaction] button

Displays the [GOT Network Interaction] dialog.

For the settings in the [GOT Network Interaction] dialog, refer to the following.

⇒5.6.4 [GOT Network Interaction] dialog

### 3) [Specify the home screen No.]

Set a mobile screen to be displayed by the home screen button on the popup display of the GOT network interaction function.

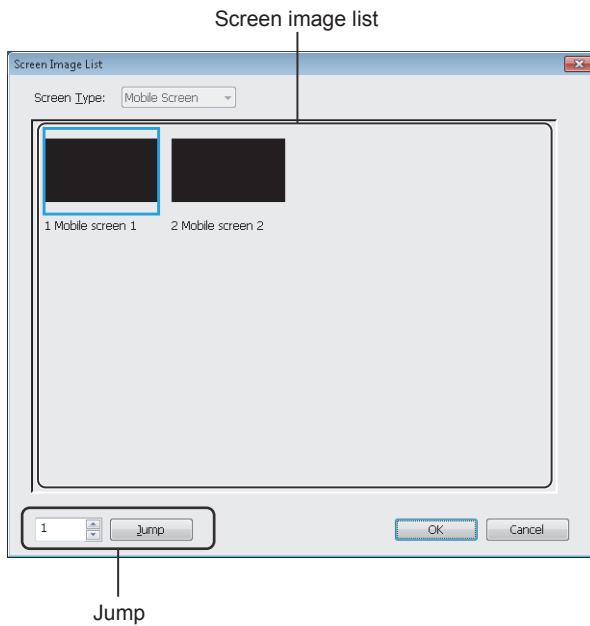

Select this item, and specify the screen number of the mobile screen.

Make sure to disable the authorization control in the mobile screen set as the home screen.

For the details of the home screen in the GOT network interaction function, refer to the following.

⇒5.6.2 ■ 2 Operation on target equipment

Click the [Browse] button to select a mobile screen in thumbnail view in the [Screen Image List] dialog.

- **[Screen Type]**  
Displays the screen type.
- **Screen image list**  
Displays mobile screen images.  
Select a destination screen.
- **Jump**  
Specify a screen number and click the [Jump] button to select the screen in the screen image list.

#### 4) [Operational Authority Status Control Device]

Set a device to control the authorization status.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) or word-specified GOT Mobile device (VGB).

For the details of the Operational Authority Status Control device, refer to the following.

→ 10.18.2 ■ 6 (2) Operational Authority Status Control device

#### 5) [Operational Authority Status Notification Device]

Set a device to notify the authorization status.

Select this item, and set the device.

You can specify a GOT Mobile device (VGD) or word-specified GOT Mobile device (VGB).

For the details of the Operational Authority Status Notification device, refer to the following.

→ 10.18.2 ■ 6 (1) Operational Authority Status Notification device

#### 6) [Setting of [Target for exclusive control of operational authority] of mobile screens]

Enables or disables the setting of [Target for exclusive control of operational authority] in all mobile screens at once.

For the mobile screen setting, refer to the following.

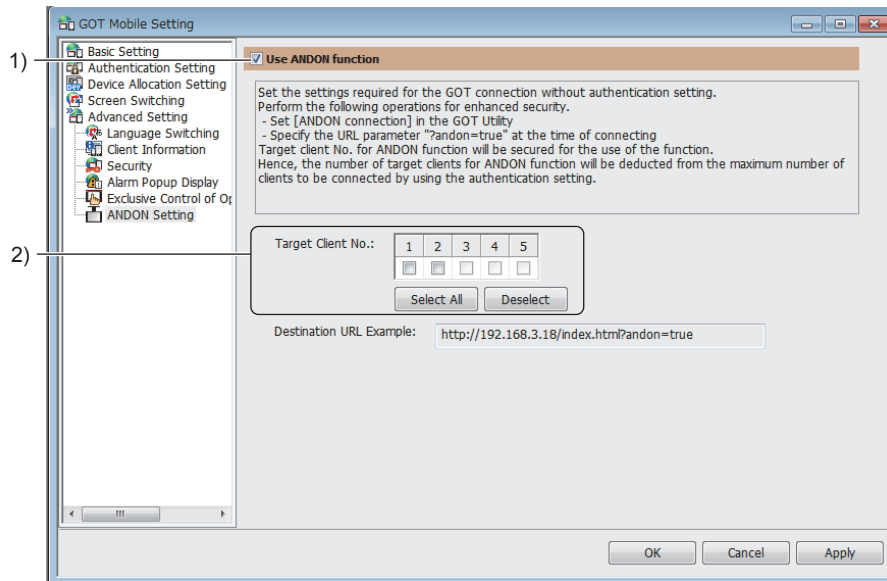

→ 10.18.7 Mobile screen properties

## ■ 10 [ANDON Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For the details of the ANDON function, refer to the following.

→ 10.18.4 ANDON function

### 1) [Use ANDON function]

Enables connection between the GOT and clients without the operator name and password-based authentication.

### 2) [Target Client No.]

Select the target client number of the ANDON function.

The selected client connects to the GOT without the operator name and password-based authentication.

Connection using the GOT Mobile exclusive authentication or the operator authentication is not applicable.

## 10.18.7 Mobile screen properties

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the properties of a mobile screen.

To display the setting dialog, perform one of the following operations.

When creating a mobile screen

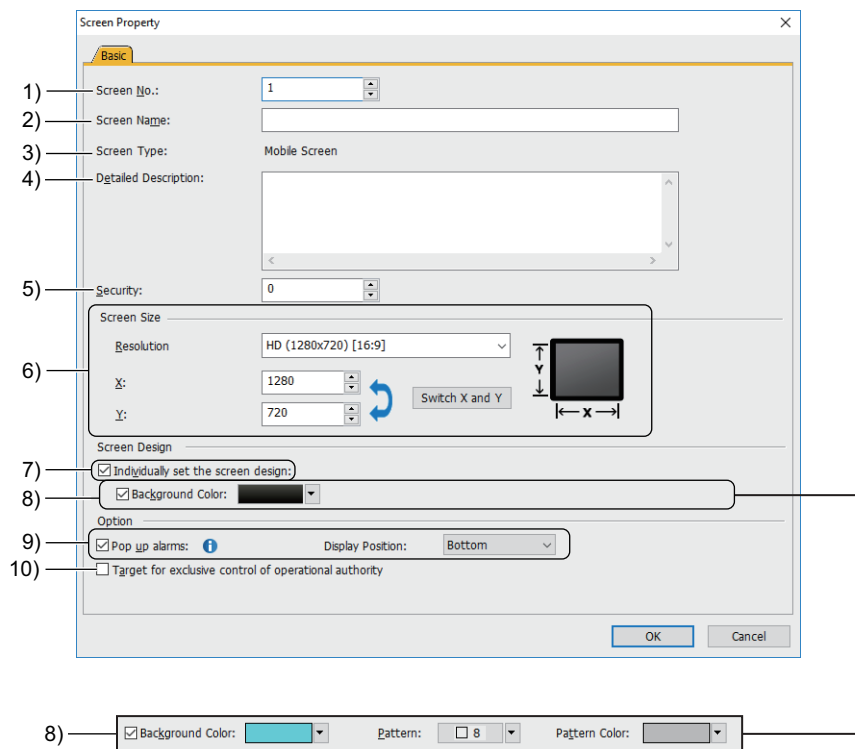

- Select [Screen] → [New] → [Mobile Screen] from the menu.
- Double-click [New] under [Mobile Screen] in the tree in the [Screen] window.

When editing an existing mobile screen

- Right-click a mobile screen, and select [Screen Property].
- Right-click a mobile screen in the tree in the [Screen] window, and select [Screen Property].  
→ ■ 1 [Basic] tab

### ■ 1 [Basic] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Screen No.]

Set a screen number.

The setting range is [0] to [32767].

If you display the [Screen Property] dialog selecting multiple screens, this value cannot be changed.

#### 2) [Screen Name]

Set the title of the screen.

Up to 32 characters can be set.

#### 3) [Screen Type]

Displays the screen type.

#### 4) [Detailed Description]

Set the explanation for the screen.

Up to 512 characters can be set.

A line feed is counted as two characters.

#### 5) [Security]

Set the security level.

The setting range is [0] to [15].

If you do not use the security function of the GOT, select [0].

⇒5.2.6 Configuring the security settings for displaying screen data on the GOT ([Screen Security])

6) **[Screen Size]**

Set the screen size.

Item	Description
[Resolution]	<p>Select the resolution of the mobile screen.</p> <p>The values of [X] and [Y] are automatically specified according to the selection for [Resolution].</p> <p>The following shows the items to be selected.</p> <ul style="list-style-type: none"> <li>• [VGA (640x480) [4:3]]</li> <li>• [SVGA (800x600) [4:3]]</li> <li>• [XGA (1024x768) [4:3]]</li> <li>• [QXGA (2048x1536) [4:3]]</li> <li>• [WXGA (1280x800) [16:10]]</li> <li>• [HD (1280x720) [16:9]]</li> <li>• [FWXGA (1366x768) [16:9]]</li> <li>• [Full HD (1920x1080) [16:9]]</li> <li>• [WUXGA (1920x1200) [16:10]]</li> <li>• [iPhone4]</li> <li>• [iPhone5]</li> <li>• [iPhone5c]</li> <li>• [iPhone5s]</li> <li>• [iPhoneSE]</li> <li>• [iPhone6]</li> <li>• [iPhone6 Plus]</li> <li>• [iPhone6s]</li> <li>• [iPhone6s Plus]</li> <li>• [iPhone7]</li> <li>• [iPhone7 Plus]</li> <li>• [iPhone8]</li> <li>• [iPhone8 Plus]</li> <li>• [iPhone X]</li> <li>• [iPad Air]</li> <li>• [iPad Air2]</li> <li>• [iPad mini 2]</li> <li>• [iPad mini 3]</li> <li>• [iPad mini 4]</li> <li>• [iPad Pro 9.7]</li> <li>• [iPad Pro 10.5]</li> <li>• [iPad Pro 12.9]</li> <li>• [iPad (5th generation)]</li> <li>• [iPad (6th generation)]</li> <li>• [Custom]</li> </ul> <p>Screen width</p> <p>The above resolutions are approximate and should be used for reference.</p> <p>Adjust the resolution according to the information device and browser to be used.</p>
[X]	<p>Screen width</p> <p>If you change a specified value, the selection for [Resolution] is changed to [Custom].</p> <p>The setting range is [480] to [3000].</p>
[Y]	<p>Screen height</p> <p>If you change a specified value, the selection for [Resolution] is changed to [Custom].</p> <p>The setting range is [480] to [3000].</p>
[Switch X and Y] button	<p>Interchanges the values of [X] and [Y].</p> <p>If you click this button, the selection for [Resolution] is changed to [Custom].</p>

7) **[Individually set the screen design]**

Enables the individual screen design (including the background color), instead of the design selected in the [Screen Design] dialog.

8) **[Background Color]**

**GOT Graphic Ver.2**

Select a background color.

For the color setting, refer to the following.

⇒6.4.2 Color settings

**GOT Graphic Ver.1**

Select a background color, pattern, and pattern color for the screen.

The pattern is displayed on the colored background.

### 9) [Pop up alarms]

An alarm pops up when an alarm occurs.

Item	Description
[Display Position]	Select the position to display an alarm to be popped up. The following shows the items to be selected. <ul style="list-style-type: none"> <li>• [Top]</li> <li>• [Center]</li> <li>• [Bottom]</li> </ul>

Configure the following settings additionally.

- User alarm settings or system alarm settings
  - 9.1.2 ■ 7 [User Alarm Observation] dialog
  - 9.1.3 ■ 5 [System Alarm Observation] dialog
- Alarm popup display settings
  - 9.1.4 ■ 4 [Alarm Popup Display] dialog

### 10) [Target for exclusive control of operational authority]

Enables the authorization control in the screen being edited.

→ 10.18.2 ■ 6 Authorization control

To enable the authorization control throughout the project, select [Enable the exclusive control of operational authority] in the [GOT Mobile Setting] window ([Exclusive Control of Operational Authority]).

→ 10.18.6 ■ 9 [Exclusive Control of Operational Authority]

## 10.18.8 Relevant settings

Set the relevant settings other than the specific settings for the GOT Mobile function as required.

The following shows the functions that are available by the relevant settings.

→ 12.1.3 GOT special register (GS)

### ■ 1 GOT internal device

Function	Setting item
Storing the number of clients connected to the GOT (Write device)	GS1400
Turning on when client 1 to 5 connect to the GOT (Write device)	GS1401.b1 to.b5
Specifying a security level with which folder and file manipulations are allowed on the file manager screen (Read device)	GS1892
Setting whether to use the URL parameter (initscreen) (Read device)	GS1896.b0
Enabling folder and file manipulations on the file manager screen (Read device)	GS1896.b1
Setting the time from when communication is lost between the GOT and a client until when the GOT forcibly turns off the touch switch being touched on the client (Read device)	GS1899

## 10.18.9 Troubleshooting

If you have any trouble with the GOT Mobile function, check the operating environment first.

→10.18.2 ■ 1 Operating environment

### ■ 1 Troubleshooting for clients

The following shows the troubleshooting for clients.

Symptom	Details of error and cause	Corrective action
Although a URL is specified, a communication error occurs and no screen appears.	The specified URL is incorrect.	Enter the correct URL. →10.18.3 ■ 3 (1) Connecting a client
	The setting for connection to the server (GOT) is configured incorrectly.	Check that the system is configured correctly. →10.18.3 ■ 1 System configuration If the system is configured correctly, check that the connection setting on the client and the following settings on GT Designer3 are configured correctly. • [GOT Standard Ethernet Setting] in the [Controller Setting] window • [Wireless LAN] in the [I/F Communication Setting] window • [Destination Access Point Setting] or [Access Point Setting] in the [GOT Setup] window ([Wireless LAN Setting]) →5.5.1 Setting channels 5.7.3 [I/F Communication Setting] dialog 5.3.12 Configuring the settings for a wireless LAN ([Wireless LAN Setting])
	The system application (extended function) for the GOT Mobile function is not installed on the GOT.	Write the package data that contains the system application (extended function) for the GOT Mobile function to the GOT. →4. COMMUNICATING WITH GOT
After the authentication, the client stays at a black screen and no mobile screen appears.	The antivirus software causes the mobile screen not to appear.	Connect the client to the GOT through a port other than the standard port No. 80. →10.18.6 ■ 1 [Basic Setting] If no mobile screen appears even after you change the port number, disable the antivirus software.
A message saying [License unregistration.] appears on the mobile screen. The client is disconnected from the GOT after a lapse of 30 minutes.	The license of the GOT Mobile function is unregistered to the GOT.	Register the license of the GOT Mobile function to the GOT. →GOT2000 Series User's Manual (Utility)

### ■ 2 Error messages on clients

#### (1) Errors before authentication

Error message	Cause	Corrective action
Unsupported browser. Check the operating environment.	The browser does not support the following items. • HTML5 • CSS3 • JavaScript • WebSocket Protocol(RFC 6455)	Use a browser that meets operating environment conditions. →10.18.2 ■ 1 (5) Client operating environment
JavaScript is disabled. Enable JavaScript and connect again.	JavaScript is disabled in the browser.	Enable JavaScript in the browser. →10.18.3 ■ 2 (3) Setting on the client
Cookie is disabled. Enable Cookie and connect again.	Cookie is disabled in the browser.	Enable Cookie in the browser. →10.18.3 ■ 2 (3) Setting on the client

#### (2) Errors at authentication

Error message	Cause	Corrective action
The operator name or password is incorrect. Please check the operator name or password and execute again.	An incorrect operator name or password has been entered at authentication.	Check the entered operator name and password.
The operator information is being edited in the destination device. Please wait for a while and connect again.	The operator authentication cannot be performed because the operator management information file is being edited on the server (GOT).	Perform the operator authentication again after the edit is completed.

Error message	Cause	Corrective action
Exceeding the maximum number of connections and the connection cannot be made. Please wait for a while and try again.	The connection failed because the number of clients has exceeded the maximum number of simultaneously connectable clients. →10.18.6 ■ 1 [Basic Setting]	<ul style="list-style-type: none"> <li>Reconnect to the GOT after any other client becomes disconnected from the GOT.</li> <li>Check that no operator who has used the GOT Mobile function maintains a logged-in state.</li> </ul>
Destination does not respond. Check the communication environment and connect again.	The client cannot communicate with the server (GOT) due to a radio disturbance or a failure in the information device.	Check that the communication environment between the server (GOT) and client is established properly.
The operator is locked or disabled and cannot log in. Please check with the administrator.	A locked operator account due to incorrect login attempts or a disabled operator account is used.	Ask your system administrator to unlock or enable the operator account.
Parameters specified in the URL is wrong. Please check parameters.	An incorrect URL parameter has been entered on the address bar in the browser.	Check the entered URL parameter. →10.18.3 ■ 3 (1) (a) URL parameters
Parameters specified in the URL is invalid. Please check the connection destination setting.	The URL parameter setting is inconsistent with the settings on GT Designer3 or the GOT.	Check that the settings are configured correctly on GT Designer3 and the GOT. →10.18.3 ■ 3 (1) (a) URL parameters
The client No. specified in the URL is in use and cannot be accessed. Please wait for a while and try again.	The connection failed because any other client is connecting to the GOT by using the specified client number.	Reconnect to the GOT after the client using the specified client number becomes disconnected from the GOT. →10.18.3 ■ 3 (1) (a) URL parameters
The operator does not meet the connection conditions and cannot log in. Please check with the administrator.	The connection with the operator authentication failed because the security level of the operator is insufficient.	Ask your system administrator to check the security level setting.
Your password has expired and cannot log in. Please change the password on the connection destination.	The connection with the operator authentication failed because the entered password has expired.	Change the password on the GOT.

### (3) Errors in the process of monitoring

Error message	Cause	Corrective action
Trial time has expired. Connection disconnected.	The trial connection time has elapsed, and the client became disconnected from the server (GOT). This is because the license number of the GOT Mobile function is unregistered to the server (GOT).	Register the license of the GOT Mobile function to the GOT. →GOT2000 Series User's Manual (Utility)
Connection with destination is disconnected. Check the communication path.	Communication between the server (GOT) and client has been lost.	Connect the client to the server (GOT) again. If connection cannot be established, check that the communication environment between the server (GOT) and client is established properly.
Destination has changed to a offline mode. The connection has been terminated.	The server (GOT) disconnected the client, because the server (GOT) entered the offline mode because of package data writing or others.	Connect the client to the server (GOT) again.
Mobile screen was not operated for a set period of time. Connection terminated.	The server (GOT) disconnected the client, because the automatic logout time elapsed. →10.18.6 ■ 1 [Basic Setting]	Connect the client to the server (GOT) again.
The operator information is being edited in the destination device. Please wait for a while and login and change password again.	You cannot log in using the operator authentication from the client. If you are already logged in, you cannot change your operator account password on the client. These are because the operator management information file is being edited on the server (GOT).	Perform the operator authentication again or change the password after the edit is completed.
You have been logged out. The connection has been terminated.	When you are logged in using the operator authentication, a logout is performed on the client.	Connect the client to the server (GOT) again.
Authentication method is set to the operator authentication. Operators cannot be changed.	The operator switching was denied because you are logged in using the operator authentication.	Log out of the operator account in use, and log in with another operator account.

11.11	Checking Data Size . . . . .	11 - 179
11.12	Zooming and Scrolling the Monitor Screen of the GOT (Screen Gesture Function). . . . .	11 - 181
11.13	Operating Objects by the Gesture (Object Gesture Function) . . .	11 - 191
11.14	Checking the Causes and Corrective Actions for an Error in the GOT (GOT Diagnostics) . . . . .	11 - 200

## 11.1 Searching for Utilizable Data (Utilize Data)

---

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

When you create a project or screen, search a sample or existing project for utilizable data based on the specified search criteria, such as a keyword.

You can find utilizable data efficiently without the knowledge of the settings in the sample or existing project.

- ⇒ 11.1.1 Specifications for the utilize data
- 11.1.2 How to use the utilize data
- 11.1.3 Precautions
- 11.1.4 [Utilize Data (Project)] dialog and [Search] dialog
- 11.1.5 [Utilize Data (Screen)] window
- 11.1.6 [Utilize] dialog
- 11.1.7 [Detail Screen Setting] dialog
- 11.1.8 Registering the add-on license

If you know the settings in a project to be utilized, you can specify data to be utilized from the project directly.

- ⇒ 11.4 Utilizing Other Project Data

### 11.1.1 Specifications for the utilize data

---

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

#### ■ 1 File formats of utilizable projects

The following shows the file formats of utilizable projects.

GOT	Project format
GOT2000 Series	<ul style="list-style-type: none"><li>• Workspace format</li><li>• Single file format (*.GTX, *.GTXS)</li></ul> <p>If a project is saved when [Include projects for the function of Utilize Data] is deselected in the [Project information] dialog, the project is not utilizable.</p>

## 11.1.2 How to use the utilize data

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

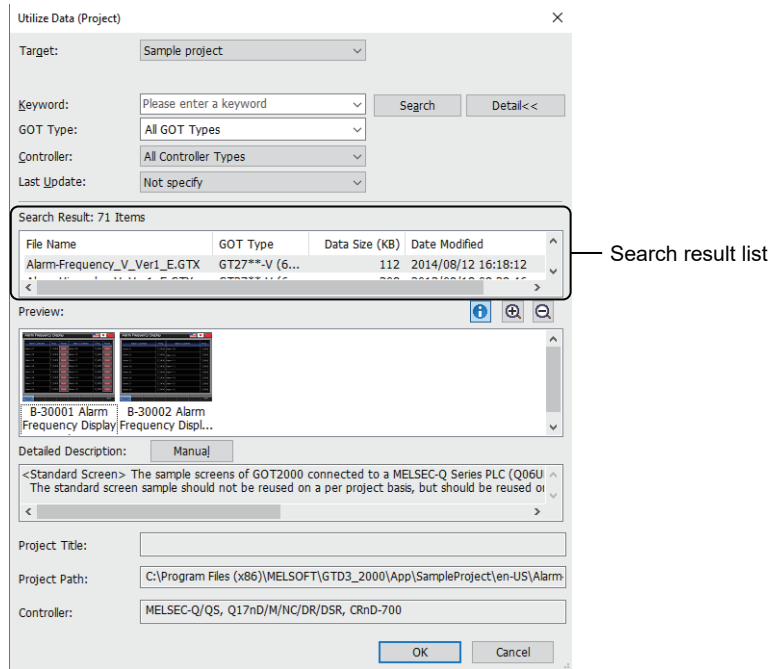

- ➡ ■ 1 Utilizing a project
- 2 Utilizing a screen

### ■ 1 Utilizing a project

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

- Step 1** Select [Project] → [Utilize Data] from the menu to display the [Utilize Data (Project)] dialog.
- Step 2** Set the search criteria and click the [Search] button to list the search results.

➡ 11.1.4 [Utilize Data (Project)] dialog and [Search] dialog

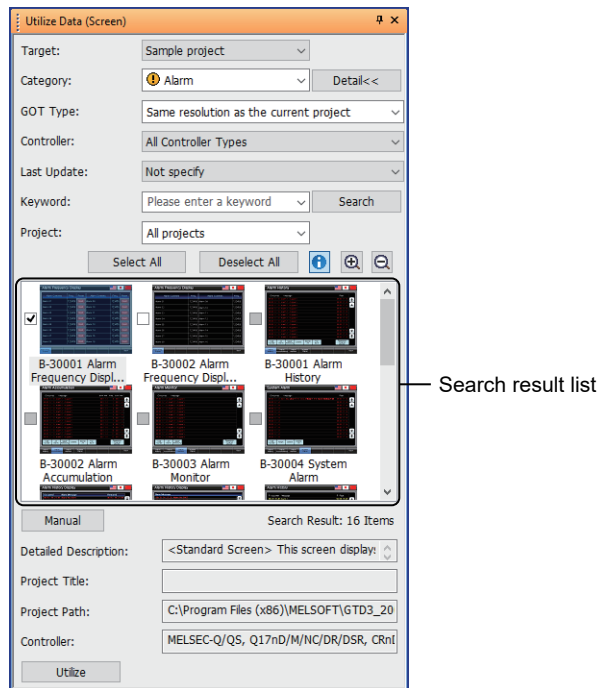

- Step 3** Select the utilizable project and click the [OK] button to create the project to be utilized.

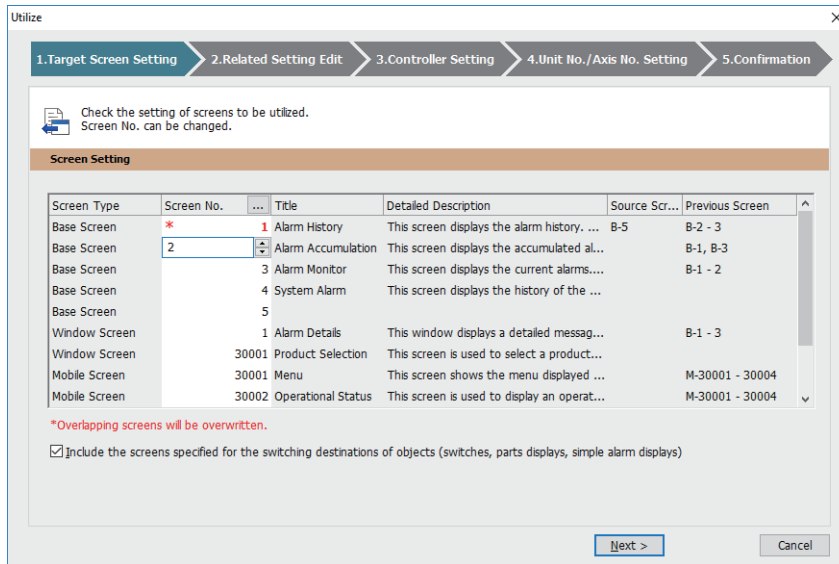

## ■ 2 Utilizing a screen

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Display the [Utilize Data (Screen)] window combined with GT Designer3.  
(The [Utilize Data (Screen)] window combined with GT Designer3 by default.)  
When the window is not displayed, operating any one of the following displays it.
- Select [Screen] → [Utilize Data] from the menu.
  - Select [View] → [Docking Window] → [Utilize Data (Screen)] from the menu.
- Step 2** Set the search criteria and click the [Search] button to list the search results.
- ⇒ 11.1.5 [Utilize Data (Screen)] window

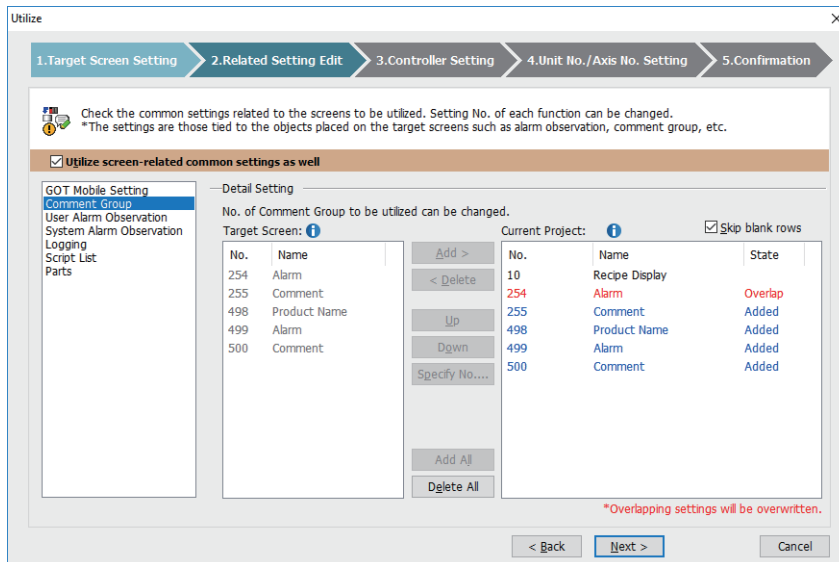

- Step 3** Select the checkbox for a screen to be utilized and perform one of the following operations to display the [Utilize] dialog.
- ⇒ 11.1.6 [Utilize] dialog
- Click the [Utilize] button.
  - Drag a target screen to the work window from the search result list.
- Step 4** Set a screen number to be assigned in the destination project, and click the [Next] button.
- ⇒ 11.1.6 ■ 1 [Target Screen Setting]

**Step 5** Set whether to utilize the settings related to the target screen, assign the setting numbers, and click the [Next] button.

⇒ 11.1.6 ■ 2 [Related Setting Edit]

**Step 6** If labels (GT Designer3) are used in the target screen and the settings related to the screen, set whether to utilize the relevant label groups, assign label group numbers, and click the [Next] button.

⇒ 11.1.6 ■ 2 [Related Setting Edit]

**Step 7** Select a channel for each controller type to be used in the destination project, and click the [Next] button.

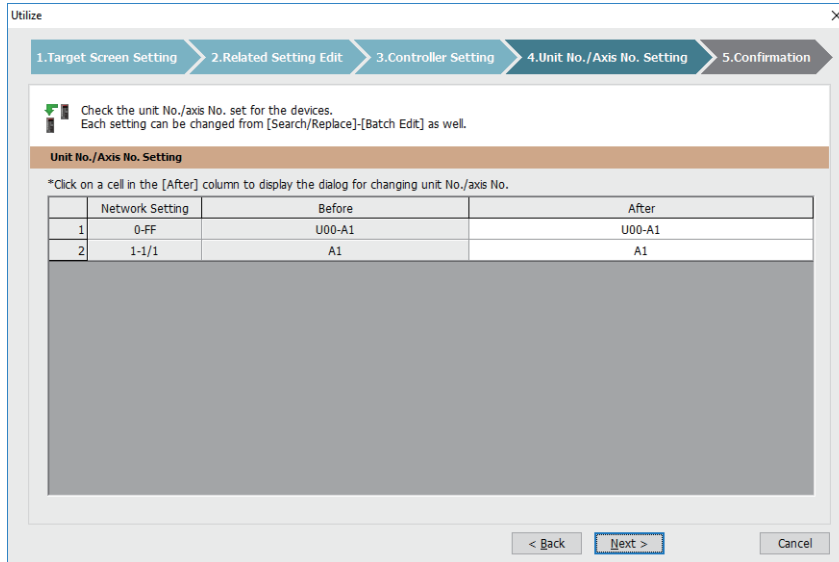

→ 11.1.6 ■ 3 [Controller Setting]

If multiple channels are used in the source project, this step is repeated for each additional channel.

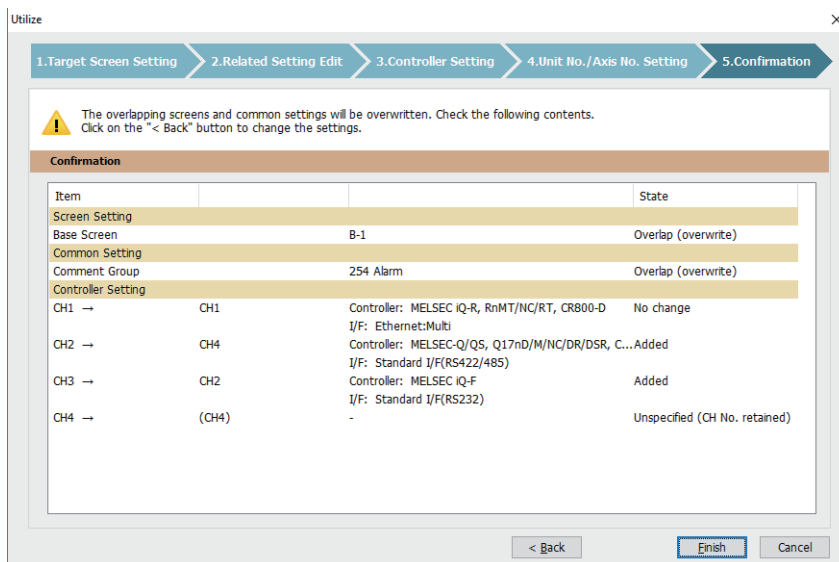

**Step 8** If necessary, change the unit number and axis number specified for an applicable device used in the target screen, and click the [Next] button.

→ 11.1.6 ■ 4 [Unit No./Axis No. Setting]

**Step 9** Confirm the displayed contents and click the [Finish] button to execute the screen utilization.

⇒ 11.1.6 ■ 5 [Confirmation]

### 11.1.3 Precautions

---

#### ■ 1 Utilizing the project protected with a security key

When the project to be searched is protected with a security key, the security key authentication is performed.  
If the authentication fails, the project name is not displayed in the search result list.

⇒2.12 Protecting a Project with a Security Key

#### ■ 2 Utilizing the project protected with the project security

##### (1) User authentication for the project

When the project security is set in the search target project, user authentication is conducted.

⇒2.13 Protecting a Project by Registering Users

When the project security is set in the project that is being edited, the search target project that can be authenticated is automatically authenticated by the logged-in username and password.

##### (2) Whether utilizing data by access privilege is available or not

###### (a) Utilizing the project

When the display of the entire project or a part of the screen is prohibited, the project cannot be utilized.

When the display of the entire project is prohibited, the project is not displayed on the [Utilize Data (Screen)] dialog.

When the screen where the display is prohibited exists, the preview is the dummy screen.

###### (b) Utilizing data of a screen

The screen where the display is prohibited cannot be utilized.

The preview of the screen where the display is prohibited is a dummy screen.

#### ■ 3 Utilizing the project containing a different GOT type setting

Utilized data is converted according to the GOT type set in the destination project.

Functions that does not correspond to the GOT type of the destination project are not eliminated.

#### ■ 4 Utilizing the project containing different controller settings

When [Retain the CH No.] is selected in the [Utilize] dialog ([Controller Setting]), the devices set for the objects on the utilized screens will be changed as shown below.

- The device name is changed according to the controller setting in the destination project.
- The device to which the controller setting in the destination project does not correspond is changed to [??] (except the devices in the script data)

Check the device setting and set it again.

#### ■ 5 Utilizing the project read from the GOT

Right after the project is read from the GOT, the [Utilize Data (Project)] dialog and others do not display the screen images set in the project.

To display the screen images set in the project, open the project read from the GOT, and save the project again.

#### ■ 6 Utilizing the project in which a system label is set

In the project being edited, when [Use system labels in conjunction with MELSOFT Navigator] of the [Type Setting] dialog is unchecked, the data of the screens from the project where a system label is set cannot be utilized.

⇒5.1.4 [Type Setting] dialog

#### ■ 7 Utilizing the project in which Windows fonts are used for comment groups

If the Windows fonts used for comment groups are not installed on the personal computer, the comments are displayed in different fonts.

To display the comments in the specified Windows fonts, make sure that the fonts are installed on the personal computer before utilizing the project.

## ■8 Utilizing the project created with GT Designer3 version earlier than 1.205P

When [Same resolution as the current project] is selected for [GOT Type] in the [Utilize Data (Screen)] window, if you search for the projects created with GT Designer3 version earlier than 1.205P, the results will be listed as shown below.

- All the projects matching the specified resolution are listed without distinction of the GOT installation orientation.
- If [GOT Type] is set to [GT SoftGOT2000] in the destination project, the projects for GT SoftGOT2000 are listed without distinction of the GOT resolution.
- If [GOT Type] is set to any item other than [GT SoftGOT2000] in the destination project, the projects for GT SoftGOT2000 are not listed.

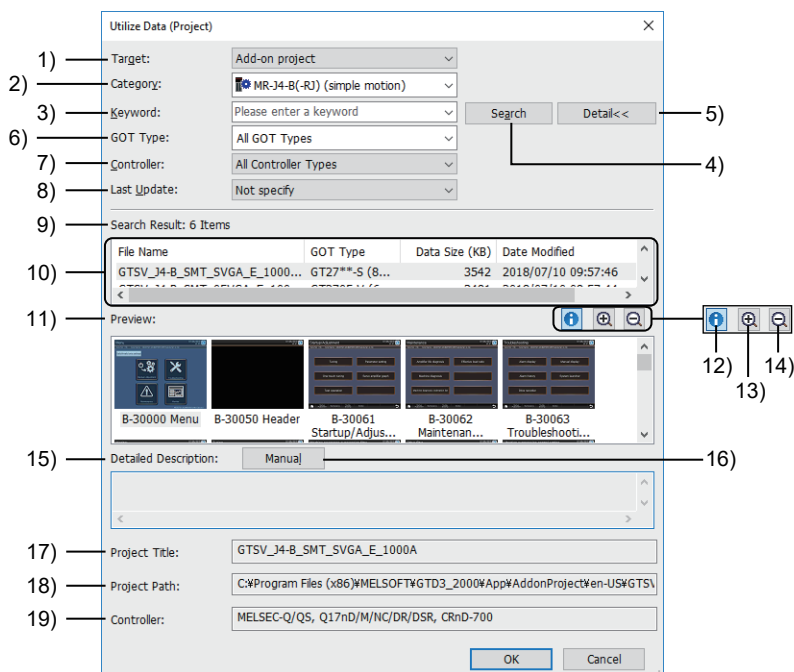

To eliminate the above problems, save the relevant projects with GT Designer3 version 1.205P or later.

### 11.1.4 [Utilize Data (Project)] dialog and [Search] dialog

The dialog name varies with the display method.

- The [Utilize Data (Project)] dialog is displayed by selecting [Project] → [Utilize Data] from the menu.
  - The [Search] dialog is displayed from the [Utilize Project] dialog.
- Add-on projects cannot be searched in the [Search] dialog.

#### 1) [Target]

Select the target for a search.

The following shows the items to be selected.

- [Add-on project]:  
This item appears when the add-on license has been registered.  
→ 11.1.8 Registering the add-on license  
Searches the add-on projects.
- [Sample project]  
Search from the sample project installed with GT Designer3.
- [Recently edited project]  
Search from the recently edited project (up to 5 projects).  
When GT Designer3 is started from MELSOFT Navigator, the project edited with GT Designer3 is not included in the search targets.
- [Project folder]  
Search from the projects in the specified folder.  
The search target is up to the projects of the folder existing in the lower three hierarchy.  
Up to 1000 projects can be included in the search targets.  
Specify the holder from the [Browse] button.

## 2) [Category]

When [Target] is set to [Add-on project], select a project type.

The following shows the items to be selected.

- [MR-J4-B(-RJ) (Simple Motion)]
- [MR-J4-B(-RJ) (Motion Controller)]

## 3) [Keyword]

Specify the keyword for a search.

Two-byte and one-byte characters are recognized.

Specifying keywords delimited with one-byte or two-byte spaces enables you to narrow the scope of a search to the projects containing the keywords.

Adding "!" before keywords can search the projects on which the specified keywords are not included.

Up to five history is displayed.

## 4) [Search] button

Searching

## 5) [Detail >>] button and [Detail <<] button

Switch displaying and not displaying the following setting items.

- [GOT Type]
- [Controller]
- [Last Update]

Even though the above setting items are not displayed, they can be included in the targets for a search.

## 6) [GOT Type]

Select a GOT type by which projects are searched.

The following shows the items to be selected.

- [All GOT Types]
- Options for [Type] in the [Type Setting] dialog
  - ⇒5.1.4 [Type Setting] dialog

## 7) [Controller]

Select the controller type for the project to be searched.

The items to be selected are the same as [Type] in setting the channel on the [Controller Setting] window.

⇒12.2.1 Correspondence between the setting of [Controller Type] and the controller used

## 8) [Last Update]

Select the last update of the project to be searched.

The following shows the items to be selected.

- [Not specify]
- [Within the last 24 hour]
- [Within the last week]
- [Within the past month]
- [Within the past year]
- [Over a year ago]

## 9) [Search Result]

Number of searched projects

## 10) Search result list

List of searched projects

## 11) [Preview]

Screen images set in the projects selected in the search result list

## 12) [Information] button

Switch displaying and not displaying the following items.

- [Information]
- [Project Title]
- [Project Path]
- [Controller]

## 13) [Zoom in] button

Zoom in the display of [Preview].

## 14) [Zoom out] button

Zoom out the display of [Preview].

## 15) [Detailed Description]

Detail description of the project selected in the search result list

### 16) [Manual] button

Displays the PDF manual for add-on projects when [Target] is set to [Add-on project].  
Displays the PDF manual for sample projects when [Target] is set to [Sample project].

### 17) [Project Title]

Title of the project selected in the search result list

### 18) [Project Path]

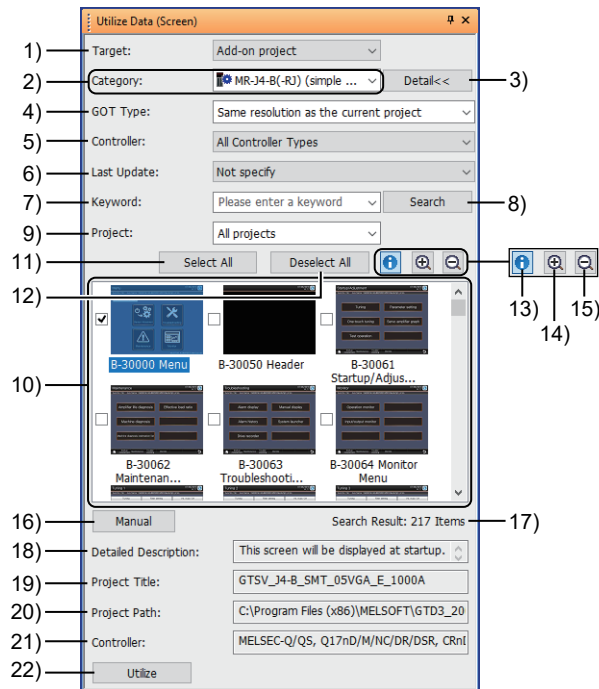

Save folder path of the project selected in the search result list

### 19) [Controller]

Controller setting(type) of the project selected in the search result list

## 11.1.5 [Utilize Data (Screen)] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Target]

Select the target for a search.  
The following shows the items to be selected.

- [Add-on project]:  
This item appears when the add-on license has been registered.  
→ 11.1.8 Registering the add-on license  
Searches the add-on projects.
- [Sample project]  
Search from the sample project installed with GT Designer3.
- [Recently edited project]  
Search from the recently edited project (up to 5 projects).  
When GT Designer3 is started from MELSOFT Navigator, the project edited with GT Designer3 is not included in the search targets.
- [Project folder]  
Search from the projects in the specified folder.  
The search target is up to the projects of the folder existing in the lower three hierarchy.  
Up to 1000 projects can be included in the search targets.  
Specify the holder from the [Browse] button.

### 2) [Category]

When [Target] is set to [Add-on project] or [Sample project], select a project type.  
The selectable items vary depending on the setting of [Target].  
When [Target] is set to [Add-on project], the following items are selectable.

- [MR-J4-B(-RJ) (Simple Motion)]
- [MR-J4-B(-RJ) (Motion Controller)]

When [Target] is set to [Sample project], the following items are selectable.

- [All]
- [Alarm]
- [Recipe]
- [GOT Mobile]
- [I/O Monitor]
- [CC-Link Network Monitor]
- [AnyWireASLINK Network Monitor]
- [iQSS Backup/Restoration]
- [MITSUBISHI ELECTRIC (Programmable Controller)]
- [MITSUBISHI ELECTRIC (Servo)]
- [MITSUBISHI ELECTRIC (Inverter)]
- [MITSUBISHI ELECTRIC (Other)]
- [SMC]
- [IAI]
- [ORIENTAL MOTOR]
- [PATLITE]
- [Temperature Controller]
- [Want to display numerical data]
- [Want to display an alarm]
- [Want to display a figure/text]
- [Want to display the panel status]
- [Want to operate the panel]
- [Want to display a graph]
- [Want to copy a file to SD card]
- [Want to register a favorite screen]

### 3) [Detail >>] button and [Detail <<] button

Switch displaying and not displaying the following setting items.

- [GOT Type]
- [Controller]
- [Last Update]

Even though the above setting items are not displayed, they can be included in the targets for a search.

### 4) [GOT Type]

Select a GOT type by which projects are searched.

The following shows the items to be selected.

- [All GOT types]:  
Selects all GOT types.
- [Same as the current project]:  
Selects the GOT type specified in the destination project.
- [Same resolution as the current project]:  
Selects the GOT type whose resolution and installation orientation are identical to the ones specified in the destination project.
- Options for [Type] in the [Type Setting] dialog  
⇒5.1.4 [Type Setting] dialog

### 5) [Controller]

Select the controller type for the project to be searched.

The items to be selected are the same as [Type] in setting the channel on the [Controller Setting] window.

⇒12.2.1 Correspondence between the setting of [Controller Type] and the controller used

### 6) [Last Update]

Select the last update of the project to be searched.

The following shows the items to be selected.

- [Not specify]
- [Within the last 24 hour]
- [Within the last week]

- [Within the past month]
  - [Within the past year]
  - [Over a year ago]
- 7) **[Keyword]**  
Specify the keyword for a search.  
Two-byte and one-byte characters are recognized.  
Specifying keywords with one-byte spaces between the keywords can search the screens on which the specified keywords are included.  
Up to five history is displayed.
- 8) **[Search] button**  
Conducts a search.
- 9) **[Project]**  
Select a project, narrowing down the thumbnails of found screens in the search result list.  
The following shows the items to be selected.
- [All projects]
  - Individual projects
- 10) **Search result list**  
Thumbnails of found screens.  
Multiple screens are selectable from within the same project.
- 11) **[Select All] button**  
Selects all the screens in the project which includes the screen selected in the search result list.
- 12) **[Deselect All] button**  
Deselects all the screens selected in the search result list.
- 13) **[Information] button**  
Displays or hides the following items.
- [Information]
  - [Project Title]
  - [Project Path]
  - [Controller]
- 14) **[Zoom in] button**  
Zoom in the display of search result list.
- 15) **[Zoom out] button**  
Zoom out the display of search result list.
- 16) **[Manual] button**  
Displays the PDF manual for add-on projects when [Target] is set to [Add-on project].  
Displays the PDF manual for sample projects when [Target] is set to [Sample project].
- 17) **[Search Result]**  
Number of found screens.
- 18) **[Detailed Description]**  
Detail description of the screen selected in the search result list
- 19) **[Project Title]**  
Title of the project including the screen selected in the search result list
- 20) **[Project Path]**  
Save folder path of the project including the screen selected in the search result list
- 21) **[Controller]**  
Controller setting(type) of the project including the screen selected in the search result list
- 22) **[Utilize] button**  
Displays the [Utilize] dialog.  
    ➔ 11.1.6 [Utilize] dialog

## 11.1.6 [Utilize] dialog

Configure the settings to utilize a screen.

In the process navigation bar, the color of each step represents the status of the step.

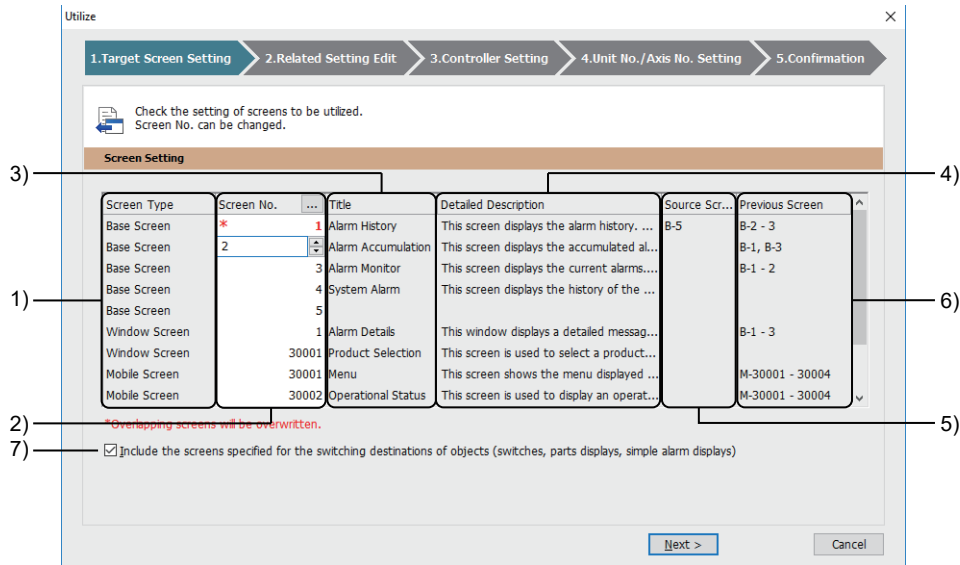

Display image	Status
	Active
	Done
	Undone

- ➡ ■ 1 [Target Screen Setting]
- 2 [Related Setting Edit]
- 3 [Controller Setting]
- 4 [Unit No./Axis No. Setting]
- 5 [Confirmation]

## 11 [Target Screen Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the screen number of a screen to be utilized in the destination project.

### 1) [Screen Type]

Type of a target screen.

### 2) [Screen No.]

Screen number of a target screen.

Change the screen number as necessary.

The screen number is displayed in red if it is used in the destination project.

Click the [...] button to display the [Detail Screen Setting] dialog.

→ 11.1.7 [Detail Screen Setting] dialog

### 3) [Title]

Title of a target screen.

### 4) [Detailed Description]

Detailed description of a target screen.

### 5) [Source Screen]

If a target screen is specified as a called screen for the set overlay screen function, the screen number of the calling screen is displayed.

### 6) [Previous Screen]

If a target screen is specified as the screen to be switched to in a touch switch setting, the screen number of the switched screen is displayed.

### 7) [Include the screens specified for the switching destinations of objects (switches, parts displays, simple alarm displays)]

Utilizes the screen that is specified as the screen to be switched to in the setting of a touch switch, parts display, or simple alarm display.

## ■ 2 [Related Setting Edit]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set whether to utilize the settings related to the screen to be utilized, and assign setting numbers.

1) Utilize screen-related common settings as well

2) Utilize Label (GT Designer3) set for screens and common settings as well

3) Setting list

4) Overwrite the network drive setting

5) Overwrite the GOT Mobile setting

6) Overwrite the recipe common setting

7) Detail Setting

8) Current Project: [Skip blank rows]

9) Add >

10) < Delete

11) Up

12) Down

13) Specify No....

14) Add All

15) Delete All

16) \*Overlapping settings will be overwritten.

17) < Back

18) Next >

19) Cancel

20) When [Network Drive] is selected in the setting list

21) When [GOT Mobile Setting] is selected in the setting list

22) When [Recipe Common Setting] is selected in the setting list

### 1) [Utilize screen-related common settings as well]

Utilizes the settings related to the target screen.

### 2) [Utilize Label (GT Designer3) set for screens and common settings as well]

This item appears when labels (GT Designer3) are used in the target screen and the settings related to the screen.

Utilizes the relevant label groups.

For information on how to display this item, refer to the following.

⇒ 11.1.2 ■ 2 Utilizing a screen

### 3) Setting list

Lists the settings related to the target screen.

The existing settings are displayed only.

- [Network Drive]
- [GOT Mobile Setting]
- [Comment Group]
- [User Alarm Observation]
- [System Alarm Observation]
- [Logging]
- [Recipe Common Setting]

This item appears when the target screen is included in an add-on project.

- [Recipe]

- [Script (Project)]  
A project script is utilized when [Include this script in a screen-related setting when utilizing project/screen] is selected in the [Script Edit] dialog.
- [Script List]
- [Object Script Symbol]
- [Device Data Transfer]  
This item appears when the target screen is included in an add-on project.
- [Trigger Action (Project)]  
This item appears when the target screen is included in an add-on project.
- [Parts]
- [Sound File]

#### 4) [Overwrite the network drive setting]

This item appears when [Network Drive] is selected in the setting list.  
Utilizes the network drive settings.

#### 5) [Overwrite the GOT Mobile setting]

This item appears when [GOT Mobile Setting] is selected in the setting list.  
Utilizes the settings of the GOT Mobile function.

#### 6) [Overwrite the recipe common setting]

This item appears when [Recipe Common Setting] is selected in the setting list.  
Utilizes the recipe common settings.

#### 7) [Target Screen]

Lists the utilizable settings.

Item	Description
[No.]	Number of each setting in the source project.
[Name]	Name of each setting in the source project.

The text color of a setting represents the status of the setting.

Text color	Description
Black	Setting that is not added to [Current Project]. To utilize a setting in the destination project, add the setting to [Current Project] with the [Add] button.
Gray	Setting added to [Current Project].

For mouse and keyboard operations, refer to the following.

⇒(1) Mouse and keyboard operations

#### 8) [Current Project]

Lists the settings in the destination project.

Item	Description
[Skip blank rows]	Only displays the rows where a setting is present.
[No.]	Number of each setting in the destination project.
[Name]	Name of each setting in the destination project.
[State]	Assignment status of each setting. • [Added]: Setting added from [Target Screen] • [Overlap]: Duplicate setting number in the destination project

The text color of a setting represents the status of the setting.

Text color	Description
Black	Setting existing in the destination project.
Blue	Setting added from [Target Screen].
Red	Duplicate setting number in the destination project.

In [Current Project], the assigned number is changeable with the [Up] button or the [Down] button.

For mouse and keyboard operations, refer to the following.

⇒(1) Mouse and keyboard operations

#### 9) [Add] button

Adds the setting selected in [Target Screen] to the row selected in [Current Project].

If no row has been preselected in [Current Project], the [Destination Data No. Specification] dialog appears. Specify a setting number to be assigned in the destination project.

10) **[Delete] button**

Deletes the setting selected in [Current Project].

11) **[Up] button, [Down] button**

Moves the setting selected in [Current Project] up or down.

12) **[Specify No.] button**

Displays the [Destination Data No. Specification] dialog.

Change the setting number of the setting selected in [Current Project].

• **[No.]**

Specify a setting number to be assigned in the destination project. The setting range varies depending on the setting to be utilized.

13) **[Add All] button**

Adds all the settings listed in [Target Screen] to [Current Project].

The settings are added to the selected row and subsequent rows in [Current Project].

If no row has been preselected in [Current Project], each setting is added with its setting number unchanged.

14) **[Delete All] button**

Deletes all the added settings from [Current Project].

**(1) Mouse and keyboard operations**

The following shows the mouse and keyboard operations in [Target Screen] and [Current Project].

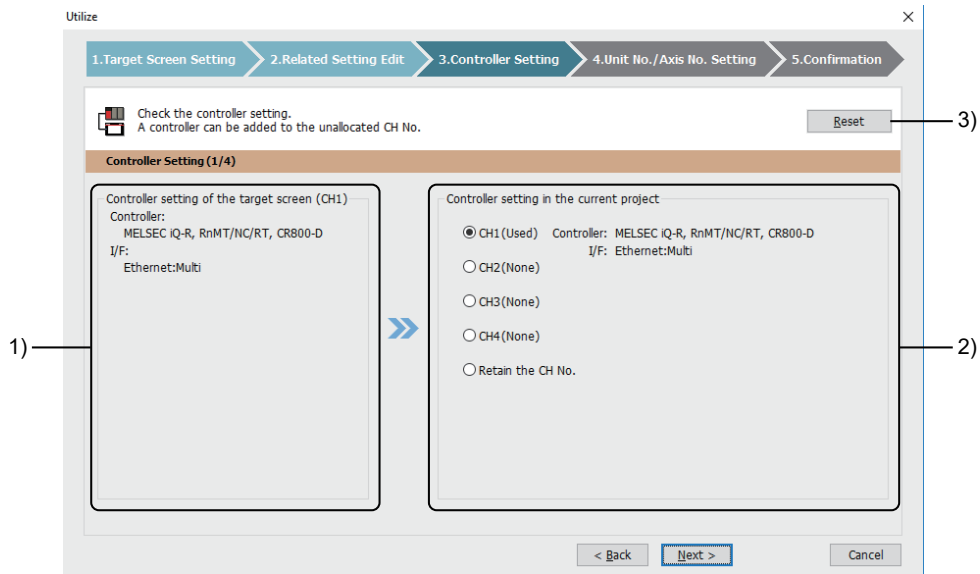

Operation	[Target Screen]	[Current Project]
Arrow (up, down)	Moves the cursor.	
[Shift] + Arrow (Up/Down)	Moves the row while selecting the row where the cursor is positioned The destination row of the cursor is also selected.	-
[Home]	Moves the cursor to the top row.	
[End]	Moves the cursor to the bottom row.	
[PageUp]	Moves the cursor up one page.	
[PageDown]	Moves the cursor down one page.	
[Shift] + [Home]	Selects the rows from the row where the cursor is positioned to the top row.	-
[Shift] + [End]	Selects the rows from the row where the cursor is positioned to the bottom row.	-
[Shift] + [PageUp]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves up one page.	-
[Shift] + [PageDown]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves down one page.	-
[Shift] + Click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.	-
[Ctrl] + [Space]	Selects or deselects a row.	Selects or deselects a row.
[Ctrl] + Click		-

### ■ 3 [Controller Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Select a channel for each controller type to be used in the destination project.

#### 1) [Controller setting of the target screen]

Controller settings in the source project.

#### 2) [Controller setting in the current project]

Controller settings in the destination project.

Select a channel for the controller type displayed in [Controller setting of the target screen].

The following shows selectable items.

Unavailable items are grayed out.

- [CH1]
- [CH2]
- [CH3]
- [CH4]
- [Retain the CH No.]

You can select the channel used for a different controller type in the destination project.

In this case, the channel number and controller type specified in the destination project will be applied.

Check the device setting after the utilization.

#### 3) [Reset] button

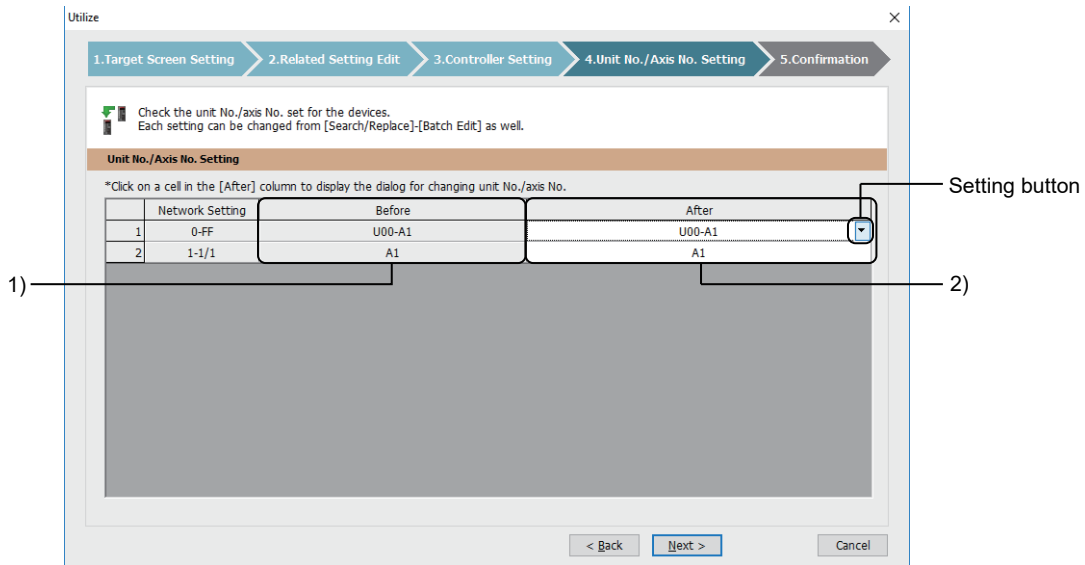

Resets the settings in [Controller setting in the current project] for all channels.

## ■ 4 [Unit No./Axis No. Setting]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

If necessary, change the unit number and axis number specified for an applicable device used in the target screens. The settings are configurable in the [Unit No./Axis No. Batch Edit] dialog as well.

→ 11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog

### 1) [Before]

Unit number and axis number specified for each applicable device used in the target screens.

### 2) [After]

If necessary, change the unit number and axis number to be used in the destination project. Click the setting button to display the unit No./axis No. setting dialog.

#### • Unit

Select a module to be routed to.

#### • [Unit No.]

Specify a unit number.

#### • [Axis No.]

Specify an axis number.

## ■ 5 [Confirmation]

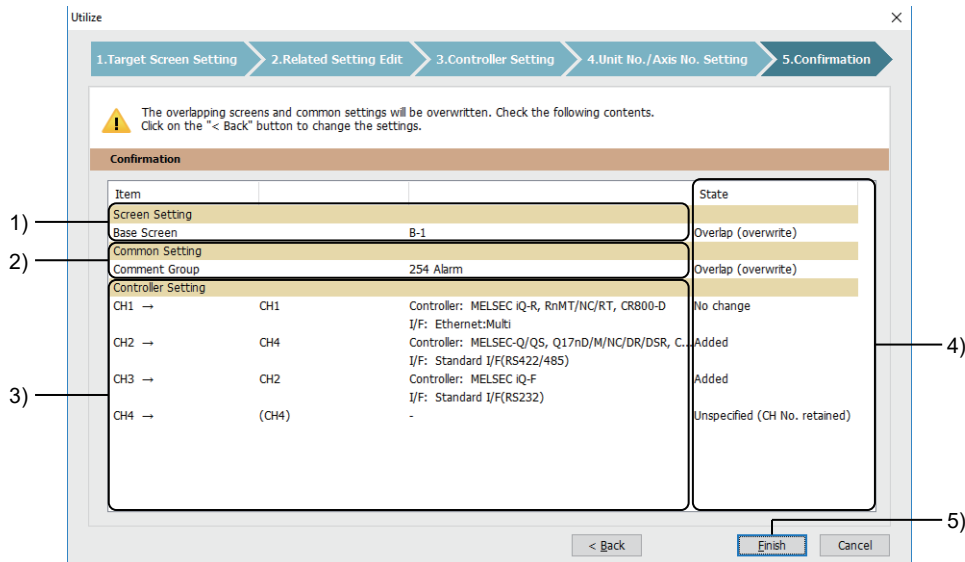

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following set contents are displayed.

- Duplicate screen number or setting number
- Controller setting

Confirm the set contents, and execute the screen utilization.

To change the settings, go back to the relevant step with the [Back] button or the process navigation bar.

### 1) [Screen Setting]

If a duplicate screen number exists in the destination project, the screen type and screen number are displayed.

→ ■ 1 [Target Screen Setting]

### 2) [Common Setting]

If a duplicate setting number exists in the destination project, the setting type and setting number are displayed.

→ ■ 2 [Related Setting Edit]

### 3) [Controller Setting]

Settings made in [Controller Setting].

### 4) [State]

Assignment status of each setting.

- [Overlap (overwrite)]  
A duplicate screen number or setting number exists in the destination project.  
If you click the [Finish] button without resolving of the duplication, the existing setting is overwritten.
- [CH No./controller change]  
The channel number and controller type are changed to the ones specified in the destination project.
- [Controller changed]  
The controller type is changed to the one specified in the destination project.
- [CH No. changed]  
The channel number is changed to the one specified in the destination project.
- [No change]  
The channel number and controller type remain unchanged.
- [Added]  
The controller settings are assigned to an unused channel in the destination project.
- [Unspecified (CH No. retained)]  
The channel number remains unchanged, and the controller type is changed to the one specified in the destination project.

### 5) [Finish] button

Executes the screen utilization.

If the script data storage destination is set to [Project Data (Internal Data)] in the source project and to [External File (External Data)] in the destination project, a dialog will appear asking where to save a script file.

Set a folder to save the script file.

→9.9.5 ■ 4 [Option] tab

If a label (GT Designer3) error occurs after the screen utilization, the [Label Check] dialog will appear.

Correct the setting of the relevant label (GT Designer3).

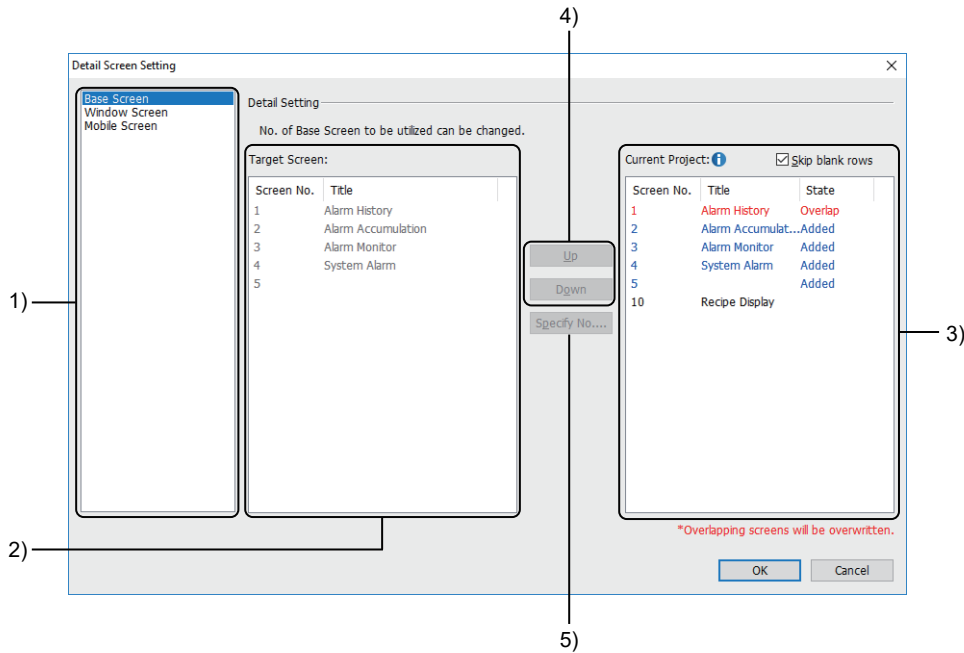

→6.1.4 ■ 4 Label check

If you select a channel being used in the destination project, check the device settings after the screen utilization.

## 11.1.7 [Detail Screen Setting] dialog

Change the screen number of a screen to be utilized.

### 1) Screen type

The screen types of target screens are listed.

- [Base Screen]
- [Window Screen]
- [Mobile Screen]

### 2) [Target Screen]

Lists the utilizable screens.

Item	Description
[Screen No.]	Screen number of each screen in the source project.
[Title]	Title of each screen in the source project.

### 3) [Current Project]

Lists the settings in the destination project.

Item	Description
[Skip blank rows]	Only displays the rows where a screen setting is present.
[Screen No.]	Screen number of each screen in the destination project.
[Title]	Title of each screen in the destination project.
[State]	Assignment status of each screen setting. <ul style="list-style-type: none"> <li>• [Added]: Screen setting added from [Target Screen]</li> <li>• [Overlap]: Duplicate screen number in the destination project</li> </ul>

The text color of a screen setting represents the assignment status of the setting.

Text color	Description
Black	Screen setting existing in the destination project.

Text color	Description
Blue	Screen setting added from [Target Screen].
Red	Duplicate screen number in the destination project.

In [Current Project], the assigned number is changeable with the [Up] button or the [Down] button.

#### 4) [Up] button, [Down] button

Moves the screen setting selected in [Current Project] up or down.

#### 5) [Specify No.] button

Displays the [Destination Data No. Specification] dialog.

Change the screen number of the screen selected in [Current Project].

#### • [No.]

Set the screen number of a screen to be utilized in the destination project.  
The setting range is [0] to [32767].

### 11.1.8 Registering the add-on license

To utilize an add-on project, purchase and register the add-on license.

For details on purchasing the add-on license, contact your local sales office.

For details on registering the add-on license, refer to the following.

- ➔ Instructions for Registering the GT Works3 Add-on License for GOT2000 Enhanced Drive Control (Servo) Project Data

## 11.2 Registering the Labels (GT Designer3) Created from Profile Data

---

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

Register the labels (GT Designer3) created from the profile (CSP+) data that is stored in the personal computer. As label groups and labels (GT Designer3) are created automatically in the registration process, you do not need to perform these tasks manually.

- ⇒ 11.2.1 Conditions to register the labels (GT Designer3) created from profile data
- 11.2.2 Specifications of the labels (GT Designer3) created from profile data
- 11.2.3 How to register the labels (GT Designer3) created from profile data
- 11.2.4 [Project Specification] dialog
- 11.2.5 [Label (GT Designer3) Auto Registration] dialog

### 11.2.1 Conditions to register the labels (GT Designer3) created from profile data

---

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

The labels (GT Designer3) created from profile data are registrable if all the following conditions are satisfied.

#### ■ 1 GX Works3

##### (1) GX Works3 version

GX Works3 version 1.045X or later is installed.

##### (2) Profile registration

The personal computer has the profile data from which labels (GT Designer3) are created. For information on how to register a profile, refer to the following.

- ⇒ Help for MELSOFT Navigator
- GX Works3 Operating Manual

##### (3) Profile language

The profile language is English or the same as the language version of GT Designer3.

##### (4) Network specified in the target GX Works3 project

The CC-Link IE Field Network is specified in the target GX Works3 project.

#### ■ 2 GT Designer3

##### (1) Controller setting

In the [Controller Setting] window, [Controller Type] is set to one of the following items.

- [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
- [MELSEC iQ-R, RnMT/RT, CR800-D]
- [MELIPC]

## 11.2.2 Specifications of the labels (GT Designer3) created from profile data

For the basic specifications of labels (GT Designer3), refer to the following.

→ 6.1.4 How to set labels (GT Designer3)

### ■1 Label group number

Label groups are numbered in descending order, starting from 200.

If any label group number already exists, the number is skipped.

### ■2 Label group name

A label group is named using the equipment name selected in the list of network-connected equipment.

→ 11.2.5 ■ 2 [I/O Information Specification]

If a same-name label group already exists, an underscore character (\_) and a number will be appended.

The following characters will be deleted from the equipment name to be a label group name.

- Numbers prefixed to the equipment name
- Symbols unavailable for a label name
- Excess characters when the maximum length of a label group name is exceeded

### ■3 Data types to be registered

The following shows the correspondences between the data types used in profile data and the ones of labels (GT Designer3) to be registered.

Data type used in profile data	Data type of a label (GT Designer3)
BOOL BIN1	Bit
BIN2 to BIN16	Unsigned BIN 16
BIN32	Unsigned BIN 32
BYTE WORD BIT_STRING2 to BIT_STRING15	Unsigned BIN 16
DWORD	Unsigned BIN 32
INT2 to 16	Signed BIN 16
INT32	Signed BIN 32
UINT2 to 16	Unsigned BIN 16
UINT32	Unsigned BIN 32
BCD4 BCD8 BCD12 BCD16	BCD16
BCD32	BCD32
STRUCT	Unsigned BIN 16

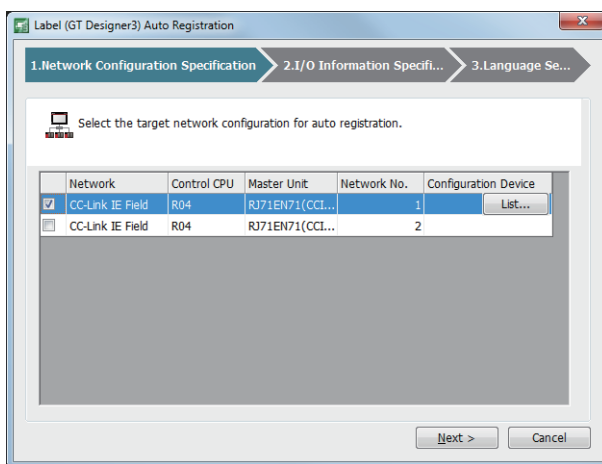

## 11.2.3 How to register the labels (GT Designer3) created from profile data

GT27 GT25 GT23 GT21 SoftGOT2000 GS

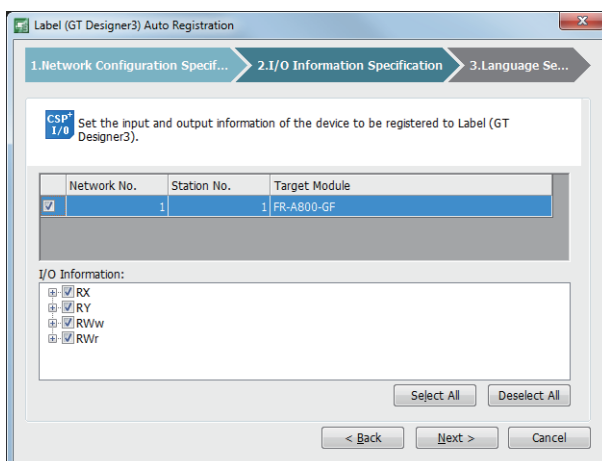

- Step 1** Select [Project] → [Import Other Data] → [Profile (CSP+)] → [Label (GT Designer3) Auto Registration] from the menu to display the [Project Specification] dialog.  
Specify the path to an applicable GX Works3 project.  
⇒ 11.2.4 [Project Specification] dialog

- Step 2** Click the [OK] button to display the [Label (GT Designer3) Auto Registration] dialog.  
⇒ 11.2.5 [Label (GT Designer3) Auto Registration] dialog
- Step 3** Select a target network, and click the [Next] button.  
⇒ 11.2.5 ■ 1 [Network Configuration Specification]

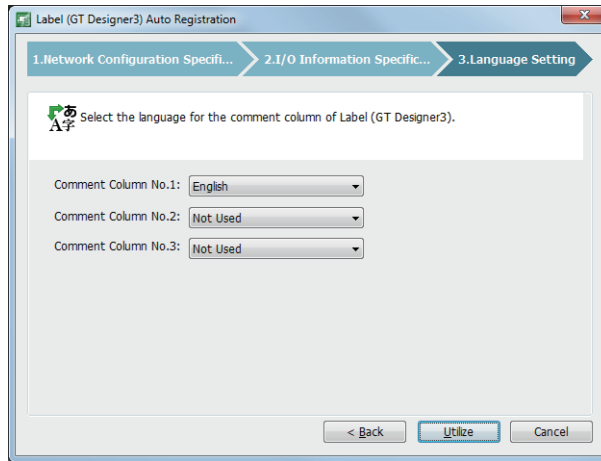

- Step 4** Select the link devices that labels (GT Designer3) are based on, and click the [Next] button.  
⇒ 11.2.5 ■ 2 [I/O Information Specification]

- Step 5** Select a language for the comments to be used for labels (GT Designer3), and click the [Utilize] button to register labels (GT Designer3).  
⇒ 11.2.5 ■ 3 [Language Setting]

## 11.2.4 [Project Specification] dialog

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Select [Project] → [Import Other Data] → [Profile (CSP+)] → [Label (GT Designer3) Auto Registration] from the menu to display the [Project Specification] dialog.

### 1) [CH No.]

Select a channel number to connect the controller that is specified in the target GX Works3 project. Channels are selectable if one of the following controller types is selected in the [Controller Setting] window.

- [MELSEC iQ-R, RnMT/NC/RT, CR800-D]
- [MELSEC iQ-R, RnMT/RT, CR800-D]
- [MELIPC]

### 2) [Network Setting]

Specify the network that is set in the target GX Works3 project.

### 3) [File Path]

Specify the path to the target GX Works3 project.

### 4) [OK] button

Confirms the entries, and displays the [Label (GT Designer3) Auto Registration] dialog.

→ 11.2.5 [Label (GT Designer3) Auto Registration] dialog

## 11.2.5 [Label (GT Designer3) Auto Registration] dialog

In the [Project Specification] dialog, click the [OK] button to display the [Label (GT Designer3) Auto Registration] dialog. Configure the settings to register labels (GT Designer3) automatically.

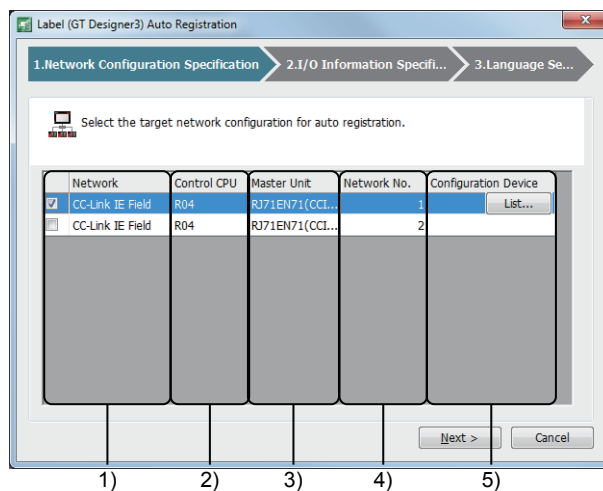

In the process navigation bar, the color of each step represents the status of the step.

Display image	Status
	Active
	Done
	Undone

- ➔ ■ 1 [Network Configuration Specification]
- 2 [I/O Information Specification]
- 3 [Language Setting]

### ■ 1 [Network Configuration Specification]

Select a target network from the list.

#### 1) [Network]

Type of a network.  
Each row displays a network configuration.  
Select a target network.

#### 2) [Control CPU]

Model of the PLC CPU on the master station.

#### 3) [Master Unit]

Model of a module on the master station.

#### 4) [Network No.]

Number of a network.

#### 5) [Configuration Device]

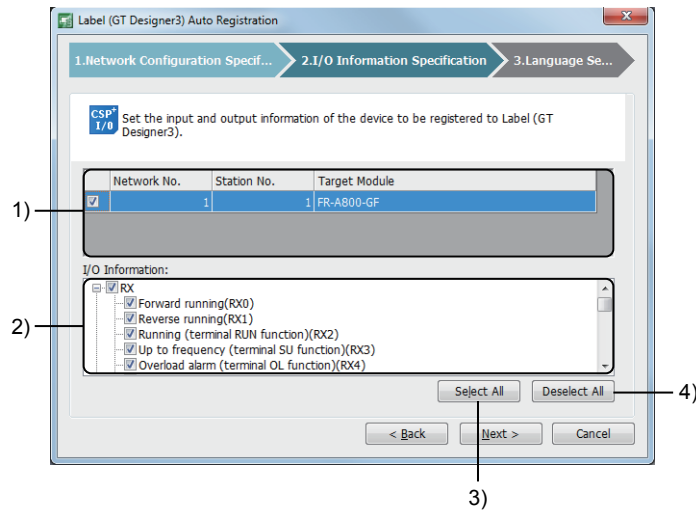

Select a row to display the [List] button.

Click the [List] button to display the [Configuration Device List] dialog where you can check the equipment on the

relevant network.

## ■2 [I/O Information Specification]

Select the link devices that labels (GT Designer3) are based on.

### 1) List of network-connected equipment

Lists the equipment on the network that has been selected in [Network Configuration Specification].

Equipment with its profile unregistered is not listed.

Select equipment to display its link devices in [I/O Information].

### 2) [I/O Information]

Link devices set for the selected equipment.

Select the link devices that labels (GT Designer3) are based on.

### 3) [Select All] button

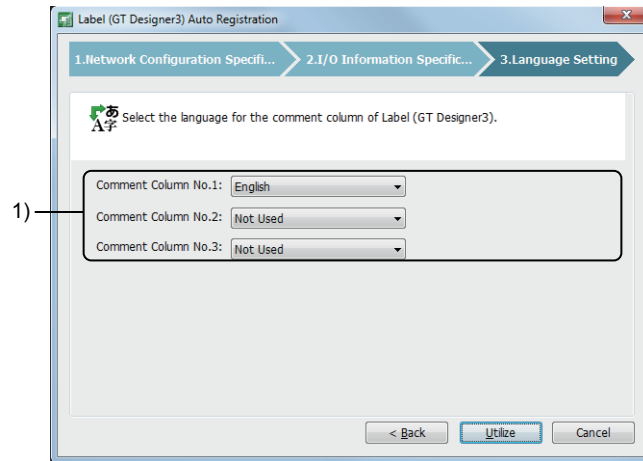

Selects all items in [I/O Information].

### 4) [Deselect All] button

Deselects all items in [I/O Information].

### ■3 [Language Setting]

Select a language for the comments to be used for labels (GT Designer3).

#### 1) [Comment Column No.1], [Comment Column No.2], or [Comment Column No.3]

Select a language for the comments to be used.

The comments are used from the profile data in the selected language.

The following shows selectable items.

- [Not Used]
- [Japanese]
- [English]
- [Chinese(GB)]

If you select the language of an unregistered profile or [Not Used], the relevant comment column will be blank.

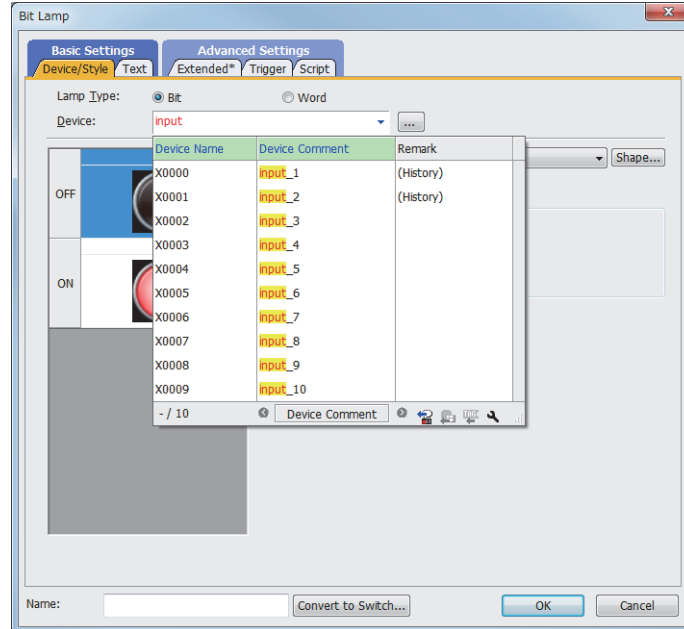

## 11.3 Setting Devices from Device Comments (Input Assist)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Search device comments and device definitions with keywords, and narrow down utilizable devices.

Without opening the setting dialog of the device, you can search and set devices with using the setting dialog for the object and others.

To search the device comments, importing the device comments is required.

- 11.3.1 Specifications of the input assist
- 11.3.2 How to use the input assist
- 11.3.3 Input assist window
- 11.3.4 [Input Assist Setting] dialog

## 11.3.1 Specifications of the input assist

- ⇒ ■ 1 Search target
- 2 Specifications of keywords

### ■ 1 Search target

The following shows the search targets of keywords.

Search target	Description
Device comment	The device comments are searched. ⇒6.1.5 ■ 1 Importing device comments and device definitions
Device definition	The device definitions are searched. ⇒6.1.5 ■ 1 Importing device comments and device definitions
System label	The system labels are searched. GT2505-V and GT SoftGOT2000 do not support system labels. ⇒6.1.2 How to set system labels
Global label	The global labels are searched. GT21 does not support global labels. ⇒6.1.3 How to set global labels
Label (GT Designer3)	The labels (GT Designer3) are searched. ⇒6.1.4 How to set labels (GT Designer3)
OMRON NJ/NX tag	The OMRON NJ/NX tags are searched. GT21 and GT SoftGOT2000 do not support OMRON NJ/NX tags. ⇒6.1.6 How to set OMRON NJ/NX tags
AB native tag	The AB native tags are searched. GT21 and GT SoftGOT2000 do not support AB native tags. ⇒6.1.8 How to set AB native tags
Device	The device names and the device numbers are searched. Representation for devices of the GOT and controllers might be different. Uses device representation for the GOT for a search. ⇒12.2 Device Range and Settings of Each Controller
Function name of the GOT internal devices	The function names of the GOT internal devices are searched. For the function name of each GOT internal device, refer to the following. ⇒12.1 GOT Internal Device

### ■ 2 Specifications of keywords

The following shows the characters specified for uses.

- @  
Specify the channel No. with @n. (n indicates No.)  
You can search devices of the given channel Nos.  
Example) @2 indicates CH2.
- One-byte space  
You can search with multiple keywords by specifying keywords with one-byte spaces between the keywords.
- "  
You can search the keyword including @ or a one-byte space with using quotation marks around a keyword.  
Example) Input "@@" to search device comments including @.

## 11.3.2 How to use the input assist

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 Preparation for the input assist
- 2 Searching devices by a keyword to set a device
- 3 Changing the sorting order of utilizable data
- 4 Narrowing down the search target
- 5 Switching available or unavailable for the input assist

### ■ 1 Preparation for the input assist

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Devices (device name and device No.) and function names of the GOT internal devices are the search target by default. ([Show the device comment/definition/tag settings] or [Show the device comment/definition/tag settings] is selected by default in the [Input Assist Setting] dialog.)

To narrow a search to the device comments, device definitions, or others, set the following.

#### (1) Narrowing a search to device comments

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To search device comments, satisfy all the following conditions.

- Import a device comment.
  - 6.1.5 ■ 1 Importing device comments and device definitions
- Select [Show the device comment/definition/tag settings] or [Show the device comment/definition/tag settings] in the [Input Assist Setting] dialog.
  - 11.3.4 [Input Assist Setting] dialog

#### (2) Narrowing a search to device definitions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To search device definitions, satisfy all the following conditions.

- Import the device definition of the station number to be used. (As station number 0 is always the search target, importing is not necessary.)
- Select [Show the device comment/definition/tag settings] or [Show the device comment/definition/tag settings] in the [Input Assist Setting] dialog.

→ 11.3.4 [Input Assist Setting] dialog

For the following controllers, just selecting [Show the device comment/definition/label settings] or [Show the device comment/definition/label/tag settings] narrows a search to device definitions.

[Manufacturer]	[Controller Type]	Search target
[MITSUBISHI ELECTRIC]	[MELSEC iQ-R, RnMT/NC/RT, CR800-D] [MELSEC iQ-R, RnMT/RT, CR800-D] for GT21)	Device definitions (special relays and special registers only)
	[MELSEC iQ-F]	Device definitions (special relays and special registers only)
	[MELSEC-Q/QS, Q17nD/M/NC/DR/DSR, CRnD-700] ([MELSEC-Q, Q17nD/M/DR/DSR, CRnD-700] for GT21)	Device definitions (special relays and special registers only)
	[MELSEC-QnA, MELDAS C6*] ([MELSEC-QnA]) for GT21)	Device definitions (special relays and special registers only)
	[MELSEC-L]	Device definitions (special relays and special registers only)
	[MELSEC-A]	Device definitions (special relays and special registers only)
	[MELSEC-FX]	Device definitions (special relays and special registers only)
	[MELIPC]	Device definitions (special relays and special registers only)
	[MELSERVO-J2M-P8A]	Device definitions
	[MELSERVO-J2M-*DU]	Device definitions
	[MELSERVO-J2S-*A]	Device definitions
	[MELSERVO-J2S-*CP]	Device definitions
	[MELSERVO-J2S-*CL]	Device definitions
	[MELSERVO-J3-*A]	Device definitions
	[MELSERVO-J3-*T]	Device definitions
	[MELSERVO-J4-*A, -JE-*A]	Device definitions
	[MELSERVO-J4-*A-RJ]	Device definitions
	[MELSERVO-JE-*C]	Device definitions
	[FREQROL 500/700/800, SENSORLESS SERVO]	Device definitions (for FR-A800, FR-F800, FR-A700, FR-F700, FR-F700P, FR-F700PJ, FR-E700, and sensorless servo)
	[FREQROL 800]	Device definitions
[FREQROL 800/E700NE(Batch monitor)]	Device definitions	
[IAI]	[IAI X-SEL Controller]	Device definitions
	[IAI ROBO CYLINDER]	Device definitions
[azbil]	[Azbil DMC50]	Device definitions

**(3) Narrowing a search to system labels**

To search system labels, satisfy all the following conditions.

- Configure the setting so that the system labels can be used.
  - 6.1.2 How to set system labels
- Select [Show the device comment/definition/label settings] of the [Input Assist Setting] dialog.
  - 11.3.4 [Input Assist Setting] dialog

**(4) Narrowing a search to global labels**

To search global labels, satisfy all the following conditions.

- Import global labels.
  - 6.1.3 How to set global labels
- Select [Show the device comment/definition/label settings] of the [Input Assist Setting] dialog.
  - 11.3.4 [Input Assist Setting] dialog

## (5) Narrowing a search to labels (GT Designer3)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To search labels (GT Designer3), satisfy all the following conditions.

- Register labels (GT Designer3).
  - 6.1.4 How to set labels (GT Designer3)
- Select [Show the device comment/definition/label settings] of the [Input Assist Setting] dialog.
  - 11.3.4 [Input Assist Setting] dialog

## (6) Narrowing a search to OMRON NJ/NX tags

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To search OMRON NJ/NX tags, satisfy all the following conditions.

- Import OMRON NJ/NX tags.
  - 6.1.6 How to set OMRON NJ/NX tags
- Select [Show the device comment/definition/label/tag settings] in the [Input Assist Setting] dialog.
  - 11.3.4 [Input Assist Setting] dialog

## (7) Narrowing a search to AB native tags

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To search AB native tags, satisfy all the following conditions.

- Import AB native tags.
  - 6.1.8 How to set AB native tags
- Select [Show the device comment/definition/label/tag settings] of the [Input Assist Setting] dialog.
  - 11.3.4 [Input Assist Setting] dialog

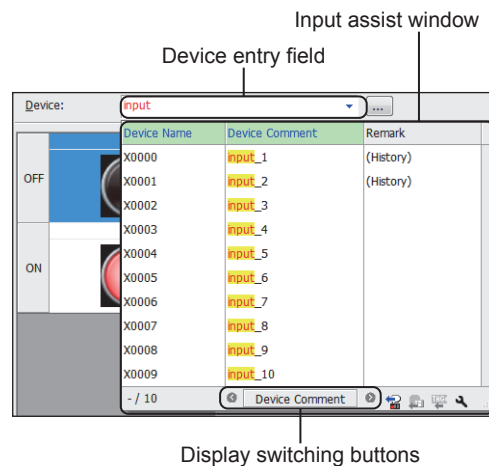

## ■ 2 Searching devices by a keyword to set a device

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Input a keyword in the device entry field in the setting dialog of the object and others to display the input assist window.

You can switch the contents displayed in the input assist window with the display switching buttons.

→ 11.3.3 Input assist window

**Step 2** Operate any one of the following to set the device in the device entry field.

- Click the device to be set.
- Select the device to be set with up and down arrow keys on the keyboard, and push the [Enter] key or the [Tab] key.

Using @ or one-byte spaces can search the devices for the given channels or use multiple keywords for a search.

→ 11.3.1 ■ 2 Specifications of keywords

### 3 Changing the sorting order of utilizable data

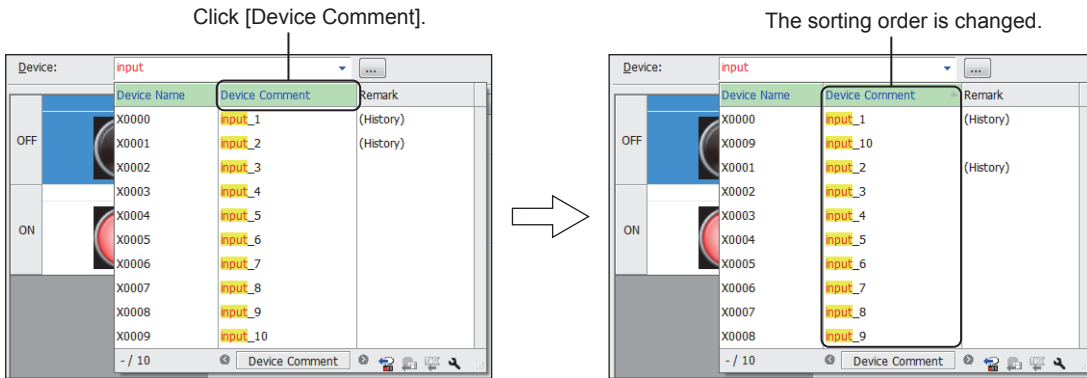

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Changing the sorting order with one condition
- (2) Changing the sorting order with multiple conditions

#### (1) Changing the sorting order with one condition

GT27 GT25 GT23 GT21 SoftGOT2000 GS

In the input assist window, click a column header to sort the devices in order of the item corresponding to the header. Each click switches to the ascending order, descending order, and no sort, in that order. Example) Sorting the devices in ascending order of device comments

#### (2) Changing the sorting order with multiple conditions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Perform one of the following operations to display the [Input Assist Setting] dialog.

- Click the setting button for the input assist window.
- Right-click on the device entry field, and select [Input Assist Setting] from the menu.

Setting button

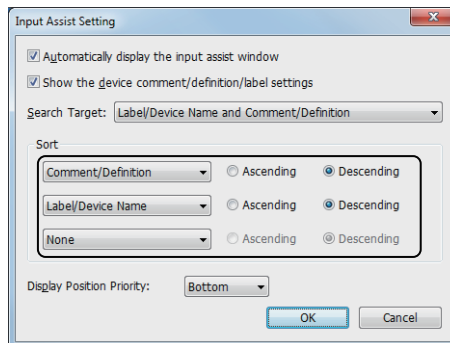

Right-click menu

**Step 2** Set the sorting order with [Sort] of the [Input Assist Setting] dialog.

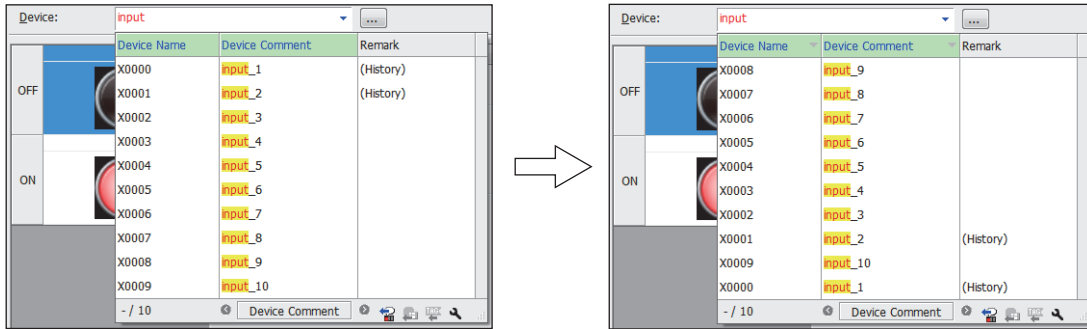

Up to three conditions for sorting order can be set and their priority is high from the top.

→ 11.3.4 [Input Assist Setting] dialog

Example) Setting [Comment/Definition] for the first condition and [Label/Device Name] for the second condition

**Step 3** Click the [OK] button to change the sorting order.

#### ■ 4 Narrowing down the search target

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Perform one of the following operations to display the [Input Assist Setting] dialog.

- Click the setting button for the input assist window.
- Right-click on the device entry field, and select [Input Assist Setting] from the menu.

Setting button

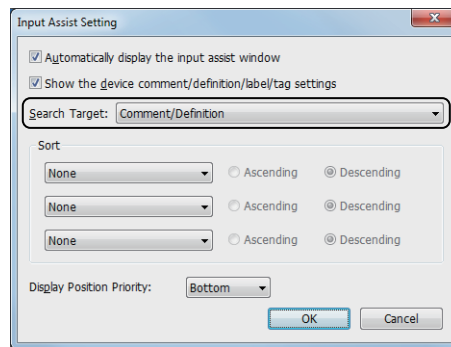

Right-click menu

**Step 2** Change the search target with [Search Target] of the [Input Assist Setting] dialog.

→ 11.3.4 [Input Assist Setting] dialog

Example) Changing the [Search Target] to [Comment/Definition]

**Step 3** Click the [OK] button to change the search target.

## 5 Switching available or unavailable for the input assist

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Perform one of the following operations to display the [Input Assist Setting] dialog.

- Click the setting button for the input assist window.
- Right-click on the device entry field, and select [Input Assist Setting] from the menu.

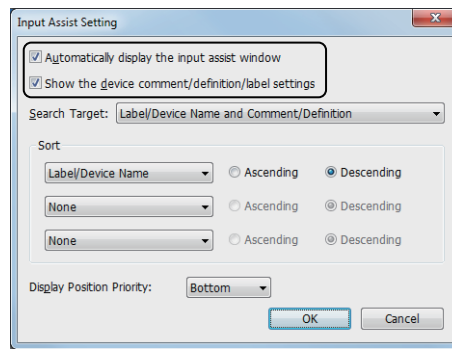

Setting button

Right-click menu

**Step 2** In the [Input Assist Setting] dialog, set whether to automatically display the input assist window, and set the items to be displayed as required.

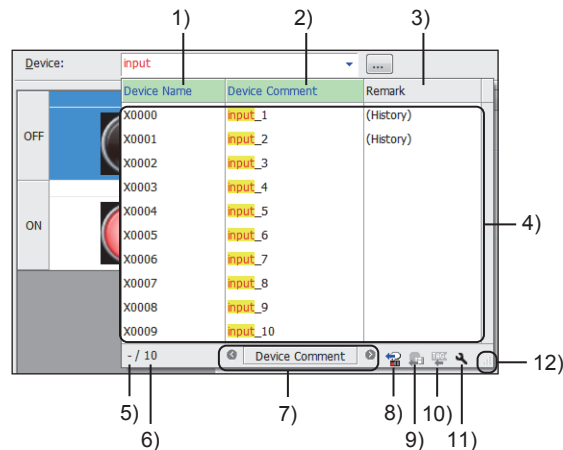

→ 11.3.4 [Input Assist Setting] dialog

- [Automatically display the input assist window]  
Clear this item not to display the input assist window even though a keyword is entered in the device input field.
- [Show the device comment/definition/label settings] or [Show the device comment/definition/label/tag settings]  
Clear this item to display only the history of the device setting on the input assist window.

### 11.3.3 Input assist window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 1) **[Device Name], [Label Name], [Tag Name]**  
Switch the ascending order, descending order, no sort in order every clicking the mouse.
- 2) **[Device Comment], [Device Definition], [Comment ]**  
Switch the ascending order, descending order, no sort in order every clicking the mouse.  
Not displayed when [Show the device comment/definition settings] of the [Input Assist Setting] dialog is deselected.  
(When labels are available, [Show the device comment/definition/label settings] is displayed instead.)
- 3) **[Remark]**  
Display [(History)] in the devices saved in the setting history.  
Switch the ascending order, descending order, no sort in order every clicking the mouse.
- 4) **Utilizable data list**  
Searched devices  
Select the row to set the device.  
The contents on the display can be scrolled with a mouse or keyboard.  
Column width can be changed with a mouse.
- 5) **Selected device**  
Position (device) where the cursor is positioned to in the utilizable data list  
The selected device is displayed with the cursor by the keyboard.
- 6) **Number of Utilizable data**  
Number of utilizable data displayed on the utilizable data list  
The number of utilizable data displayed on the utilizable data list is changed with a scroll of the utilizable data list.
- 7) **Display switching buttons**  
Switches the targets to be displayed in the list.  
The text on the center button indicates the type of the data displayed in the utilizable data list.
  - [Device Comment]
  - [Device Definition]
  - [System Label]
  - [Global Label]
  - [OMRON NJ/NX Tag]
  - [AB Native Tag]
  - [Label (GT Designer3)]
 The targets can be switched by using short cut keys ([Ctrl] + [←] or [Ctrl] + [→]).
- 8) **[Device Comment / Device Definition List] button**  
Displays the [Device Comment / Device Definition List] dialog.  
Import the device comment and the device definition.  
→6.1.5 ■ 4 [Device Comment / Device Definition List] dialog
- 9) **[Global Label List] button**  
Displays the [Global Label List] dialog.  
Import global labels.

⇒6.1.3 ■ 6 [Global Label List] dialog

#### 10) **Tag list button**

Displays the [OMRON NJ/NX Tag List] dialog or the [AB Native Tag List] dialog.

Import OMRON NJ/NX tags or AB native tags.

⇒6.1.6 How to set OMRON NJ/NX tags

6.1.8 How to set AB native tags

#### 11) **Setting button**

Display the [Input Assist Setting] dialog.

Select available or unavailable for the input assist, or the search target.

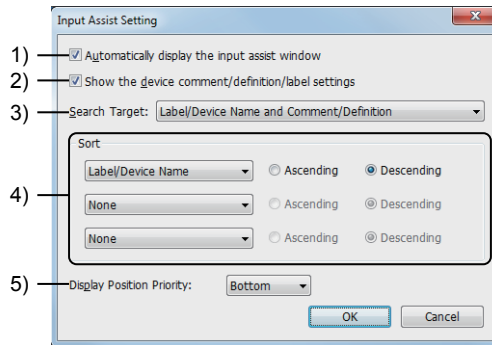

⇒11.3.4 [Input Assist Setting] dialog

#### 12) **Changing the window size**

To change the size of the input assist window, move the mouse pointer to the lower right corner of the window where the pointer becomes a double-headed arrow, and drag the pointer.

## 11.3.4 [Input Assist Setting] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Automatically display the input assist window]

Automatically displays the input assist window when a keyword is entered in the device entry field in the object setting dialog and others.

Even though this item is cleared, you can display the input assist window by the following operation.

### 2) [Show the device comment/definition/tag settings], [Show the device comment/definition/tag settings]

Displays the device comments, device definitions, and others as utilizable data in the input assist window. Clear this item to display only the history of the device setting on the input assist window.

### 3) [Search Target]

Select the target for a search.

The following shows the items to be selected.

- [Label/Device Name and Comment/Definition] or [Device/Label/Tag Name and Comment/Definition]
- [Label/Device Name] or [Device/Label/Tag Name]
- [Comment/Definition]

### 4) [Sort]

Set the sorting order of the utilizable data list of the input assist window.

The following shows the items to be selected.

- [Label/Device Name] or [Device/Label/Tag Name]
- [Comment/Definition]
- [Remark]
- [None]

Up to three conditions for sorting order can be set and their priority is high from the top.

Select [Ascending] and [Descending] for each condition.

### 5) [Display Position Priority]

Select the display position of the input assist window against the device input field.

The following shows the items to be selected.

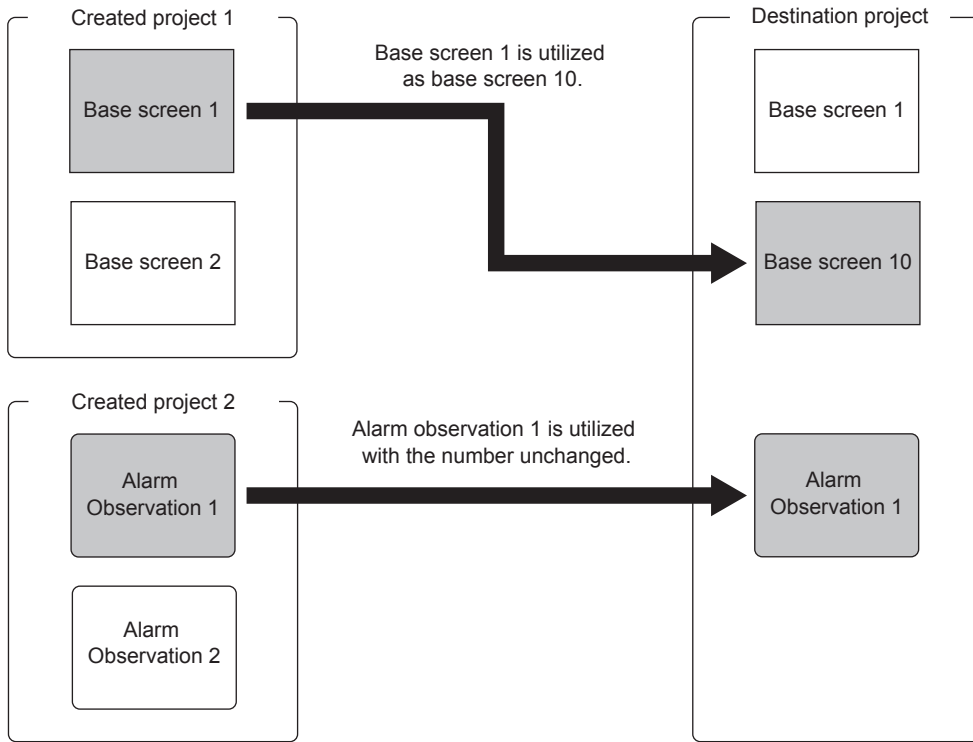

- [Bottom]
- [Top]
- [Right]
- [Left]

## 11.4 Utilizing Other Project Data

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The settings for screens and functions can be read from a specified project (source) into the project (destination) being edited.

You can create a project efficiently by utilizing data of an existing project.

- ⇒ 11.4.1 Specifications of the project utilization
- 11.4.2 How to use the project utilization
- 11.4.3 Precautions
- 11.4.4 [Utilize Project] dialog
- 11.4.6 [Select Project] dialog

## 11.4.1 Specifications of the project utilization

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- ■ 1 Utilizable projects
- 2 Utilizable data

### ■ 1 Utilizable projects

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

The following table lists the utilizable projects.

GOT	Project format
GOT2000 Series	<ul style="list-style-type: none"> <li>• Workspace format</li> <li>• A single file format (*.GTX, *.GTXS)</li> </ul>

### ■ 2 Utilizable data

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

Select data to utilize from [Source Project] of the [Utilize Project] dialog.

→ 11.4.4 [Utilize Project] dialog

The following table lists the utilizable data.

[Source Project]	Utilizable data	Supported model
[GOT Environmental Setting / GOT Setup / GOT Ethernet Setting]	Utilizes the following settings. <ul style="list-style-type: none"> <li>• [Environmental Setting] window (except the setting for [Operation Log])</li> <li>• [GOT Setup] window</li> <li>• [GOT Ethernet Setting] window</li> </ul>	<b>GT27 GT25 GT23</b> <b>GT21 GS</b> <b>SoftGOT2000</b>
	Utilizes the setting for [iQSS Utility] in the [GOT Setup] window.	<b>GT27 GT25 GT23</b> <b>GT21 GS</b> <b>SoftGOT2000</b>
	Utilizes the setting for [Operation Log] in the [Environmental Setting] window.	<b>GT27 GT25 GT23</b> <b>GT21 GS</b> <b>SoftGOT2000</b>
	Utilizes the settings of [Network Drive] in the [GOT Setup] window.	<b>GT27 GT25 GT23</b> <b>GT21 GS</b> <b>SoftGOT2000</b>

[Source Project]		Utilizable data	Supported model
[Controller Setting]	[Routing Information]	Utilizes the setting for [Routing Information] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Getaway Server]	Utilizes the setting for [Getaway Server] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Gateway Client]	Utilizes the setting for [Gateway Client] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Mail]	Utilizes the setting for [Mail] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[FTP Server]	Utilizes the setting for [FTP Server] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[File Transfer]	Utilizes the setting for [File Transfer] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[MELSEC Redundant]	Utilizes the setting for [MELSEC Redundant] in the [Controller Setting] window. The MELSEC redundant setting is not migrated if the corresponding channel is not set in the destination project.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Station No. Switching]	Utilizes the setting for [Station No. Switching] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Peripheral Setting]	[Buffer Memory Unit No. Switching]	Utilizes the setting for [Buffer Memory Unit No. Switching] in the [Controller Setting] window.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Bar Code]	Utilizes the setting for the [Bar Code] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[RFID]	Utilizes the setting for the [RFID] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[VNC Server]	Utilizes the setting for the [VNC Server] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000  (Only available to GT2107-W of GT21 models)
	[Video/RGB Input]	Utilizes the setting for the [Video/RGB Input] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Multimedia]	Utilizes the setting for the [Multimedia] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[External I/O / Operation Panel]	Utilizes the setting for the [External I/O / Operation Panel] dialog (except the setting for [Destination I/F]). To utilize the setting for [Destination I/F], utilize [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Printer]	Utilizes the settings of the [Printer] dialog (except the setting of [Destination I/F]). To utilize the setting of [Destination I/F], utilize the settings of [I/F Communication Setting].	GT27 GT25 GT23 GT21 GS SoftGOT2000

[Source Project]	Utilizable data	Supported model
[GOT Network Interaction]	Utilizes the setting of the [GOT Network Interaction] dialog.	
[GOT Mobile Setting]	Utilizes the setting of the [GOT Mobile Setting] window.	
[I/F Communication Setting]	Utilizes the following settings. <ul style="list-style-type: none"> <li>Interface setting for each channel The same channel No. set for the source project is required to be enabled for the destination project.</li> <li>The setting for [Destination I/F] in the setting for each peripheral device</li> </ul>	
[Screen Design]	Utilizes the setting of the [Screen Design] dialog.	
[Base Screen]	Utilizes base screens. Screens to be utilized can be selected individually. The following settings for the screens to be utilized are also utilized. <ul style="list-style-type: none"> <li>Screen trigger action</li> <li>Project script setting A project script is utilized when [Include this script in a screen-related setting when utilizing project/screen] is selected in the [Script Edit] dialog.</li> <li>Screen script setting</li> <li>Script symbol</li> </ul> When utilized by the destination project, script data are associated with an existing script number + 1. To specify a script number to be used in utilization by the destination project, select [Script].	
[Window Screen]	Utilizes window screens. Screens to be utilized can be selected individually. The following settings for the screens to be utilized are also utilized. <ul style="list-style-type: none"> <li>Screen trigger action</li> <li>Project script setting A project script is utilized when [Include this script in a screen-related setting when utilizing project/screen] is selected in the [Script Edit] dialog.</li> <li>Screen script setting</li> <li>Script symbol</li> </ul> When utilized by the destination project, script data are associated with an existing script number + 1. To specify a script number to be used in utilization by the destination project, select [Script].	
[Report Screen]	Utilizes report screens. Screens to be utilized can be selected individually. If the following settings are configured for the report screen to be utilized, the destination report screen will be utilized together. <ul style="list-style-type: none"> <li>[Output Destination] is set to [File].</li> <li>[Specification] is set to [Add to other report file].</li> </ul>	
[Mobile Screen]	Utilizes mobile screens. Screens to be utilized can be selected individually.	
[Label Group]	Utilizes label groups. Label groups to be utilized can be selected individually.	
[Comment]	Utilizes comment groups. Comment groups to be utilized can be selected individually.	

[Source Project]		Utilizable data	Supported model
[Alarm]	[Alarm Common Setting]	Utilizes the setting for the [Alarm Common Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[User Alarm Observation]	Utilizes the user alarm observation settings. User alarm observation settings to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[System Alarm Observation]	Utilizes the setting for the [System Alarm Observation] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Alarm Popup Display]	Utilizes the setting for the [Alarm Popup Display] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Logging]	Utilizes logging settings. Logging settings to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[Recipe]	[Recipe Common Setting]	Utilizes the setting for the [Recipe Common Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Recipe]	Utilizes recipe settings. Recipe settings to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Script]	[Script (Project, Symbol)]	Utilizes the following settings. • Project script setting • Script symbol The script of a utilized project script setting is executed after the script of an existing project script setting in the destination project is executed.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	Registered script	Utilizes scripts. Scripts to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Object Script Symbol]	Utilizes the setting for the [Object Script Symbol] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Device Data Transfer]	Utilizes device data transfer settings. Device data transfer settings to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[Trigger Action (Project)]	Utilizes the settings for the trigger actions commonly used in a project. To utilize the settings for the trigger actions of individual screens, utilize the screen for which the required trigger actions have been set.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[Time Action]	Utilizes the setting for the time action.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[Hard Copy]	Utilizes the setting for the [Hard Copy] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[MES Interface]	Utilizes the settings of the [MESInterface] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000	

[Source Project]		Utilizable data	Supported model
[Parts]	[Parts Setting]	Utilizes the setting for the [Parts Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	Registered parts	Utilizes parts. Parts to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Sound Files]	[Touch Key Sound Setting]	Utilizes the setting for the [Touch Key Sound Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	Registered sound files	Utilizes sound files. Sound files to be utilized can be selected individually.	GT27 GT25 GT23 GT21 GS SoftGOT2000

## 11.4.2 How to use the project utilization

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### Point

#### Before utilizing another project

When the [Utilize Project] dialog is displayed while the following windows are open, the settings for the windows cannot be utilized.

- [Environmental Setting] window
- [GOT Setup] window
- [Controller Setting] window

Before displaying the [Utilize Project] dialog, close the above windows.

**Step 1** Select [Project] → [Utilize Project] from the menu to display the [Utilize Project] dialog.

⇒ 11.4.4 [Utilize Project] dialog

**Step 2** Click the [Browse] button to display the [Open Project] dialog or [Select Project] dialog.

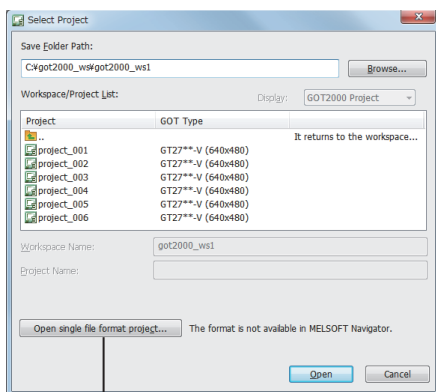

Switch the screens according to the format of the source project.

- Workspace format: Select in the [Select Project] dialog.

⇒ 11.4.6 [Select Project] dialog

- A single file format: Select in the [Open Project] dialog.

⇒ 2.3.2 ■ 5 [Open Project] dialog (single file format)

Switching to the [Open Project] dialog

Switching to the [Select Project] dialog

**Step 3** In the [Open Project] dialog or [Select Project] dialog, select a source project and click the [Open] button.

The source project can be also set with the following methods

- In the [Utilize Project] dialog, click the [Search] button to display the [Utilize Data (Project)] dialog and search the source project.
- Enter the path to the [Source Project] and press the [Tab] key.

If project security has been set for the source project, the [User Authentication] dialog is displayed. Enter a user name and the password.

**Step 4** The path to the source project is set for [Source Project] in the [Utilize Project] dialog.

Select the settings to utilize in the [Source Project] tree.

When the following items are selected, the numbers set in [Destination] are enabled.

- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen]
- [Label Group]
- [Comment]
- [User Alarm Observation]
- [Logging]
- [Recipe]
- [Script]
- [Device Data Transfer]
- [Parts]
- [Sound Files]

For the settings of the numbers used by the destination project, refer to the following.

- ➔ ■ 1 Utilizing settings without changing the numbers set in the source project
- 2 Specifying a start number in utilizing settings for the source destination with their order and differences retained
- 3 Specifying numbers setting by setting in utilization

**Step 5** Click the [Utilize] button to read the selected settings into the destination project.

**Step 6** If data in another project need utilizing, proceed to step 2.

When you have completed the utilization, close the [Utilize Project] dialog.

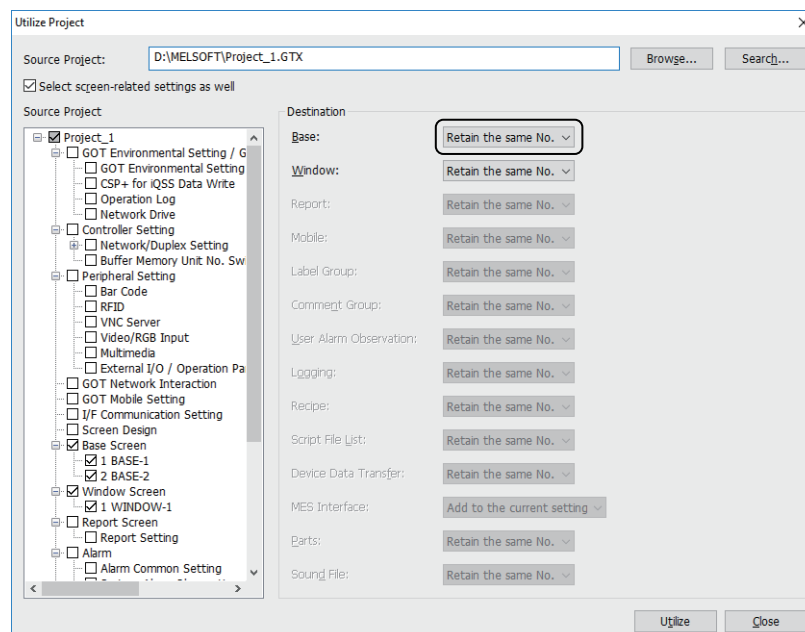

## ■ 1 Utilizing settings without changing the numbers set in the source project

The following shows the procedure for utilizing settings for a source project as those for a destination project without changing the associated numbers that have been set in the source project.

**Step 1** In [Destination] of the [Utilize Project] dialog, select [Retain the same No.].

Example) Utilizing a base screen

**Step 2** Click the [Utilize] button to read the settings selected in the [Source Project] tree into the destination project.

**Step 3** When you have completed the utilization, close the [Utilize Project] dialog.

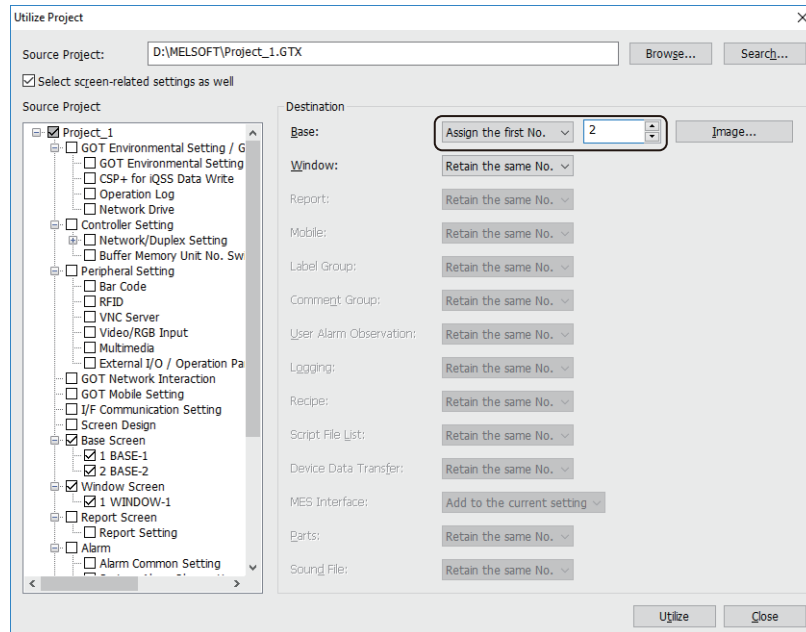

## ■ 2 Specifying a start number in utilizing settings for the source destination with their order and differences retained

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the procedure for specifying a start number in utilizing settings for a source project as those for a destination project with their order and differences retained.

**Step 1** Select [Assign the first No.] in [Destination] of the [Utilize Project] dialog and set a start number.

Example) Utilizing a base screen

**Step 2** Click the [Utilize] button to read the settings selected in the [Source Project] tree into the destination project.

**Step 3** When you have completed the utilization, close the [Utilize Project] dialog.

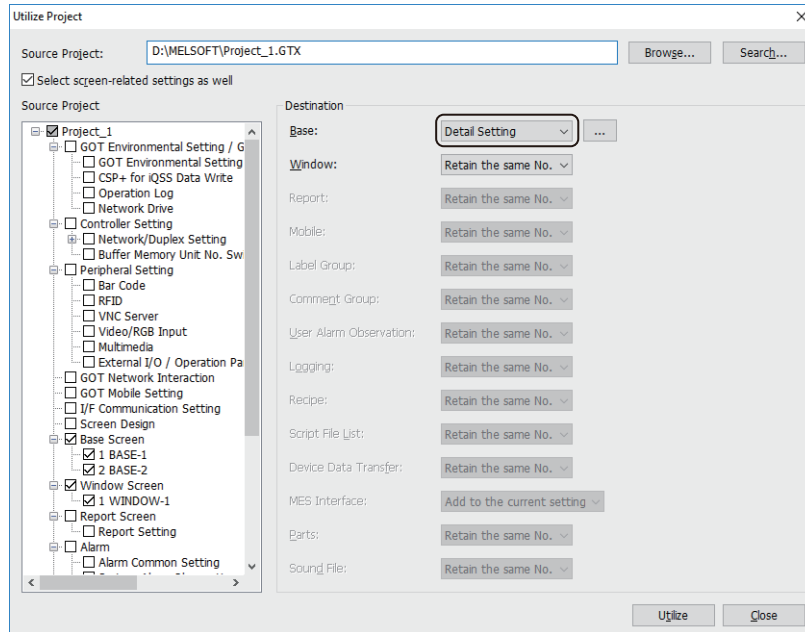

### ■ 3 Specifying numbers setting by setting in utilization

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the procedure for specifying numbers setting by setting in utilization, which are used by the destination project.

**Step 1** Select [Detail Setting] in [Destination] of the [Utilize Project] dialog and click the [...] button to display the [Detail Setting] dialog.

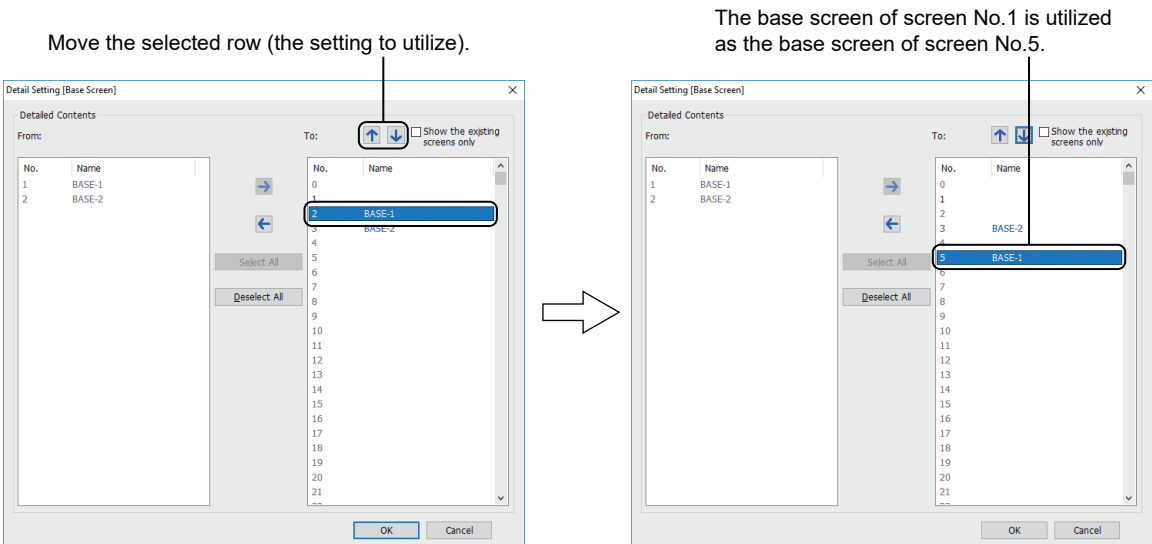

Example) Utilizing a base screen

**Step 2** In [Destination], select the setting to utilize (in the row displaying the text in green).

Move the row you have selected with the [↑] or [↓] button into the row corresponding to the number used by the destination project.

Example) Utilizing a base screen of screen No.1 as that of screen No.5

⇒ 11.4.5 [Detail Setting] dialog

**Step 3** When you have completed the setting, click the [OK] button.

**Step 4** Click the [Utilize] button in the [Utilize Project] dialog to read the settings selected in the [Source Project] tree into the destination project.

**Step 5** When you have completed the utilization, close the [Utilize Project] dialog.

### 11.4.3 Precautions

#### ■ 1 Utilizing the project edited with a different version of GT Designer3

When the version of GT Designer3 being used is older than that used to edit the source project, the functions not supported by GT Designer3 being used are deleted.

For the relation between the version of GT Designer3 and supported functions, refer to the following.

→12.12 Upgraded Additional Function List

#### ■ 2 Utilizing the project protected with a security key

When the source project is protected with a security key, the security key authentication is performed.

If the authentication fails, the data cannot be utilized.

→2.12 Protecting a Project with a Security Key

#### ■ 3 Utilizing the project protected with the project security

If project security has been set for the source project, user authentication is performed.

Users for who display is disabled cannot utilize data.

#### ■ 4 Utilizing the project containing a different GOT type setting

Utilized data are converted according to the GOT type set for the destination project.

The functions not supported by the GOT type set for the destination project are deleted.

#### ■ 5 Utilizing the project containing different controller settings

Utilized data are converted according to the controller type set for the destination project.

According to the combination of the settings for the source project and those for the destination project, the devices set for utilized data are changed as described below.

- The devices are changed to the equivalents supported by the controller set for the destination project.
- The devices not supported by the controller set for the destination project are changed to [??] (except the devices in script data).

Check and change the device settings.

#### ■ 6 Utilizing the project in which a system label is set

In the project being edited, when [Use system labels in conjunction with MELSOFT Navigator] of the [Type Setting] dialog is unchecked, the data of the screens from the project where a system label is set cannot be utilized.

→5.1.4 [Type Setting] dialog

#### ■ 7 Utilizing scripts

Even if the controller settings for the source project and destination project are different, the devices in script data are not automatically changed.

Check and change the device settings.

#### ■ 8 Utilizing categories

Categories cannot be utilized.

When the categories set for figures and objects do not exist in the destination project, the categories are changed to [None] in utilization.

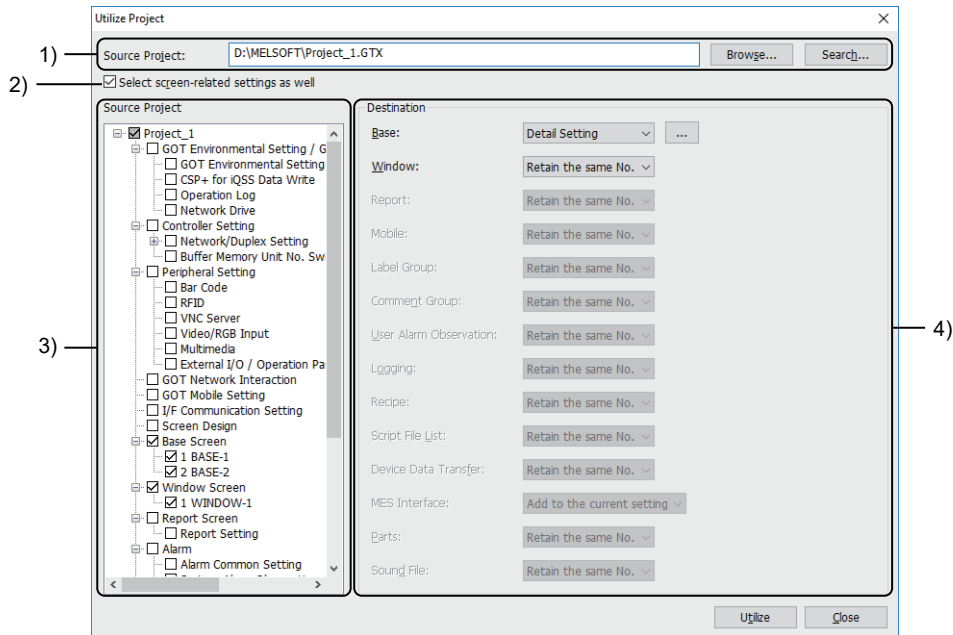

Before utilizing, add categories that exist in the source project into the destination project.

#### ■ 9 Utilizing the project in which Windows fonts are used for comment groups

If the Windows fonts used for comment groups are not installed on the personal computer, the comments are displayed in different fonts.

To display the comments in the specified Windows fonts, make sure that the fonts are installed on the personal computer before utilizing the project.

## 11.4.4 [Utilize Project] dialog

### 1) [Source Project]

Set the path to the source project.

Item	Description
[Browse] button	Displays the [Open Project] dialog or the [Select Project] dialog. Set the path to the source project. → 11.4.6 [Select Project] dialog 2.3.2 ■ 5 [Open Project] dialog (single file format)
[Search] button	Displays the [Search] dialog. Searches projects that can be utilized. → 11.1.4 [Utilize Data (Project)] dialog and [Search] dialog

### 2) [Select screen-related settings as well]

When items are selected in the [Source Project] tree, the relevant settings are also selected.

Example) If a base screen for which a screen script has been set is selected, the script is also selected.

### 3) [Source Project]

When a path is set for [Source Project], the utilizable source project settings are displayed in the tree structure.

Select the settings to utilize.

⇒ 11.4.1 ■ 2 Utilizable data

The settings nonexistent in the source project or destination project are not displayed in the tree structure.

When the following items are selected, the related settings in [Destination] become available to specify numbers or utilization methods.

- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen]
- [Label Group]
- [Comment]
- [User Alarm Observation]
- [Logging]
- [Recipe]
- [Script]
- [Device Data Transfer]
- [MES Interface]
- [Parts]

- [Sound Files]

#### 4) [Destination]

In each setting, specify a number to be used in the destination project or a utilization method. The following shows selectable items.

- [Assign the first No.]

Specifies a start number in utilizing settings for the source project as those for the destination project with their order and differences retained.

Set a start number.

When a number falls out of the acceptable range, the setting associated with the number is not utilized.

Set a start number.

- [Base]: [0] to [32767]
- [Window]: [0] to [32767]
- [Report]: [1] to [32]
- [Mobile]: [1] to [32767]
- [Label Group]: [1] to [200]
- [Comment Group]: [1] to [500]
- [User Alarm Observation]: [1] to [32767]
- [Logging]: [1] to [32767]
- [Recipe]: [1] to [32767]
- [Script File List]: [1] to [32767]
- [Device Data Transfer]: [1] to [255]
- [Parts]: [1] to [32767]
- [Sound File]: [1] to [500]

Click the [Image] button of [Base], [Window], [Report], or [Mobile] to display the [Screen Image List] dialog.

- **[Screen Type]**

Select the type of the screen.

- **Screen image list**

Displays screen images.

- **Jump**

Specify a screen number and click the [Jump] button to select the screen in the screen image list.

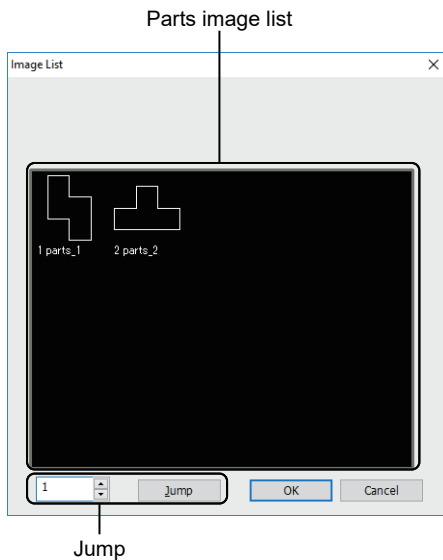

If the start number set for [Label Group], [Comment Group], [User Alarm Observation], [Logging], [Recipe], or [Device Data Transfer] is used in the destination project, the name of the setting is displayed.

Example) If comment group No.1 has been used

The name of comment group No.1 is displayed.

Click the [Image] button of [Parts] to display the [Image List] dialog.

- **Parts image list**  
Display the images of parts.
- **Jump**  
Set a part number and click the [Jump] button to display the images of the specified part on the parts image list.

Click the [Browse] button of [Sound File] to display the [Sound File List] dialog.

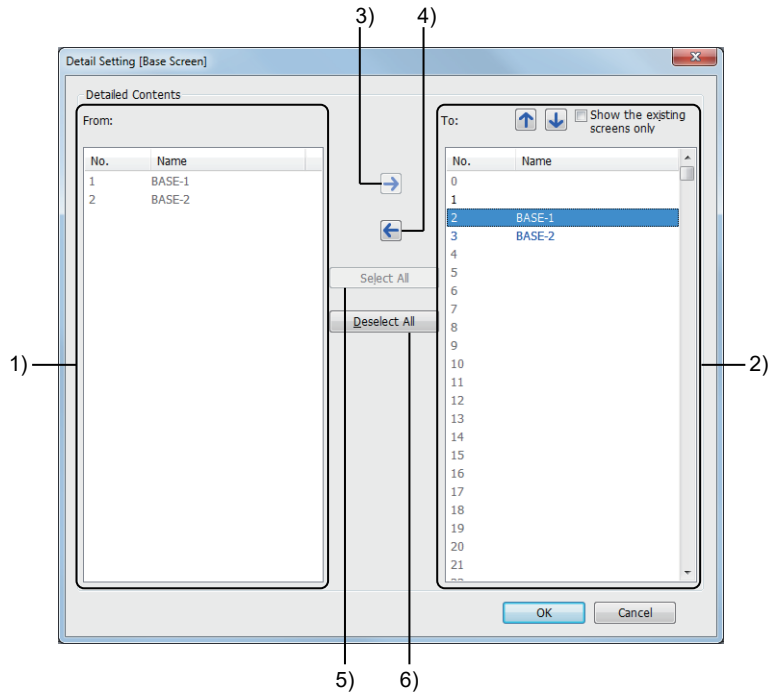

When the dialog is displayed from the [Utilize Project] dialog, sound files are not registered and deleted.

⇒ 10.12.6 [Sound File List] dialog

- [Retain the same No.]  
Utilize settings for the source project as those for the destination project without changing the associated numbers that have been set in the source project.
- [Detail Setting]  
Specifies numbers setting by setting in utilization, which are used by the destination project.  
Click the [...] button to display the [Detail Setting] dialog.  
⇒ 11.4.5 [Detail Setting] dialog
- [Add to the current setting]  
Adds the settings that are unused in the destination project.
- [Overwrite all]  
Overwrites all settings of the destination project with those of the source project.

## 11.4.5 [Detail Setting] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [From]

Lists the settings utilizable from the source project.

Item	Description
[No.]	Number of each setting in the source project.
[Name]	Name of each setting in the source project.

The text color of a setting represents the status of the setting.

Text color	Description
Black	Setting that is not added to [To]. To utilize a setting in the destination project, add the setting to [To] with the [→] button.
Gray	Setting added to [To].

For mouse and keyboard operations, refer to the following.

- ■ 1 Mouse and keyboard operations

### 2) [To]

Lists the settings in the destination project.

Item	Description
[↑] button, [↓] button	Moves the setting selected in [To] up or down.
[Show the existing screens only]	Only displays the rows where a setting is present.
[No.]	Number of each setting in the destination project.
[Name]	Name of each setting in the destination project.

The text color of a setting represents the status of the setting.

Text color	Description
Black	Setting existing in the destination project.
Blue	Setting added from [From].
Red	Duplicate setting number in the destination project.

The number of each setting in the destination project can be changed with the [ ↑ ] button or the [ ↓ ] button. For mouse and keyboard operations, refer to the following.

➡ ■ 1 Mouse and keyboard operations

### 3) [→] button

Adds the setting selected in [From] to the row selected in [To].

If no row has been preselected in [To], the [Destination Data No. Specification] dialog appears.

- **[Destination Data No.]**

Specify a setting number to be assigned in the destination project. The setting range varies depending on the setting to be utilized.

### 4) [←] button

Deletes the setting selected in [To].

### 5) [Select All] button

Adds all the settings listed in [From] to [To].

The settings are added to the selected row and subsequent rows in [To].

If no row has been preselected in [To], each setting is added with its setting number unchanged.

### 6) [Deselect All] button

Deletes all the added settings from [To].

## ■ 1 Mouse and keyboard operations

The following shows operating [From] and [To] with a mouse and keyboard.

Operation	[From]	[To]
Arrow (up, down)	Moves the cursor.	
[Shift] + Arrow (Up/Down)	Moves the row while selecting the row where the cursor is positioned The destination row of the cursor is also selected.	-
[Home]	Moves the cursor to the top row.	
[End]	Moves the cursor to the bottom row.	
[PageUp]	Moves the cursor up one page.	
[PageDown]	Moves the cursor down one page.	
[Shift] + [Home]	Selects the rows from the row where the cursor is positioned to the top row.	-
[Shift] + [End]	Selects the rows from the row where the cursor is positioned to the bottom row.	-
[Shift] + [PageUp]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves up one page.	-
[Shift] + [PageDown]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves down one page.	-
[Shift] + Click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.	-
[Ctrl] + [Space]	Selects or deselects a row.	Selects or deselects a row.
[Ctrl] + Click		-

## 11.4.6 [Select Project] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Save Folder Path]

Set the destination path to save the project.  
The path can be set from the [Browse] button.

### 2) [Workspace/Project List]

The workspaces and projects in the path set in the [Save Folder Path] are displayed.  
If a workspace is double-clicked, the projects in the workspace are displayed.

### 3) [Workspace Name]

Displays the workspace name selected in [Workspace/Project List].

### 4) [Project Path]

Displays the project name selected in [Workspace/Project List].

Up to 200 characters can be used for the total number of the characters of [Save Folder Path], [Workspace Name], and [Project Name].

"\" at the end of the project name is not counted as a character.

### 5) [Open single file format project] button

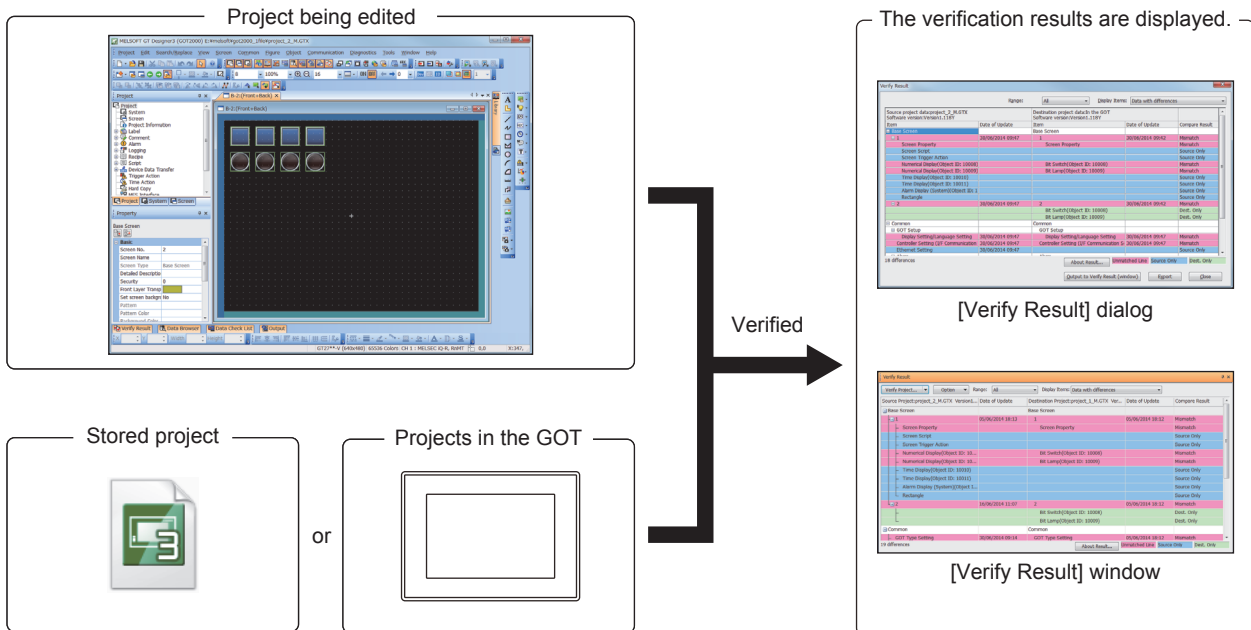

Switches the dialog to the [Open Project] dialog.

→ 2.3.2 ■ 5 [Open Project] dialog (single file format)

# 11.5 Verifying Project being Edited with Other Projects

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The project being edited by GT Designer3 can be verified against another project and the difference can be checked.

Verification is available for the following projects.

- Projects stored in a personal computer
- Projects in the GOT

- ⇒ 11.5.1 Specification of verification
- 11.5.2 How to use verification
- 11.5.3 Precautions
- 11.5.4 [Verify Project] dialog
- 11.5.5 [Verify Result] window
- 11.5.6 [Verify Result] dialog
- 11.5.7 Details of the exported file

## 11.5.1 Specification of verification

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

- ⇒ ■ 1 Verifiable projects
- 2 Verification method

### ■ 1 Verifiable projects

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

- ⇒ (1) Verifying against a stored project in a personal computer
- (2) Verifying against a project in the GOT

#### (1) Verifying against a stored project in a personal computer

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

The following shows the format of verifiable projects.

GOT	Project format
GOT2000 Series	<ul style="list-style-type: none"><li>• Workspace format</li><li>• A single file format (*.GTX, *.GTXS)</li></ul>

Verification is unavailable between the projects that specify different GOT types.

If the verification target is a project with a system application, the system application is not verified.

#### (2) Verifying against a project in the GOT

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

Verification against the GOT in the GOT2000 series is available in communication with it.

Verification is unavailable between the projects that specify different GOT types.

### ■ 2 Verification method

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

The following shows the methods of verifying a project.

- Data check

This method verifies settings.

- Time stamp check

This method verifies time stamps of files.

This method can be selected only for verifying against a project in GOT.

The following shows the verification target items of each method.

- ⇒ 11.5.6 ■ 1 Verification items for data check
- 11.5.6 ■ 2 Verification items for time stamp check

## 11.5.2 How to use verification

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒ ■ 1 Verifying against a stored project
- 2 Verifying against the GOT

### ■ 1 Verifying against a stored project

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Perform one of the following operations to display the [Verify Project] dialog.

⇒ 11.5.4 [Verify Project] dialog

- Select [Project] → [Verify Data] from the menu.
- In the [Verify Result] window, click the [Verify Project] button and select [Verify Project] from the pull-down menu.

**Step 2** Set [Target Project] and click the [Verify] button.

If project security is set for the verification target, the [User Authentication] dialog is displayed.

Enter a user name and the password.

If different versions of GT Designer3 are used for the project being edited and the verification target project, a dialog appears, confirming that a verification is executed according to the version of GT Designer3 used for the project being edited.

Click [Yes] button to execute the verification.

**Step 3** The [Verify Result] window displays the verification results.

In the [Verify Result] window, double-click a verification result to display the corresponding figure, object, or setting dialog.

⇒ 11.5.5 [Verify Result] window

### ■ 2 Verifying against the GOT

GT27 GT25 GT23 GT21 SoftGOT2000 GS

For how to verify the project being edited against a project in GOT, refer to the following.

⇒ 4.3.2 ■ 4 Verifying projects between the GOT and GT Designer3

## 11.5.3 Precautions

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 Verifying against a project protected with a security key

When the verification target project is protected with a security key, the security key authentication is performed.

If the authentication fails, verifying the project is not available.

⇒ 2.12 Protecting a Project with a Security Key

### ■ 2 Verifying against a project for which project security has been set.

If security is set for the verification target project, user authentication is performed.

If display-disabled screens or scripts exist in the project being edited or the verification target project, verification of the project is unavailable.

### ■ 3 Verifying against a project edited by GT Designer3 of another version

If the version of GT Designer3 used to edit the verification target project and that being used for the project being edited are different, the verification results may be different from those obtained when the version is the same.

### ■ 4 Verifying the current project against the project stored in the GOT after writing package data to multiple GOTs in one go

When you write package data to multiple GOTs in one go, the individual identification information and the communication interface setting data are not written.

Accordingly, inconsistencies in the following settings may be detected as a result of the verification.

- [Individual Identification Information]
- [Controller Setting (I/F Communication Setting)]

## 11.5.4 [Verify Project] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Target Project]

Set the project being edited and the verification target project.  
The path can be set from the [Browse] button.

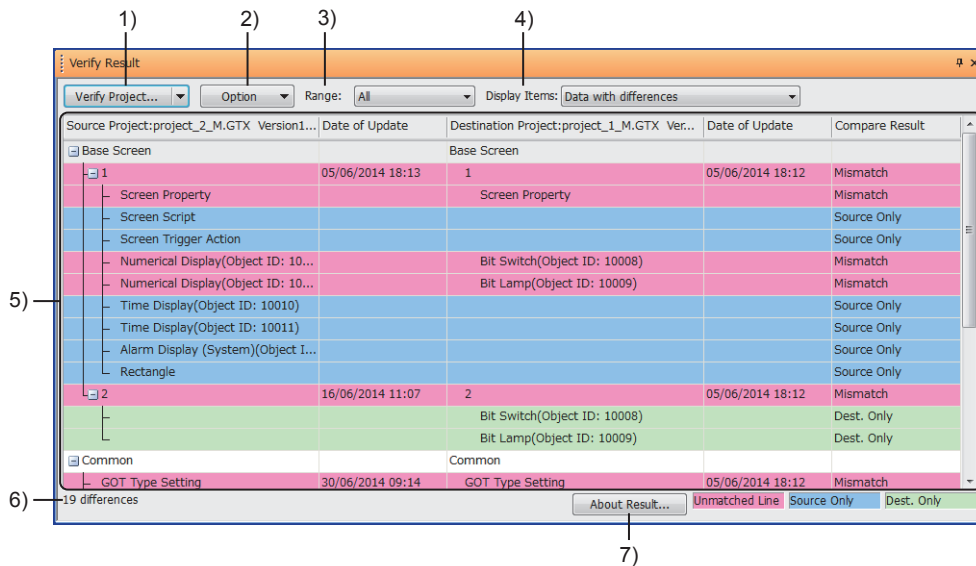

### 2) [Verify] button

Starts verification and displays the [Verify Result] window.  
The verification results can be checked.

⇒ 11.5.5 [Verify Result] window

## 11.5.5 [Verify Result] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Verify Project] button

Select an item from the pull-down menu to start a verification.

Item	Description
[Verify Project]	Verifies the project being edited against a project saved in the personal computer.
[Verify GOT]	Displays the [GOT Verification] tab of the [Communicate with GOT] dialog. ⇒ 4.8.2 ■ 3 [GOT Verification] tab In the dialog, verify the project being edited against a project saved in the GOT.

### 2) [Option] button

Select an item from the pull-down menu to operate the [Verify Result] window.

Item	Description
[Export] button	Saves the verification results as a Unicode text file. Set [File name] and click the [Save] button in the displayed dialog. ⇒ 11.5.7 Details of the exported file

### 3) [Range]

Narrow the displayed contents of the verification results by selecting a verification item.  
The following shows selectable items.

- [All]
- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen] (GT27 and GT25)
- [Common settings]

#### 4) [Display Items]

Narrow the displayed contents of the verification results by selecting the type of differences. The following shows selectable items.

- [All]
- [Data with differences]
- [Data that exists in the source only]
- [Data that exists in the destination only]
- [Mismatched data]

#### 5) Verification results

Displays the results of verification.

In each row, the target item for verification is shown.

The item that has been set for neither the project being edited nor the verification target project is not displayed.

The verified items differ depending on the verification method.

(For the verification against a project stored in a personal computer, the verification method available is only the data check.)

⇒11.5.6 ■ 1 Verification items for data check

11.5.6 ■ 2 Verification items for time stamp check

The background color of a row varies according to the type of a difference.

- Blue: The item exists only in the verification source project.
- Green: The item exists only in the verification target project.
- Red: The item exists in both projects and the data are not matched.

Double-click an item in the verification source project to select the corresponding figure/object, or display the corresponding setting dialog.

For the behavior of double-clicking an item, refer to the following.

⇒11.5.6 ■ 1 Verification items for data check

Right-click a row and select [Open the Setting dialog] from the menu to display the corresponding setting dialog.

This function is not available to the row indicating an order mismatch and the data existing only in the verification target project.

The verification results are retained even if you close the [Verify Result] window.

To delete the verification results, close the project or convert the GOT type set in the project.

Item	Description
[Source Project]	Displays the information of the project being edited.
[Destination Project]	Displays the information of the verification target project.
[Compare Result]	Displays the presence/absence and the type of differences.

#### 6) Number of differences

This item appears when any difference exists.

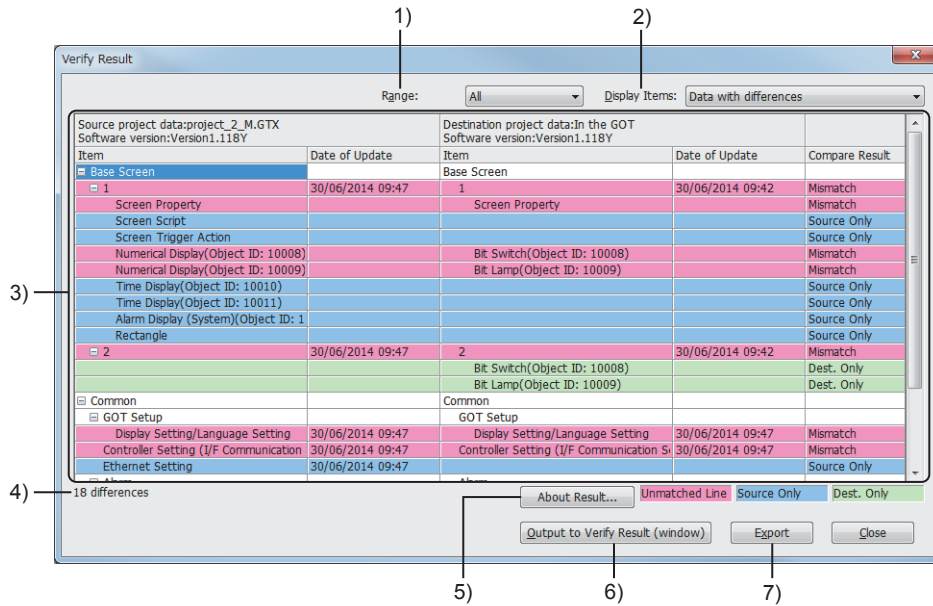

When the verification method is set to the data check, the item (screen number or title) immediately below the [Base Screen], [Window Screen], [Report Screen], or [Mobile Screen] row is not counted.

#### 7) [About Result] button

Displays Help.

## 11.5.6 [Verify Result] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Range]

Narrow the displayed contents of the verification results by selecting a verification item. The following shows selectable items.

- [All]
- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen] (GT27 and GT25)
- [Common settings]

### 2) [Display Items]

Narrow the displayed contents of the verification results by selecting the type of differences. The following shows selectable items.

- [All]
- [Data with differences]
- [Data that exists in the source only]
- [Data that exists in the destination only]
- [Mismatched data]

### 3) Verification results

Displays the results of verification.

In each row, the target item for verification is shown.

The item that has been set for neither the project being edited nor the verification target project is not displayed.

The verified items differ depending on the verification method.

(For the verification against a project stored in a personal computer, the verification method available is only the data check.)

- ■ 1 Verification items for data check
- 2 Verification items for time stamp check

The background color of a row varies according to the type of a difference.

- Blue: The item exists only in the verification source project.
- Green: The item exists only in the verification target project.
- Red: The item has a difference in its data.

Item	Description
[Source project data]	Displays the information of the project being edited.
[Destination project data]	Displays the information of the verification target project.

Item	Description
[Compare Result]	Displays the presence/absence and the type of differences.

#### 4) Number of differences

This item appears when any difference exists.

When the verification method is set to the data check, the item (screen number or title) immediately below the [Base Screen], [Window Screen], [Report Screen], or [Mobile Screen] row is not counted.

#### 5) [About Result] button

Displays Help.

#### 6) [Output to Verify Result (window)] button

This item appears only when the verification method is set to the data check.

Displays the verification results in the [Verify Result] window.

The settings of [Range] and [Display Items] are retained.

Even if the [Verify Result] dialog is closed, you can check the verification results.

→11.5.5 [Verify Result] window

#### 7) [Export] button

Saves the verification results as a Unicode text file.

Set [File name] and click the [Save] button in the displayed dialog.

→11.5.7 Details of the exported file

### ■ 1 Verification items for data check

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the items to be verified by the data check.

In the [Verify Result] window, double-clicking an item in the verification source project selects the corresponding figure/object, or displays the corresponding setting dialog.

#### (1) [Screen Design]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Double-click this item to display the [Screen Design] dialog.

#### (2) [Base Screen]

Verifies the base screens that exist in a project by screen No.

Also verifies the following items set in each screen.

[Item]	Remarks	Supported models
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Screen Property] dialog.	GT27 GT25 GT23
[Screen Script]	Double-clicking this item displays the [Screen] tab of the [Script] dialog.	GT21 GS
[Screen Trigger Action]	Double-clicking this item displays the [Screen] tab of the [Trigger Action] dialog.	SoftGOT2000
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	
[(Unmatched figure/object stacking order)]	The placement orders of figures or objects, and the states of grouping are verified. This item appears when the numbers of placed figures or objects are the same. The verification starts from the rearmost figure or object. Double-clicking this item selects a figure or object in which the first placement order difference is detected. When the placement order of a figure or object is directly changed, double-clicking this item may select any figure or object whose placement order is affected by the change. The placement order also differs when figures or objects are grouped.	

### (3) [Window Screen]

Verifies the window screens that exist in a project by screen No.  
Also verifies the following items set in each screen.

[Item]	Remarks	Supported models
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Screen Property] dialog.	GT27 GT25 GT23
[Screen Script]	Double-clicking this item displays the [Screen] tab of the [Script] dialog.	GT21 GS
[Screen Trigger Action]	Double-clicking this item displays the [Screen] tab of the [Trigger Action] dialog.	SoftGOT2000
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	
[(Unmatched figure/object stacking order)]	The placement orders of figures or objects, and the states of grouping are verified. This item appears when the numbers of placed figures or objects are the same. The verification starts from the rearmost figure or object. Double-clicking this item selects a figure or object in which the first placement order difference is detected. When the placement order of a figure or object is directly changed, double-clicking this item may select any figure or object whose placement order is affected by the change. The placement order also differs when figures or objects are grouped.	

### (4) [Report Screen]

Verifies the report screens that exist in a project by screen No.  
Also verifies the following items set in each screen.

[Item]	Remarks	Supported models
[Report Setting]	Double-clicking this item displays the [Report Setting] dialog.	GT27 GT25 GT23
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Screen Property] dialog.	GT21 GS
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	SoftGOT2000

### (5) [Mobile Screen]

Verifies the mobile screens that exist in a project by screen No.  
Also verifies the following items set in each screen.

[Item]	Remarks	Supported models
[Screen Property]	Double-clicking this item displays the corresponding screen and the [Screen Property] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
Figure/object type name (Object ID) (Name)	The figures or objects having the same object ID are verified. The figure IDs are controlled internally and cannot be checked. When you cut or copy a figure and then paste it to the location where the original figure has been placed, if the original and pasted figures have different IDs, the figures are handled as different data. The name appears when it is set for a figure or object. Double-clicking this item selects the corresponding figure or object on the screen editor.	
[(Unmatched figure/object stacking order)]	The placement orders of figures or objects, and the states of grouping are verified. This item appears when the numbers of placed figures or objects are the same. The verification starts from the rearmost figure or object. Double-clicking this item selects a figure or object in which the first placement order difference is detected. When the placement order of a figure or object is directly changed, double-clicking this item may select any figure or object whose placement order is affected by the change. The placement order also differs when figures or objects are grouped.	

### (6) [Common]

[Item]	Remarks	Supported models
[GOT Type Setting]	Double-clicking this item displays the [Type Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000

	[Script Text]	Double-clicking this item displays the [Script File List] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Object Script Symbol]	Double-clicking this item displays the [Object Script Symbol] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[MES Interface]	Double-clicking this item displays the [MES Interface] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[Application Setting]	Double-clicking this item displays the [System Application] tab of the [Application Selection] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000	
[Parts]	[Parts Setting]	Double-clicking this item displays the [Parts Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
	[Parts]	The data is verified by registered part. Double-clicking this item displays the parts editor for the corresponding part.	GT27 GT25 GT23 GT21 GS SoftGOT2000

[Item]	Remarks	Supported models
[Touch Key Sound Setting]	Double-clicking this item displays the [Touch Key Sound Setting] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Sound Files]	[Sound Files]  The data is verified by registered sound file. Double-clicking this item displays the [Sound File List] dialog.	(Except GT2505-V and GT25HS-V)
[Project information]	The latest update date and the edit version history are not included in the verification targets. Double-clicking this item displays the [Project information] dialog.	GT27 GT25 GT23 GT21 GS SoftGOT2000

### (7) [Individual Identification Information]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following pieces of information are included in the individual identification information.

- [GOT ID]
- [GOT Net No.]
- [GOT Station]
- [GOT IP Address]
- [Subnet Mask]
- [Default Gateway]
- [Peripheral S/W Communication Port No.]
- [Transparent Port No.]
- [IP Filter Setting]
- [Restrict write from GT Designer3 of the older versions]

Double-clicking this item displays the [I/F Communication Setting] dialog.

### (8) [Communication Settings with GOT / IP List]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Double-clicking this item displays the [Communication Configuration] dialog.

### (9) [System Label]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Displaying the setting dialog by double-clicking is not available.

## ■ 2 Verification items for time stamp check

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the items to be verified by the time stamp check.

The time stamp check does not support displaying a setting dialog from a verification result.

[Item]	Remarks	Supported models
[Base Screen]	Verifies the base screens that exist in a project by screen No.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Window Screen]	Verifies the window screens that exist in a project by screen No.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Report Screen]	Verifies the report screens that exist in a project by screen No.	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Mobile Screen]	Verifies the mobile screens that exist in a project by screen No.	GT27 GT25 GT23 GT21 GS SoftGOT2000

[Item]	Remarks	Supported models
[Common]	The following settings are also verified. • [Project information] Except the last update date and the edit history. • [Screen Design]	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Startup Logo]	-	
[GOT Setup]	If [Connection Type] is set to [Ethernet] in the [Printer] dialog, the printer settings are verified.	
[Controller Setting (I/F Communication Setting)]	-	
[Ethernet Setting]	-	
[Label] (label (GT Designer3))	The data is verified by label group No.	
[Comment]	The data is verified by comment group No.	
[Recipe]	[Recipe Common Setting]	-
	[Recipe]	The data is verified by recipe No.
[Device Data Transfer]	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
[MES Interface]	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Application Setting]	-	
[Parts]	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Sound]	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Individual Identification Information]	-	
[Communication Settings with GOT / IP List]	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
[System Label]	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
[Label] (label (GT Designer3))	-	GT27 GT25 GT23 GT21 GS SoftGOT2000

## 11.5.7 Details of the exported file

The following shows the details of the exported file of verification results.

1)		2)	
Source project data:Project_1.GTX	Software version:Version1.185T	Destination project data:Project_2.GTX	Software version:Version1.185T
Item	Date of Update	Item	Date of Update

### 1) [Source project data]

Displays the information of the project being edited.

In each row, the target item for verification is shown.

⇒ 11.5.1 ■ 2 Verification method

### 2) [Destination project data]

Displays the information of the verification target project.

In each row, the target item for verification is shown.

⇒ 11.5.1 ■ 2 Verification method

### 3) Types of differences

Displays the types of differences.

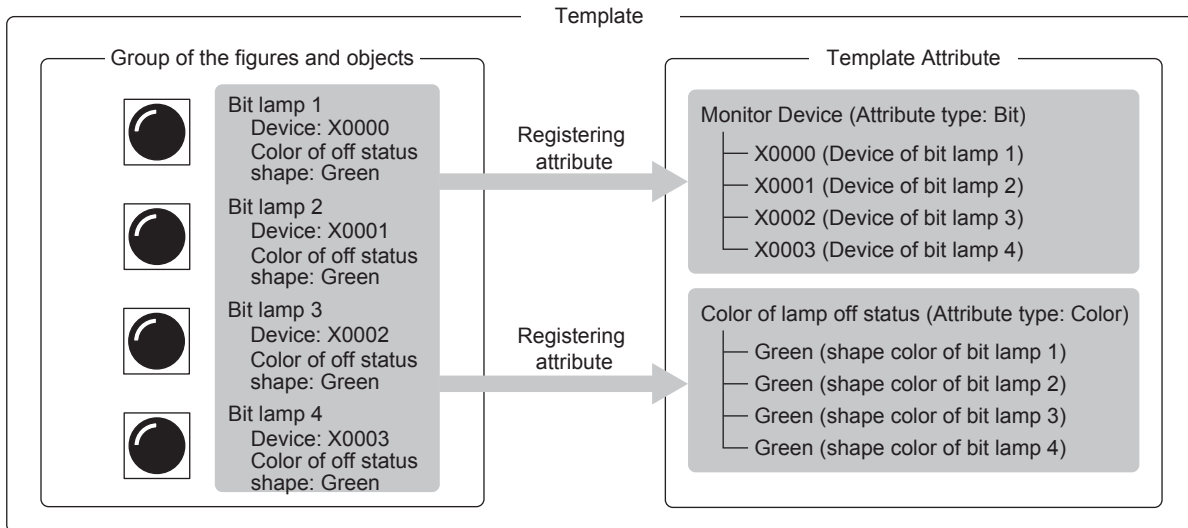

- [L]: The item exists only in the verification source project.
- [R]: The item exists only in the verification target project.
- [D]: The item has a difference in its data.

## 11.6 Efficient Drawing with Templates

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Templates are the combination of the following group and information.

- Group of the figures and objects on the screen editor
- The attribute information for the above group (template attribute)

For the attributes registered into template attributes, the set values can be batch changed.

Because the attributes of figures and object do not need changing separately, drawing data can be utilized efficiently.

- Batch changing successive devices by changing the first device with the difference between any two of successive device numbers retained

Example) Changing the first device of the device range (X0000 to X0003) of a template attribute to X1000

The difference between any two of successive device numbers is retained.

- Batch changing the color

Example) Changing the lamp color of a template attribute from green into red

The colors of all the lamps are changed to red.

If created templates are registered in the library, they can be utilized in creating another screen.

- ⇒ 11.6.1 Specifications of the template
- 11.6.2 How to use the template
- 11.6.3 Precautions
- 11.6.4 [Edit Template Attribute] dialog
- 11.6.5 [Register to Template] dialog
- 11.6.6 [Property] window (when the template property is displayed)

## 11.6.1 Specifications of the template

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 Figures and objects that can be registered in a template
- 2 Template attributes and the types of attributes that can be registered
- 3 Displaying templates on the screen editor

### ■ 1 Figures and objects that can be registered in a template

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The figures and objects on the same screen editor can be registered in a template.

Figures and objects that have been registered in a template cannot be registered in another template.

### ■ 2 Template attributes and the types of attributes that can be registered

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Up to 255 template attributes can be possessed by a single template.

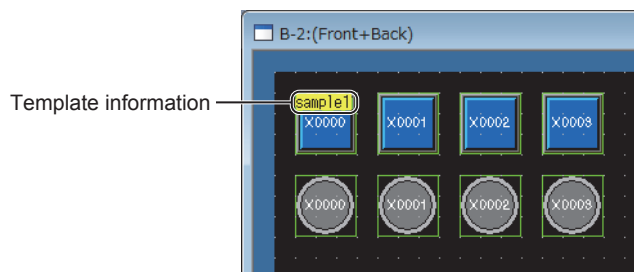

The following shows the types of the attributes that can be registered as template attributes.

- Bit (device)
- Word (device)
- Numerical value
- Character string
- Color
- Figure
- Font
- Text size

### ■ 3 Displaying templates on the screen editor

GT27 GT25 GT23 GT21 SoftGOT2000 GS

When a template is placed on the screen editor, a template information box that indicates the existence of the template is shown.

The template information box displays the template's name.

The information boxes can be used to rearrange the figures and objects registered in the template and to open the editor screen for the template.

#### (1) Displaying template information boxes

Template information boxes are displayed only on the screen editor of GT Designer3.

The boxes are not displayed in the [Screen Preview] window and [Data View] window of GT Designer3, and on the GOT display screen.

#### (2) Display settings for template information boxes

Display/hide template information boxes and change their background colors in the [View] tab of the [Options] tab.

The text of the template name is displayed in the color set for [Device/Object ID Text Color].

- 11.10.5 ■ 1 [Options] dialog ([View] tab)

### (3) Operations on template information boxes

- Template information boxes can be moved as in the case of figures and objects.  
To move a template information box simultaneously with registered figures and objects, select them together.  
When a template information box is double-clicked, all the registered figures and objects are selected.
- When a copy and paste, replication, and consecutive copy operation are performed on a template information box, the registered figures and objects are also processed.
- Rotation, reversing, and part registration cannot be performed.

## 11.6.2 How to use the template

---

- ■ 1 Creating screens using templates
- 2 Creating and editing templates
- 3 Registering templates at the library
- 4 Canceling template settings

### ■ 1 Creating screens using templates

- (1) Before utilizing templates
- (2) Utilizing templates of the library
- (3) Checking the attributes of the figures and objects in templates
- (4) Batch changing the set values for attributes
- (5) Changing by attribute

#### (1) Before utilizing templates

Certain templates require settings necessary for the project in which the templates are utilized, such as the controller setting and Go To Screen switch setting.  
Check the settings of the template to be utilized and set necessary items for the project.  
The following shows the required settings for the project in which templates are utilized.

##### (a) Controller setting

Before pasting templates, set the items in the [Controller Setting] dialog.

→5.5.1 ■ 4 [Controller Setting]

If the settings for a pasted template are not supported by the set controller, the device settings are changed as described below.

- The devices are changed to the equivalents supported by the controller.
- The devices not supported by the set controller (because the equivalents do not exist or they are outside the acceptable setting range) are changed to [??].

When setting a controller that does not support the settings for the template, check and change the device settings.

##### (b) Common setting

When utilizing templates in which user alarm displays and historical trend graphs are used, set necessary common setting items, such as user alarm observation and logging.

##### (c) Go To Screen switch setting

After pasting on a base screen a template in which a Go To Screen switch is placed, check and change [Screen No.] of the switch in consideration of the base screen No.

→8.2.7 ■ 1 [Next Screen] tab

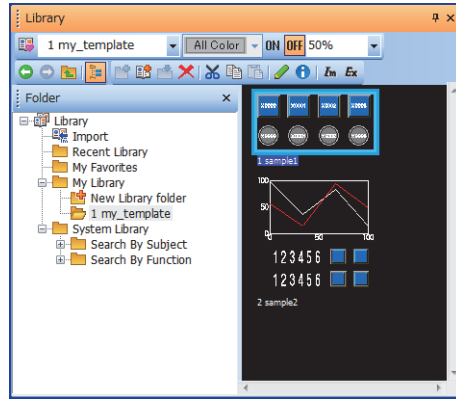

### (2) Utilizing templates of the library

**Step 1** Select [View] → [Docking Window] → [Library List], [Library List (Template)] from the menu to display the [Library] window.

**Step 2** Click the template to utilize, in the [Library] window.

→8.1.3 [Library] window

In My Library, you cannot check if the library data include the template.  
 Paste the template on the screen editor to check if the template information box is displayed.

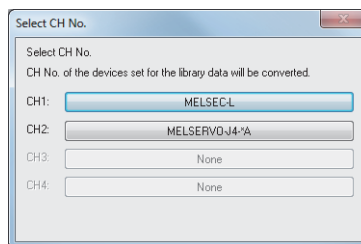

→ 11.6.1 ■ 3 Displaying templates on the screen editor

**Step 3** Click the screen editor to paste the template.

To change the sizes or positions of individual figures and objects, cancel the grouping.  
 Even if the grouping is canceled, the registration of the figures and objects in the template is not canceled.

For certain templates, the [Select CH No.] dialog is displayed when the templates are pasted.

Select the channel of the controller to monitor.

The controller devices that have been set for the template are changed as described below according to the controller on the selected channel.

- The devices are changed to the equivalents supported by the controller on the selected channel.
- The devices not supported by the controller on the selected channel (because the equivalents do not exist or they are outside the acceptable setting range) are changed to [??].

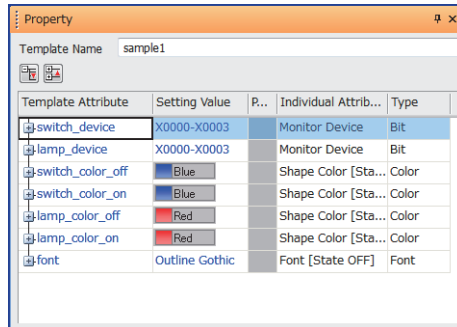

When selecting the channel of a controller that does not support the settings for the template, check and change the device settings.

### (3) Checking the attributes of the figures and objects in templates

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following procedure shows how to check the set values for the attributes of the figures and objects in a template.

- Step 1** When carrying out one of the following operations, the details of the settings for the template are displayed in the [Property] window.
- Double-click the template information box on the screen editor or in the [Data Browser] window.
  - Right-click the template information box on the screen editor and select [Display Template Property] from the menu.
  - On the screen editor or in the [Data Browser] window, select a figure or object that has been registered in the template and click the [Template Property] button displayed in the [Property] window.
- Step 2** Check the set values for attributes in the [Property] window.
- ⇒ 11.6.6 [Property] window (when the template property is displayed)

For the procedure for changing the set values, refer to the following.

- ⇒ (4) Batch changing the set values for attributes  
 (5) Changing by attribute

### (4) Batch changing the set values for attributes

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the procedure for changing the set values for attributes in the [Property] window.

Example) When the template attribute is "Bit" and the same device is set for multiple registered attributes

- Step 1** Display the details of the template with the [Property] window.
- ⇒ (3) Checking the attributes of the figures and objects in templates
- Step 2** Change the set value for the attribute in the target template attribute row.

Change the start device from X0000 to X1000.

- Step 3** The set values for the registered attributes in the template attribute are changed.

Template Attribute	Setting Value	P...	Individual Attrib...	Type
switch_device	X1000-X1003		Monitor Device	Bit
-Bit Switch	X1000	1	Monitor Device	
-Bit Switch	X1001	1	Monitor Device	
-Bit Switch	X1002	1	Monitor Device	
-Bit Switch	X1003	1	Monitor Device	
lamp_device	X0000-X0003		Monitor Device	Bit

The set value for each attribute is changed according to the start device.

When a setting falls out of the input range as a result of the batch change, it causes an error.

If a set value falls out of the input range, the set values in the corresponding figure/object attribute row and the successive rows below are not changed.

The following describes the specifications of the batch change for each attribute.

**(a) Bit, word**

By changing the start device of the set values for attributes, the set values for the attributes below the start device can be batch changed. The difference between any two of successive device numbers is not changed.

Devices' names can be also batch changed.

Batch change is enabled when the following conditions are satisfied.

- Devices that have the same channel No., network No., station No., CPU No., and block No. are set for all the attributes.
- Devices that have the same name are set for all the attributes.

Even if the data types of the attributes are different, batch change is enabled.

To change the set values for all the attributes to the same device, change the set values for the attributes individually.

→(5) Changing by attribute

**(b) Numerical value**

By changing the smallest of the set values for the attributes, the set values for the attributes can be batch changed. The difference between any two of successive set values is not changed.

Before	
Template Attribute	Set value
<input type="checkbox"/> -Screen No.	1 to 60
<input type="checkbox"/> -Go To Screen switch	1
<input type="checkbox"/> -Go To Screen switch	10
⋮	⋮
<input type="checkbox"/> -Go To Screen switch	60

Change the smallest value from 1 to 100.

After	
Template Attribute	Set value
<input type="checkbox"/> -Screen No.	100 to 159
<input type="checkbox"/> -Go To Screen switch	100
<input type="checkbox"/> -Go To Screen switch	109
⋮	⋮
<input type="checkbox"/> -Go To Screen switch	159

The set values are changed but the difference between any two of successive set values is not changed.

To change the set values for all the attributes to the same value, change the set values for the attributes individually.

⇒(5) Changing by attribute

**(c) Character string**

The set values for all the attributes can be batch changed to the same character string.

Before	
Template Attribute	Set value
<input type="checkbox"/> -Switch name	
<input type="checkbox"/> -Bit Switch	Switch 1
<input type="checkbox"/> -Bit Switch	Switch 2
⋮	⋮
<input type="checkbox"/> -Bit Switch	Switch 10

Type SWITCH as a set value in the template attribute row.

After	
Template Attribute	Set value
<input type="checkbox"/> -Switch name	SWITCH
<input type="checkbox"/> -Bit Switch	SWITCH
<input type="checkbox"/> -Bit Switch	SWITCH
⋮	⋮
<input type="checkbox"/> -Bit Switch	SWITCH

The set values of all the attributes are changed.

The maximum number of characters that can be typed in a single template attribute row is the same as the upper limit of the widest of all the acceptable input ranges for the registered attributes.

However, the maximum number of characters for each attribute is within the acceptable input range for each attribute.

**(d) Color**

The set values for all the attributes can be batch changed to the same color.

Before	
Template Attribute	Set value
<input type="checkbox"/> -Off color (each screen)	Red
<input type="checkbox"/> -Go To Screen switch	Red
<input type="checkbox"/> -Go To Screen switch	Red
⋮	⋮
<input type="checkbox"/> -Go To Screen switch	Red

Change the set value for the template attribute row from red to blue.

After	
Template Attribute	Set value
<input type="checkbox"/> -Off color (each screen)	Blue
<input type="checkbox"/> -Go To Screen switch	Blue
<input type="checkbox"/> -Go To Screen switch	Blue
⋮	⋮
<input type="checkbox"/> -Go To Screen switch	Blue

The set values of all the attributes are changed.

For the following attributes, different ways of setting colors are had. Hence if the attributes are mixed in the same template attribute, the colors are not batch changed.

- Text color of switches and lamps
- Color of the switches with their figures from the system library (color switching)
- Color of logo texts (color fill effect)

**(e) Figures, fonts, text sizes**

The set values for all the attributes can be batch changed to the same.

Example) When the type is text size

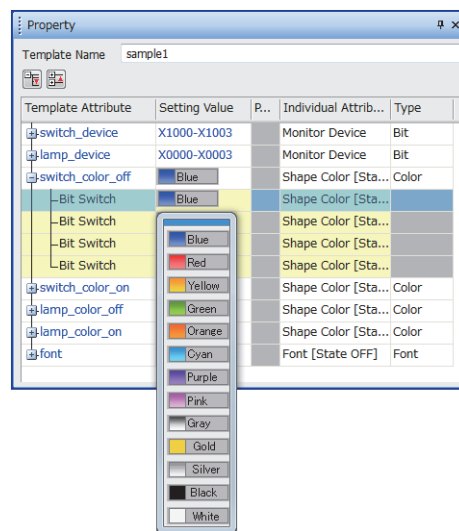

If the acceptable setting range for each attribute is the same, the sizes are batch changed.

## (5) Changing by attribute

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- Step 1** Display the details of the template with the [Property] window.
- (3) Checking the attributes of the figures and objects in templates
- Step 2** When the setting in a figure/object attribute row is changed, the set value for the attribute is changed.

If the model is a figure, the set value can be changed in the [Image List] dialog.  
→6.4.2 Color settings

## ■2 Creating and editing templates

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- (1) Creating templates and registering figures and objects into the templates
- (2) Registering figures and objects into an existing template.
- (3) Deleting figures and objects from a template
- (4) Creating template attributes
- (5) Deleting template attributes
- (6) Registering attributes into template attributes
- (7) Deleting attributes from the template attributes

### (1) Creating templates and registering figures and objects into the templates

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- Step 1** On the screen editor, select the figure or object to register in a template.
- Step 2** Either of the following operations displays the [Register To Template] dialog.
- Select [Edit] → [Template Registration] → [Register to Template] from the menu.
  - Right-click the figure or object and select [Template Registration] → [Register to Template] from the menu.
- Step 3** Select [New] and set [New Template Name].

These items are not displayed if there is no template on the screen editor.

**Step 4** Click the [OK] button to display the [Edit Template Attribute] dialog.

→ 11.6.4 [Edit Template Attribute] dialog

**Step 5** Edit the template attribute then click the [OK] button to complete registering into the template.

When a new template is created, template attributes are displayed on the screen editor.

For the procedure for editing template attributes in the [Edit Template Attribute] dialog, refer to the following.

→ (4) Creating template attributes

(5) Deleting template attributes

(6) Registering attributes into template attributes

(7) Deleting attributes from the template attributes

## (2) Registering figures and objects into an existing template.

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

**Step 1** On the screen editor, select the figure or object to register in a template.

**Step 2** Either of the following operations displays the [Register To Template] dialog.

- Select [Edit] → [Template Registration] → [Register to Template] from the menu.

- Right-click the figure or object and select [Template Registration] → [Register to Template] from the menu.

**Step 3** Select [Add] then select the target template for registering.

**Step 4** Click the [OK] button to display the [Edit Template Attribute] dialog.

→ 11.6.4 [Edit Template Attribute] dialog

**Step 5** Edit the template attribute then click the [OK] button to complete registering into the template.

For the procedure for editing template attributes in the [Edit Template Attribute] dialog, refer to the following.

→ (4) Creating template attributes

(5) Deleting template attributes

(6) Registering attributes into template attributes

(7) Deleting attributes from the template attributes

## (3) Deleting figures and objects from a template

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

**Step 1** On the screen editor, select the figure or object to delete from the template.

**Step 2** Either of the following operations deletes the figure or object from the template.

- Select [Edit] → [Template Registration] → [Deregister from Template] from the menu.

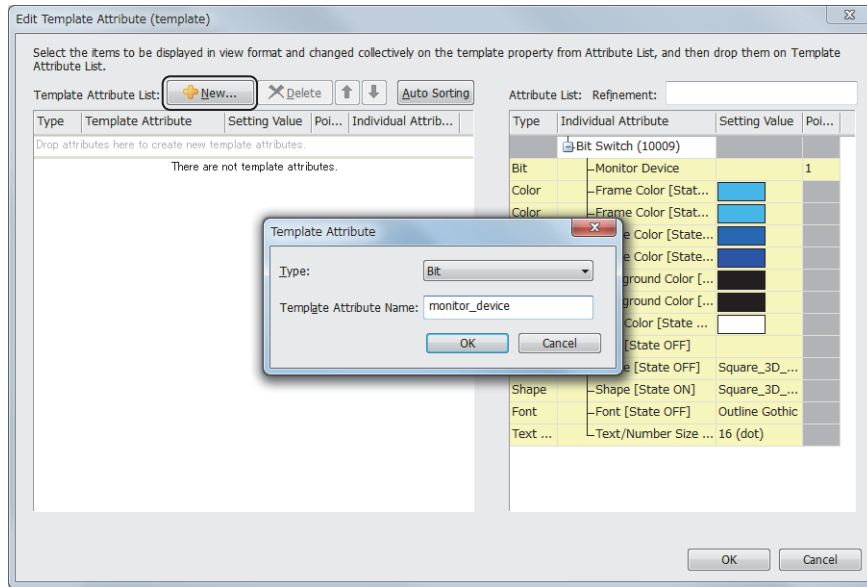

- Right-click the figure or object and select [Template Registration] → [Deregister from Template] from the menu.

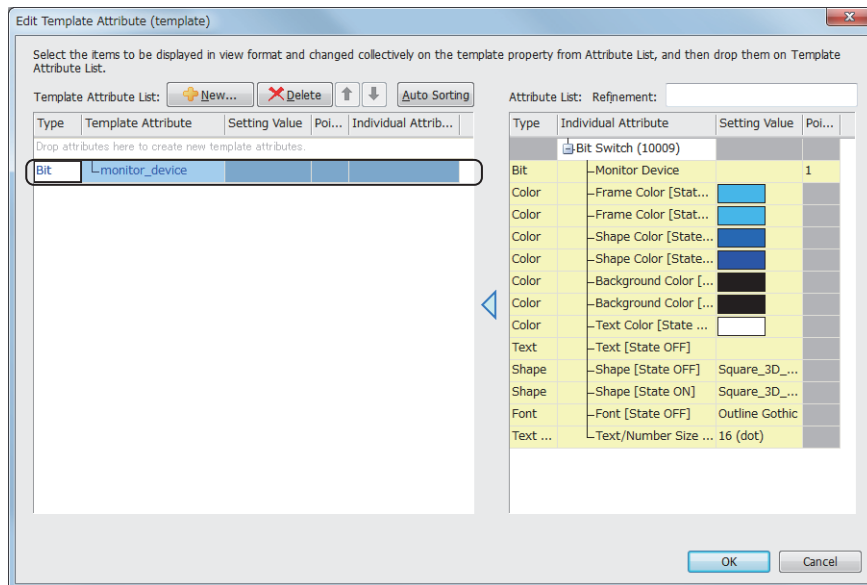

#### (4) Creating template attributes

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Either of the following operations displays the [Edit Template Attribute] dialog.
- Select the template information box or a figure/an object and select [Edit] → [Edit Template Attribute] from the menu.
  - Right-click the template information box or the figure/object and select [Edit Template Attribute] from the menu.
- 11.6.4 [Edit Template Attribute] dialog
- Step 2** Click the [New] button to display the [Template Attribute] dialog.

- Step 3** Set [Type] and [Template Attribute Name] and click the [OK] button. The template attribute is created.

When the [Auto Sorting] button is clicked, the attributes in [Attribute List] are classified according to their types and are automatically registered in the automatically created corresponding template attributes. Only the attributes in [Attribute List] are registered in the automatically created template attributes. The target attributes for the automatic creation can be operated using [Refinement]. For the procedure for registering attributes in template attributes, refer to the following.

→ (6) Registering attributes into template attributes

## (5) Deleting template attributes

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### Step 1

Either of the following operations displays the [Edit Template Attribute] dialog.

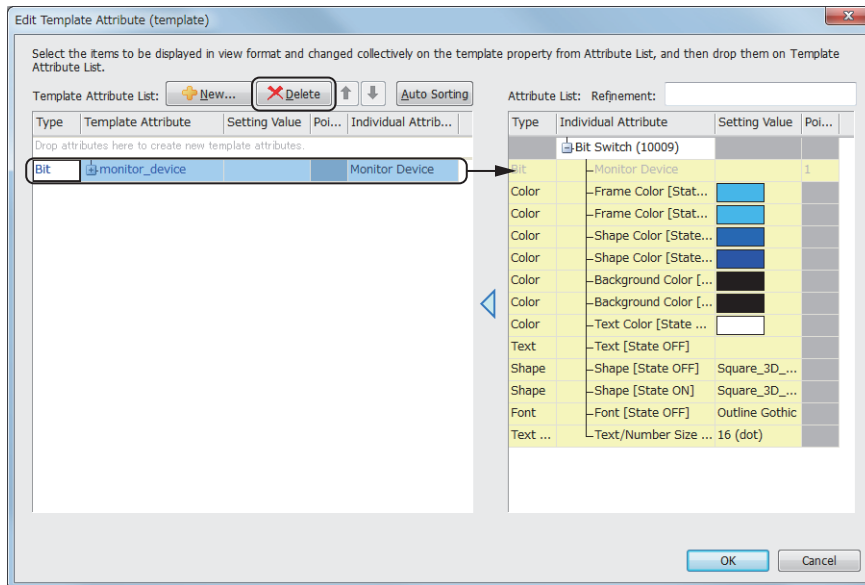

- Select the template information box or a figure/an object and select [Edit] → [Edit Template Attribute] from the menu.
- Right-click the template information box or the figure/object and select [Edit Template Attribute] from the menu.

⇒ 11.6.4 [Edit Template Attribute] dialog

### Step 2

Either of the following operations deletes the template attribute.

- Drag the template attribute to delete from [Template Attribute List] to [Attribute List].
- Select the template attribute row to delete in [Template Attribute List] and click the [Delete] button.

The attributes that have been registered in the template attribute are also deleted.

## (6) Registering attributes into template attributes

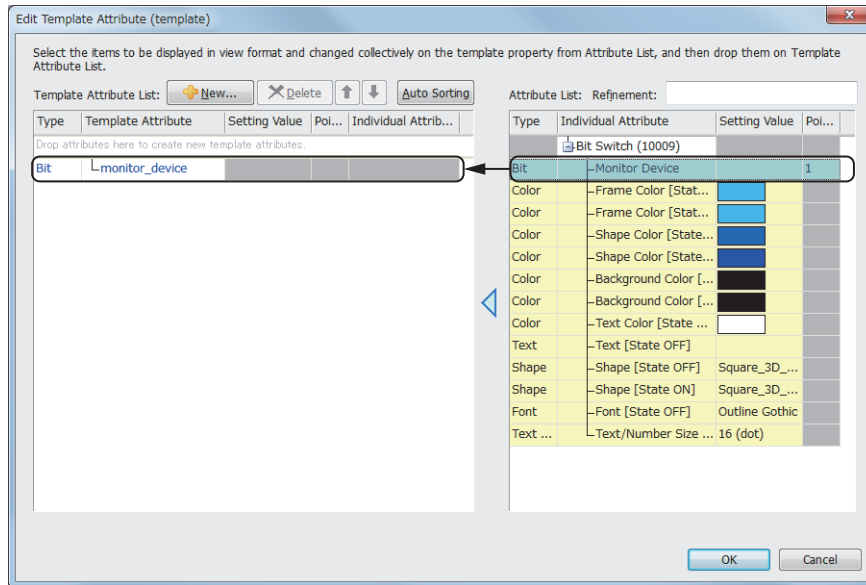

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Either of the following operations displays the [Edit Template Attribute] dialog.

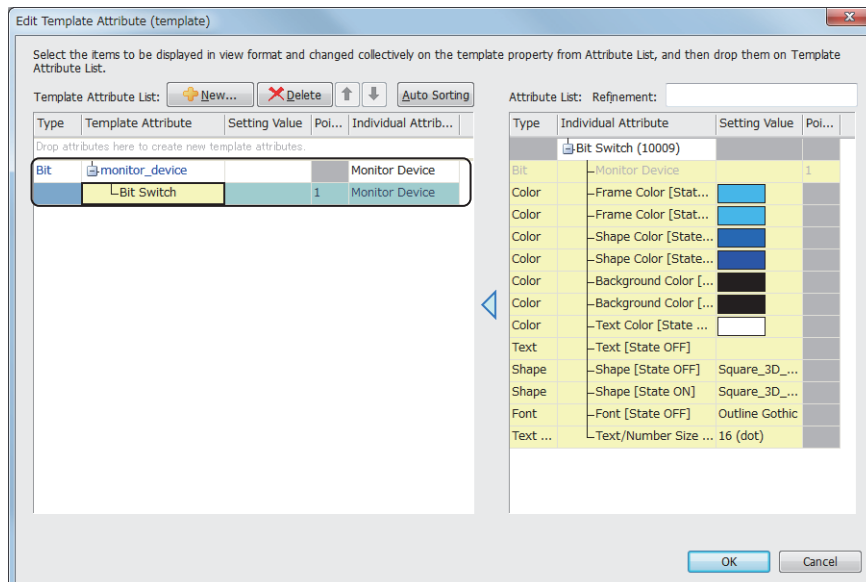

- Select the template information box or a figure/an object and select [Edit] → [Edit Template Attribute] from the menu.
- Right-click the template information box or the figure/object and select [Edit Template Attribute] from the menu.

→ 11.6.4 [Edit Template Attribute] dialog

**Step 2** Drag the target attribute from [Attribute List] into a template attribute row in [Template Attribute List].

**Step 3** The dragged attribute is registered in the template attribute.

## (7) Deleting attributes from the template attributes

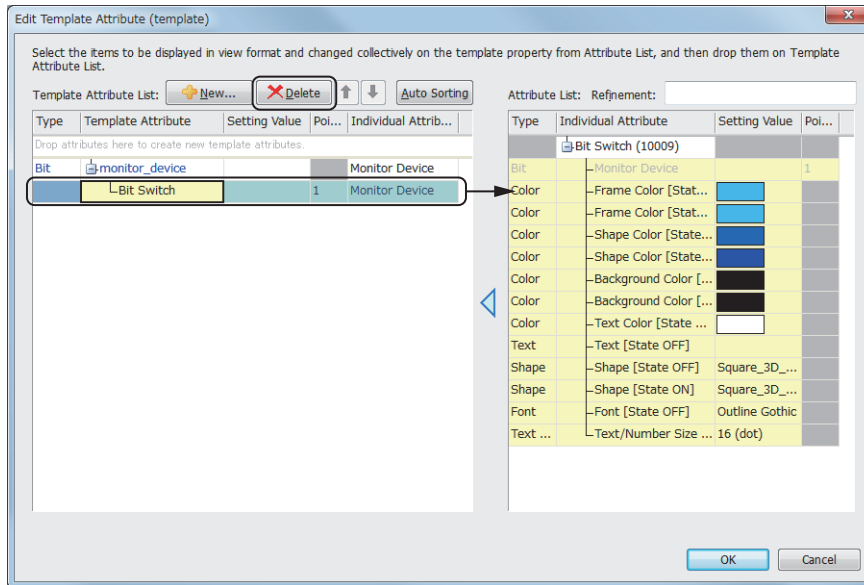

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Either of the following operations displays the [Edit Template Attribute] dialog.

- Select the template information box or a figure/an object and select [Edit] → [Edit Template Attribute] from the menu.
  - Right-click the template information box or the figure/object and select [Edit Template Attribute] from the menu.
- 11.6.4 [Edit Template Attribute] dialog

**Step 2** Either of the following operations deletes the target attribute from the template attribute.

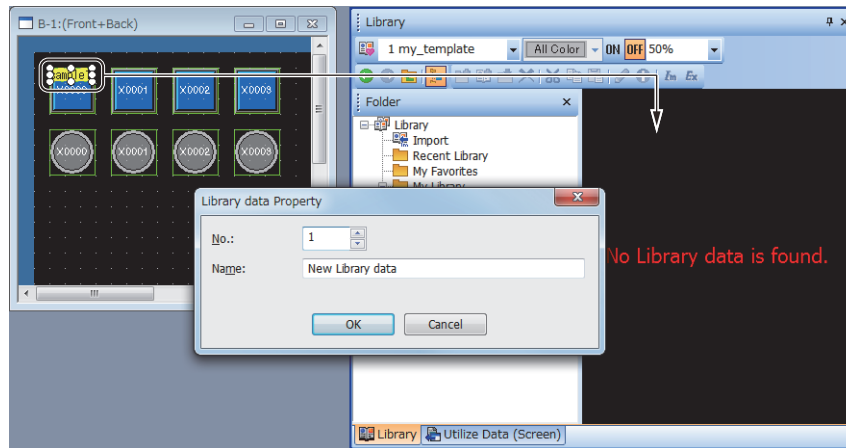

- Drag the attribute to delete from [Template Attribute List] to [Attribute List].
- Select the attribute row to delete in [Template Attribute List] and click the [Delete] button.

### ■ 3 Registering templates at the library

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [View] → [Docking Window] → [Library List] from the menu to display the [Library] window.  
 → 8.1.3 [Library] window
- Step 2** In the [Library] window, display the folder into which the target template is registered.  
 The library folders into which templates can be registered are favorites and My Library.  
 To register into My Library, create a library folder in it.
- Step 3** Drag into the [Library] window the template information box of the target template for registering into the library. The [Library data Property] dialog appears.

- Step 4** In the [Library data Property] dialog, set [No.] and [Name], then click the [OK] button. The template is registered in the library.

### ■ 4 Canceling template settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** In the screen editor, select the template information box to delete.  
 Figures and objects selected together with the box are deleted simultaneously with the template.  
 When the template information box is double-clicked, all the registered figures and objects are selected.
- Step 2** Either of the following operations cancels the target template setting.
- Select [Edit] → [Delete] from the menu.
  - Right-click the template information box and select the [Delete] menu.

## 11.6.3 Precautions

### ■1 Operations on figures and objects that have been registered in templates

#### (1) Registering into templates

Objects that have been registered in a template cannot be registered into another template.

#### (2) Replication operation

On figures and objects that have been registered in a template, a copy and paste, replication, and consecutive copy operation can be carried out.

However, replicas of figures and objects are not automatically registered into the template.

#### (3) Operations causing deletions from templates

When figures and objects that have been registered in a template are cut, deleted, or dragged onto another screen, they are deleted from the template.

#### (4) Grouping

Template information boxes and figures/objects that have been registered in templates are grouped only with the following combination.

- Figures and objects that have been registered in the same template

Figures and objects that have been registered in the same template can be grouped.

For the grouping method, refer to the following.

→6.6.8 [Group], [Ungroup]

#### (5) Individual settings for figures and objects that have been registered in templates

The following describes the operations performed when the settings for figures and objects that have been registered in a template are changed individually in the setting dialog.

- When an attribute is added due to a change of the setting, the attribute is not automatically registered into the template attribute.
- When an attribute that has been registered in a template attribute is deleted due to a change of the setting, it is also deleted from the template attribute.
- After the setting is changed, if the change is canceled with [Undo], the registration status of the template attribute returns to the previous.

### ■2 Precautions of utilizing templates

The [Select CH No.] dialog is displayed only when the templates in the system library are utilized.

The dialog is not displayed when the templates that have been registered as favorites and in My Library. Also, Device conversion according to the controller setting is not carried out.

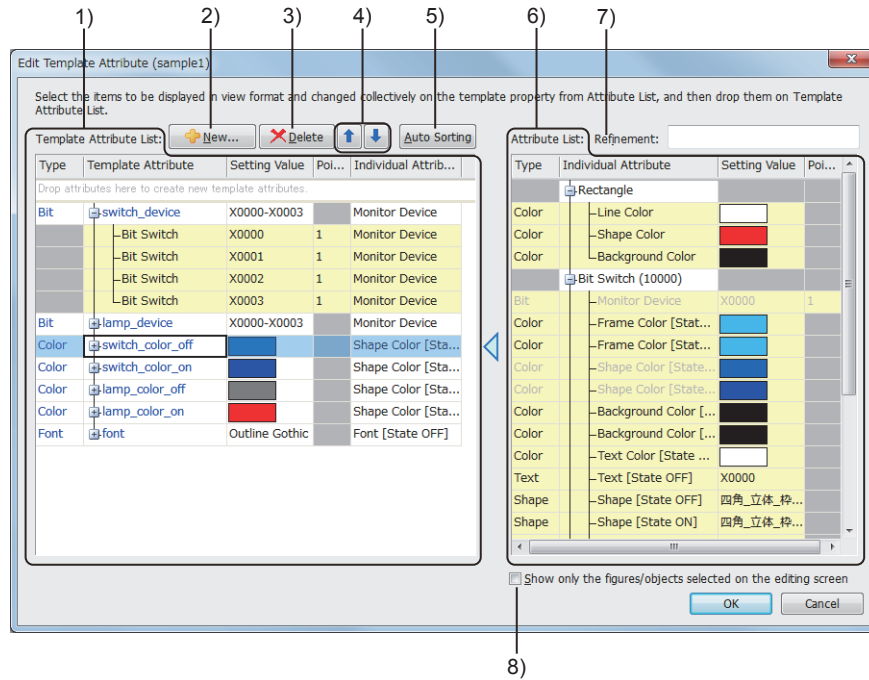

### ■3 Precautions of registering figures into a template

For cases where 10000 or more figures have been registered in a template, when the project is transferred to the GOT or data storage, the 10000th and those registered later are deleted from the template.

The project saved in the GOT or data storage is different from the one designed before the transfer. Exercise care when reading the project saved after the transfer.

## 11.6.4 [Edit Template Attribute] dialog

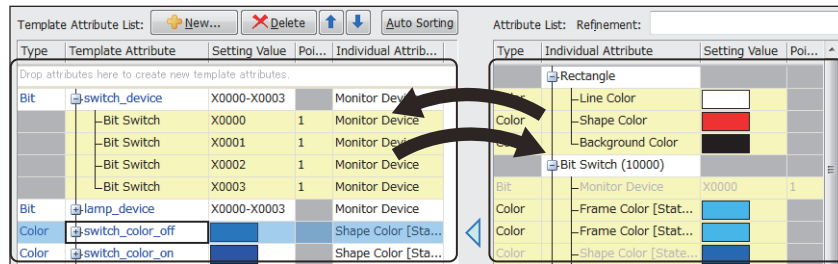

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Template Attribute List]

Lists template attributes.

Attributes can be dragged between [Template Attribute List] and [Attribute List] to register into/delete from the template attributes.

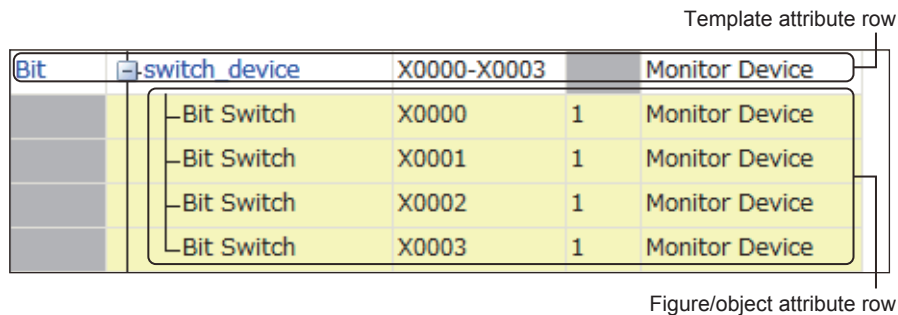

For the operations with the mouse or keyboard, refer to the following.

#### ➡ ■ 1 Mouse and keyboard operations

Up to 5000 figure/object attributes can be registered into a single template attribute.

The relation between a template attribute and the registered attributes are shown in a tree.

- Template attribute row: Displays template attributes.
- Figure/object attribute row: Displays the attributes of figures/objects that have been registered in the template attribute.  
When a row is selected, handles appear for the figure/object on the screen editor that has the corresponding attribute.

The handles indicate that the figure/object has the corresponding attribute.

If not grouped

If grouped

Item	Description
[Type]	Displays the types of the template attributes. To change the settings, double-click them. When the settings are changed, the registered attributes are deleted.
[Template Attribute]	Each row displays different contents. • <b>Template attribute row:</b> Displays the names of the template attributes. To change the settings, double-click them. Up to 128 characters can be set. • <b>Figure/object attribute row:</b> Displays the types of the figures or names of the objects. For the attributes of objects for which [Name] is not set, the types are displayed instead of the names.
[Setting Value]	Displays the set values for the attributes. They cannot be changed.
[Points]	Each [Type] displays different contents. • [Bit], [Word]: Displays the number of the consecutive devices. • [Number] having the consecutive or random setting: Displays the number of the consecutive values.
[Individual Attribute]	Each row displays different contents. • <b>Template attribute row:</b> Displays the names of the attributes that have been registered in the template attribute. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed. • <b>Figure/object attribute row:</b> Displays the names of the figure/object attributes. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed.

## 2) [New] button

Displays the [Template Attribute] dialog.

A template attribute can be created.

Up to 255 template attributes can be possessed by a single template.

### • [Type]

Select the type of the template attribute to create.  
The following shows selectable items.

- [Bit]
- [Word]
- [Color]
- [Number]
- [Text]
- [Shape]
- [Font]
- [Text Size]

### • [Template Attribute Name]

Set the name of the template attribute.  
Up to 128 characters can be set.

## 3) [Delete] button

Deletes a template attribute or attribute selected in [Template Attribute List].

When a template attribute is deleted, the attributes that have been registered in the template attribute are also deleted.

## 4) [↑], [↓] button

Moves a row selected in [Template Attribute List].

When a template attribute row is moved, the figure/object attributes that have been registered in the template attribute are also moved.

When multiple rows are selected, the difference between any two of successive rows is retained.

When a template attribute row is selected together with figure/object rows, they cannot be moved.

### 5) [Auto Sorting] button

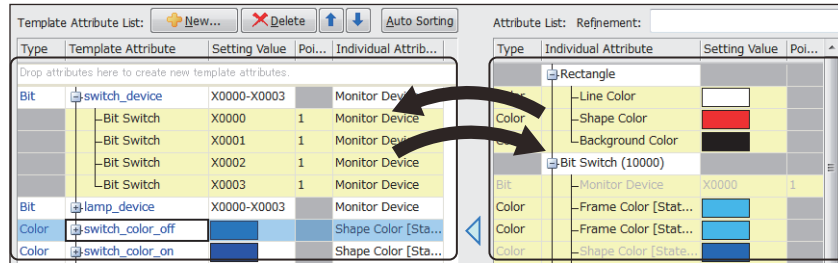

Classifies all the attributes displayed in [Attribute List] according to set value and registers them into the template attributes automatically created in [Template Attribute List].

The classification method depends on [Type].

### 6) [Attribute List]

Lists the figures and objects that have been registered and those in the process of being registered.

Attributes can be dragged between [Template Attribute List] and [Attribute List] to register into/delete from the template attributes.

For the operations with the mouse or keyboard, refer to the following.

#### ➡ ■ 1 Mouse and keyboard operations

The text color of the attributes that have already been registered becomes gray.

The relation between figures/objects and attributes are shown in a tree.

- Figure/object row: Displays the figures and objects.
- Attribute row: Displays the attributes the figures and objects have.

Clicking the top row sorts the results by item.

When a row is selected, the corresponding figure/object on the screen editor is displayed.

The handles indicate the corresponding figure/object.

Item	Description
[Type]	Displays the types of the attributes.
[Individual Attribute]	Each row displays different contents. <ul style="list-style-type: none"> <li>• Figure/object row: Displays the types of the figures or names of the objects and the object ID. For the attributes of objects for which [Name] is not set, the types are displayed instead of the names.</li> <li>• Attribute row: Displays the names of the figure/object attributes. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed.</li> </ul>
[Setting Value]	Displays the set values for the attributes. They cannot be changed.

Item	Description
[Points]	<p>Each [Type] displays different contents.</p> <ul style="list-style-type: none"> <li>• [Bit], [Word]: Displays the number of the consecutive devices.</li> <li>• [Number] having the consecutive or random setting: Displays the number of the consecutive values.</li> </ul>

### 7) [Refinement]

Narrows the displayed contents of [Attribute List] by keywords.

Up to 128 characters can be set.

This search operation is case-insensitive.

To narrow the contents using multiple keywords, separate each keyword with one-byte spaces.

### 8) [Show only the figures/objects selected on the editing screen]

Displays in [Attribute List] only the figures and objects selected on the screen editor when the [Edit Template Attribute] dialog is opened.

When the [Edit Template Attribute] dialog is opened for a newly created template, no entry is displayed.

## ■ 1 Mouse and keyboard operations

### (1) Operations for the lists on display

The following table describes the mouse and keyboard operations for [Template Attribute List] and [Attribute List] in the [Edit Template Attribute] dialog.

Operation	[Template Attribute List]	[Attribute List]
Arrow (Up/Down)	Moves the cursor.	Moves the focus upward or downward.
Arrow (Left)		<ul style="list-style-type: none"> <li>• When a figure/object row is selected Folds an unfolded tree. If the tree has been folded, moves the focus upward.</li> <li>• When an attribute row is selected Moves the focus up to a figure/object row.</li> </ul>
Arrow (Right)		<ul style="list-style-type: none"> <li>• When a figure/object row is selected Unfolds a folded tree. If the tree has been unfolded, moves the focus downward.</li> <li>• When an attribute row is selected Moves the focus downward.</li> </ul>
[Shift] + Arrow (Up/Down)	Moves the row while selecting the row where the cursor is positioned The destination row of the cursor is also selected.	Moves the row while selecting the row where the cursor is positioned The destination row of the cursor is also selected.
[+] (Numeric keypad)	Unfolds the tree of the template attribute row where the cursor was placed.	
[-] (Numeric keypad)	Folds the tree of the template attribute row where the cursor was placed.	
[Shift] + [+] (Numeric keypad)	Unfolds all the trees.	
[Shift] + [-] (Numeric keypad)	Folds all the trees.	
[Home]	Moves the cursor to the top row.	Selects the top row.
[End]	Moves the cursor to the bottom row.	Selects the bottom row.
[PageUp]	Moves the cursor up one page.	Moves the cursor up one page.
[PageDown]	Moves the cursor down one page.	Moves the cursor down one page.
[Shift] + [Home]	Selects the rows from the row where the cursor is positioned to the top row.	Selects the rows from the row where the cursor is positioned to the top row.
[Shift] + [End]	Selects the rows from the row where the cursor is positioned to the bottom row.	Selects the rows from the row where the cursor is positioned to the bottom row.
[Shift] + [PageUp]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves up one page.	Selects the rows from the row where the cursor is positioned to the row where the cursor moves up one page.
[Shift] + [PageDown]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves down one page.	Selects the rows from the row where the cursor is positioned to the row where the cursor moves down one page.
[Shift] + Click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.
[Ctrl] + [Space]	Selects or deselects a row.	
[Ctrl] + click		

Operation	[Template Attribute List]	[Attribute List]
[F2]	Enables the cell where the cursor was placed to be edited.	
Double-click	The target columns for editing are [Type] and [Template Attribute] in a template attribute row. →(2) Operations when a cell is edited	-
Drag	<ul style="list-style-type: none"> <li>• Dragging from [Attribute List] to [Template Attribute List] Registers a dragged attribute into a template attribute.</li> <li>• Dragging from [Template Attribute List] to [Attribute List] Deletes a dragged attribute from a template attribute.</li> </ul>	

## (2) Operations when a cell is edited

The following table lists the keyboard operations for editing cells in [Template Attribute List].

Operation	[Template Attribute List]
[Enter]	Confirms and ends the edit.
[Esc]	Discards and ends the edit.

## 11.6.5 [Register to Template] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [New]

Newly creates a template into which figures and objects are registered.

Item	Description
[New Template Name]	Set the name of the template to create. Up to 128 characters can be set.

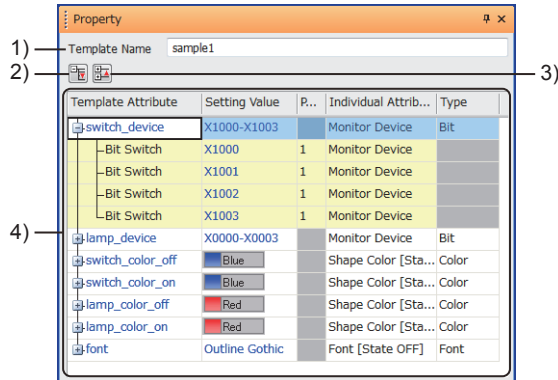

### 2) [Add]

Specifies an existing template as the target for registration.  
Select the target template.

## 11.6.6 [Property] window (when the template property is displayed)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following describes the screen layout shown when the template setting is displayed in the [Property] window.

### 1) [Template Name]

Displays the template name.  
The name can be changed.  
Up to 128 characters can be set.

### 2) [Unfold All] button

Expands all template attribute items.

### 3) [Fold All] button

Collapses all template attribute items.

### 4) Template attribute list

Lists template attributes.  
The set values for attributes can be batch changed by template attribute.  
Example) Changing the first device of the device range (X0000 to X0003) of a template attribute to X1000

The difference between any two of successive device numbers is retained.

For the operations with the mouse or keyboard, refer to the following.

➔ ■ 1 Mouse and keyboard operations

The relation between a template attribute and the registered attributes are shown in a tree.

Template attribute row				
[-] switch_device	X0000-X0003		Monitor Device	Bit
[-] Bit Switch	X0000	1	Monitor Device	
[-] Bit Switch	X0001	1	Monitor Device	
[-] Bit Switch	X0002	1	Monitor Device	
[-] Bit Switch	X0003	1	Monitor Device	

Figure/object attribute row

- Template attribute row: Displays the template attribute rows.
- Figure/object attribute row: Displays the attributes of figures/objects that have been registered in the template attribute.  
Clicking the top row sorts the results by item.  
When a row is selected, handles appear for the figure/object on the screen editor that has the corresponding attribute.

The handles indicate that the figure/object has the corresponding attribute.

When a figure/object attribute row is double-clicked, the setting dialog of the corresponding figure/object is displayed.

Item	Description
[Template Attribute]	<p>Each row displays different contents.</p> <ul style="list-style-type: none"> <li>• Template attribute row: Displays the names of the template attributes. To change the settings, double-click them. Up to 128 characters can be set.</li> <li>• Figure/object attribute row: Displays the types of the figures or names of the objects. For the attributes of objects for which [Name] is not set, the types are displayed instead of the names.</li> </ul>
[Setting Value]	<p>Each row displays different contents.</p> <ul style="list-style-type: none"> <li>• Template attribute row: Displays the background color of set values in white when the conditions for batch change are satisfied. Displays the background color of set values in gray when the conditions for batch change are not satisfied. For the conditions for batch change and the procedure for the change, refer to the following. ⇒ 11.6.2 ■ 1 (4) Batch changing the set values for attributes</li> <li>• Figure/object attribute row: Displays the set values for figures and objects.</li> </ul>
[Points]	<p>Each [Type] displays different contents.</p> <ul style="list-style-type: none"> <li>• [Bit], [Word]: Displays the number of the consecutive devices.</li> <li>• [Number] having the consecutive or random setting: Displays the number of the consecutive values.</li> </ul>
[Individual Attribute]	<p>Each row displays different contents.</p> <ul style="list-style-type: none"> <li>• Template attribute row: Displays the names of the attributes that have been registered in the template attribute. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed.</li> <li>• Figure/object attribute row: Displays the names of the figure/object attributes. Additionally, conditions are displayed if set. For a script part, the attribute name and execution order number of each script are displayed.</li> </ul>
[Type]	Displays the types of the template attributes.

## ■ 1 Mouse and keyboard operations

### (1) Operations for the lists on display

The following table shows how to operate the template attribute list in the [Property] window with the mouse or keyboard.

Operation	Action
Arrow (Up/Down/Left/Right)	Moves the cursor.
[Shift] + Arrow (Up/Down)	Moves the row while selecting the row where the cursor is positioned The destination row of the cursor is also selected.
[+] (Numeric keypad)	Unfolds the tree of the template attribute row where the cursor was placed.
[-] (Numeric keypad)	Folds the tree of the template attribute row where the cursor was placed.
[Shift] + [+] (Numeric keypad)	Unfolds all the trees.
[Shift] + [-] (Numeric keypad)	Folds all the trees.
[Home]	Moves the cursor to the top row.
[End]	Moves the cursor to the bottom row.
[PageUp]	Moves the cursor up one page.
[PageDown]	Moves the cursor down one page.

Operation	Action
[Shift] + [Home]	Selects the rows from the row where the cursor is positioned to the top row.
[Shift] + [End]	Selects the rows from the row where the cursor is positioned to the bottom row.
[Shift] + [PageUp]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves up one page.
[Shift] + [PageDown]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves down one page.
[Shift] + Click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.
[Ctrl] + [Space]	Selects or deselects a row.
[Ctrl] + Click	
[Tab]	Moves the cursor to the right cell.
[Shift] + [Tab]	Moves the cursor to the left cell.
[Enter]	Moves the cursor downward by one row.
[Alt] + [Enter]	Displays the setting dialog for the figure/object corresponding to the figure/object attribute row where the cursor was placed.
[Ctrl] + [C]	<ul style="list-style-type: none"> <li>• Template attribute row Copies the set value in the cell of [Template Attribute] where the cursor was placed as a character string.</li> <li>• Figure/object attribute row Copies the cell of [Setting Value] where the cursor was placed.</li> </ul>
[Ctrl] + [V]	<ul style="list-style-type: none"> <li>• Template attribute row Pastes a character string in the cell of [Template Attribute] being edited.</li> <li>• Figure/object attribute row Pastes in the cell of [Setting Value] where the cursor was placed.</li> </ul>
[F2]	<p>Enables the cell where the cursor was placed to be edited. The target columns for editing are [Template Attribute] (template attribute rows only) and [Setting Value]. →(2) Operations when a cell is edited</p>
Double-click	<ul style="list-style-type: none"> <li>• Columns of [Template Attribute] (template attribute rows only) and [Setting Value] Enables the cell to be edited.</li> <li>• Any cell other than above Displays the setting dialog for the shape/object having attributes. →(2) Operations when a cell is edited</li> </ul>
Drag	<ul style="list-style-type: none"> <li>• Dragging from [Attribute List] to [Template Attribute List] Registers a dragged attribute into a template attribute.</li> <li>• Dragging from [Template Attribute List] to [Attribute List] Deletes a dragged attribute from a template attribute.</li> </ul>

## (2) Operations when a cell is edited

The following table lists the keyboard operations for editing cells in [Template Attribute List].

Operation	Action
[Enter]	Confirms and ends the edit.
[Esc]	Discards and ends the edit.
[Tab]	Confirms the edit and moves the cursor to the right cell.
[Shift] + [Tab]	Confirms the edit and moves the cursor to the left cell.
[Alt] + [Enter]	Inserts a line feed when text is input.

## 11.7 Managing figures and objects by category

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Figures and objects can be managed by grouping them into categories according to the usage.

The devices and shapes set for figures or objects can be changed by category in a batch.

- 11.7.1 Specifications of the category
- 11.7.2 How to use the category
- 11.7.3 Precautions
- 11.7.4 [Category List] window

## 11.7.1 Specifications of the category

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒ ■ 1 Category type
- 2 Registering into categories
- 3 Operations which can be performed by category

### ■ 1 Category type

GT27 GT25 GT23 GT21 SoftGOT2000 GS

[Switch], [Lamp], and [Other] are provided as default categories.  
Categories can be created by a user.

### ■ 2 Registering into categories

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Each figure and object can be registered to one category.

One figure/object cannot be registered to multiple categories.

When figures and objects are placed on the screen editor, they are registered to the default categories as described below.

- Switch: Registered to [Switch].
- Lamp: Registered to [Lamp].
- Other than the above: Registered to [Other].

### ■ 3 Operations which can be performed by category

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the operations which can be performed on registered figures and objects on a category basis.

- Device batch edit:  
Change devices in a batch.
- Unit No./axis No. batch edit:  
Change unit numbers and axis numbers in a batch.
- Network batch edit:  
Change the network settings in a batch, such as the network number, station number, and CPU number.
- CH No. batch edit:  
Change channel numbers in a batch.
- Color batch edit:  
Change colors in a batch.
- Shape batch edit:  
Change the shapes of touch switches and lamps in a batch.

## 11.7.2 How to use the category

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 Creating categories
- 2 Changing the destination category for registering figures and objects
- 3 Batch changing the settings by category

### ■ 1 Creating categories

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [View] → [Docking Window] → [Category List] from the menu to display the [Category List] window.  
→ 11.7.4 [Category List] window
- Step 2** Right-click any one of the categories and select [New Category] from the menu to display the [Edit Category] dialog.

- Step 3** Set the name of a new category and click the [OK] button.  
Up to 32 characters can be set.

- Step 4** A category is created.

Creating a new category and registering a figure or an object to the category can be performed simultaneously.

- 11.7.2 ■ 2 (2) Changing from the menu
- 11.7.2 ■ 2 (3) Changing in the setting dialog of figure or object

## ■ 2 Changing the destination category for registering figures and objects

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Changing in the [Category List] window
- (2) Changing from the menu
- (3) Changing in the setting dialog of figure or object

### (1) Changing in the [Category List] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select [View] → [Docking Window] → [Category List] from the menu to display the [Category List] window.

→11.7.4 [Category List] window

Figures and objects in a closed screen are not displayed in the [Category List] window.

Open the screen on which the target figure or object for putting into another category has been placed.

→2.5.2 ■ 1 Opening screens

**Step 2** Drag the target figure or object into the destination category. The category is changed.

### (2) Changing from the menu

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select the target figure or object for placing into another category on the screen editor, then select [Edit] → [Add to Category] from the menu, and then select any one of the following categories.

- [Switch]  
Changes the destination category for registration to [Switch].
- [Lamp]  
Changes the destination category for registration to [Lamp].
- [Other]  
Changes the destination category for registration to [Other].
- [User-defined Category]  
Displays the [Add to Category] dialog.  
Change or create a category.  
Proceed to step 2.

**Step 2** Set the destination category for registration for [Category] and click the [OK] button to change the category of the figure or object.

If [None] is selected, the figure or object is not registered to any categories.

If a nonexistent category is set, the category is newly created and the target is registered.

Up to 32 characters can be set.

### (3) Changing in the setting dialog of figure or object

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** On the screen editor, double-click the target figure or object for placing into another category to display the setting dialog.

**Step 2** Set the destination category for registration for [Category] and click the [OK] button to change the category of the figure or object.

If [None] is selected, the figure or object is not registered to any categories.

If a nonexistent category is set, the category is newly created and the target is registered.

Up to 32 characters can be set.

Example) The setting dialog of a bit lamp

### 3 Batch changing the settings by category

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select [View] → [Docking Window] → [Category List] from the menu to display the [Category List] window.  
→ 11.7.4 [Category List] window

**Step 2** Right-click any one of the categories and select the following menus according to the target settings for batch change.

- [Device Batch Edit]: Change devices in a batch.
- [Unit No./Axis No. Batch Edit]: Change unit numbers and axis numbers in a batch.
- [Network Batch Edit]: Change the network settings in a batch, such as the network number, station number, and CPU number.
- [CH No. Batch Edit]: Change channel numbers in a batch.
- [Color Batch Edit]: Change colors in a batch.
- [Shape Batch Edit]: Change the shapes of touch switches and lamps in a batch.

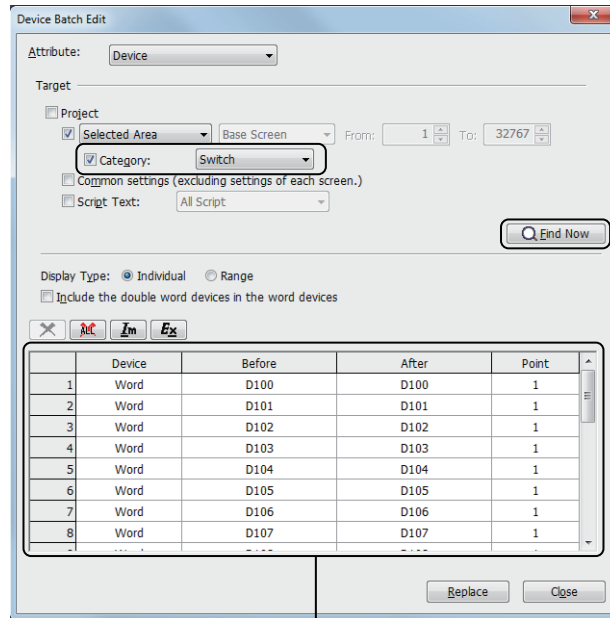

**Step 3** The setting dialog which is corresponding to the selected menu is displayed.

For the description of each setting dialog, refer to the following.

- 11.8.4 ■ 3 [Device Batch Edit] dialog
- 11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog
- 11.8.4 ■ 5 [Network Batch Edit] dialog
- 11.8.4 ■ 6 [CH No. Batch Edit] dialog
- 11.8.4 ■ 7 [Color Batch Edit] dialog
- 11.8.4 ■ 8 [Shape Batch Edit] dialog

**Step 4** Select the search target in [Category] and click the [Find Now] button to display the settings for which batch change is enabled.

Example) [Device Batch Edit] dialog

Settings for which batch change is enabled

**Step 5** Change the settings in [After] and click the [Replace] button to apply the settings collectively.

### 11.7.3 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■ 1 Project for which project security is set

If a login user does not have access to edit projects, the user cannot create or change any categories.

#### ■ 2 Precautions for batch change

##### (1) Figures and objects not displayed in the [Category List] window

Figures and objects in a closed screen are not displayed in the [Category List] window.

However, figures and objects that have been registered in categories are identified as the targets for batch change even if the figures and objects are not displayed in the [Category List] window.

##### (2) Other precautions

⇒ 11.8.4 ■ 2 Precautions

### 11.7.4 [Category List] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) Category list

Lists the categories in the project.

[Switch], [Lamp], and [Other] are default categories.

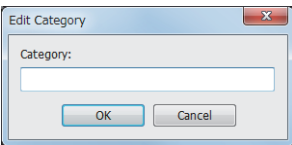

Registered figures and objects in each category are displayed in a tree view.

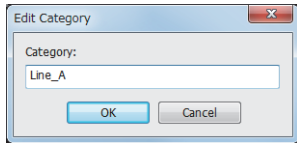

A category of figures and objects can be changed by dragging them to another category.

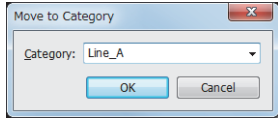

Right-click a category, a figure, or an object to display a menu for operating a category.

#### 2) Right-click menu of category

Item	Description
[New Category]	<p>Displays the [Edit Category] dialog. Create a new category.</p>  <p>• <b>Category I</b> Set a category's name. Up to 32 characters can be set.</p>

Item	Description
[Rename Category]	<p>Displays the [Edit Category] dialog. Change the name of the right-clicked category. The names of [Switch], [Lamp], [Other] cannot be changed.</p>  <p>• <b>Category I</b> Set a category's name. Up to 32 characters can be set.</p>
[Delete Category]	<p>Deletes the right-clicked category. The registered figures, objects are deleted from the category. [Switch], [Lamp], [Other] cannot be deleted.</p>
[Device Batch Edit]	<p>Displays the [Device Batch Edit] dialog. Change devices in a batch. →11.8.4 ■ 3 [Device Batch Edit] dialog</p>
[Unit No./Axis No. Batch Edit]	<p>Displays the [Unit No./Axis No. Batch Edit] dialog. Change unit numbers and axis numbers in a batch. →11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog</p>
[Network Batch Edit]	<p>Displays the [Network Batch Edit] dialog. Change the network settings in a batch, such as the network number, station number, and CPU number. →11.8.4 ■ 5 [Network Batch Edit] dialog</p>
[CH No. Batch Edit]	<p>Displays the [CH No. Batch Edit] dialog. Change channel numbers in a batch. →11.8.4 ■ 6 [CH No. Batch Edit] dialog</p>
[Color Batch Edit]	<p>Displays the [Color Batch Edit] dialog. Change colors in a batch. →11.8.4 ■ 7 [Color Batch Edit] dialog</p>
[Shape Batch Edit]	<p>Displays the [Shape Batch Edit] dialog. Change the shapes of touch switches and lamps in a batch. →11.8.4 ■ 8 [Shape Batch Edit] dialog</p>

### 3) Right-click menu of a figure or an object

Item	Description
[Move]	<p>Displays the [Move to Category] window. Change the destination category for registration of the right-clicked figure or object.</p>  <p>• <b>Category I</b> Change the destination category for registration. If [None] is selected, the figure or object is not registered to any categories. If a nonexistent category is set, the category is newly created and the target is registered. Up to 32 characters can be set.</p>
[Remove]	<p>Deletes the right-clicked figure or object from the category.</p>
[Open Editing Screen]	<p>Selects the right-clicked figure or object on the screen editor.</p>

## 11.8 Searching for and Editing Settings of Projects

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 11.8.1 Searching for a device (Device search)
- 11.8.2 Listing devices (Device list)
- 11.8.3 Listing strings (Text list)
- 11.8.4 Changing the set values in a batch (Batch Edit)
- 11.8.5 Searching for and editing a specific setting (Data Browser)

### 11.8.1 Searching for a device (Device search)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Search the current project for devices, labels, or tags.

You can perform a keyword search, identify which functions use the found devices, and change the related settings.

- ■ 1 How to use the device search
  - 2 Precautions for the device search
  - 3 [Device Search] window

#### ■ 1 How to use the device search

- (1) Searching the project for matching devices
- (2) Changing or deleting the settings related to a found device

##### (1) Searching the project for matching devices

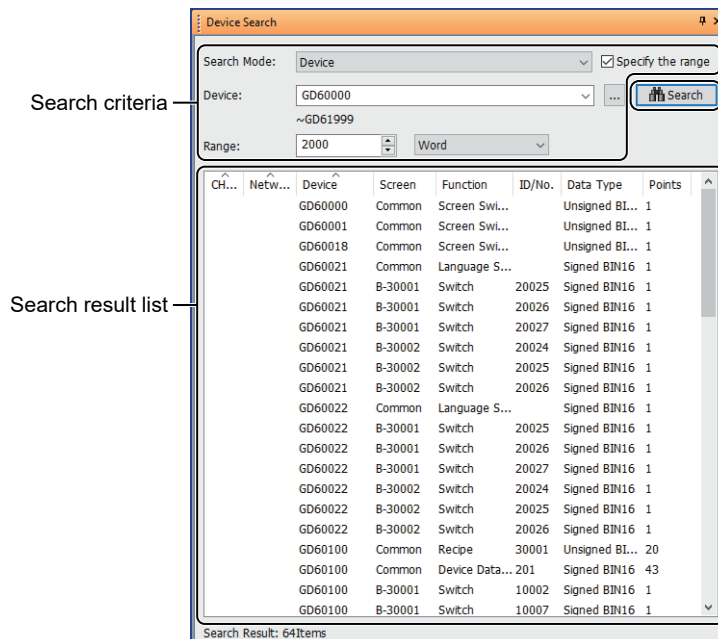

**Step 1** Perform one of the following operations to display the [Device Search] window.

- Press the [Ctrl] + [F] key combination.
- Select [Search/Replace] → [Device Search] from the menu.
- Select [View] → [Docking Window] → [Device Search] from the menu.
- Click the [Device Search] button on the toolbar.
- Select [Device Search] from the right-click context menu.

→ ■ 3 [Device Search] window

**Step 2** Set the search criteria and click the [Search] button to display the found devices, labels, or tags in the search result list.

When [Search Mode] is set to [Keyword (Label/Tag)], [Keyword (Label)], or [Keyword (Device)], if [Keyword] is left blank, clicking the [Search] button lists all the devices, labels, or tags used in the project.

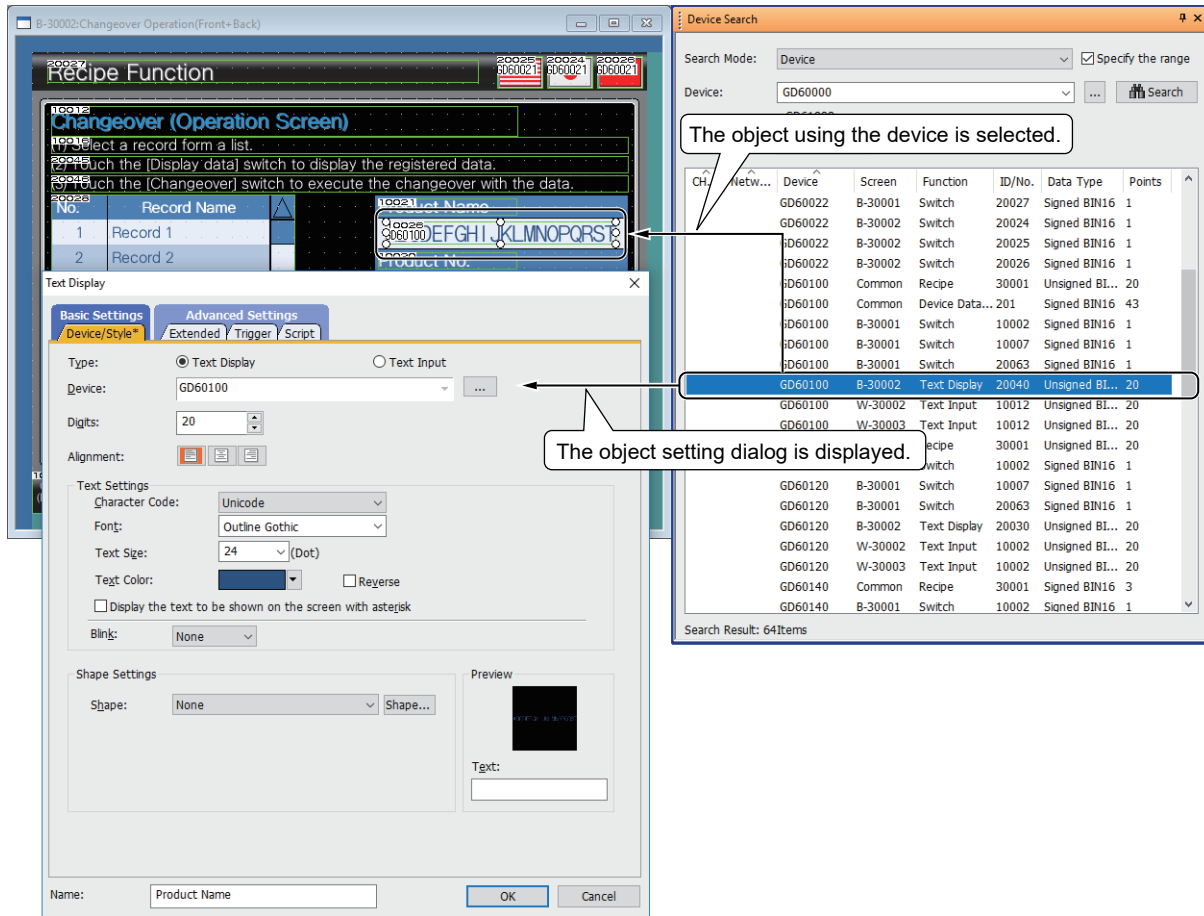

## (2) Changing or deleting the settings related to a found device

**Step 1** Search for devices in the [Device Search] window.

→ (1) Searching the project for matching devices

**Step 2** Double-click a found device in the search result list to display the setting dialog for the figure, object, or common setting where the device is specified.

Change or delete settings as necessary.

**Step 3** Click the [Search] button again to apply setting changes to the search result list.

## ■ 2 Precautions for the device search

### (1) Unsupported devices

The following devices are not listed in the [Device Search] window.

- Devices used for the display-prohibited screens or scripts in a project protected with the project security
- Devices used for the MES interface function
- Devices assigned to script symbols

### (2) Searching for the devices of non-Mitsubishi Electric equipment

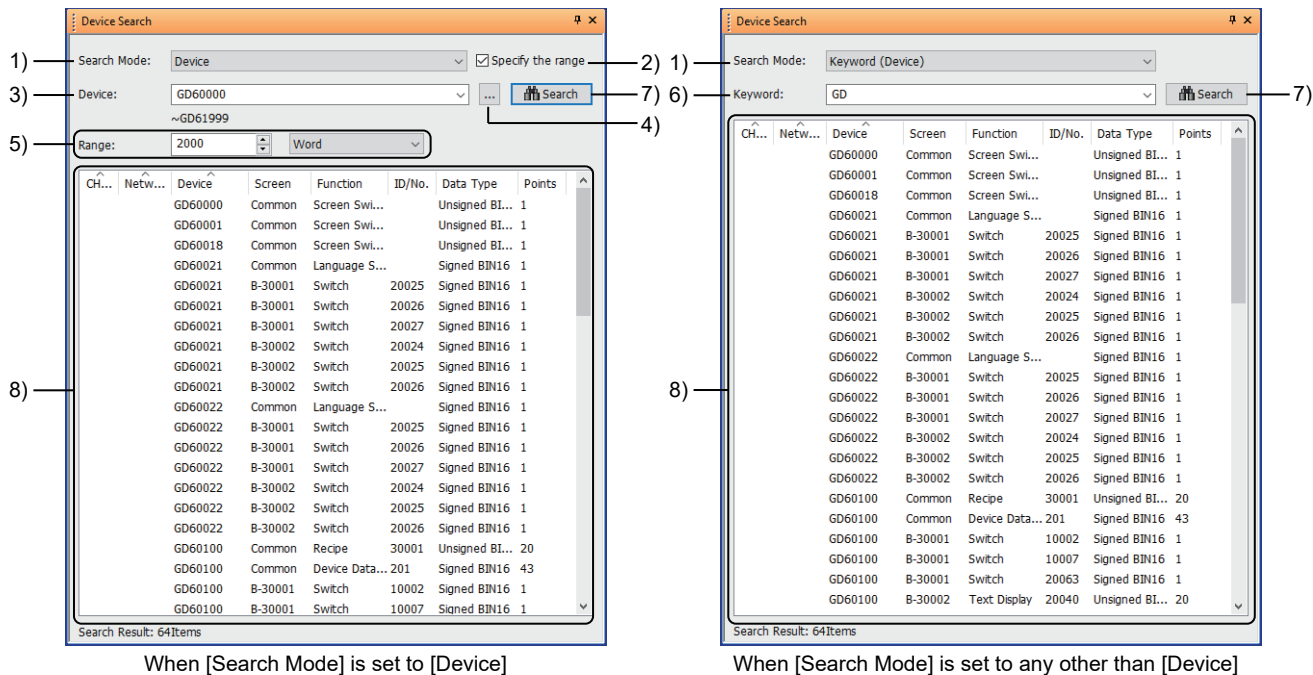

Among the devices of non-Mitsubishi Electric equipment, some bit devices and word devices are used for the same purpose, but have different device names.

When [Search Mode] is set to [Device], the search result list will display the specified device and other devices that are used for the same purpose as the specified device.

To find the specified device only, select [Keyword (Device)] for [Search Mode].

### ■ 3 [Device Search] window

#### 1) [Search Mode]

Select a search mode.

The following shows selectable items.

- [Device]  
Searches for the device that matches the specified device, channel number, and network setting.  
If one of consecutive devices is specified, the start device of the consecutive devices is searched for.
- [Keyword (Label/Tag)] (for GT27, GT25, GT23, and GT21 (excluding GT2105-Q))  
Searches for labels and tags containing the specified keyword.
- [Keyword (Label)] (for GT2105-Q and GT SoftGOT2000)  
Searches for labels containing the specified keyword.
- [Keyword (Device)]  
Searches for devices containing the specified keyword.

#### 2) [Specify the range]

This item appears when [Search Mode] is set to [Device].

Enables the setting to specify the scope of a search.

#### 3) [Device]

This item appears when [Search Mode] is set to [Device].

Specify a device, channel number, and network setting.

If you specify no channel number and network setting, channel No. 1 and 0-FF (host station) are assumed.

The search result list will display the device matching the specified conditions or the start device of consecutive devices containing the matching device.

The device, channel number, and network setting are settable in the [Setting] dialog alternatively.

#### 4) [...] button

This item appears when [Search Mode] is set to [Device].

Displays the [Setting] dialog.

Specify a device, channel number, and network setting.

If you specify no channel number and network setting, channel No. 1 and 0-FF (host station) are assumed.

- [Device Type]  
Select the data type of a device.  
The following shows selectable items.

- [Bit]
- [Word]
- [Double Word]
- [Device]

Specify a device, channel number, and network setting.  
→6.1.1 How to set devices

### 5) [Range]

This item appears when [Specify the range] is selected.  
Specify the number of devices and the device type.

The consecutive devices starting from the specified device are searched for.  
The maximum number of devices varies depending on the device name.  
The following shows selectable device types.

- [Bit]
- [Word]
- [Double Word]

### 6) [Keyword]

This item appears when [Search Mode] is set to [Keyword (Label/Tag)], [Keyword (Label)], or [Keyword (Device)].  
Specify a search keyword.  
The labels, tags, or devices containing the specified keyword will be listed in the search result list.  
To specify multiple keywords, enter a one-byte space between them.

### 7) [Search] button

Performs a search.  
The hits will be listed in the search result list.  
If two or more objects and figures are selected on the screen editor, the devices, labels, or tags specified for the objects and figures will be searched.  
In this case, the title bar of the window displays [selected range].

### 8) Search result list

Lists the search results.  
Right-click the column header of the list to select columns to be displayed.

Column	Description
[Label/Tag], [Label]	Labels or tags that contain the string specified with [Keyword]
[Device]	<ul style="list-style-type: none"> <li>• When [Search Mode] is set to [Device] Device matching the specified device, channel number and network setting, or the start device of consecutive devices containing the matching device</li> <li>• When [Search Mode] is set to [Keyword (Label/Tag)] or [Keyword (Label)] Devices assigned to the found labels or tags</li> <li>• When [Search Mode] is set to [Keyword (Device)] Devices that contain the string specified with [Keyword]</li> </ul>
[CH No.]	Channel numbers specified for the devices listed
[Network]	<p>Network numbers, station numbers, and CPU numbers that are specified for the devices listed Example) When network No. 1, station No. 2, and CPU No. 3 are set</p>
[Screen]	<p>Locations where the devices listed are set "n" represents a screen number.</p> <ul style="list-style-type: none"> <li>• [Common]: Common setting</li> <li>• [B-n]: Base screen</li> <li>• [W-n]: Window screen</li> <li>• [R-n]: Report screen</li> <li>• [M-n]: Mobile screen</li> </ul>
[Function]	Functions that use the devices listed
[ID/No.]	Object IDs of the objects where the devices listed are set, or setting numbers of the functions where the devices listed are set
[Data Type]	Data types of the devices listed

Column	Description
[Points]	Number of consecutive devices

## (1) Mouse and keyboard operations

The following shows the mouse and keyboard operations for the search result list in the [Device Search] window.

Operation	Description
Arrow (up or down)	Move the cursor.
[Enter]	Move the cursor down one row.
[Home] [Ctrl] + Arrow (up)	Move the cursor to the top row.
[End] [Ctrl] + Arrow (down)	Move the cursor to the bottom row.
[PageUp]	Move the cursor up one page.
[PageDown]	Move the cursor down one page.
Click	Select the figure or object where the selected device is set, on the screen editor.
Double click	Open the setting dialog for the figure, object, or common setting where the selected device is set.

### 11.8.2 Listing devices (Device list)

The devices and labels used in the project are displayed in a list.

You can narrow the targets displayed in the list, jump to the location where a selected device is used, and export the device list.

- ■ 1 How to use the device list
  - 2 Precautions
  - 3 [Device List] window
  - 4 Details of the exported file

#### ■ 1 How to use the device list

- (1) Listing the devices used in the project
- (2) Searching for a device or jumping to the location where a selected device is used
- (3) Exporting the device list

#### (1) Listing the devices used in the project

**Step 1** Select [Search/Replace] → [Device List] from the menu then select either of the following items to display the [Device List] window.

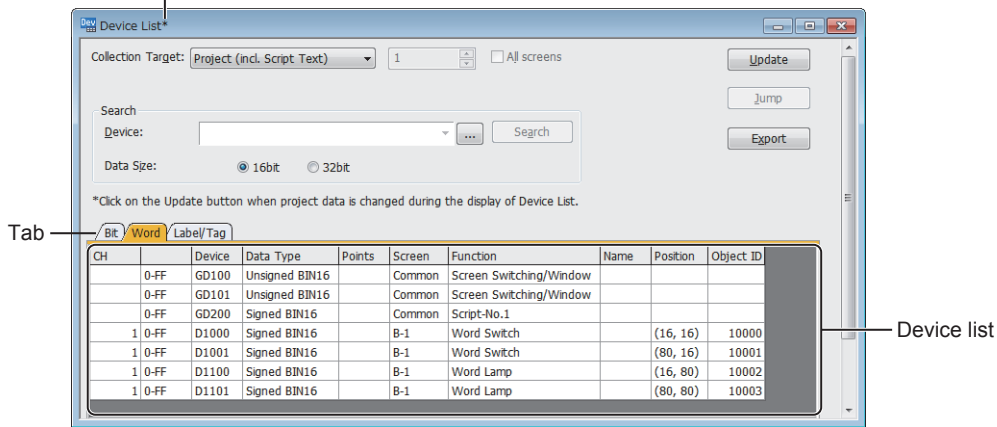

→ 11.8.2 ■ 3 [Device List] window

- [Screen]:  
Displays the [Device List] window and sets the currently selected screen editor as the target for collecting devices.
- [Project]:  
Displays the [Device List] window and sets the whole project (including script texts) as the target for collecting devices.
- [Script Text]:  
Displays the [Device List] window and sets all script texts as the target for collecting devices.

**Step 2** After selecting any item for [Collection Target], click the [Update] button to update the device list.

To switch the display of bit devices, word devices, labels, and others, switch the tabs.

[\*] indicates that the device list being displayed is not in the latest condition.

Even though any device setting is changed while the [Device List] window is displayed, the device list is not automatically updated.

If the device list being displayed is not in the latest condition, [\*] is displayed in the title bar.

Click the [Update] button to update the list.

**Point**

**Cross reference function for MELSOFT Navigator (iQ Works only)**

To search a system label used for another project in a workspace, use the cross reference function for MELSOFT Navigator.

⇒ Help on MELSOFT Navigator

**(2) Searching for a device or jumping to the location where a selected device is used**

**Step 1** Display the [Device List] window.

⇒(1) Listing the devices used in the project

**Step 2** Select a target in which the device you search for is included for [Collection Target] and click the [Update] button.

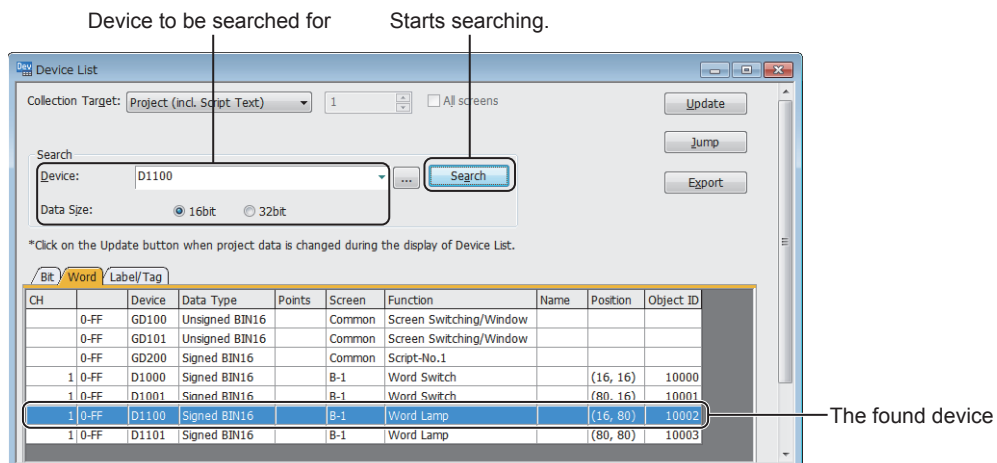

**Step 3** Switch the following tabs according to the target you search for.

- [Bit] tab: Displays bit devices.
- [Word] tab: Displays word devices.
- [Label/Tag] tab ([Label] tab for GT2105-Q and GT SoftGOT2000): Displays labels or tags.

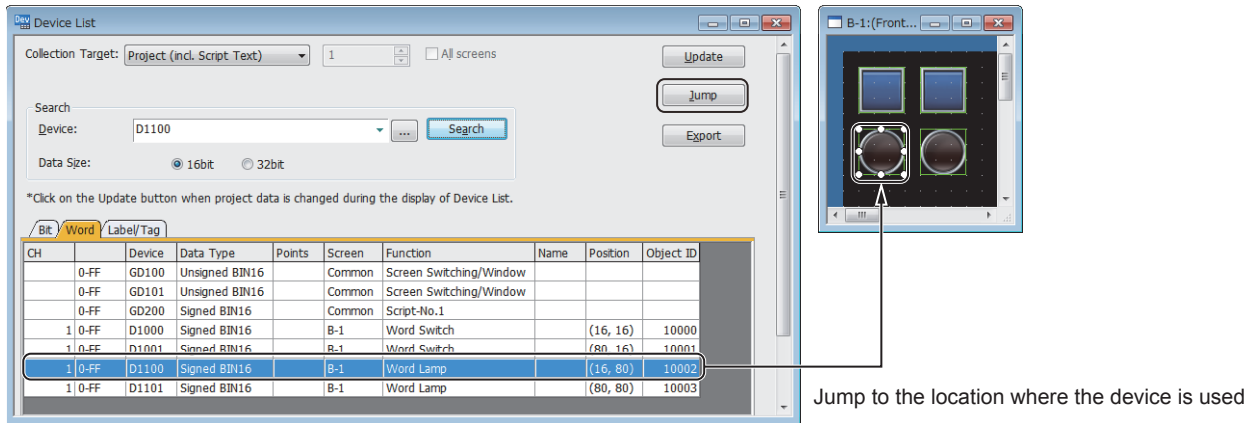

**Step 4** Set a device or label you search for and click the [Search] button.

- [Bit] tab: Set [Device].
- [Word] tab: Set [Device] and [Data Size].
- [Label/Tag] tab ([Label] tab for GT2105-Q and GT SoftGOT2000): Set [Label/Tag Name].

**Step 5** The corresponding device is selected in the device list.

- Step 6** If you select a device in the device list and click the [Jump] button, a figure or an object for which the selected device is used is selected on the screen editor.
- If any device which has been used for something other than figures and objects is selected, the [Jump] button is disabled.

### (3) Exporting the device list

- Step 1** Display the [Device List] window.
- (1) Listing the devices used in the project
- Step 2** Click the [Export] button to display the [Save As] dialog.
- Step 3** Set [File name] and [Save as type] and click the [Save] button to export the device list.
- ■ 4 Details of the exported file

### ■ 2 Precautions

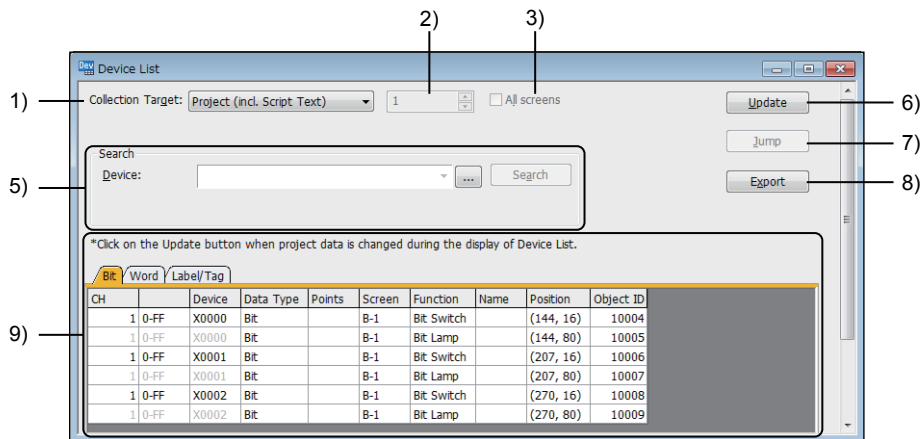

#### (1) Project for which project security is set

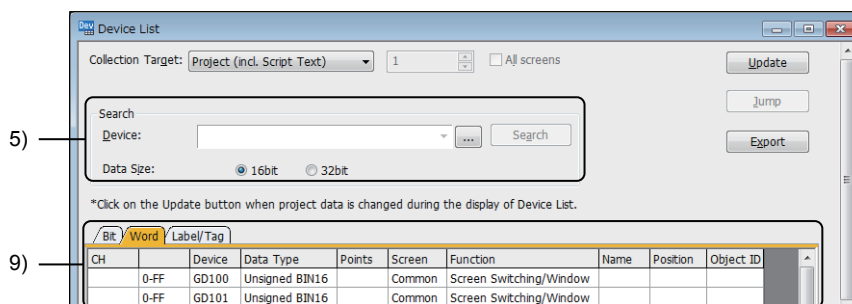

The devices used for display-disabled screens or scripts are not displayed in the [Device List] window.

### ■ 3 [Device List] window

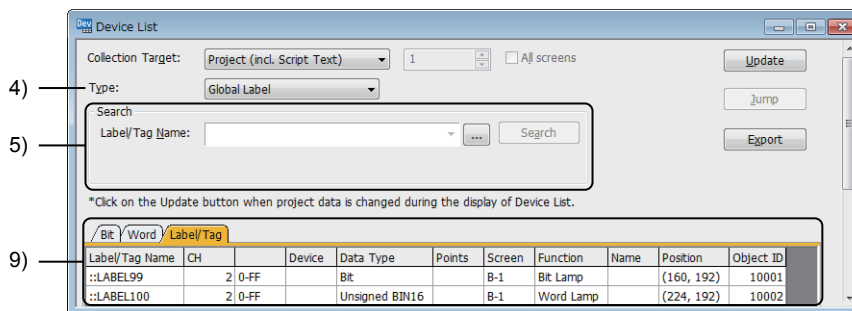

GT27 GT25 GT23 GT21 SoftGOT2000 GS

When the [Bit] tab is selected

When the [Word] tab is selected

When the [Label/Tag] tab is selected

#### 1) [Collection Target]

Select a target to be displayed in the device list.

After changing any device setting, click the [Update] button to update the device list.

The following shows selectable items.

- [Project (incl. Script Text)]
- [Project (excl. Script Text)]
- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen] (GT27 and GT25)
- [All Script Text]
- [Script List]
- [Project/Screen Script Text]
- [Object Script Text] (Not supported by GT21)
- [Script Parts Script Text]

#### 2) Target screen number

When [Base Screen], [Window Screen], [Report Screen], or [Mobile Screen] is selected for [Collection Target], set the

screen number to be searched for.

The following shows the setting range.

- [Base Screen], [Window Screen], or [Mobile Screen]: [0] to [32767]
- [Report Screen]: [1] to [32]

### 3) [All screens]

When [Base Screen], [Window Screen], [Report Screen], or [Mobile Screen] is selected for [Collection Target], all the screens of the selected screen type are targeted for collection.

If you check this item, the target screen number is disabled.

### 4) [Type] ([Label Type] for GT2105-Q and GT SoftGOT2000)

Select the type of the labels or tags displayed in the device list.

The following shows selectable items.

- [All]
- [System Label]
- [Label (GT Designer3)]
- [Global Label] (Not available to GT21)
- [OMRON NJ/NX Tag]
- [AB Native Tag]

### 5) [Search]

Set search conditions.

Item	Description
[Device]	Set a device you search for.
[Data Bit]	This item is displayed when the [Word] tab is selected. Set a data size of the device you search for. The following shows selectable items. <ul style="list-style-type: none"> <li>• [16bit]</li> <li>• [32bit]</li> </ul>
[Label/Tag Name] ([Label Name] for GT2105-Q and GT SoftGOT2000)	This item is displayed when the [Label/Tag] tab or the [Label] tab is selected. Set the label name or tag name you search for.
[...] button	Displays the device setting dialog when the [Bit] tab or the [Word] tab is selected. When the [Label/Tag] tab or the [Label] tab is selected, the dialog to appear varies with the selection for [Type] as shown below. <ul style="list-style-type: none"> <li>• When [System Label] is selected for [Type], the [Import System Labels to Project] appears. <ul style="list-style-type: none"> <li>→6.1.2 ■ 3 System label setting</li> </ul> </li> <li>• When [Label (GT Designer3)] is selected for [Type], the [Select Label (GT Designer3)] dialog appears. <ul style="list-style-type: none"> <li>→6.1.4 ■ 9 [Select Label (GT Designer3)] dialog</li> </ul> </li> <li>• When [Global Label] is selected for [Type], the [Select Global Label] dialog appears. <ul style="list-style-type: none"> <li>→6.1.3 ■ 7 [Select Global Label] dialog</li> </ul> </li> <li>• When [OMRON NJ/NX Tag] is selected for [Type], the [Select OMRON NJ/NX Tag] dialog appears. <ul style="list-style-type: none"> <li>→6.1.6 ■ 8 [Select OMRON NJ/NX Tag] dialog</li> </ul> </li> </ul>
[Search] button	Starts searching.

### 6) [Update] button

Updates the device list.

If the device list being displayed is not in the latest condition, [\*] is displayed in the title bar of the [Device List] window.

### 7) [Jump] button

Displays a figure or object for which the device selected in the device list is used.

If any device which is used for something other than figures and objects is selected, the [Jump] button is disabled.

### 8) [Export] button

Saves the device list as a CSV file or Unicode text file.

Set [File name] and [Save as type] in the displayed dialog and click the [Save] button.

→ ■ 4 Details of the exported file

### 9) Device list

The list of the devices used in the project.

Each tab displays different contents.

Switch the following tabs according to the contents to be checked.

- [Bit] tab: Displays the list of bit devices.
- [Word] tab: Displays the list of word devices.
- [Label/Tag] tab ([Label] tab for GT2105-Q and GT SoftGOT2000): Displays the list of labels or tags.

Dragging each column enables changing the width of column.

Item	Description										
[Label/Tag Name] ([Label Name] for GT2105-Q and GT SoftGOT2000)	This item is displayed on the [Label/Tag] tab or the [Label] tab. Label names or tag names										
[CH], network No., station number, CPU No.	Channel Nos., network Nos., station numbers, and CPU Nos. Example) For the device with the channel No. 2, network No. 1, station number 2, and CPU No. 3 <div style="text-align: center; border: 1px solid black; padding: 5px; margin: 10px auto; width: fit-content;"> <table border="1"> <thead> <tr> <th>CH</th> <th>Network No.</th> <th>Station</th> <th>CPU No.</th> <th>Device</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>1</td> <td>2/3</td> <td>X0000</td> <td></td> </tr> </tbody> </table> </div> <p>If the same device is consecutively displayed, the text color of the second row and later rows is gray.</p>	CH	Network No.	Station	CPU No.	Device	2	1	2/3	X0000	
CH	Network No.	Station	CPU No.	Device							
2	1	2/3	X0000								
[Device]	Devices If the same device is consecutively displayed, the text color of the second row and later rows is gray.										
[Data Type]	Data type of the devices										
[Points]	Number of devices which are consecutively set										
[Screen]	Screens for which the devices are used <ul style="list-style-type: none"> <li>[Common]: Common setting</li> <li>[B-n]: Base screen ("n" indicates the screen number.)</li> <li>[W-n]: Window screen ("n" indicates the screen number.)</li> <li>[R-n]: Report screen ("n" indicates the screen number.)</li> <li>[M-n]: Mobile screen ("n" indicates the screen number.)</li> </ul>										
[Function]	Function names for which the devices are used										
[Name]	Names of figures and objects										
[Position]	Coordinates where the figures and objects are placed										
[Object ID]	Object IDs of the figures and objects

## 11.8.3 Listing strings (Text list)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The strings used in the current project are listed.

You can narrow the targets displayed in the list and jump to the location where a selected text is used.

- ⇒ ■ 1 How to use the text list
  - 2 Precautions
  - 3 [Text List] window

### ■ 1 How to use the text list

GT27 GT25 GT23 GT21 SoftGOT2000 GS

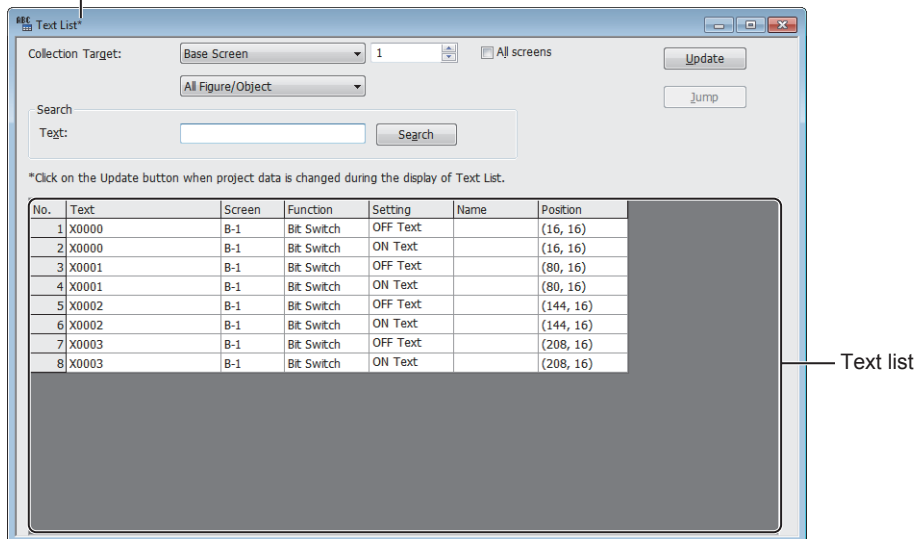

- ⇒ (1) Listing the strings used in the project
- (2) Searching for a text or jumping to the location where a selected text is used

#### (1) Listing the strings used in the project

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Search/Replace] → [Text List] from the menu to display the [Text List] window.
  - ⇒ 11.8.3 ■ 3 [Text List] window
- Step 2** After selecting any item for [Collection Target], click the [Update] button to update the text list.

[\*] indicates that the text list being displayed is not in the latest condition.

Even though any text setting is changed while the [Text List] window is displayed, the text list is not automatically updated.

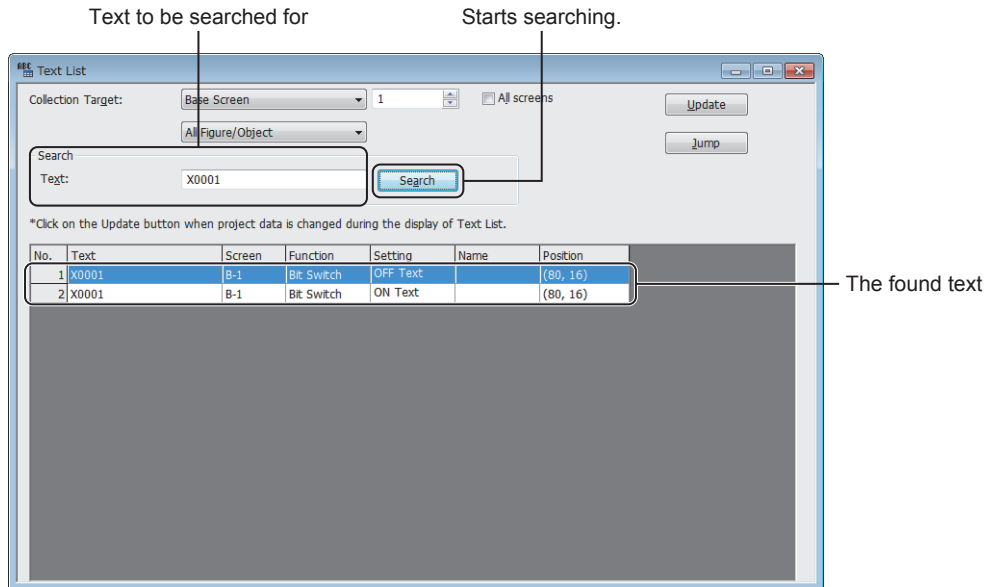

If the text list being displayed is not in the latest condition, [\*] is displayed in the title bar.

Click the [Update] button to update the list.

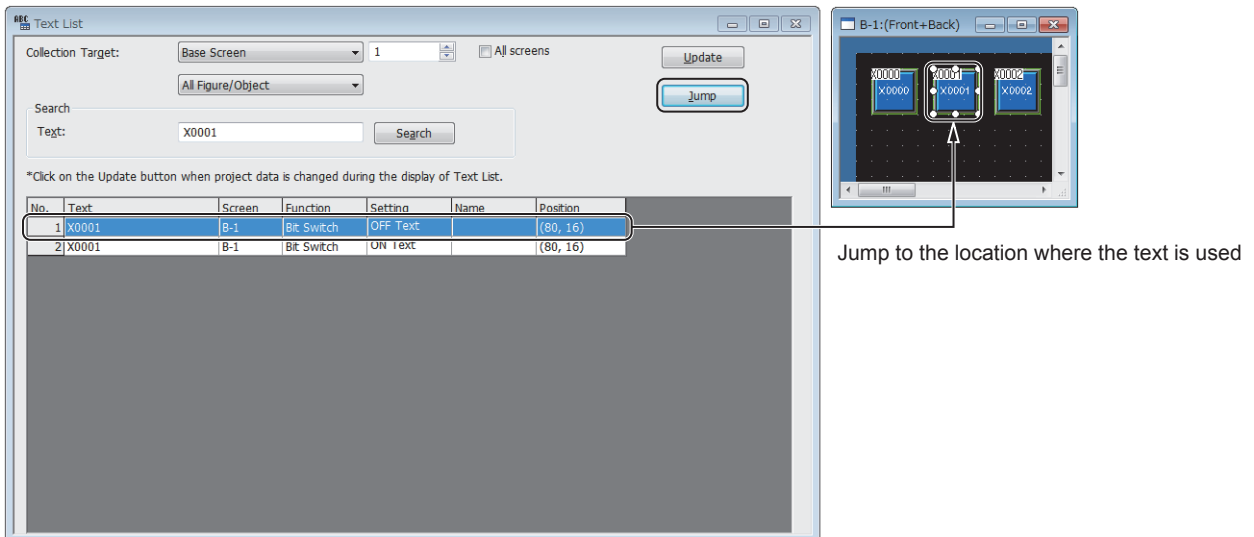

#### (2) Searching for a text or jumping to the location where a selected text is used

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Display the [Text List] window.
  - ⇒ (1) Listing the strings used in the project
- Step 2** Select a target in which the text you search for is included for [Collection Target] and click the [Update] button.
- Step 3** Set the text you search for in [Text] and click the [Search] button.
- Step 4** The corresponding text is displayed in the text list.

**Step 5** If you select a text in the text list and click the [Jump] button, a figure or an object for which the selected text is used is used on the screen editor.  
If any text which is used for something other than figures and objects is selected, the [Jump] button is disabled.

## ■2 Precautions

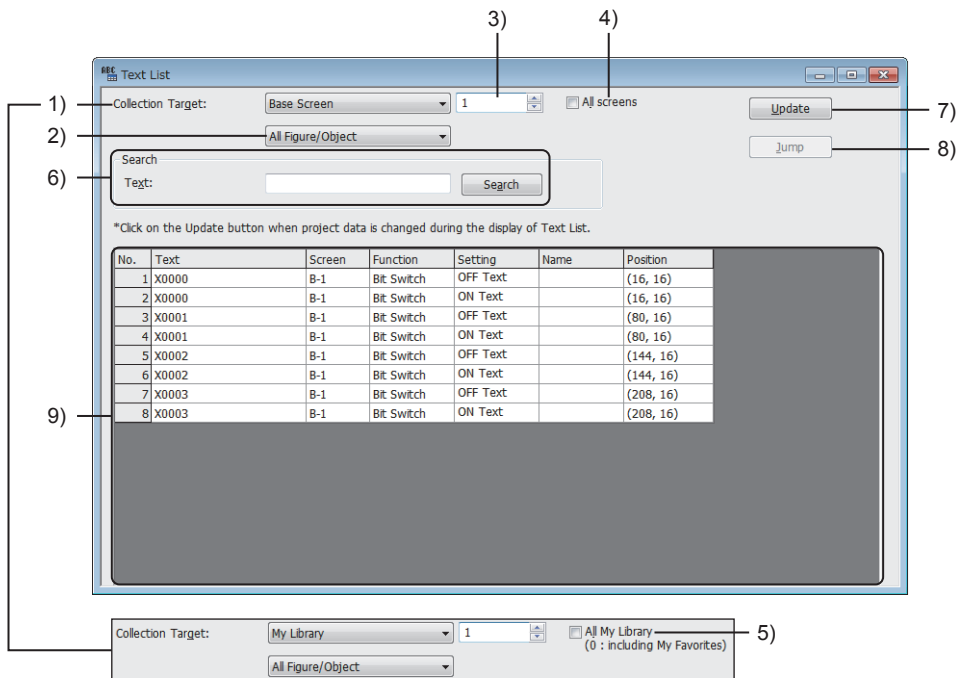

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### (1) Project for which project security is set

The text used for display-disabled screens is not displayed in the [Text List] window.

### ■ 3 [Text List] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Collection Target]

Select a target to be displayed in the text list.

After changing any text setting, click the [Update] button to update the text list.

The following shows selectable items.

- [Project]
- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen] (GT27 and GT25)
- [Parts]
- [My Library]

#### 2) Additional condition

Select an additional condition to narrow the collection target.

The following shows selectable items.

- [All Figure/Object]
- [Text Figure]
- [Logo Text Figure]
- [Switch]
- [Lamp]
- [Bit Comment]
- [Panelmeter]
- [Graphical Meter](GT27, GT25, GT23, GT SoftGOT2000)
- [Hyperlink](GT27, GT25)

#### 3) Target number

Depending on the selection for [Collection Target], the setting item differs.

- [Base Screen], [Window Screen], [Report Screen], and [Mobile Screen]

Set a screen number as the collection target.

The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767].

The setting range of [Report Screen] is [1] to [32].

- [Parts]

Set a parts number as the collection target.

The setting range is [1] to [32767].

- [My Library]  
Set a library folder number as the collection target.  
The setting range is [0] to [512].

#### 4) [All screens]

Depending on the selection for [Collection Target], the setting item differs.  
If you check this item, the target number is disabled.

- [Base Screen], [Window Screen], [Report Screen], and [Mobile Screen]  
Sets all screens with the screen type selected in [Collection Target] as the collection target.
- [Parts]  
Sets all parts as the collection target.

#### 5) [All My Library]

Sets all library folders as the collection target.

#### 6) [Search]

Set search conditions.

Item	Description
[Text]	Set a text you search for.
[Search] button	Starts searching.

#### 7) [Update] button

Updates the text list.

If the text list being displayed is not in the latest condition, [\*] is displayed in the title bar of the [Text List] window.

#### 8) [Jump] button

Displays the location where the text selected in the text list is used.

#### 9) Text list

The list of the texts used in the project.

Dragging each column enables changing the width of column.

Item	Description
[Text]	Texts.
[Screen]	The screens for which the texts are used. <ul style="list-style-type: none"><li>• [B-n]: Base screen ("n" indicates the screen number.)</li><li>• [W-n]: Window screen ("n" indicates the screen number.)</li><li>• [R-n]: Report screen ("n" indicates the screen number.)</li><li>• [M-n]: Mobile screen ("n" indicates the screen number.)</li><li>• [P-n]: Part ("n" indicates the parts number.)</li><li>• [L x n], [L x-y n]: Folder of the my library ("x" indicates the folder number which is one level lower than My Library. "y" indicates the folder number which is two levels lower than My Library. "n" indicates the data number.)</li></ul>
[Function]	Function names for which the texts are used
[Setting]	Settings for which the texts are used
[Name]	Names which are set for the figures and objects
[Position]	Coordinates where the figures and objects are placed

## 11.8.4 Changing the set values in a batch (Batch Edit)

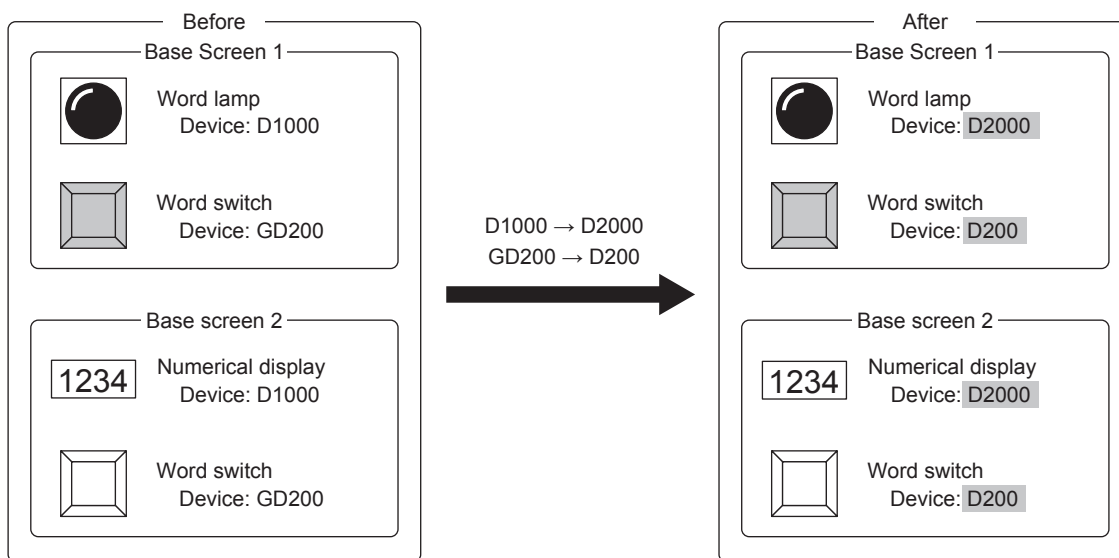

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The settings including the device settings and the figure settings can be changed in a batch. The following shows the settings which can be changed in a batch.

- Device, label, OMRON NJ/NX tag, or AB native tag
- Unit No. and axis No.
- Network setting (Network No., station number, and CPU No.)
- Channel No.
- Color of a figure or object
- Shape of a touch switch or lamp

The settings of different figures and objects can be changed in a batch.

Example) Changing devices in a batch

- ■ 1 How to use the Batch Edit
- 2 Precautions
- 3 [Device Batch Edit] dialog
- 4 [Unit No./Axis No. Batch Edit] dialog
- 5 [Network Batch Edit] dialog
- 6 [CH No. Batch Edit] dialog
- 7 [Color Batch Edit] dialog
- 8 [Shape Batch Edit] dialog

### ■ 1 How to use the Batch Edit

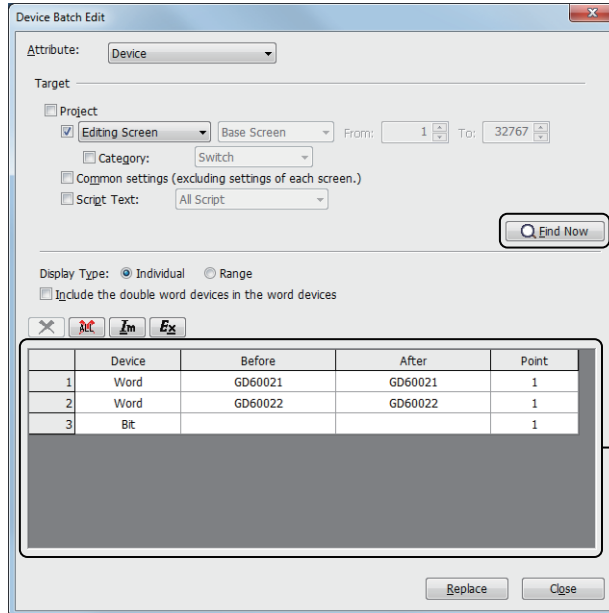

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Changing devices in a batch
- (2) Changing unit numbers and axis numbers in a batch
- (3) Changing the network settings in a batch
- (4) Changing channel numbers in a batch
- (5) Changing the colors of figures and objects in a batch
- (6) Changing the shapes of touch switches and lamps in a batch

## (1) Changing devices in a batch

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Search/Replace] → [Batch Edit] → [Device] from the menu to display the [Device Batch Edit] dialog.  
If you have selected figures and objects on the screen editor before selecting the menu, the [Device Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.  
→ 11.8.4 ■ 3 [Device Batch Edit] dialog
- Step 2** Set [Target] and [Display Type] and click the [Find Now] button to list search results.

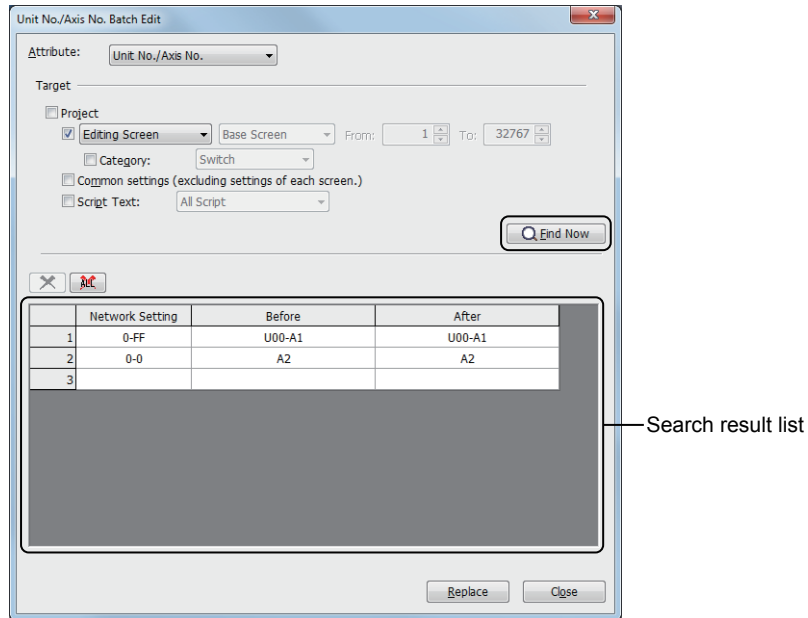

- Step 3** In the search result list, double-click a cell in the [After] column, and set a new value.  
→ 6.1.1 How to set devices
- Step 4** Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

## (2) Changing unit numbers and axis numbers in a batch

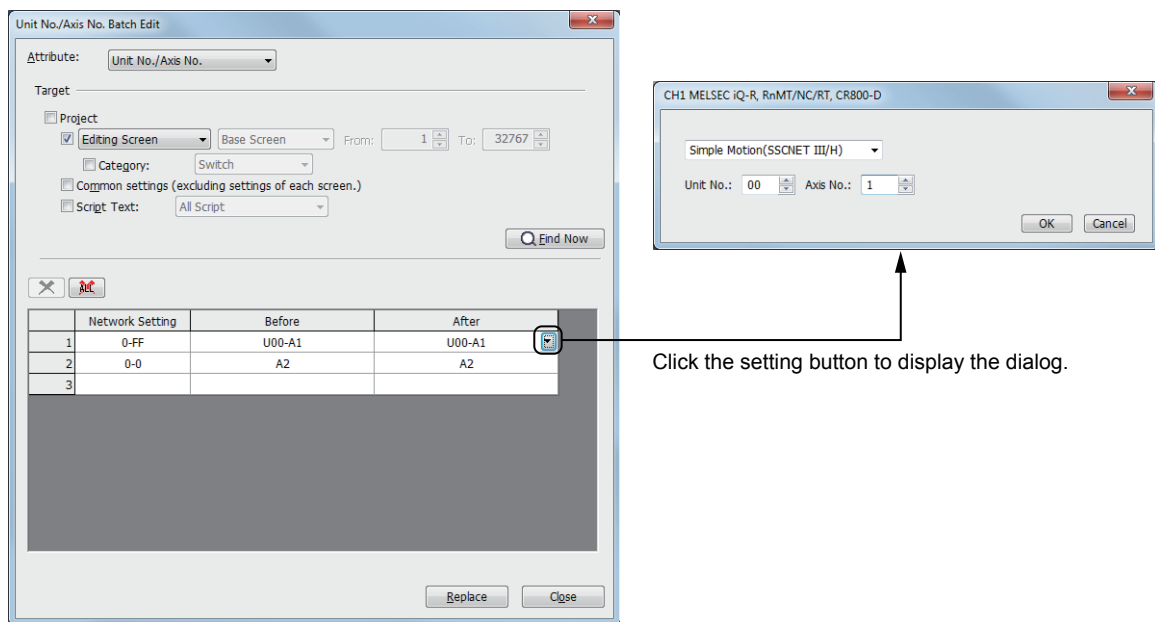

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Search/Replace] → [Batch Edit] → [Unit No./Axis No.] from the menu to display the [Unit No./Axis No. Batch Edit] dialog.  
If you have selected figures and objects on the screen editor before selecting the menu, the [Unit No./Axis No. Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.  
→ 11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog
- Step 2** Set [Target] and click the [Find Now] button to display the found settings in the search result list.

**Step 3** In the search result list, click a cell in the [After] column to display the setting button.

**Step 4** Click the setting button to display the unit No./axis No. setting dialog.  
Set a value to be applied after the batch edit, and click the [OK] button.

Click the setting button to display the dialog.

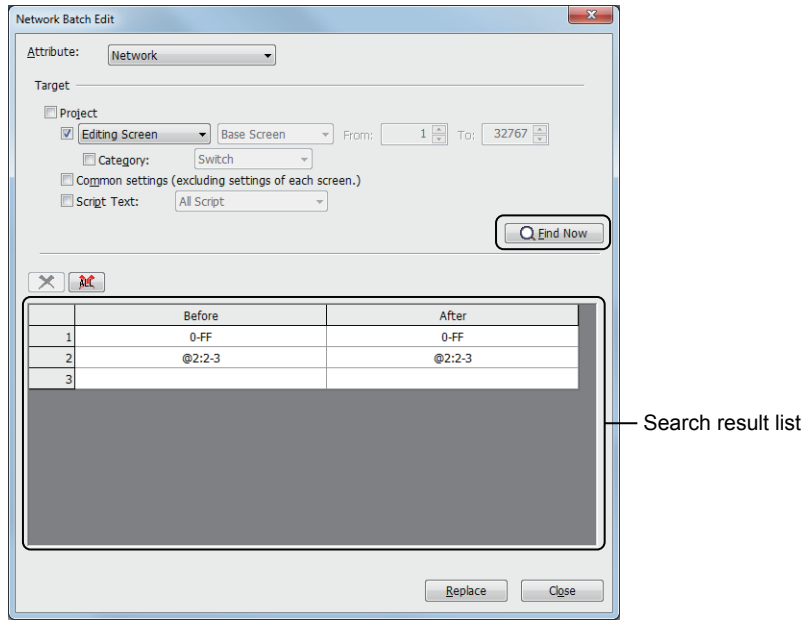

**Step 5** Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

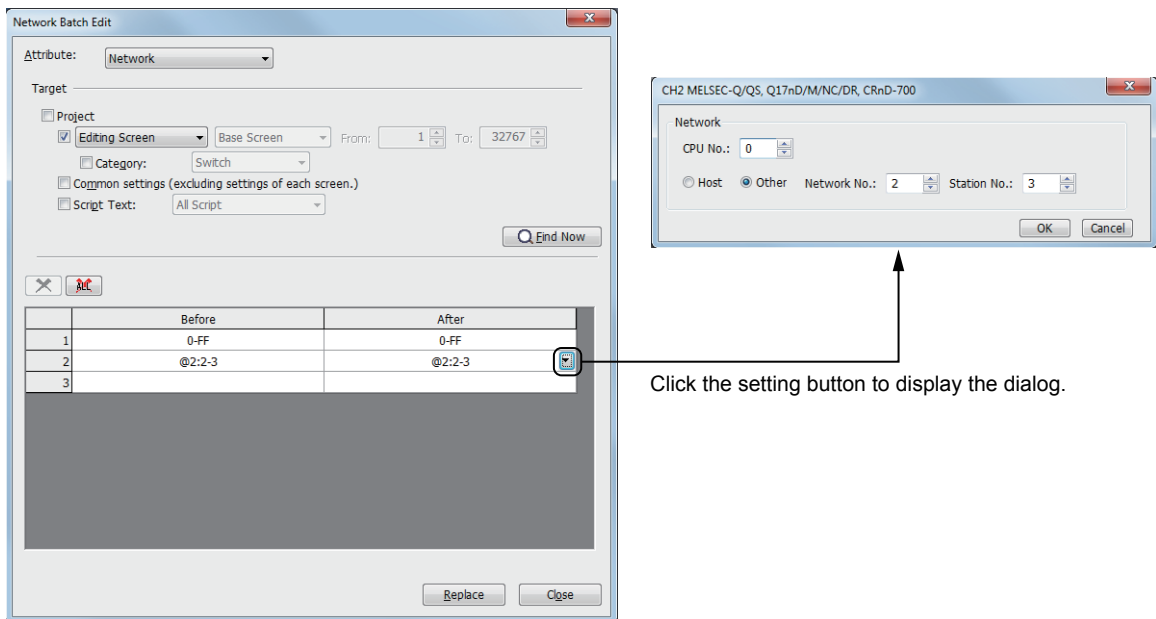

### (3) Changing the network settings in a batch

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Search/Replace] → [Batch Edit] → [Network] from the menu to display the [Network Batch Edit] dialog.
- If you have selected figures and objects on the screen editor before selecting the menu, the [Network Batch Edit] dialog display the settings of the selected figures and objects in the search result list.
- 11.8.4 ■ 5 [Network Batch Edit] dialog
- Step 2** Select a target to execute the batch edit for [Target] and click the [Find Now] button to display the found settings in the search result list.

- Step 3** In the search result list, click a cell in the [After] column to display the setting button.
- Step 4** Click the setting button to display the network setting dialog.
- Set a setting value after the batch edit and click the [OK] button.

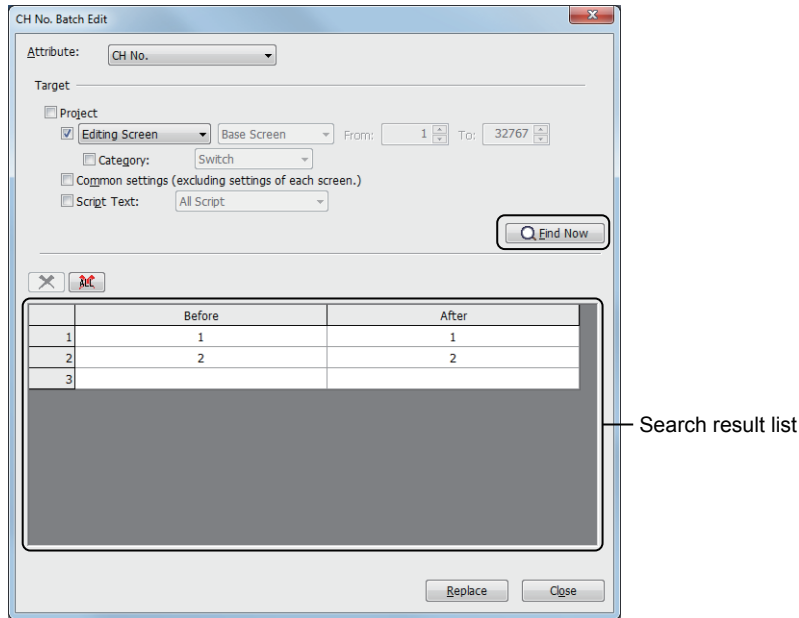

- Step 5** Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

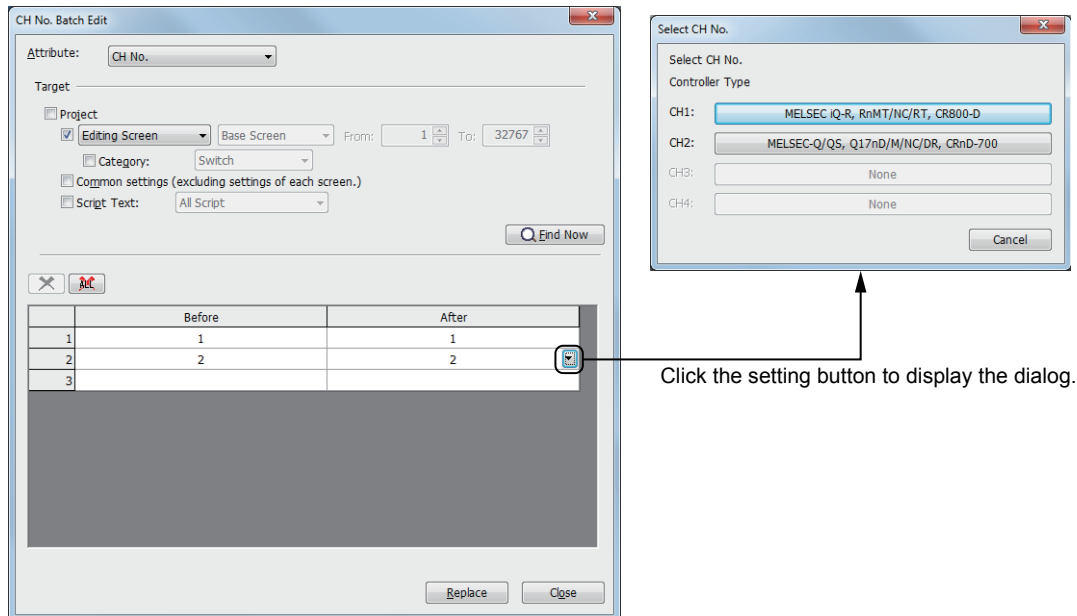

#### (4) Changing channel numbers in a batch

- Step 1** Select [Search/Replace] → [Batch Edit] → [CH No.] from the menu to display the [CH No. Batch Edit] dialog. If you have selected figures and objects on the screen editor before selecting the menu, the [CH No. Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.  
 ↳ 11.8.4 ■ 6 [CH No. Batch Edit] dialog
- Step 2** Select a target to execute the batch edit for [Target] and click the [Find Now] button to display the found settings in the search result list.

- Step 3** In the search result list, click a cell in the [After] column to display the setting button.
- Step 4** Click the setting button to display the [Select CH No.] dialog. Select a channel No. after the batch change and click the [OK] button.

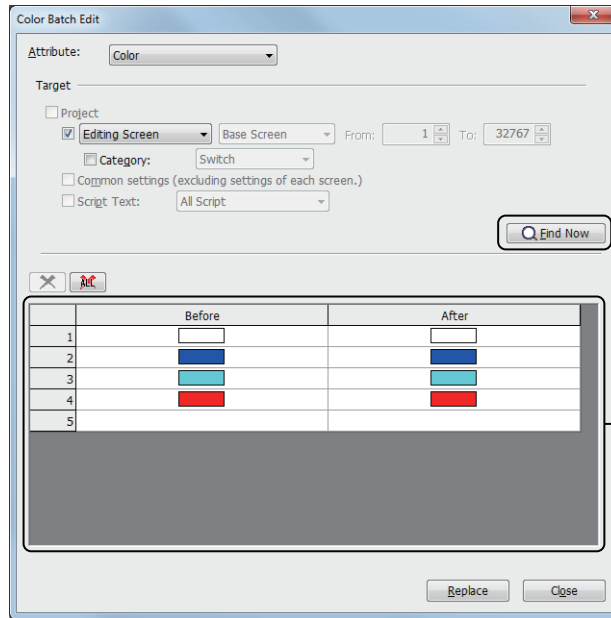

- Step 5** Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

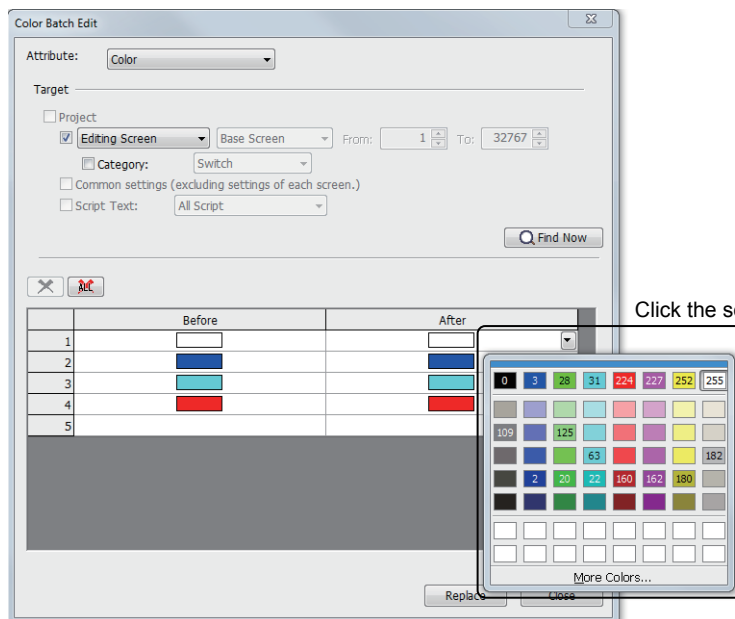

## (5) Changing the colors of figures and objects in a batch

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Search/Replace] → [Batch Edit] → [Color] from the menu to display the [Color Batch Edit] dialog. If you have selected figures and objects on the screen editor before selecting the menu, the [Color Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.
- 11.8.4 ■ 7 [Color Batch Edit] dialog
- Step 2** Select a target to execute the batch edit for [Target] and click the [Find Now] button to display the found settings in the search result list.

- Step 3** In the search result list, click a cell in the [After] column to display the setting button.
- Step 4** Click the setting button to display the color palette. Set a color after the batch edit.
- 6.4.2 Color settings

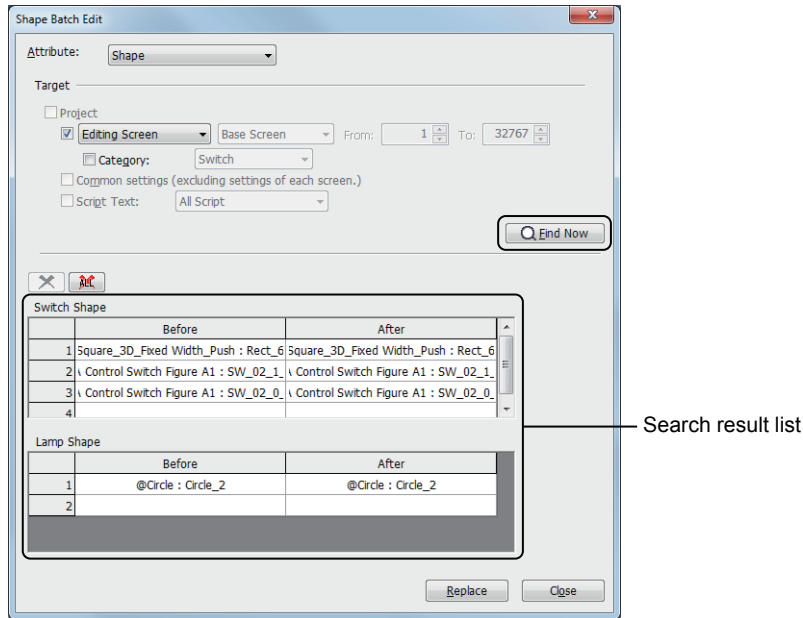

- Step 5** Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

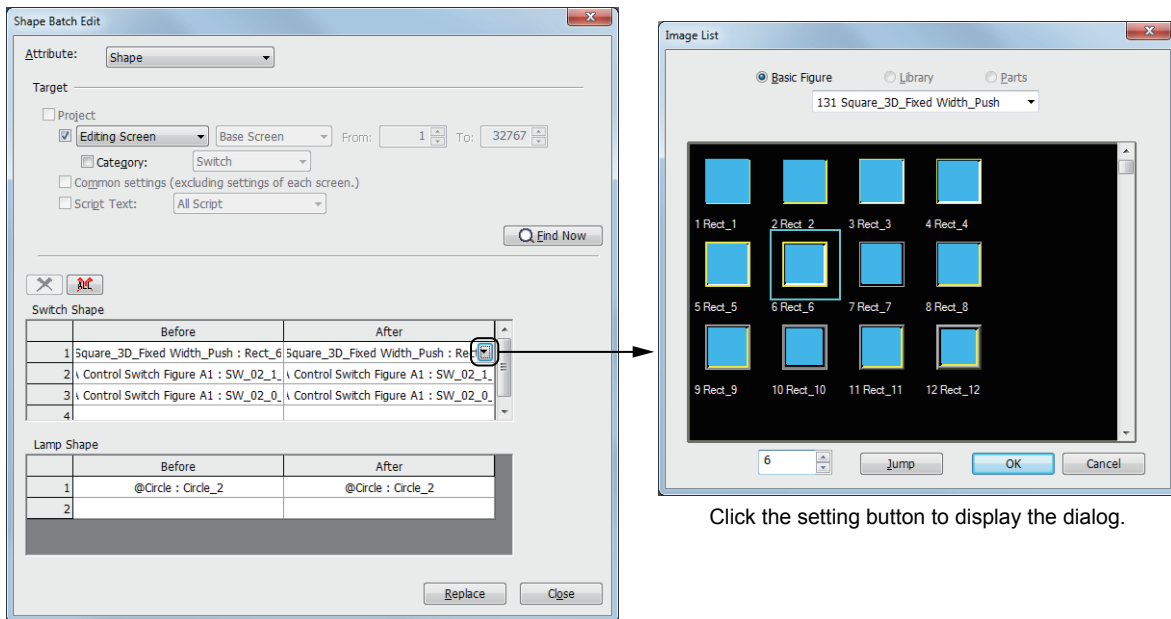

**(6) Changing the shapes of touch switches and lamps in a batch**

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- Step 1** Select [Search/Replace] → [Batch Edit] → [Shape] from the menu to display the [Shape Batch Edit] dialog. If you have selected figures and objects on the screen editor before selecting the menu, the [Shape Batch Edit] dialog displays the settings of the selected figures and objects in the search result list.  
 ↳ 11.8.4 ■ 8 [Shape Batch Edit] dialog
- Step 2** Select a target to execute the batch edit for [Target] and click the [Find Now] button to display the found settings in the search result list.

- Step 3** In the search result list, click a cell in the [After] column to display the setting button.
- Step 4** Click the setting button to display the [Image List] dialog. The image types of figures ([Basic Figure], [Library] and [Parts]) cannot be changed. Select a figure after the batch edit and click the [OK] button.

- Step 5** Click the [Replace] button to replace the settings in the [Before] column with the settings in the [After] column.

## ■ 2 Precautions

### (1) Precautions for changing devices in a batch

#### (a) Changing devices into different device types

The devices for which the settable device types are fixed (including bit devices and word devices) cannot be changed into different device types.

#### (b) Changing consecutive devices

The start device of consecutive devices cannot be changed to a device which is out of the device range.

#### (c) Changing a device of the object for which the offset function is enabled

The device of the object for which the offset function is enabled cannot be changed to a bit device specified as a word device.

#### (d) Changing system labels

You cannot change a system label to the following invalid system labels.

- System labels that are not registered in the system label database
- System labels without devices assigned

#### (e) Changing to global labels

For collectively changing to global labels, the data type consistency check is not performed automatically between the global labels and the objects or others where the global labels are used.

You are recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the global labels exported with GX Works3.

#### (f) Changing to labels (GT Designer3)

For collectively changing to labels (GT Designer3), the data type consistency check is not performed automatically between the labels (GT Designer3) and the objects or others where the labels (GT Designer3) are used.

You are recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the labels (GT Designer3) exported with GT Designer3.

You cannot change the devices of objects or others to the following invalid labels (GT Designer3).

- Labels (GT Designer3) unregistered in label groups

#### (g) Changing to OMRON NJ/NX tags

For collectively changing to OMRON NJ/NX tags, the data type consistency check is not performed automatically between the OMRON NJ/NX tags and the objects or others where the tags are used.

You are recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the OMRON NJ/NX tags exported from Sysmac Studio.

#### (h) Changing to AB native tags

For collectively changing to AB native tags, the data type consistency check is not performed automatically between the AB native tags and the objects or others where the AB native tags are used.

You are recommended to check the data type consistency by comparing the contents between the device list on GT Designer3 and the AB native tags exported from RSLogix 5000.

#### (i) Collectively changing double-word devices

Double-word devices are collectively changed in units of two words.

When the start device number is an even number, only the devices whose device number is an even number are changed collectively.

When the start device number is an odd number, only the devices whose device number is an odd number are changed collectively.

Example)

For five double-word devices (D0 to D9), D0, D2, D4, D6, and D8 are changed collectively.

D1, D3, D5, D7, and D9 are not changed.

To collectively change word and double-word devices, select [Include the double word devices in the word devices] in the [Device Batch Edit] dialog.

#### (j) Collectively changing the string-type labels and tags

When the string-type and non-string type devices, labels, and tags are set as the batch edit targets, the string-type labels and tags cannot be changed collectively.

**(2) Precautions for changing channel numbers in a batch**

**(a) Devices for script texts**

The devices for script texts are out of the target of the CH No. Batch Edit.

**(b) Changing to a device which does not exist**

If a channel No. is set for a device which does not exist in the controller after the batch edit and the CH No. Batch Edit is executed, the device is displayed as [??].

After changing channel numbers in a batch, check that all the devices set in the project are not displayed as [??].

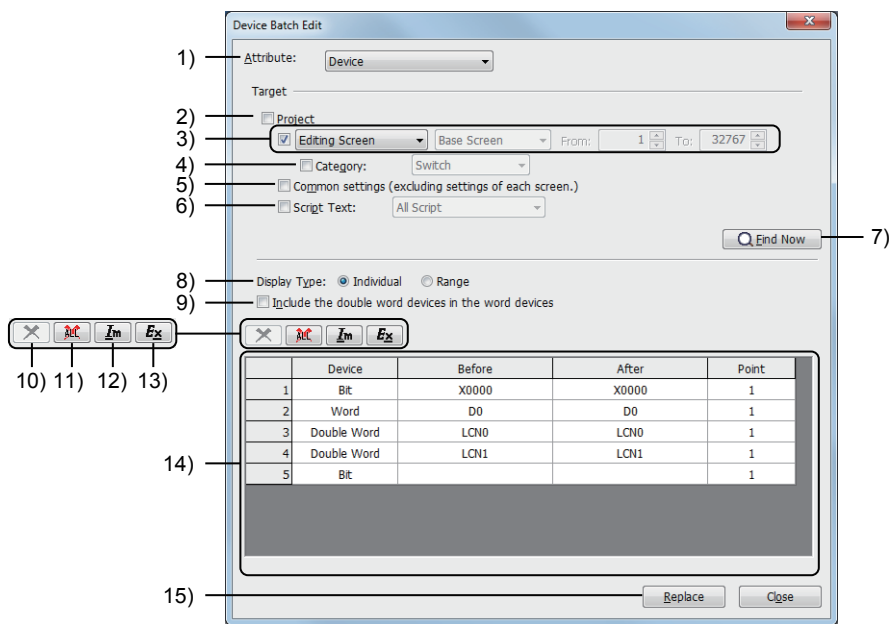

**(3) Precautions for using the color batch edit**

When you select a shape in a given color from the system library for an object, the object is excluded from the target of the color batch edit.

**(4) Project for which project security is set**

The settings for display-disabled screens and scripts are not displayed in the batch edit dialog.

**■ 3 [Device Batch Edit] dialog**

**1) [Attribute]**

Select an attribute to change in a batch.

The dialog to be displayed differs depending on the selected item.

- [Device]: Displays the [Device Batch Edit] dialog. → 11.8.4 ■ 3 [Device Batch Edit] dialog
- [Unit No./Axis No. Batch Edit]: Displays the [Unit No./Axis No. Batch Edit] dialog. → 11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog
- [Network]: Displays the [Network Batch Edit] dialog. → 11.8.4 ■ 5 [Network Batch Edit] dialog
- [CH No.]: Displays the [CH No. Batch Edit] dialog. → 11.8.4 ■ 6 [CH No. Batch Edit] dialog
- [Color]: Displays the [Color Batch Edit] dialog. → 11.8.4 ■ 7 [Color Batch Edit] dialog
- [Shape]: Displays the [Shape Batch Edit] dialog.

2) **[Project]**

Searches the whole project.

3) **Search target screens**

The specified screens are searched.

The following shows selectable items.

- [All screens]:  
Searches all screens.
- [Editing screen]:  
Searches the screen editor displayed in the foreground.
- [Screen range]:  
Searches the screens of the specified type and screen numbers.

• Screen type

Set a screen type as the search target. The following shows selectable items.

- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen] (GT27 and GT25)

• [From], [To]

Set the range of the screen numbers to search.

The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767].

The setting range of [Report Screen] is [1] to [32].

• [Selected area]:

Searches the figures and objects selected on the screen editor before the [Device Batch Edit] dialog is opened.

This item is enabled only when figures and objects have been selected on the screen editor.

4) **[Category]**

Searches the specified category.

The following shows selectable items.

- [Switch]
- [Lamp]
- [Other]
- User-created category

⇒ 11.7 Managing figures and objects by category

5) **[Common settings (excluding settings of each screen)]**

Searches the common settings.

6) **[Script Text]**

Searches the scripts of the specified type.

The following shows selectable items.

- [All Script]
- [Script List]
- [Project/Screen Script]
- [Object Script]
- [Script Parts]

7) **[Search] button**

Conducts a search based on the setting of [Target].

Search results are displayed in the search result list.

8) **[Display Type]**

Select the display type of the search results.

- [Individual]  
Lists devices individually.
- [Range]  
Lists devices collectively by device type.

9) **[Include the double word devices in the word devices]**

Displays word devices and double-word devices.

10) **[Delete] button**

Deletes the row selected in the search result list.

### 11) [Clear] button

Clears all the contents in the search result list.

### 12) [Import] button

Imports the device batch edit data.

### 13) [Export] button

Exports the device batch edit data.

⇒(1) Details of the exported file

### 14) Search result list

Lists the search results.

Double-clicking each cell enables changing the settings.

You can also directly set [Device], [Before], [After], and [Point] without a search to execute the batch edit.

Item	Description
[Device]	Device types ([Bit], [Word], [Double Word])
[Before]	The setting values of the found settings
[After]	Set a device applied after the batch edit. The setting values before the batch edit are displayed in the [After] column right after the searching. Double-clicking each cell of the [After] column enables changing the devices. If you change a device in the [After] column and then change the setting of [Display Type], the last-minute device change is discarded. ⇒6.1.1 How to set devices
[Points]	Number of devices which are consecutively set In a detail setting row where a system label is set in [Before] or [After], [Points] is fixed to [1], and the cell color of [Points] changes to gray.

### 15) [Replace] button

Executes the batch edit with the settings in the search result list.

#### (1) Details of the exported file

The following shows the details of the exported file of the search results.

	A	B	C	D
1	Device Batch Edit			
2				
3	Device	Before	After	Point
4	Bit	X0000	GB1 000	1
5	Bit	X0001	GB1 001	1
6	Bit	X0002	GB1 002	1
7	Bit	X0003	GB1 003	1

1)                      2)                      3)                      4)

#### 1) [Device]

Device types.

#### 2) [Before]

Devices before the change.

#### 3) [After]

Devices after the change.

When [Range] is selected for [Display Type], only the start device is exported.

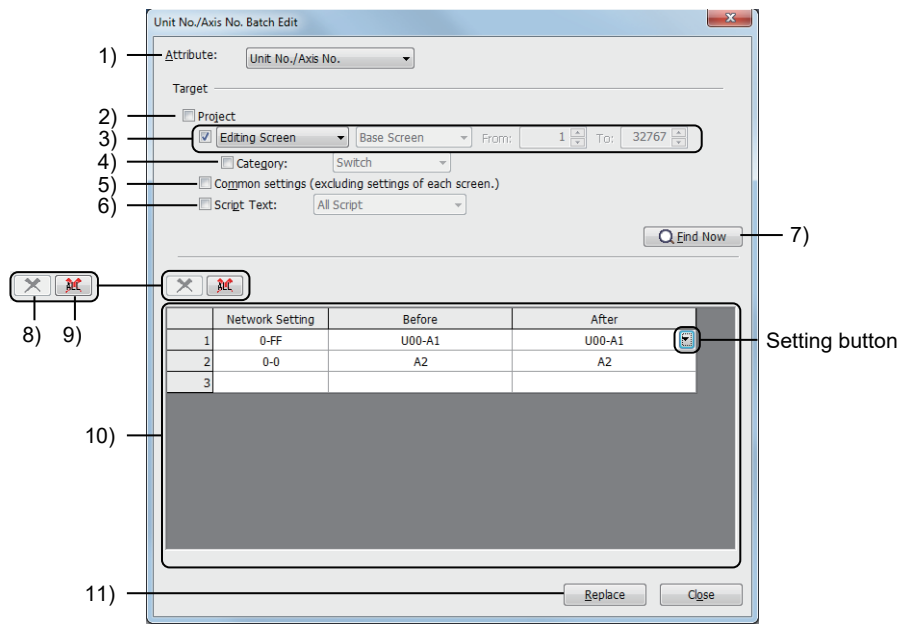

#### 4) [Point]

Number of devices.

## ■4 [Unit No./Axis No. Batch Edit] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Attribute]

Select an attribute to change in a batch.

The dialog to be displayed differs depending on the selected item.

- [Device]:  
Displays the [Device Batch Edit] dialog.  
⇒ 11.8.4 ■ 3 [Device Batch Edit] dialog
- [Unit No./Axis No. Batch Edit]:  
Displays the [Unit No./Axis No. Batch Edit] dialog.  
⇒ 11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog
- [Network]:  
Displays the [Network Batch Edit] dialog.  
⇒ 11.8.4 ■ 5 [Network Batch Edit] dialog
- [CH No.]:  
Displays the [CH No. Batch Edit] dialog.  
⇒ 11.8.4 ■ 6 [CH No. Batch Edit] dialog
- [Color]:  
Displays the [Color Batch Edit] dialog.  
⇒ 11.8.4 ■ 7 [Color Batch Edit] dialog
- [Shape]:  
Displays the [Shape Batch Edit] dialog.  
⇒ 11.8.4 ■ 8 [Shape Batch Edit] dialog

### 2) [Project]

Searches the whole project.

### 3) Search target screens

The specified screens are searched.

The following shows selectable items.

- [All screens]:  
Searches all screens.
- [Editing screen]:  
Searches the screen editor displayed in the foreground.
- [Screen range]:

Searches the screens of the specified type and screen numbers.

- **Screen type**  
Set a screen type as the search target.  
The following shows selectable items.
  - [Base Screen]
  - [Window Screen]
  - [Report Screen]
  - [Mobile Screen] (GT27 and GT25)
- **[From], [To]**  
Set the range of the screen numbers to search.  
The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767].  
The setting range of [Report Screen] is [1] to [32].

- **[Selected area]:**  
Searches the figures and objects selected on the screen editor before the [Unit No./Axis No. Batch Edit] dialog is opened.  
This item is enabled only when figures and objects have been selected on the screen editor.

**4) [Category]**

Searches the specified category.  
The following shows selectable items.

- [Switch]
- [Lamp]
- [Other]
- User-created category  
    ⇒ 11.7 Managing figures and objects by category

**5) [Common settings (excluding settings of each screen)]**

Searches the common settings.

**6) [Script Text]**

Searches the scripts of the specified type.  
The following shows selectable items.

- [All Script]
- [Script List]
- [Project/Screen Script]
- [Object Script]
- [Script Parts]

**7) [Search] button**

Conducts a search based on the setting of [Target].  
Search results are displayed in the search result list.

**8) [Delete] button**

Deletes the row selected in the search result list.

**9) [Clear] button**

Clears all the contents in the search result list.

**10) Search result list**

Lists the search results.

Click the setting button of a cell in the [After] column to display the unit No./axis No. setting dialog.

- **Unit**  
Select a module to be routed to.
- **[Unit No.]**  
Specify a unit number.
- **[Axis No.]**  
Specify an axis number.

You can also directly set [Network Setting], [Before], and [After] without conducting a search, and then execute the batch edit.

Click the setting button of a blank cell to display the [Select CH No.] dialog.

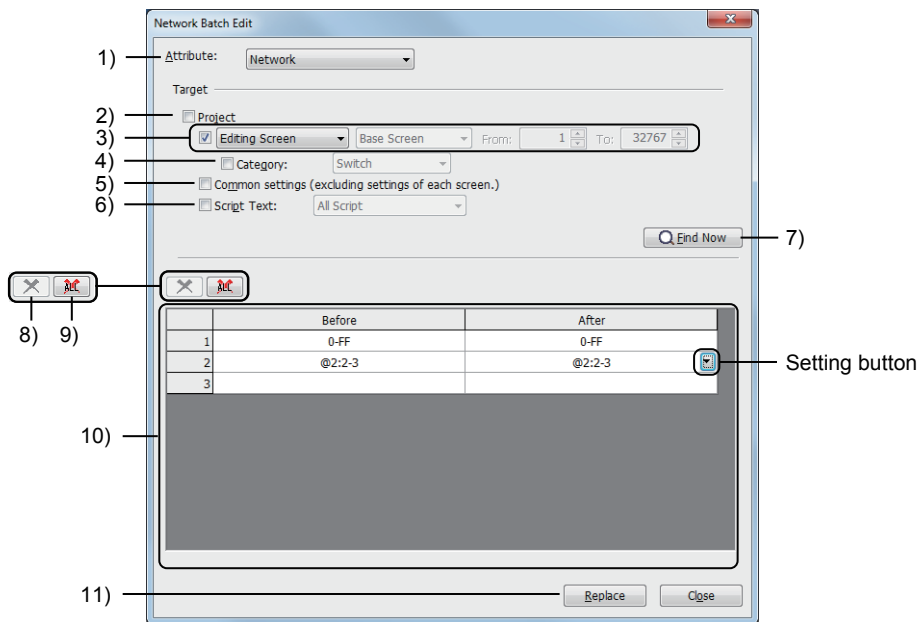

- [Controller Type]  
Select a channel.  
Click a channel button to display the network setting dialog or the unit No./axis No. setting dialog.  
The number of channels varies by GOT model.

Item	Description
[Network Setting]	Current network settings of the found settings.
[Before]	The setting values of the found settings
[After]	Configure the setting values after the batch edit. The setting values before the batch edit are displayed in the [After] column right after the searching.

### 11) [Replace] button

Executes the batch edit with the settings in the search result list.

## ■ 5 [Network Batch Edit] dialog

### 1) [Attribute]

Select an attribute to change in a batch.  
The dialog to be displayed differs depending on the selected item.

- [Device]:  
Displays the [Device Batch Edit] dialog.  
→ 11.8.4 ■ 3 [Device Batch Edit] dialog
- [Unit No./Axis No. Batch Edit]:  
Displays the [Unit No./Axis No. Batch Edit] dialog.  
→ 11.8.4 ■ 4 [Unit No./Axis No. Batch Edit] dialog
- [Network]:  
Displays the [Network Batch Edit] dialog.  
→ 11.8.4 ■ 5 [Network Batch Edit] dialog
- [CH No.]:  
Displays the [CH No. Batch Edit] dialog.  
→ 11.8.4 ■ 6 [CH No. Batch Edit] dialog

- [Color]:  
Displays the [Color Batch Edit] dialog.  
    ⇒ 11.8.4 ■ 7 [Color Batch Edit] dialog
- [Shape]:  
Displays the [Shape Batch Edit] dialog.  
    ⇒ 11.8.4 ■ 8 [Shape Batch Edit] dialog

## 2) [Project]

Searches the whole project.

## 3) Search target screens

The specified screens are searched.

The following shows selectable items.

- [All screens]:  
Searches all screens.
- [Editing screen]:  
Searches the screen editor displayed in the foreground.
- [Screen range]:  
Searches the screens of the specified type and screen numbers.

Screen type

### • Screen type

Set a screen type as the search target.  
The following shows selectable items.

- [Base Screen]
- [Window Screen]
- [Report Screen]
- [Mobile Screen] (GT27 and GT25)

### • [From], [To]

Set the range of the screen numbers to search.  
The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767].  
The setting range of [Report Screen] is [1] to [32].

- [Selected area]:  
Searches the figures and objects selected on the screen editor before the [Network Batch Edit] dialog is opened.  
This item is enabled only when figures and objects have been selected on the screen editor.

## 4) [Category]

Searches the specified category.

The following shows selectable items.

- [Switch]
- [Lamp]
- [Other]
- User-created category  
    ⇒ 11.7 Managing figures and objects by category

## 5) [Common settings (excluding settings of each screen)]

Searches the common settings.

## 6) [Script Text]

Searches the scripts of the specified type.

The following shows selectable items.

- [All Script]
- [Script List]
- [Project/Screen Script]
- [Object Script]
- [Script Parts]

## 7) [Search] button

Conducts a search based on the setting of [Target].

Search results are displayed in the search result list.

## 8) [Delete] button

Deletes the row selected in the search result list.

## 9) [Clear] button

Clears all the contents in the search result list.

## 10) Search result list

Lists the search results.

Click the setting button in a cell of the search result list to display the network setting dialog.

- **[CPU No.]**  
Set a CPU No.
- **[Host], [Other]**  
Select [Host] or [Other].  
When [Other] is selected, set [Network No.] and [Station No.].

You can also directly set [Before] and [After] without a search to execute the batch edit.

Click the setting button in a blank cell to display the [Select CH No.] dialog.

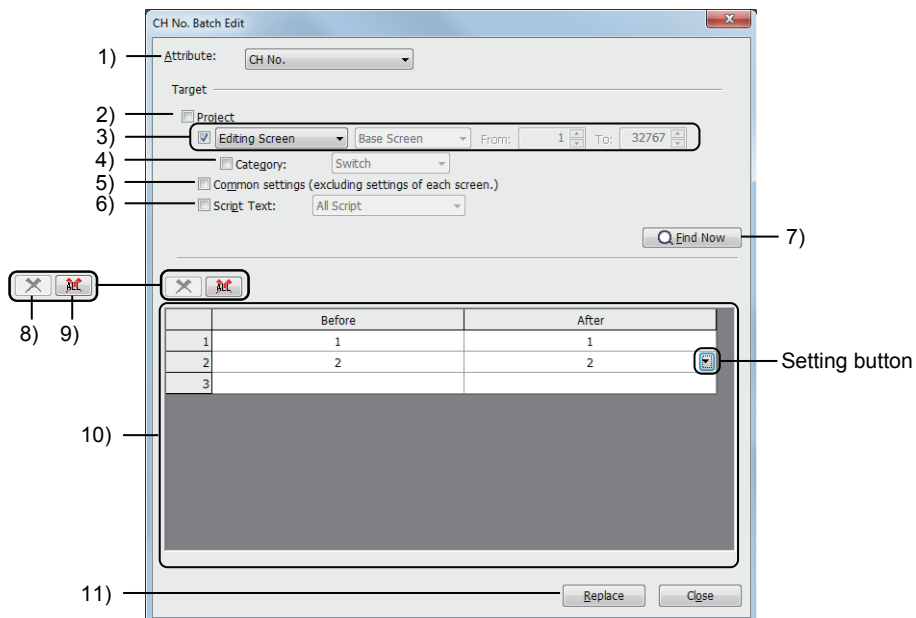

- **[Controller Type]**  
Select a channel.  
Click each channel button to display the network setting dialog.  
The number of channels depends on the GOT model.

Item	Description
[Before]	The setting values of the found settings
[After]	Configure the setting values after the batch edit. The setting values before the batch edit are displayed in the [After] column right after the searching.

### 11) [Replace] button

Executes the batch edit with the settings in the search result list.

## ■ 6 [CH No. Batch Edit] dialog

### 1) [Attribute]

Select an attribute to change in a batch.

The dialog to be displayed differs depending on the selected item.

- **[Device]:**  
Displays the [Device Batch Edit] dialog.  
⇒ 11.8.4 ■ 3 [Device Batch Edit] dialog

- [Unit No./Axis No. Batch Edit]:  
Displays the [Unit No./Axis No. Batch Edit] dialog.

- [Network]:  
Displays the [Network Batch Edit] dialog.  
    ⇒ 11.8.4 ■ 5 [Network Batch Edit] dialog
- [CH No.]:  
Displays the [CH No. Batch Edit] dialog.  
    ⇒ 11.8.4 ■ 6 [CH No. Batch Edit] dialog
- [Color]:  
Displays the [Color Batch Edit] dialog.  
    ⇒ 11.8.4 ■ 7 [Color Batch Edit] dialog
- [Shape]:  
Displays the [Shape Batch Edit] dialog.  
    ⇒ 11.8.4 ■ 8 [Shape Batch Edit] dialog

## 2) [Project]

Searches the whole project.

## 3) Search target screens

The specified screens are searched.

The following shows selectable items.

- [All screens]:  
Searches all screens.
- [Editing screen]:  
Searches the screen editor displayed in the foreground.
- [Screen range]:  
Searches the screens of the specified type and screen numbers.

Screen type

- Screen type  
Set a screen type as the search target.  
The following shows selectable items.
  - [Base Screen]
  - [Window Screen]
  - [Report Screen]
  - [Mobile Screen] (GT27 and GT25)
- [From], [To]  
Set the range of the screen numbers to search.  
The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767].  
The setting range of [Report Screen] is [1] to [32].

- [Selected area]:  
Searches the figures and objects selected on the screen editor before the [CH No. Batch Edit] dialog is opened.  
This item is enabled only when figures and objects have been selected on the screen editor.

## 4) [Category]

Searches the specified category.

The following shows selectable items.

- [Switch]
- [Lamp]
- [Other]
- User-created category  
    ⇒ 11.7 Managing figures and objects by category

## 5) [Common settings (excluding settings of each screen)]

Searches the common settings.

## 6) [Script Text]

Searches the scripts of the specified type.

The following shows selectable items.

- [All Script]
- [Script List]
- [Project/Screen Script]
- [Object Script]
- [Script Parts]

7) **[Search] button**

Conducts a search based on the setting of [Target].  
Search results are displayed in the search result list.

8) **[Delete] button**

Deletes the row selected in the search result list.

9) **[Clear] button**

Clears all the contents in the search result list.

10) **Search result list**

Lists the search results.

Click the setting button in a cell of the search result list to display the [Select CH No.] dialog.

• **[Controller Type]**

Select a channel.

The number of channels depends on the GOT model.

You can also directly set [Before] and [After] without a search to execute the batch edit.

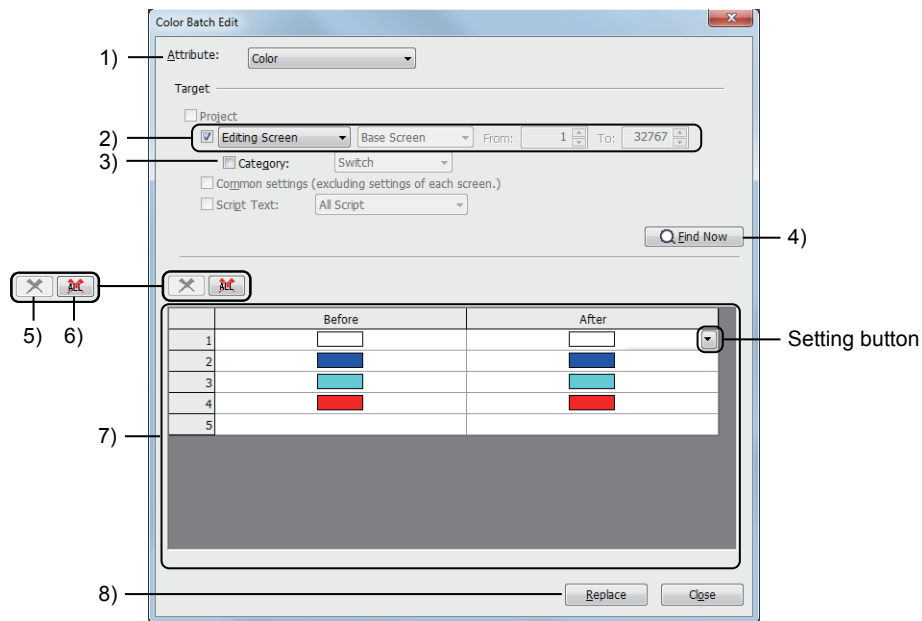

Item	Description
[Before]	The setting values of the found settings
[After]	Configure the setting values after the batch edit. The setting values before the batch edit are displayed in the [After] column right after the searching.

11) **[Replace] button**

Executes the batch edit with the settings in the search result list.

## ■ 7 [Color Batch Edit] dialog

The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767].  
The setting range of [Report Screen] is [1] to [32].

- **[Selected area]:**  
Searches the figures and objects selected on the screen editor before the [Shape Batch Edit] dialog is opened.  
This item is enabled only when figures and objects have been selected on the screen editor.

### 3) **[Category]**

Searches the specified category.  
The following shows selectable items.

- [Switch]
- [Lamp]
- [Other]
- User-created category  
    ⇒ 11.7 Managing figures and objects by category

### 4) **[Search] button**

Conducts a search based on the setting of [Target].  
Search results are displayed in the search result list.

### 5) **[Delete] button**

Deletes the row selected in the search result list.

### 6) **[Clear] button**

Clears all the contents in the search result list.

### 7) **Search result list**

Lists the search results.  
Click the setting button in a cell of the search result list to display the [Image List] dialog.  
The image types of figures ([Basic Figure], [Library] and [Parts]) cannot be changed.  
    ⇒ 6.5.5 ■ 1 (3) [Image List] dialog  
You can also directly set [Before] and [After] without a search to execute the batch edit.

Item	Description
[Switch Shape]	Shapes set for touch switches
[Lamp Shape]	Shapes set for lamps
[Before]	The setting values of the found settings
[After]	Configure the setting values after the batch edit. The setting values before the batch edit are displayed in the [After] column right after the searching.

### 8) **[Replace] button**

Executes the batch edit with the settings in the search result list.

## 11.8.5 Searching for and editing a specific setting (Data Browser)

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The common setting, figures, and objects set in the project are displayed in a list.  
You can narrow the targets displayed in the list by specifying conditions with keywords.  
You can change the settings separately or in a batch in the [Data Browser] window.

- ⇒ ■ 1 How to use the data browser
  - 2 Precautions
  - 3 [Data Browser] window
  - 4 [Range/Target Setting] dialog
  - 5 [Display Item Setting] dialog
  - 6 [Text Replacement] dialog
  - 7 Details of the exported file

### ■ 1 How to use the data browser

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒ (1) Displaying the settings in the project
- (2) Changing the targets to be displayed in the data browser
- (3) Changing the items to be displayed in the data browser
- (4) Changing the settings displayed in the data browser separately
- (5) Changing the settings displayed in the data browser in a batch
- (6) Exporting the data collected in the data browser

#### (1) Displaying the settings in the project

GT27 GT25 GT23 GT21 SoftGOT2000 GS

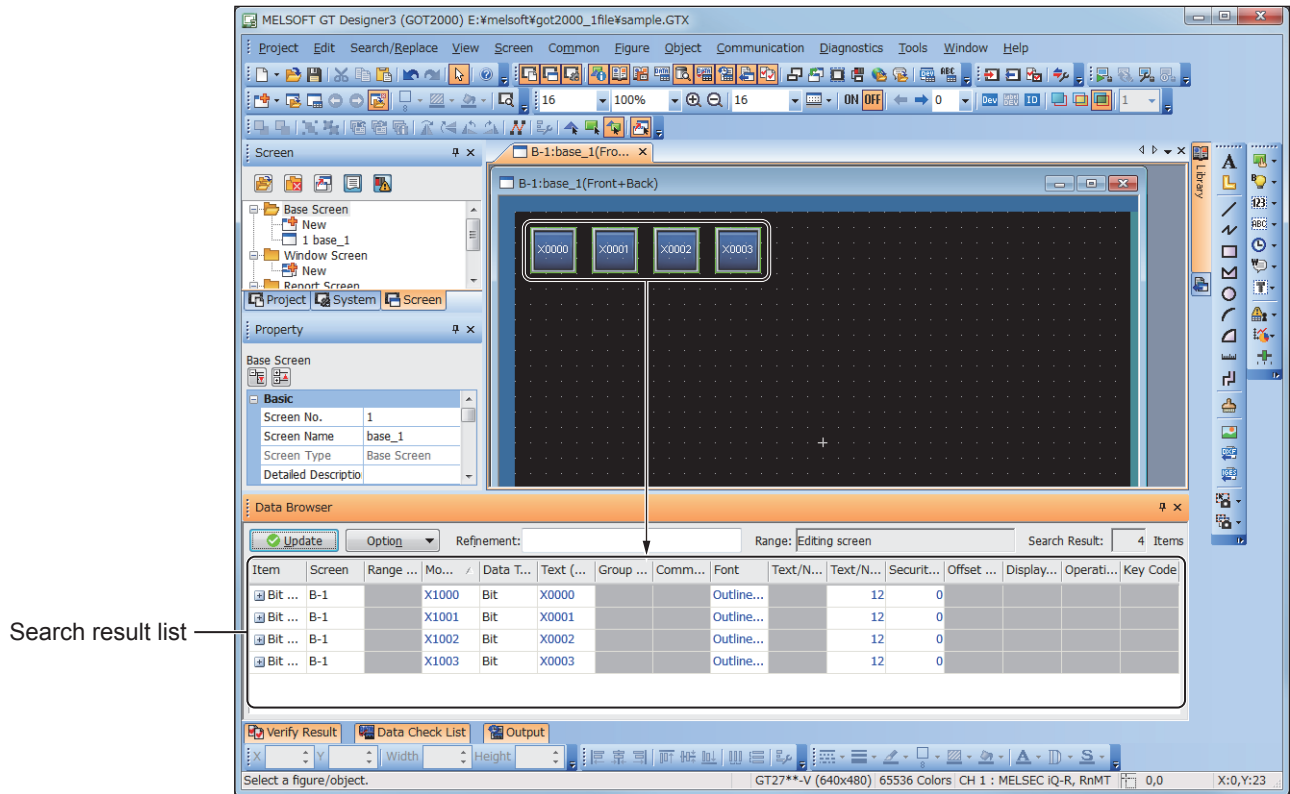

Perform one of the following operations to display the [Data Browser] window.

- Select [Search/Replace] → [Data Browser] from the menu.
- Select [View] → [Docking Window] → [Data Browser] from the menu.
  - ⇒ 11.8.5 ■ 3 [Data Browser] window

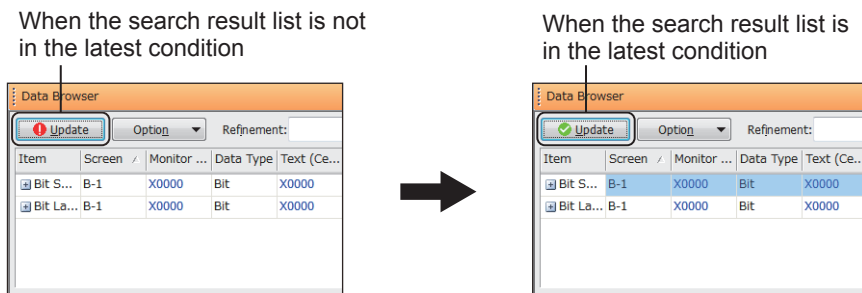

The search result list in the [Data Browser] window displays the search results according to the setting of the search range.

Example) When [Editing screen] is selected for [Range]

When the [Data Browser] window is displayed, the settings of the screen editor displayed at the topmost position are displayed.

If any setting in the project is changed while the [Data Browser] window is displayed, the search result list is not automatically updated.  
Click the [Update] button to update the search result list.

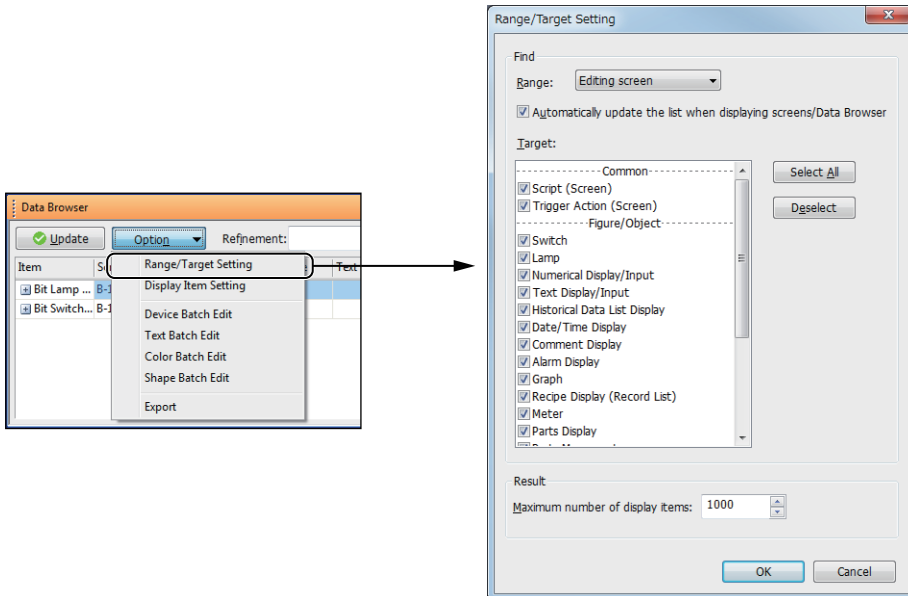

To change the targets or items displayed in the [Data Browser] window, refer to the following.  
 ➔(2) Changing the targets to be displayed in the data browser  
 (3) Changing the items to be displayed in the data browser

## (2) Changing the targets to be displayed in the data browser

**GT27** **GT25** **GT23** **GT21** **SoftGOT2000** **GS**

- Step 1** Perform one of the following operations to display the [Data Browser] window.
- Select [Search/Replace] → [Data Browser] from the menu.
  - Select [View] → [Docking Window] → [Data Browser] from the menu.
- ➔11.8.5 ■ 3 [Data Browser] window
- Step 2** Click the [Option] button and select [Range/Target Setting] from the pull-down menu.  
The [Range/Target Setting] dialog appears.

**Step 3** Set [Range] and [Target].

→ 11.8.5 ■ 4 [Range/Target Setting] dialog

**Step 4** Click the [OK] button to reflect the setting to the [Data Browser] window.

### (3) Changing the items to be displayed in the data browser

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

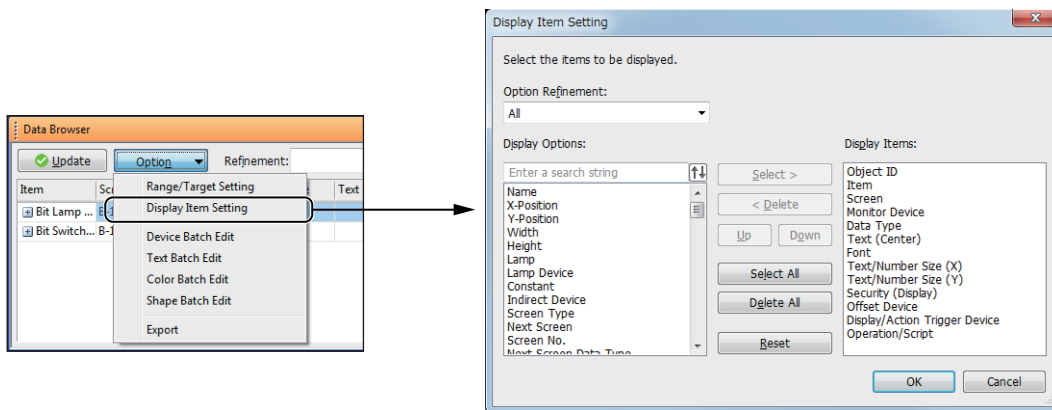

**Step 1** Perform one of the following operations to display the [Data Browser] window.

- Select [Search/Replace] → [Data Browser] from the menu.
- Select [View] → [Docking Window] → [Data Browser] from the menu.

→ 11.8.5 ■ 3 [Data Browser] window

**Step 2** Click the [Option] button and select [Display Item Setting] from the pull-down menu.

The [Display Item Setting] dialog appears.

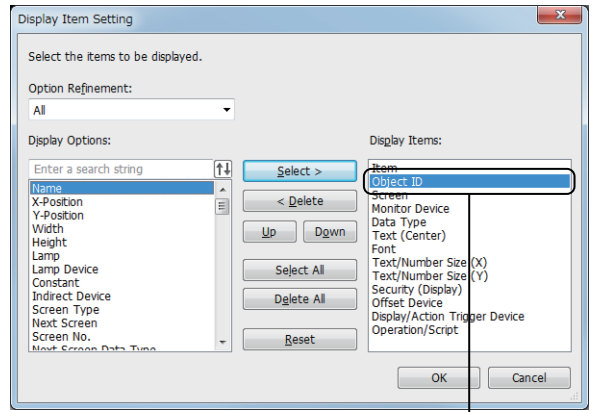

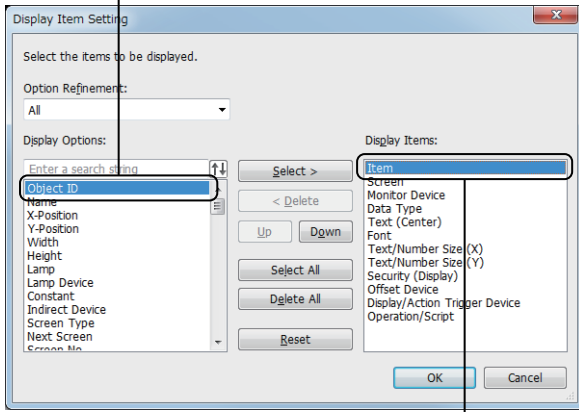

**Step 3** Use the [Select] button and the [Delete] button to determine the items listed in [Display Items].

For the details of the operation buttons, refer to the following.

→ 11.8.5 ■ 5 [Display Item Setting] dialog

Example 1) Setting [Object ID] as the display target

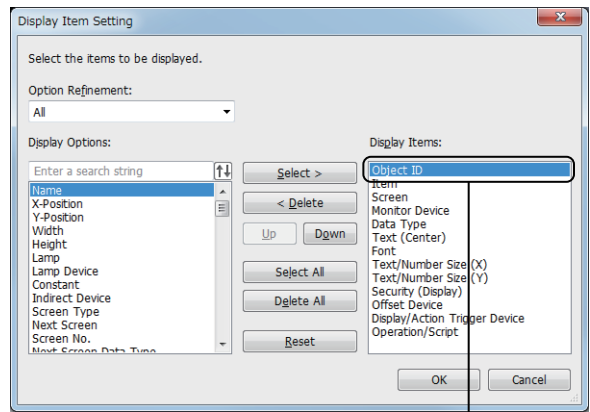

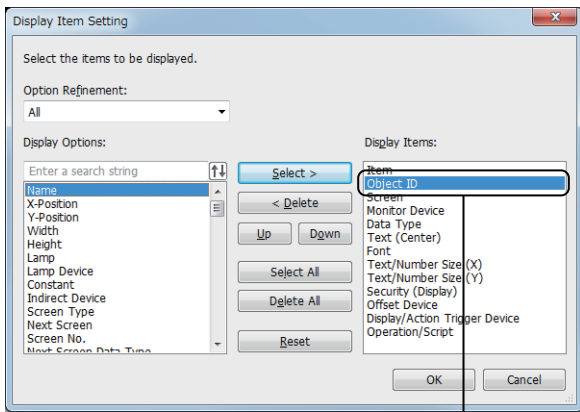

Select an item to move.

Select the destination to insert the item to be moved from [Display Options].  
(The item is inserted just below the selected item.)

Clicking the [Select] button moves the item.

Example 2) Moving up the order of [Object ID]

Select an item to change the order.

Clicking the [Up] button moves up the item.

**Step 4** Click the [OK] button to reflect the setting to the [Data Browser] window.

#### (4) Changing the settings displayed in the data browser separately

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

**Step 1** Perform one of the following operations to display the [Data Browser] window.

- Select [Search/Replace] → [Data Browser] from the menu.
  - Select [View] → [Docking Window] → [Data Browser] from the menu.
- ⇒ 11.8.5 ■ 3 [Data Browser] window

**Step 2** The text color of each cell in the search result list indicates whether you can edit the cell or not in the [Data Browser] window.

Double-click a cell whose text color is blue and edit the setting.

- When the text color is blue:

The setting can be edited in the [Data Browser] window.

Double-click each cell to edit the setting.

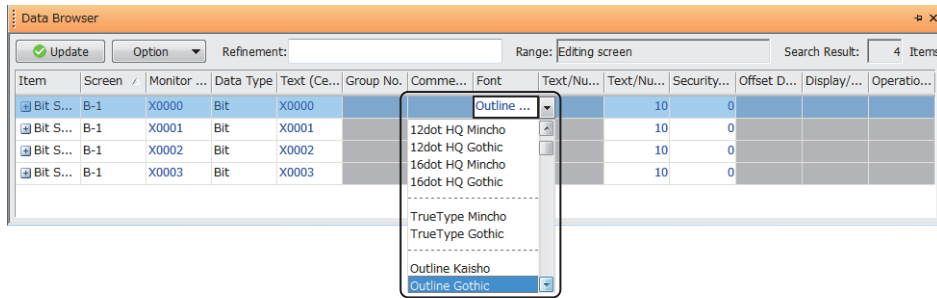

- When the text color is black:

The setting cannot be edited in the [Data Browser] window.

Double-click each cell to display the setting dialog.

The setting method differs depending on the setting to be edited.

Example) Changing a font

For the operation with a mouse and keyboard, refer to the following.

⇒11.8.5 ■ 3 (1) Mouse and keyboard operations

### (5) Changing the settings displayed in the data browser in a batch

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

**Step 1** Perform one of the following operations to display the [Data Browser] window.

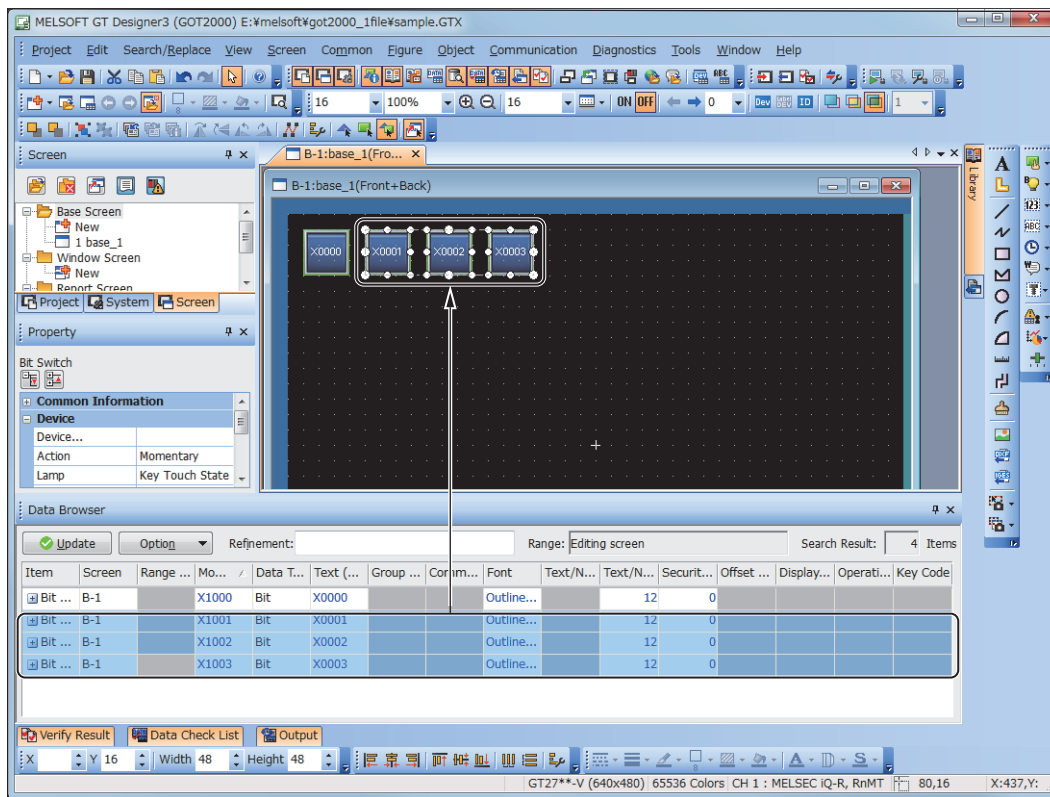

- Select [Search/Replace] → [Data Browser] from the menu.
- Select [View] → [Docking Window] → [Data Browser] from the menu.

⇒11.8.5 ■ 3 [Data Browser] window

**Step 2** Select targets (rows) for which the batch edit is executed in the search result list.

Multiple rows can be selected by either of the following methods.

- [Shift] + click:  
Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.
- [Ctrl] + Click  
Selects or deselects a row.
- [Shift] + Arrow (Up/Down):  
Moves the cursor while selecting the row where the cursor was placed.  
The destination row of the cursor is also selected.

The figures and objects corresponding to the rows selected in the search result list are selected on the screen editor.

**Step 3** Click the [Option] button, and select [Device Batch Edit], [Text Batch Edit], [Color Batch Edit], or [Shape

Batch Edit] from the pull-down menu.

The batch edit dialog to change each setting appears.

Example) When the [Text Batch Edit] is selected from the menu

**Step 4** Set each item in the displayed dialog and click the [Replace] button to execute the batch edit with the configured settings.

- [Device Batch Edit] dialog  
→ 11.8.4 ■ 3 [Device Batch Edit] dialog
- [Text Replacement] dialog  
→ 11.8.5 ■ 6 [Text Replacement] dialog
- [Color Batch Edit] dialog  
→ 11.8.4 ■ 7 [Color Batch Edit] dialog
- [Shape Batch Edit] dialog  
→ 11.8.4 ■ 8 [Shape Batch Edit] dialog

**Step 5** Click the [OK] button to close the batch edit dialog.

**Step 6** Click the [Update] button to update the search result list.

## (6) Exporting the data collected in the data browser

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Perform one of the following operations to display the [Data Browser] window.

- Select [Search/Replace] → [Data Browser] from the menu.
- Select [View] → [Docking Window] → [Data Browser] from the menu.  
→ 11.8.5 ■ 3 [Data Browser] window

**Step 2** Click the [Option] button and select [Export] from the pull-down menu.

The [Save As] dialog appears.

**Step 3** Set [File name] and [Save as type] and click the [Save] button to export the search result list.

→ 11.8.5 ■ 7 Details of the exported file

## ■ 2 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### (1) The operations which cannot be restored by [Undo]

The settings which were changed by either of the following operations cannot be restored even though [Edit] → [Undo] is selected from the menu.

Before changing the settings, check the contents to be changed.

- Changing the settings with the Text Batch Edit, Device Batch Edit, or Color Batch Edit
- Changing the settings of the figures and objects placed on a screen editor which is not opened
- Changing the common setting

### (2) The settings which cannot be edited while the corresponding screen is closed

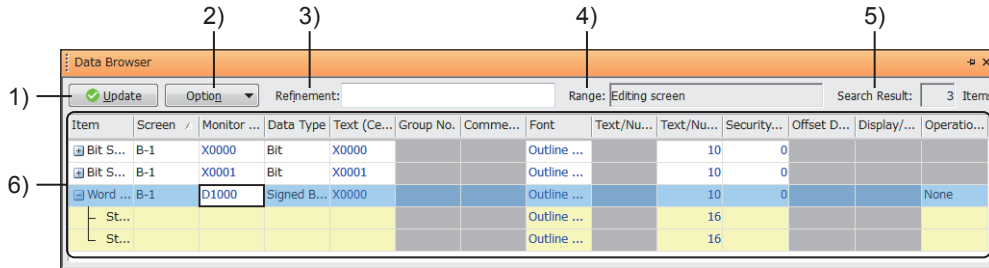

Some settings (including the settings of X-coordinates, Y-coordinates, and logo texts) cannot be edited while the corresponding screens are closed.

If you change those settings in the [Data Browser] window, open a screen on which the figures and objects to be edited are placed.

### (3) Project for which project security is set

When editing the project is prohibited, the settings cannot be changed in the [Data Browser] window. The settings for display-disabled screens and scripts are not displayed in the [Data Browser] window. Although the settings for edit-disabled screens and scripts are displayed in the [Data Browser] window, the settings cannot be changed and deleted.

### ■ 3 [Data Browser] window

#### 1) [Update] button

Updates the search result list.  
The display of the [Update] button differs depending on the status of the search result list.

When the search result list is not in the latest condition

When the search result list is in the latest condition

#### 2) [Option] button

Operates the [Data Browser] window from the pull-down menu.

Item	Description
[Range/Target Setting]	Displays the [Range/Target Setting] dialog. Set a target to be displayed in the search result list. →11.8.5 ■ 4 [Range/Target Setting] dialog
[Display Item Setting]	Displays the [Display Item Setting] dialog. Set an item to be displayed in the search result list. →11.8.5 ■ 5 [Display Item Setting] dialog
[Device Batch Edit]	Displays the [Device Batch Edit] dialog. The device settings selected in the search result list can be edited in a batch. →11.8.4 ■ 3 [Device Batch Edit] dialog
[Text Batch Edit]	Displays the [Text Batch Edit] dialog. The text settings selected in the search result list can be edited in a batch. →11.8.5 ■ 6 [Text Replacement] dialog
[Color Batch Edit]	Displays the [Color Batch Edit] dialog. The color settings selected in the search result list can be edited in a batch. →11.8.4 ■ 7 [Color Batch Edit] dialog
[Shape Batch Edit]	Displays the [Shape Batch Edit] dialog. The shape settings selected in the search result list can be edited in a batch. →11.8.4 ■ 8 [Shape Batch Edit] dialog
[Export]	Saves the search result list as a CSV file or a Unicode text file. Set [File name] and [Save as type] in the displayed dialog and click the [Save] button. →11.8.5 ■ 7 Details of the exported file

#### 3) [Refinement]

Narrows the displayed contents of the search result list by keywords.  
Up to 128 characters can be set.  
To narrow the contents using multiple keywords, separate each keyword with one-byte spaces.

#### 4) [Range]

Range selected in [Range] of the [Range/Target Setting] dialog

5) **[Search Result]**

The number of the targets displayed in the search result list

6) **Search result list**

Displays the search result.

Clicking the top row sorts the results by item.

If you select a row, the corresponding figure or object is also selected on the screen editor.

You can edit the settings of some items.

The text color of each cell indicates whether you can edit the cell or not in the [[Data Browser] window.

- When the text color is blue:

The setting can be edited in the [Data Browser] window.

Double-click each cell to edit the setting.

The setting method differs depending on the setting to be edited.

- When the text color is black:

The setting cannot be edited in the [Data Browser] window.

Double-click each cell to display the setting dialog.

For the operations with the mouse or keyboard, refer to the following.

⇒ (1) Mouse and keyboard operations

(1) **Mouse and keyboard operations**

(a) **Operations for the list display**

The following table shows how to operate the search result list in the [Data Browser] window with the mouse or keyboard.

Operation	Action
Arrow (Up/Down/Left/Right)	Moves the cursor.
[Shift] + Arrow (Up/Down/Left/Right)	Move the cursor while selecting the cell with the cursor. The cell to which the cursor is moved is also selected.
[+] (Numeric keypad)	Unfolds the tree of the row with the cursor.
[-] (Numeric keypad)	Folds the tree of the row with the cursor.
[Shift] + [+] (Numeric keypad)	Unfolds all the trees.
[Shift] + [-] (Numeric keypad)	Folds all the trees.
[Home]	Moves the cursor to the top row.
[End]	Moves the cursor to the bottom row.
[PageUp]	Moves the cursor up one page.
[PageDown]	Moves the cursor down one page.
[Shift] + [Home]	Selects the rows from the row where the cursor is positioned to the top row.
[Shift] + [End]	Selects the rows from the row where the cursor is positioned to the bottom row.
[Shift] + [PageUp]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves up one page.
[Shift] + [PageDown]	Selects the rows from the row where the cursor is positioned to the row where the cursor moves down one page.
[Shift] + Click	Selects the rows from the row where the cursor is positioned to the row where the mouse is clicked.
[Ctrl] + [Space]	Selects or deselects a row.
[Ctrl] + Click	
[Tab]	Moves the cursor to the right cell.
[Shift] + [Tab]	Moves the cursor to the left cell.
[Enter]	Moves the cursor downward by one row.
[Alt] + [Enter]	Displays the setting dialog for the figure or object corresponding to the row with the cursor.
[F3]	

Operation	Action
[Ctrl] + [C]	<ul style="list-style-type: none"> <li>When selecting a cell in the [Item] column The figure or object corresponding to the selected row is copied. When multiple cells are selected, only the figures and objects placed on the same screen editor are copied.</li> <li>When selecting a cell in a column other than the [Item] column The setting value of the cell with the cursor is copied. When multiple cells are selected, the setting values of all the selected cells are copied.</li> </ul>
[Ctrl] + [X]	Cuts the figure or object corresponding to the row with the cursor.
[Ctrl] + [V]	<ul style="list-style-type: none"> <li>When copying a cell in the [Item] column The copied figure or object is pasted on the screen editor.</li> <li>When copying a cell in a column other than the [Item] column The copied text is pasted on the cell with the cursor. The value which is out of the setting range cannot be pasted.</li> </ul>
[Ctrl] + [D]	Pastes a copy of the figure or object corresponding to the row with the cursor on the screen editor.
[Ctrl] + [A]	Selects all the figures and objects placed on the screen editor displayed at the topmost position.
[Ctrl] + [U]	Cancel the grouping of the figures and objects corresponding to the rows with the cursor.
[Delete]	Clears the value in the cell with the cursor. (This operation is available for the cells for which can be edited directly.) Clearing the items for which numerical values are set makes the setting values to zero.
[Back space]	Enables the cell where the cursor was placed to be edited. When the cell which can be edited directly is selected, the setting value is cleared and editing is enabled. →(b) Operations when a cell is edited
Character keys	When a cell which can be edited directly is selected with the cursor, editing the cell is enabled by inputting any character with the keys. →(b) Operations when a cell is edited
[F2]	Enables the cell where the cursor was placed to be edited. You can edit only the cells whose text color is blue. →(b) Operations when a cell is edited
Double-click	<ul style="list-style-type: none"> <li>Any cell whose text color is blue Enables the cell to be edited.</li> <li>Any cell other than above Double-clicking a cell displays the setting dialog for a figure or an object corresponding to the selected cell. →(b) Operations when a cell is edited</li> </ul>
Drag	Selects multiple cells.

### (b) Operations when a cell is edited

The following table shows the keyboard operation for when a cell in the search result list is edited.

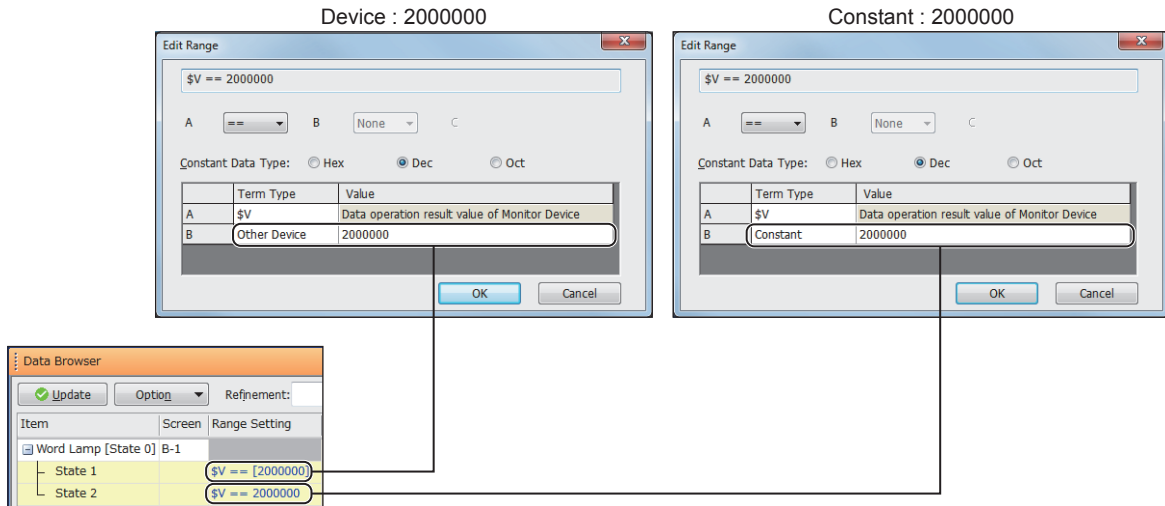

Operation	Action
[Enter]	Confirms and ends the edit.
[Esc]	Discards and ends the edit.
[Tab]	Confirms the edit and moves the cursor to the right cell.
[Shift] + [Tab]	Confirms the edit and moves the cursor to the left cell.
[Alt] + [Enter]	Inserts a line feed when text is input.

#### • Editing [Range Setting] and [Input Range Setting]

When you directly enter a device name for [Range Setting] or [Input Range Setting] with numeric characters only, enclose the characters in square brackets.

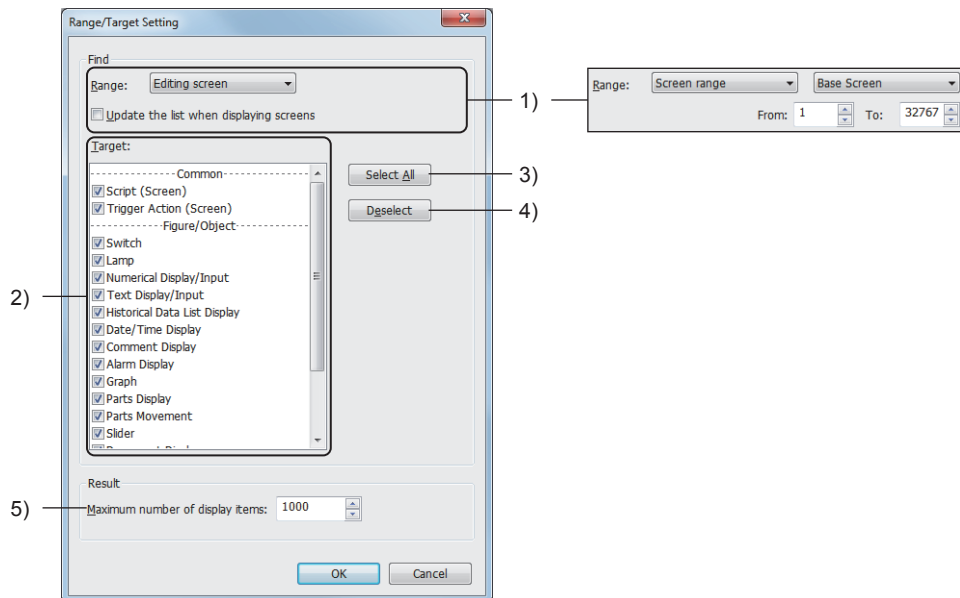

The numeric characters, which are not enclosed in square brackets, are processed as a constant.

Example) Specifying the device (2000000) of the SHARP equipment for [Range Setting]

#### ■ 4 [Range/Target Setting] dialog

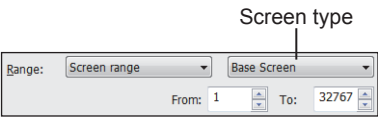

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Range]

Selects the range to be displayed in the [Data Browser] window.  
The following shows selectable items.

Item	Description
[All screens]	Searches all screens.
[Editing screen]	Searches the screen editor displayed in the foreground. <ul style="list-style-type: none"> <li>• [Automatically update the list when displaying screens/Data Browser]</li> </ul> Updates the display contents of the [Data Browser] window upon any of the following operations. <ul style="list-style-type: none"> <li>·Displaying or switching a screen editor</li> <li>·Displaying the [Data Browser] window hidden by the auto-hiding function</li> </ul>

Item	Description
[Screen range]	<p>Searching is performed for the specified screens only.</p> <div style="text-align: center;">  </div> <p>• <b>Screen type</b> Set a screen type as the search target. The following shows selectable items.</p> <ul style="list-style-type: none"> <li>• [Base Screen]</li> <li>• [Window Screen]</li> <li>• [Report Screen]</li> <li>• [Mobile Screen] (GT27 and GT25)</li> </ul> <p>• <b>[From], [To]</b> Set the range of the screen numbers to search. The setting range of [Base Screen], [Window Screen], or [Mobile Screen] is [0] to [32767]. The setting range of [Report Screen] is [1] to [32].</p>

2) **[Target]**

Set the target to be displayed in the [Data Browser] window.

3) **[Select All button]**

Selects all the items in [Target].

4) **[Deselect] button**

Deselects all the items in [Target].

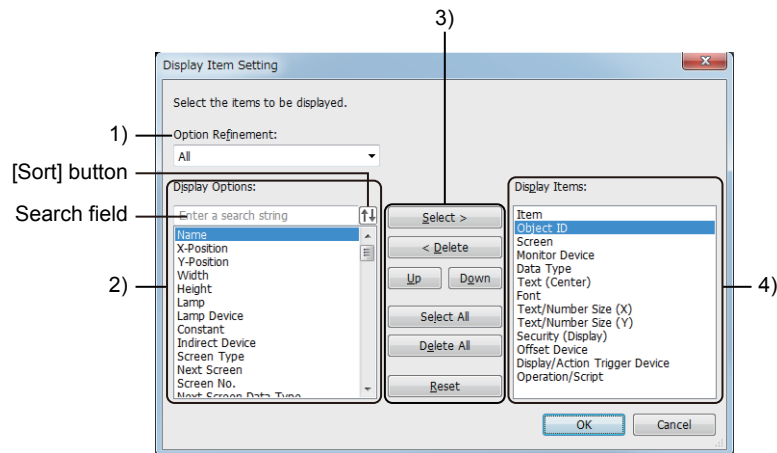

5) **[Maximum number of display items]**

Sets the maximum number of data to be displayed in the search result list.

The setting range is [1] to [10000].

## ■ 5 [Display Item Setting] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Option Refinement]

Narrows the items displayed in [Display Options].

### 2) [Display Options]

Options of the items displayed in the search result list

Select an item and click the [Select] button to move the item to [Display Items].

To narrow down the list, enter a string in the search field.

To sort the list in ascending or descending order, click the [Sort] button.

### 3) Operation buttons

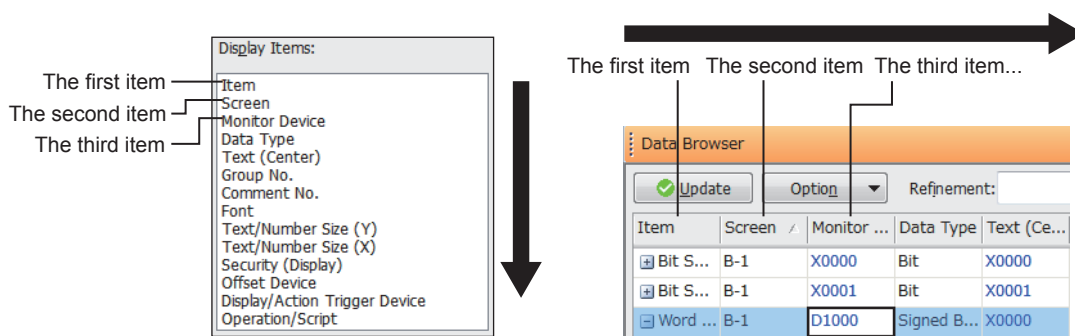

Item	Description
[Select] button	Moves the item selected in [Display Options] to [Display Items].
[Delete] button	Moves the item selected in [Display Items] to [Display Options].
[Up] button, [Down] button	Move the item selected in [Display Items] upward or downward.
[Select All] button	Moves all the items in [Display Options] to [Display Items].
[Delete All] button	Moves all the items other than [Item] in [Display Items] to [Display Options].
[Reset] button	Restores the items in [Display Items] to the default ones.

### 4) [Display Items]

Items to be displayed in the search result list

If any item is selected and the [Delete] button is clicked, the selected item is moved to [Display Options].

The items in the search result list are displayed in the order set for [Display Items].

If any item is selected and the [Up] button or the [Down] button is clicked, the position of the selected item is moved upward or downward.

## 6 [Text Replacement] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Find what]

Set a text before the replacement.  
Up to 512 characters can be set.  
Capital letters and small letters are distinguished.

### 2) [Replace with]

Set a text after the replacement.  
Up to 512 characters can be set.  
Capital letters and small letters are distinguished.

### 3) [Replace] button

The text set in [Find what] is replaced with the text set in [Replace with].

## 7 Details of the exported file

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the details of the exported file of the corrected data in the data browser.

Item	Screen	Monitor Device	Data Type	Text (Center)	Group No.	Comment No.	Font
1 Result List							
2 Target:Script (Screen) Switch Lamp							
3 Range:Editing screen							
4							
5 Item	Screen	Monitor Device	Data Type	Text (Center)	Group No.	Comment No.	Font
6 Bit Switch [State OFF]	B-1	X0000	Bit				Outline Gothic
7 State ON							Outline Gothic
8 Bit Lamp [State OFF]	B-1	X0000	Bit				Outline Gothic
9 State ON							Outline Gothic
10 Word Lamp [State 0]	B-1	D100	Signed BIN16				Outline Gothic
11 State 1							Outline Gothic
12 State 2							Outline Gothic

### 1) [Target]

Target to be displayed in the [Data Browser] window

### 2) [Range]

Target to be displayed in the [Data Browser] window

### 3) Item

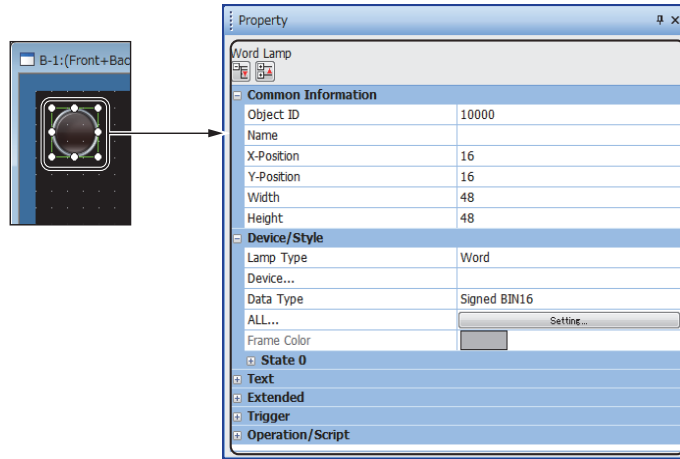

Item set in the [Display Item Setting]

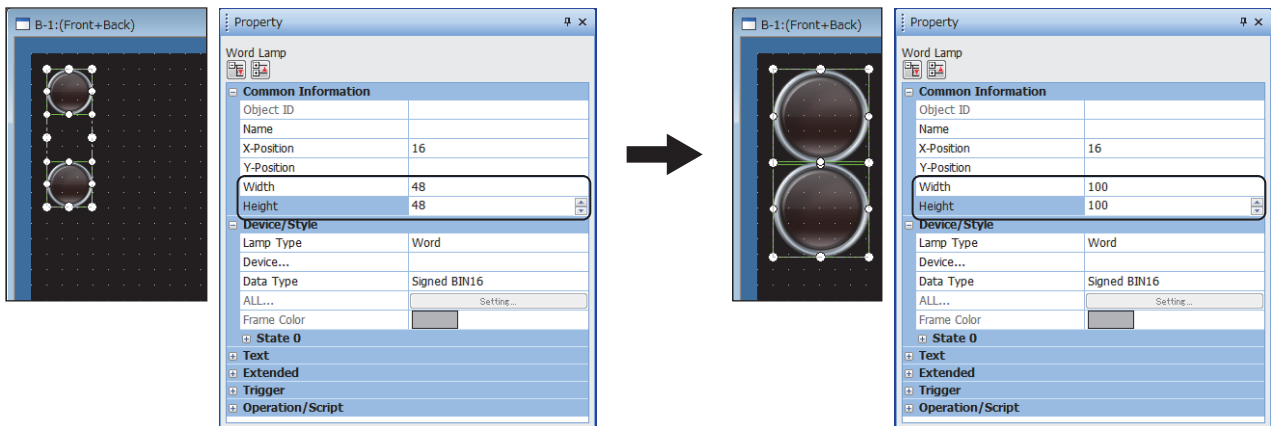

## 11.9 Checking and Editing Settings of Screens and Objects (Property Sheet)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The list of attributes and set values of a selected screen, figure, or object can be displayed. Settings can be checked or changed without opening the setting dialog. Example) Selecting a word lamp

Set values can be changed collectively by selecting multiple figures or objects on the same screen. Example) Collectively changing the width and height of bit switches

- 11.9.1 Specifications of the property sheet
- 11.9.2 How to use the property sheet
- 11.9.3 Precautions
- 11.9.4 [Property] window

## 11.9.1 Specifications of the property sheet

---

### ■ 1 Targets for the display of the [Property] window

The following shows the targets for displaying the list of attributes in the [Property] window.

- Base screen
- Window screen
- Report Screen
- Mobile Screen
- Figure
- Object
- Template

When multiple figures and objects on the same screen are selected, the attributes of them are displayed on the same sheet.  
When a group is selected, all the grouped figures and objects are identified as the targets for the property sheet.

### ■ 2 Batch change of attributes

The batch change is applicable to the attributes that are common to the selected figures or objects.

### ■ 3 Width and height of a figure or object

The following shows the setting ranges of the width and height of a figure or object.

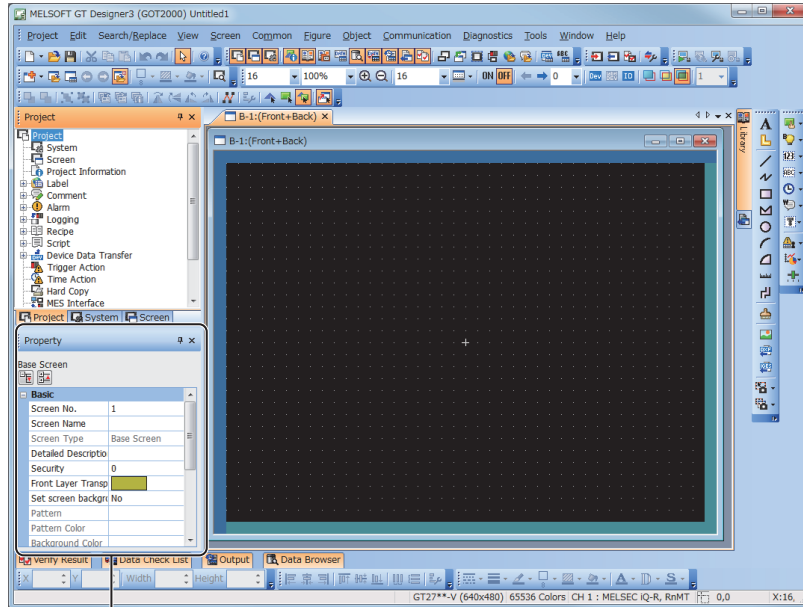

Item	Setting range
[Width]	[1] to [2000]
[Height]	[1] to [1600]

In the [Property] window, the width and height of a grouping of figures or objects are not changeable.

## 11.9.2 How to use the property sheet

GT27 GT25 GT23 GT21 SoftGOT2000 GS

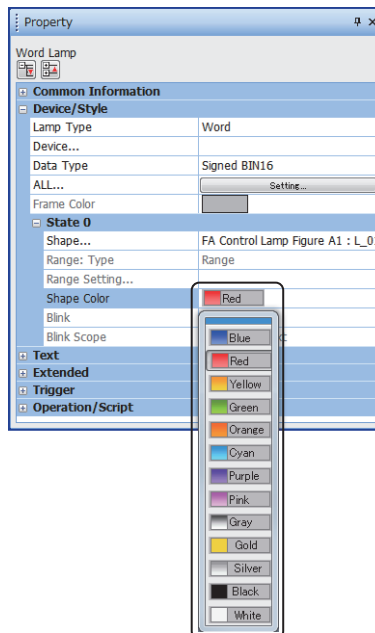

- Step 1** Click [View] → [Docking Window] → [Propertysheet] from the menu to display the [Property] window.  
In the default setting, the [Property] window is docked with GT Designer3.  
→ 11.9.4 [Property] window

[Property] window

- Step 2** Select the target screen, figure, or object to display the attributes of the target in the [Property] window.  
**Step 3** To change an attribute, change the set value in the attribute list of the [Property] window.

The method of setting each attribute is the same as that applied to each setting dialog.  
Example) Changing the color

## 11.9.3 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 Batch change performed when multiple targets are selected

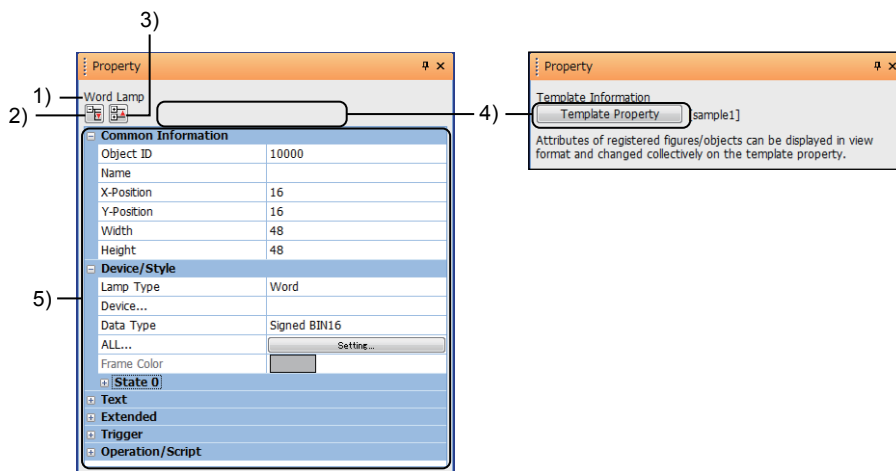

A change of a set value in the [Property] window is reflected in the attribute of all the selected figures and objects.  
To avoid an unintentional change, select only the targets that need the change.

### ■ 2 Shape settings of objects

In the [Property] window, the shape of objects cannot be changed to [None].  
Change the shape of objects to [None] in the setting dialog for each object if necessary.

## 11.9.4 [Property] window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) Display target

Displays the target that gets its attributes displayed in the [Property] window.

#### 2) [Unfold All] button

Expands all attribute items.

#### 3) [Fold All] button

Collapses all attribute items.

#### 4) [Template Property] button

Appears when a template information box is selected.

Switches the [Property] window to the one for template attributes.

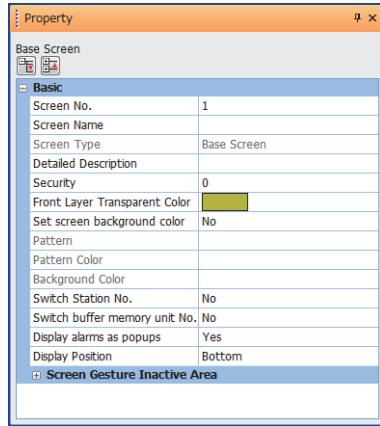

⇒ 11.6.6 [Property] window (when the template property is displayed)

#### 5) Attribute list

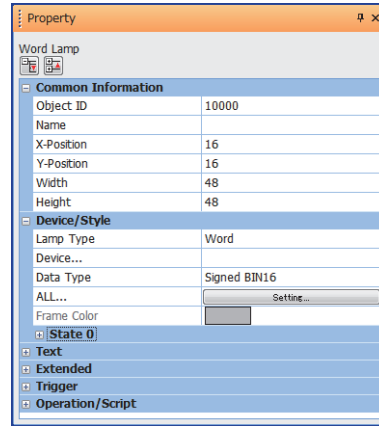

Lists the attributes the target has had.

The contents displayed depend on the target.

- Base screens, window screens, report screens and mobile screens  
The same contents as those in the [Basic] tab in the [Screen Property] dialog are displayed.
- Figures and objects  
The coordinates (X, Y), size (width, height), and the same contents as those in each setting dialog are displayed.
- Templates  
The template attributes are displayed.  
⇒ 11.6.6 [Property] window (when the template property is displayed)

When a base screen is selected

When a word lamp is selected

If multiple figures and objects on the same screen are selected, certain attributes can be changed collectively.

If multiple different figures and objects are selected, the attribute list is displayed as follows.

- If a figure is included in the selection

The attribute list is displayed on the basis of the attributes of the figure in the back most layer.

- If no figure is included in the selection

The attribute list is displayed on the basis of the attributes of the object of the smallest object ID number.

If the set values of attributes common to multiple selected figures and objects differ among the figures and objects, the fields of the set values turn blank.

The attributes that cannot be changed are displayed with the text color in gray.

## 11.10 Customizing GT Designer3

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒ 11.10.1 Customizing the toolbar
- 11.10.2 Customizing the docking window
- 11.10.3 Customizing the operation
- 11.10.4 Customizing the settings related to editing operations
- 11.10.5 Customizing the display
- 11.10.6 Customizing the default value
- 11.10.7 Interaction with iQ Works

### 11.10.1 Customizing the toolbar

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The position of the toolbars for GT Designer3 can be changed and a toolbar can be created in collecting frequently used functions.

- ⇒ ■ 1 Changing the position of toolbars
- 2 Adding/deleting buttons to/from a toolbar
- 3 Resetting toolbars
- 4 Creating toolbars
- 5 Deleting toolbars
- 6 [Customize] dialog

For the details of toolbar types and the method of switching between displaying and hiding toolbars, refer to the following.

- ⇒ 2.2.2 Toolbar and shortcut keys

#### ■ 1 Changing the position of toolbars

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** When the mouse cursor is moved over the left end of the toolbar to move, the shape of the mouse cursor changes as shown below.

- Step 2** Drag the toolbar to the destination while holding it clicked. The toolbar moves.

## ■ 2 Adding/deleting buttons to/from a toolbar

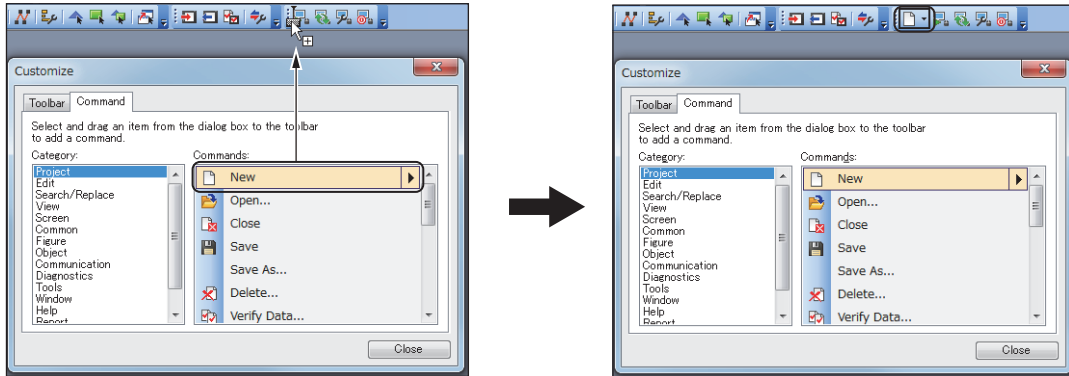

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- ⇒ (1) Adding buttons
- (2) Deleting buttons

### (1) Adding buttons

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- Step 1** Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
- Step 2** Select [Category] in the [Command] tab and drag the command to add from [Command] to the toolbar to which the corresponding button is added.  
The button corresponding to the dragged command is added.

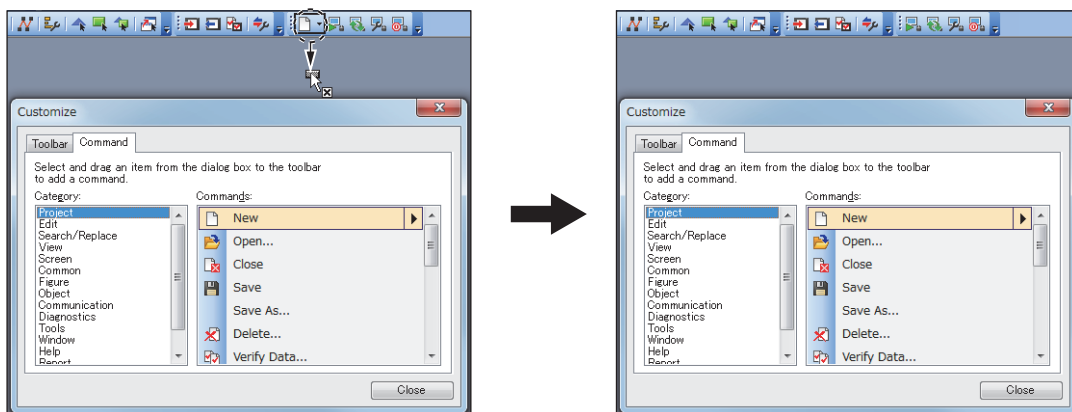

⇒ 11.10.1 ■ 6 (2) [Command] tab

- Step 3** When you have completed making necessary changes, close the [Customize] dialog.  
Changes made to the default toolbars can be reset in the [Toolbar] tab.
- ⇒ 11.10.1 ■ 6 (1) [Toolbar] tab

### (2) Deleting buttons

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

- Step 1** Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
- Step 2** While the [Customize] dialog is displayed, drag out of the toolbar the button to delete from the toolbar.  
The dragged button is deleted.

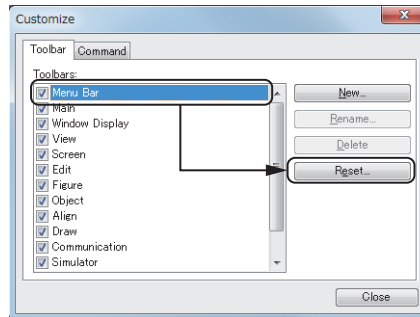

- Step 3** When you have completed making necessary changes, close the [Customize] dialog.

### ■ 3 Resetting toolbars

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1 Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
- Step 2 Select the toolbar to reset in the [Toolbar] tab and click the [Reset] button to reset the toolbar.

Only the default toolbars can be reset.

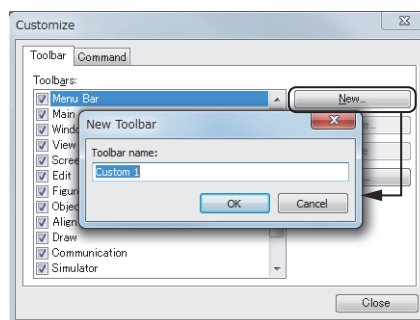

- Step 3 When you have completed making necessary changes, close the [Customize] dialog.

### ■ 4 Creating toolbars

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1 Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
- Step 2 Click the [New] button in the [Toolbar] tab to display the [New Toolbar] dialog.

- Step 3 Set [Toolbar name] and click the [OK] button to create a new toolbar.

Add buttons in the [Command] tab.

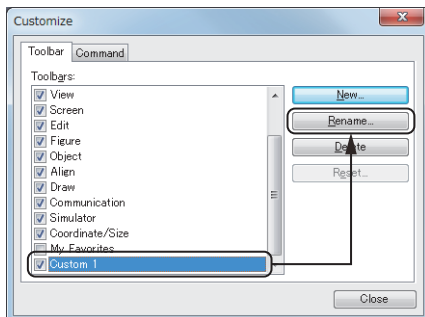

⇒ 11.10.1 ■ 2 (1) Adding buttons

## ■5 Deleting toolbars

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- Step 1** Select [Tools] → [Customize] from the menu to display the [Customize] dialog.
- Step 2** Select the toolbar to delete in the [Toolbar] tab and click the [Delete] button to display the toolbar.
- Only the toolbars created by a user can be deleted.

- Step 3** When you have completed making necessary changes, close the [Customize] dialog.

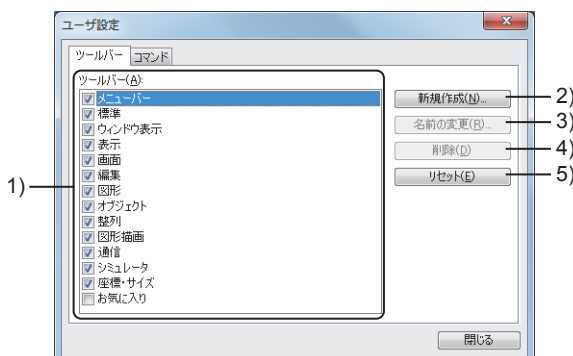

## ■6 [Customize] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒(1) [Toolbar] tab  
(2) [Command] tab

### (1) [Toolbar] tab

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Toolbars]

- Lists the toolbars.
- Switches between displaying and hiding each toolbar.

#### 2) [New] button

- Displays the [New Toolbar] dialog.
- Creates a new toolbar.

#### • [Toolbar name]

- Set the name of the toolbar to create.
- Up to 255 characters can be set.

#### 3) [Rename] button

- Displays the [Rename Toolbar] dialog.
- Changes the name of the toolbar selected in [Toolbars].

The names of the default toolbars cannot be changed.

• **[Toolbar name]**

Set the new name of the toolbar used after the change.  
Up to 255 characters can be set.

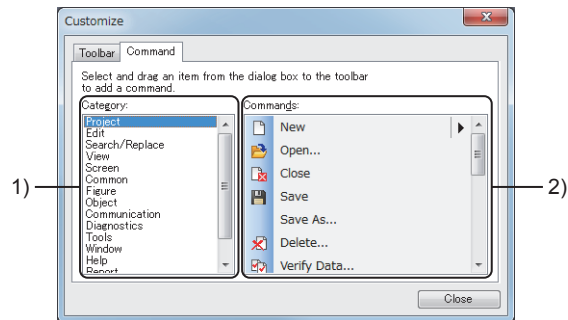

4) **[Delete] button**

Deletes the toolbar selected in the [Toolbars].  
The default toolbars cannot be deleted.

5) **[Reset] button**

Resets the contents of the toolbar selected in [Toolbars] to the initial status.  
Only the default toolbars can be reset.

(2) **[Command] tab**

1) **Category I**

Lists the categories of commands.  
Switches the contents displayed in [Command].

2) **[Command]**

Display the commands to add to the toolbars.  
Drag a command to a toolbar to add a button in the toolbar.

## 11.10.2 Customizing the docking window

GT27 GT25 GT23 GT21 SoftGOT2000 GS

With this function, the position of docking windows can be changed and multiple docking windows can be combined into a single window.

Docking windows can be displayed or hidden as required.

Customized docking windows are saved and retained for the next startup.

If project security is set, customized docking windows are saved by user.

- ■ 1 Screen layout of the docking windows
- 2 Changing the position of docking windows

For the details of docking window types, and the method of switching between displaying and hiding the docking windows, refer to the following.

- 2.2 Screen Layout of GT Designer3
- 2.2.2 Toolbar and shortcut keys

### ■ 1 Screen layout of the docking windows

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the screen layout common to the docking windows.

Example) [Category List] window

#### 1) Title bar

Displays the title of the docking window.

Drag this bar to display the docking guide on the screen.

→ 11.10.2 ■ 2 (1) Docking

#### 2) Autohide button

The contents of the docking window are displayed only when the mouse cursor is moved over the title bar of the docking window.

#### 3) Docking tabs

Switches docking windows.

The tabs are displayed when docking windows are docked.

To extract a docking window from the dock window, drag the corresponding tab out of the dock window.

### ■ 2 Changing the position of docking windows

GT27 GT25 GT23 GT21 SoftGOT2000 GS

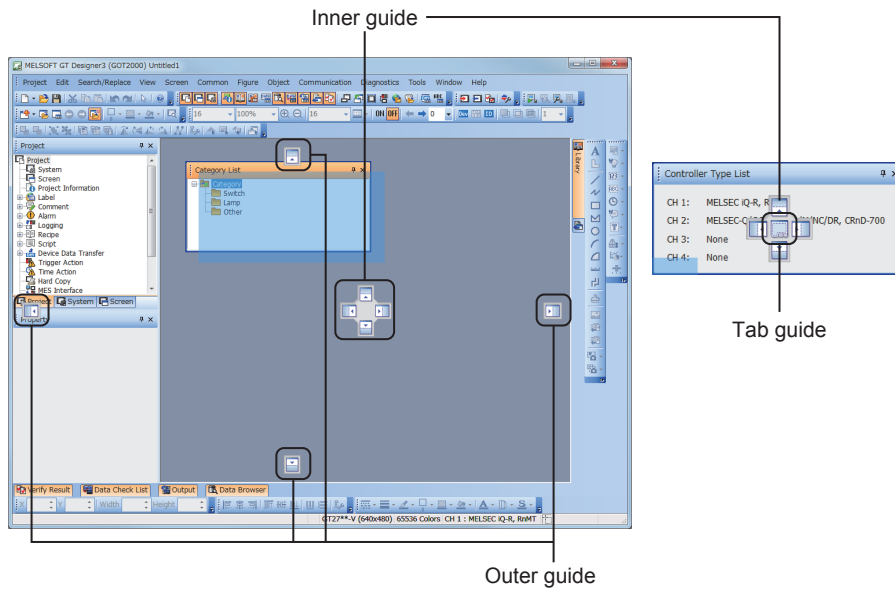

- (1) Docking
- (2) Extracting docking windows from a dock window

## (1) Docking

Example) Docking the [Category List] window with the main screen.

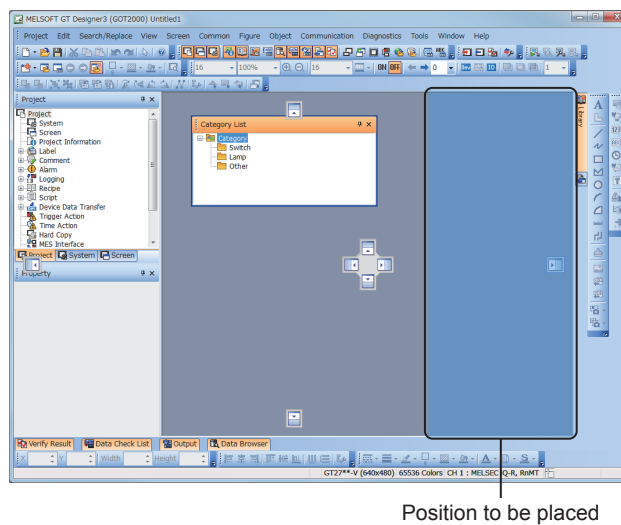

**Step 1** Drag the title bar of the docking window to dock over the main screen to display the docking guides.

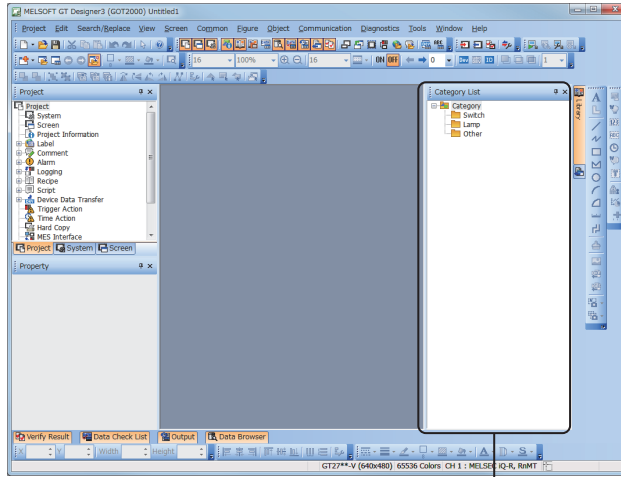

The following shows the types of the docking guides.

- Inner guide (Right/Left/Up/Down)  
Docks the window in a position nearer to the center than where the other docking windows have been already docked.
- Tab guide  
Appears in the center of the inner guide when the docking window is dragged over another docking window. Docks the docking window with another docking window.
- Outer guide (Right/Left/Up/Down)  
Docks the window in a position farther from the center than where the other docking windows have been already docked.

**Step 2** Move the mouse cursor over a docking guide while dragging the docking window over to display the indication of the position where the docking window is placed when it is docked.

**Step 3** Drop the window while the mouse cursor is on the docking guide to dock the docking window.

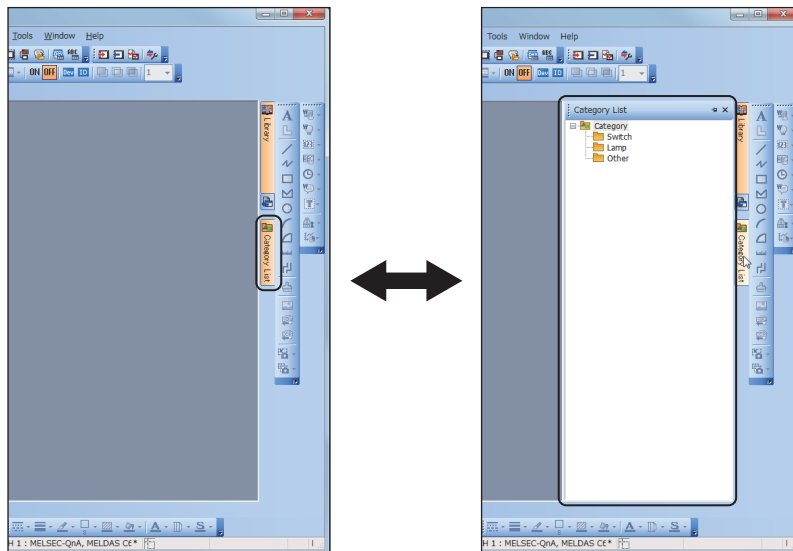

A docking window has been docked.

**Step 4** Enable autohide with the autohide button to display the tab of the docking window.

→ 11.10.2 ■ 1 Screen layout of the docking windows

Place the mouse cursor over the tab to display the docking window.

To change the size of the docking window, place the mouse cursor over and drag the docking window frame.

**(2) Extracting docking windows from a dock window**

**GT27 GT25 GT23 GT21 SoftGOT2000 GS**

**Step 1** Disable autohide of the docking window with the autohide button.

→ 11.10.2 ■ 1 Screen layout of the docking windows

**Step 2** Drag the corresponding tab or the title bar out of the dock window to extract the docking window from the dock window.

Double-clicking the title bar or the tab also extracts the window.

## 11.10.3 Customizing the operation

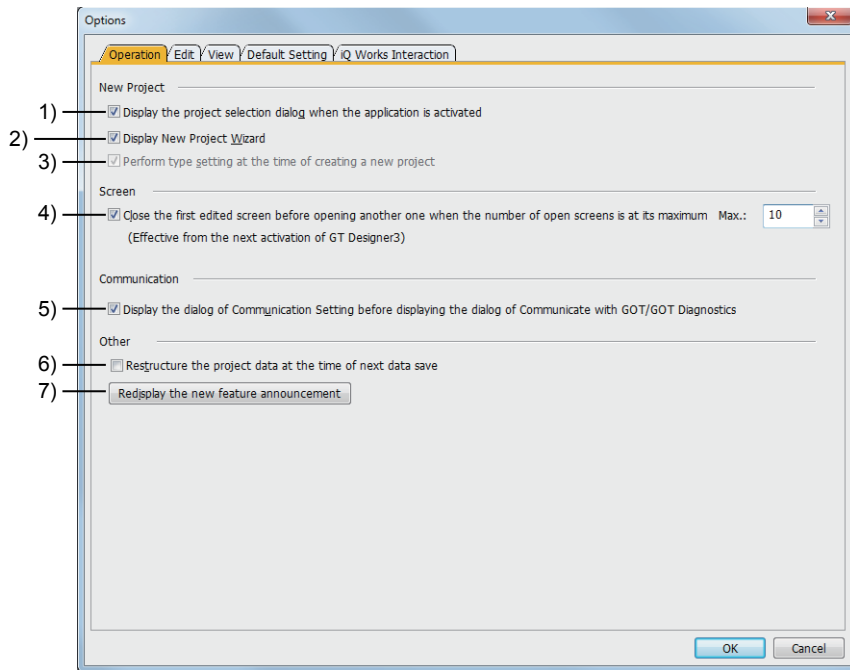

GT27 GT25 GT23 GT21 SoftGOT2000 GS

You can customize settings related to the operations of GT Designer3.

- Step 1** Select [Tools] → [Option] from the menu to display the [Options] dialog.
- Step 2** Change the settings of the [Operation] tab and click the [OK] button to get the settings reflected.
- ⇒ ■ 1 [Option] dialog ([Operation] tab)

### ■ 1 [Option] dialog ([Operation] tab)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Display the project selection dialog when the application is activated]

Displays the [Select Project] dialog at the startup of GT Designer3.

⇒2.1.1 Starting GT Designer3

#### 2) [Display New Project Wizard]

Displays the wizard for a new project when it is created.

⇒2.3.1 ■ 1 Using the wizard

#### 3) [Perform type setting at the time of creating a new project]

Displays the [Type Setting] dialog when a project is created.

When the [Display New Project Wizard] is selected, this operation is disabled.

⇒2.3.1 ■ 2 Without using the wizard

#### 4) [Close the first edited screen before opening another one when the number of open screens is at its maximum]

Closes the first-opened screen when a new editor is opened after the number of screen editors being opened reaches its maximum.

The setting is enabled at the next start-up of GT Designer3.

Item	Description
[Max]	Set the maximum number of screens which can be opened. The setting range is [1] to [25].

#### 5) [Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics]

Displays the [Communication Configuration] dialog before displaying the [Communicate with GOT] dialog or the [GOT Diagnostics] dialog.

#### 6) [Restructure the project data at the time of next data save]

Deletes unnecessary data from a project data to reduce the project data size when the project data is saved.

After the project data is saved, this item is automatically deselected.

Therefore, this setting is not maintained after the project data is saved.

When restructuring the project data, note the following.

- If the personal computer, which the project data is saved and restructured in, does not have Windows fonts used in the project data, each Windows font is changed to the default font of each object.
- The verification results of the project data before and after a restructuring may have inconsistencies.
- When the restructured project data is written to the GOT again, all the screen data are rewritten.

#### 7) [Redisplay the new feature announcement] button

Redisplays the dismissed [New Feature Announcement] dialog.

This item appears when [Do not show this message again] is selected in the [New Feature Announcement] dialog.

### 11.10.4 Customizing the settings related to editing operations

---

Customize the settings related to editing operations on GT Designer3.

**Step 1** Select [Tools] → [Option] from the menu to display the [Options] dialog.

**Step 2** Customize the settings on the [Edit] tab and click the [OK] button to apply changes.

→ ■ 1 [Options] dialog ([Edit] tab)

## ■ 1 [Options] dialog ([Edit] tab)

GT27

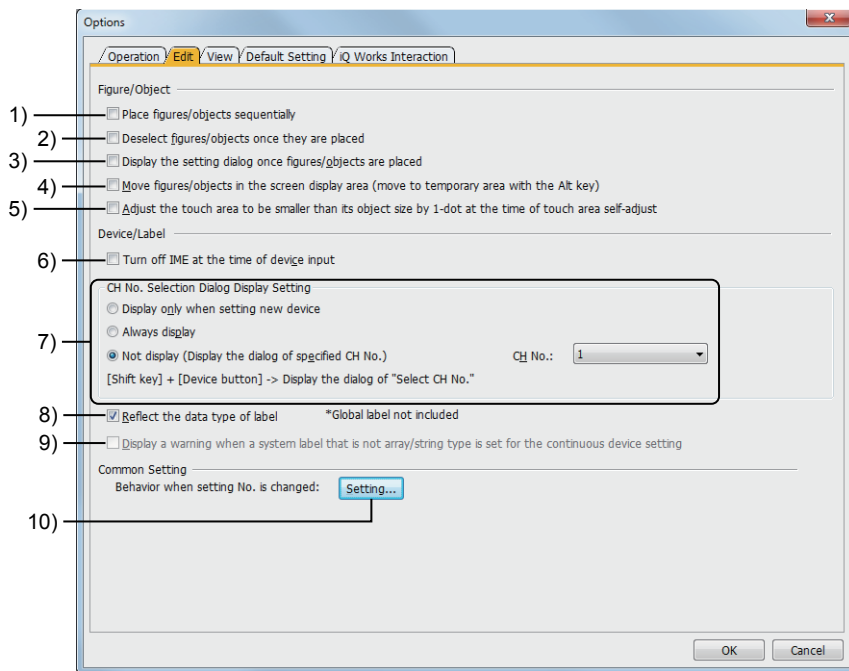

GT25

GT23

GT21

SoftGOT2000

GS

### 1) [Place figures/objects sequentially]

Retains the control of the arrangement mode after a figure or an object is placed. The same figure or object can be placed repeatedly without selecting it from the menu.

To cancel the arrangement mode, right-click or press the [ESC] key.

### 2) [Deselect figures/objects once they are placed]

Deselects figures and objects after they are placed.

### 3) [Display the setting dialog once figures/objects are placed]

Displays the setting dialog automatically every time a figure or an object is placed.

### 4) [Move figures/objects in the screen display area (move to temporary area with the Alt key)]

Limits the area where figures and objects can be placed to the screen display area on the screen editor.

If figures and objects are operated while the [ALT] key is pressed, they can be also placed in the temporary area.

### 5) [Adjust the touch area to be smaller than its object size by 1-dot at the time of touch area self-adjust]

Reduces the touch area to be inside the object area at the time of the touch area self-adjustment. The edge of the touch area becomes 1 dot away from the edge of the object area.

For the touch area self-adjustment, refer to the following.

⇒6.6.14 [Edit Touch Area]

### 6) [Turn off IME at the time of device input]

Disables IME to enter only one-byte characters to specify a device.

### 7) [CH No. Selection Dialog Display Setting]

Select whether to display or hide the [Select CH No.] dialog at the device setting.

The [Select CH No.] dialog is displayed when two or more channels are set.

⇒6.1.1 How to set devices

The following shows selectable items.

- [Display only when setting new device]  
Displays the [Select CH No.] dialog only when a device is newly set.
- [Always display]  
Always displays the [Select CH No.] dialog at the device setting.
- [Not display (Display the dialog of specified CH No.)]  
Does not display the [Select CH No.] dialog at the device setting.

Displays the device setting dialog of the channel set for [CH No.].

Item	Description
[CH No.]	<p>Set these items when [Not display (Display the dialog of specified CH No.)] is selected. The following shows selectable items.</p> <ul style="list-style-type: none"> <li>• [System Label]: Displays the [Import System Labels to Project] dialog.</li> <li>• [Label (GT Designer3)]: Displays the [Select Label (GT Designer3)] dialog.</li> <li>• [Global Label]: Displays the [Select Global Label] dialog.</li> <li>• [OMRON NJ/NX Tag]: Displays the [Select OMRON NJ/NX Tag] dialog.</li> <li>• [1], [2], [3], [4]: Displays the device setting dialog of a set channel.</li> <li>• [Latest]: Displays the device setting dialog of the same channel as that of the latest device setting.</li> </ul>

### 8) [Reflect the data type of label]

Makes data types of objects or others reflect those of the following labels used in the device setting.

- System label
- Label (GT Designer3)

For the correspondence of data types between the system labels and the devices on GT Designer3, refer to the following.

→ 6.1.2 ■ 2 Applicable system labels

### 9) [Display a warning when a system label that is not array/string type is set for the continuous device setting]

Displays a message when the [Import] button is clicked in the [Import System Labels to Project] dialog if a non-array-type or non-string-type system label is set for any of consecutive devices.

### 10) [Setting] button

Displays the [Setting] dialog.

Select whether to reflect a number change to the related common settings and object settings.

→ ■ 2 [Setting] dialog (for customizing the settings related to editing operations)

## ■ 2 [Setting] dialog (for customizing the settings related to editing operations)

### 1) [Comment Group No.], [Comment No.], and [Parts No.]

Select whether to reflect a number change to the related common settings and object settings if the registered number of the following items are changed.

- Comment group
- Comment
- Part

The following shows selectable items.

- [Always reflect]
 

Reflects a number change to the related common settings and object settings.
- [Not reflect]
 

Does not reflect a number change to the related common settings and object settings.
- [Display the confirmation message]
 

Displays a confirmation dialog with each number change.

Select whether to reflect a number change to the related common settings and object settings.

## 11.10.5 Customizing the display

GT27 GT25 GT23 GT21 SoftGOT2000 GS

You can customize the settings related to the display of GT Designer3.

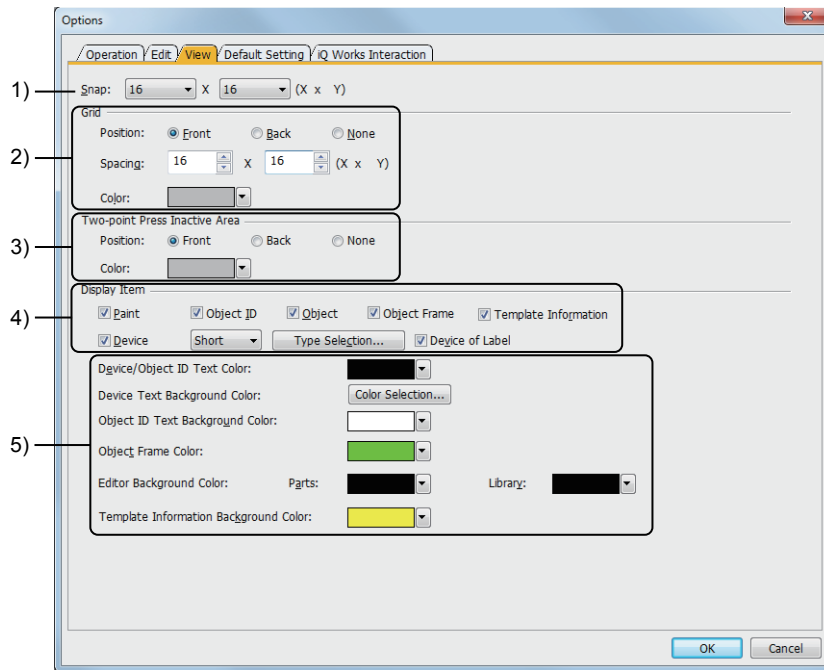

**Step 1** Select [Tools] → [Option] from the menu to display the [Options] dialog.

**Step 2** Change the setting of the [View] tab and click the [OK] button to get the setting reflected.

→ ■ 1 [Options] dialog ([View] tab)

### ■ 1 [Options] dialog ([View] tab)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Snap]

Select the interval (in dots) between figures and objects when they are placed or moved on the screen editor. The following shows selectable items.

- [1]
- [2]
- [4]
- [8]
- [16]

#### 2) [Grid]

Set the position and the distance between the lines of the grid on the screen editor.

The grid is set not for each project but for GT Designer3. The customized grid is enabled regardless of the project to be opened.

Item	Description
[Position]	Select the display position of the grid. The following shows selectable items. <ul style="list-style-type: none"> <li>• [Front]</li> <li>• [Back]</li> <li>• [None]</li> </ul>
[Spacing]	Set the grid spacing (in dots). The setting range is [2] to [64] dots.
[Color]	Select the grid color. <p style="text-align: right;">→6.4.2 Color settings</p>

#### 3) [Two-point Press Inactive Area]

Set the display position and the color of the two-point press inactive area on the screen editor.

Only GT27 is supported.

To enable the two-point touch on the GOT, the touched points must be in different two-point press inactive areas. Place the points for the two-point touch in different two-point press inactive areas.

⇒ 8.2.3 ■ 2 (1) Simultaneous 2-point press

Item	Description
[Position]	Select the display position of the two-point press inactive area. The following shows selectable items. <ul style="list-style-type: none"> <li>• [Front]</li> <li>• [Back]</li> <li>• [None]</li> </ul>
[Color]	Select the color of the two-point press inactive area ⇒ 6.4.2 Color settings

#### 4) [Display Item]

Set the information to be displayed on the screen editor.

Item	Description
[Paint]	Displays a color on the area to be filled.
[Object ID]	Displays the object ID numbers on the objects.
[Object]	Displays the objects on the screen editor.
[Object Frame]	Displays the object frames on the screen editor.
[Template Information]	Displays the template information on the screen editor.
[Device]	Displays the set devices on the objects. The display type can be selected. The following shows selectable items. <ul style="list-style-type: none"> <li>• [Short]: Displays devices only. (For labels (GT Designer3): Displays label names only.)</li> <li>• [Full]: Displays channel numbers, network numbers, station numbers, CPU numbers, and devices. (For labels (GT Designer3): Displays label group names and label names.)</li> </ul> Click the [Type Selection] button to display the [Type Selection] dialog. Whether to display or hide the devices other than monitor devices and display colors can be set. ⇒ ■ 2 [Type Selection] dialog
[Device of Label]	Displays the devices assigned to the following labels on objects. <ul style="list-style-type: none"> <li>• System label</li> <li>• Label (GT Designer3)</li> </ul>

#### 5) Color setting

Set a text color and background color.

⇒ 6.4.2 Color settings

Item	Description
[Device/Object ID Text Color]	Select the text color of the devices and object ID numbers displayed on the objects.
[Device Text Background Color]	Select the text background color of the devices displayed on the objects. Click the [Color Selection] button to display the [Type Selection] dialog. Whether to display or hide the devices other than monitor devices and display colors can be set. ⇒ ■ 2 [Type Selection] dialog
[Object ID Text Background Color]	Select the text background color of the object ID numbers displayed on the objects.
[Object Frame Color]	Select the display color of the object frames.
[Editor Background Color]	<ul style="list-style-type: none"> <li>• [Parts] Select the background color of the parts editor.</li> <li>• [Library] Select the background color of the library editor.</li> </ul>
[Template Information Background Color]	Select the background color of the template information.

## ■ 2 [Type Selection] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Monitor Device]

Displays the monitor devices on the objects.  
This item cannot be deselected.  
Select the text background color of the devices.

### 2) [Lamp Device of Switch]

Displays the devices set for the lamp function of touch switches.  
Select the text background color of the devices.

### 3) [Trigger Type]

Displays the devices set as display conditions or operating conditions  
Select the text background color of the devices.

## 11.10.6 Customizing the default value

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Default values are values preset for placed figures or objects.

By setting frequently used values as the default values, drawings can be efficiently executed.

- ■ 1 How to use default values
- 2 [Option] dialog ([Default Setting] tab)

### ■ 1 How to use default values

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Changing default values in the [Option] dialog
- (2) Setting the values set for edited figures and objects as the default values
- (3) Canceling changes and resetting the default values to the initial values
- (4) Exporting the default values
- (5) Importing the default values

### (1) Changing default values in the [Option] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

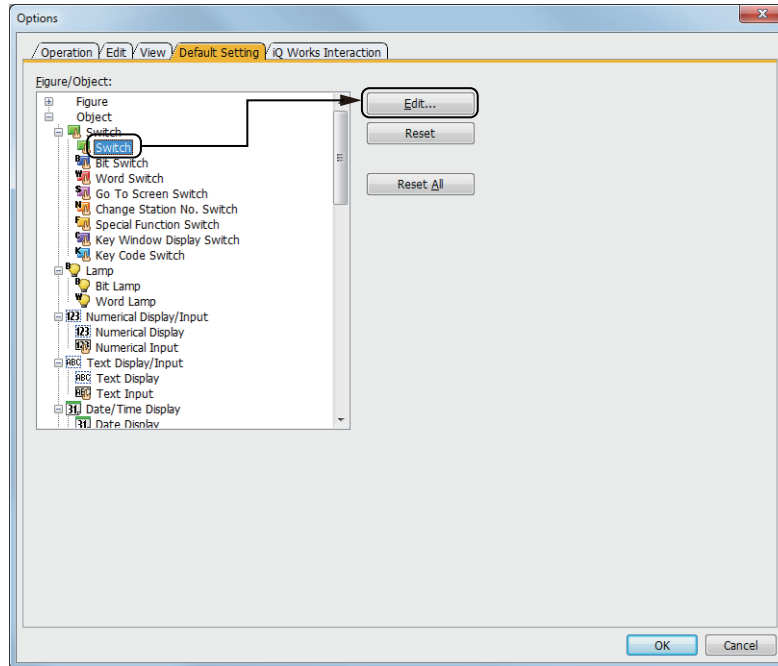

**Step 1** Carry out either of the following operations to display the [Option] dialog.

- Select [Tools] → [Default Setting] → [Edit] from the menu.
- Select [Tools] → [Option] from the menu.

**Step 2** Select the target for the change of the default value in [Figure/Object] of the [Default Setting] tab and click the [Edit] button.

→ 11.10.6 ■ 2 [Option] dialog ([Default Setting] tab)

Example) Setting the default value of switches

**Step 3** Displays the setting dialog for the target selected in [Figure/Object].

Set a default value and click the [OK] button

**Step 4** Click the [OK] button in the [Option] dialog to complete changing the default value.

### (2) Setting the values set for edited figures and objects as the default values

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows how to set the values set for a figure/an object as the default values.

**Step 1** Place a figure or an object on the screen editor and change the settings in the setting dialog or others.

→ 6.5.1 Placing figures and objects

**Step 2** Select the figure or the object and [Edit] → [Set to Default] from the menu to set the values set for the figure or object as the default values.

### (3) Canceling changes and resetting the default values to the initial values

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Carry out either of the following operations to display the [Option] dialog.

- Select [Tools] → [Default Setting] → [Edit] from the menu.
- Select [Tools] → [Option] from the menu.

**Step 2** Carry out either of the following operations.

- Resetting default values to the initial values by figure/object  
Select the target for resetting the default value in [Figure/Object] in the [Default Setting] tab and click the [Reset] button.
- Resetting the default values of all the figures and objects to the initial values

Click the [Reset All] button in the [Default Setting] tab.

**Step 3** Click the [OK] button in the [Option] dialog to complete changing the default value.

#### (4) Exporting the default values

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select [Tools] → [Default Setting] → [Export] from the menu to display the [Save As] dialog.

**Step 2** Set [File name] and [Save as type] and click the [Save] button to export the default value setting.

#### (5) Importing the default values

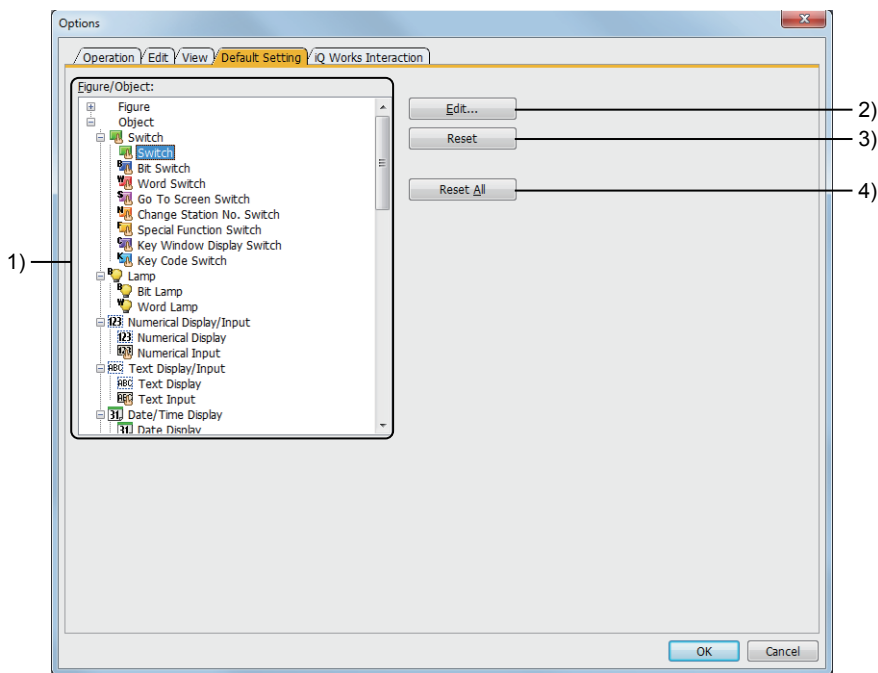

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select [Tools] → [Default Setting] → [Import] from the menu to display the [Open Default Setting File] dialog.

**Step 2** Set [File name] and [Save as type] and click the [Open] button to import the default value setting.

### ■ 2 [Option] dialog ([Default Setting] tab)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Figure/Object]

Lists figures and objects.

For the items of figures and objects that have got the default values changed, [\*] is displayed to the right of the names.

When an item is double-clicked, the setting dialog is displayed as it is displayed when the [Edit] button is clicked.

#### 2) [Edit] button

Displays the setting dialog of the figure/object selected in [Figure/Object].

The items for which no default value can be set are displayed in gray.

After changing settings, click the [OK] button to change the default value.

#### 3) [Reset] button

Resets the default value of the figure/object selected in [Figure/Object] to the initial value.

#### 4) [Reset All] button

Resets the default value of all the figures and objects to the initial values.

## 11.10.7 Interaction with iQ Works

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2107-W.

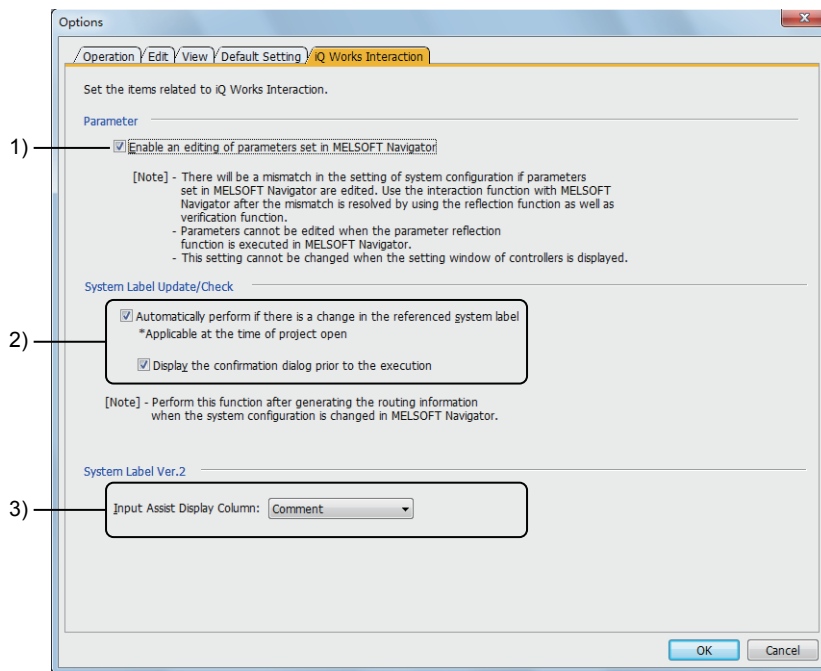

You can change the settings related to the operations of GT Designer3 in interaction with MELSOFT Navigator.

- Step 1** Select [Tools] → [Option] from the menu to display the [Options] dialog.
- Step 2** Change the settings of the [iQ Works Interaction] tab and click the [OK] button to get the settings reflected.
- ■ 1 [Option] dialog ([iQ Works Interaction] tab)

### ■ 1 [Option] dialog ([iQ Works Interaction] tab)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2107-W.

#### 1) [Enable an editing of parameters set in MELSOFT Navigator]

Allows edits to be performed on the parameters reflected from MELSOFT Navigator by GT Designer3.

When editing the parameters reflected from MELSOFT Navigator, make the same changes to the settings for MELSOFT Navigator.

If the settings differ between MELSOFT Navigator and GT Designer3, the GOT may not communicate with controllers after package data are transferred to the GOT.

In this case, match the settings for MELSOFT Navigator with those for GT Designer3 using verification between parameter reflection/system configuration information and parameters, provided by MELSOFT Navigator.

For how to use MELSOFT Navigator, refer to the following.

→ Help on MELSOFT Navigator

#### 2) [Automatically perform if there is a change in the referenced system label]

If there is a change in the system label being referred when a project is opened, updates the system label automatically.

Item	Description
[Display the confirmation dialog prior to the execution]	Displays the confirmation dialog before system labels are automatically updated.

#### 3) [Input Assist Display Column]

Of the comment set for a system label Ver.2, select the column to be displayed on the input assist.

The following shows selectable items.

- [Comment]
- [Comment2]

- [Comment3]
- [Comment4]
- [Comment5]
- [Comment6]
- [Comment7]
- [Comment8]
- [Comment9]
- [Comment10]
- [Comment11]
- [Comment12]
- [Comment13]
- [Comment14]
- [Comment15]
- [Comment16]

---

**Point** **Editing the parameters reflected from MELSOFT Navigator**

When editing the parameters reflected from MELSOFT Navigator, make the same changes to the settings for MELSOFT Navigator.

If the settings differ between MELSOFT Navigator and GT Designer3, the GOT may not communicate with controllers after package data are transferred to the GOT.

In this case, match the settings for MELSOFT Navigator with those for GT Designer3 using verification between parameter reflection/system configuration information and parameters, provided by MELSOFT Navigator.

For how to use MELSOFT Navigator, refer to the following.

→ Help on MELSOFT Navigator

## 11.11 Checking Data Size

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The data size of created screens or projects can be checked.

→ 11.11.1 Checking the data size of a screen

11.11.2 Checking data size of project

For the relationship between the GOT storage memory (ROM)/operation memory (RAM) and the data to be transferred, refer to the following.

→ 12.6 Data Transferred to the GOT and Storage Destination

### 11.11.1 Checking the data size of a screen

GT27 GT25 GT23 GT21 SoftGOT2000 GS

**Step 1** Select the screen to check the data size.

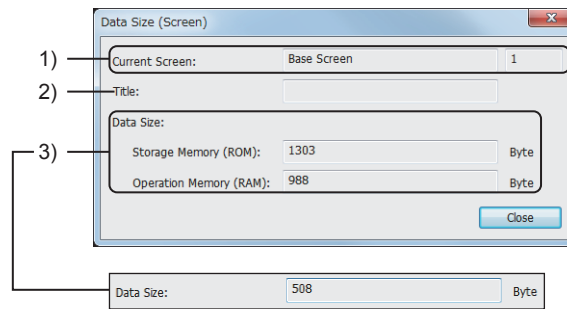

**Step 2** Select [Tools] → [Data Size] → [Screen] from the menu to display the [Data Size (Screen)] dialog.

Check the data size.

→ ■ 1 [Data Size (Screen)] dialog

#### ■ 1 [Data Size (Screen)] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

GT SoftGOT2000 and GT21

#### 1) [Current Screen]

Displays the type of the screen being edited and the associated number.

#### 2) [Title]

Displays the title of the screen being edited.

#### 3) [Data Size]

Displays the data size of the screen.

For GT SoftGOT2000, the data size of the screen saved in a personal computer is displayed.

For GT21, the data size of the screen expanded in the GOT operation memory (RAM) is displayed.

Item	Description
[Storage Memory (ROM)]	Displays the data size of the screen saved in the GOT storage memory (ROM).
[Operation Memory (RAM)]	Displays the data size of the screen expanded in the GOT operation memory (RAM).

## 11.11.2 Checking data size of project

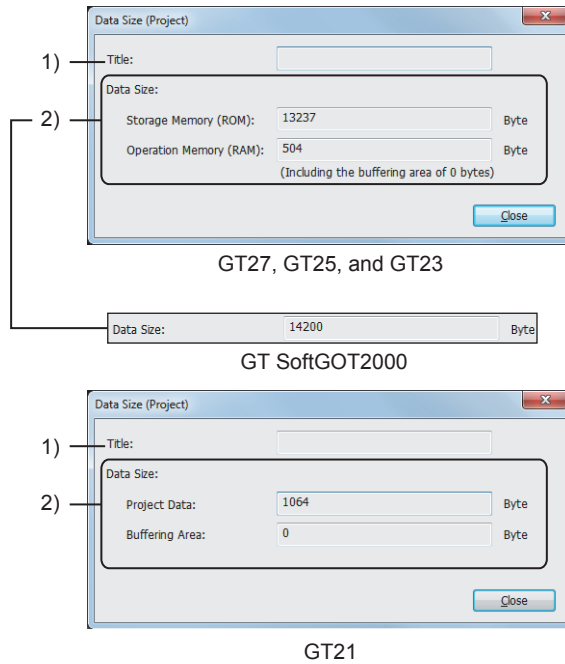

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Select [Tools] → [Data Size] → [Project] from the menu to display the [Data Size (Project)] dialog.  
Check the data size.

→ ■ 1 [Data Size (Project)] dialog

### ■ 1 [Data Size (Project)] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Title]

Displays the title of the project.

#### 2) [Data Size]

Displays the data size of the project.

For GT SoftGOT2000, the data size of the project saved in a personal computer is displayed.

Item	Description
[Storage Memory (ROM)]	This item appears for GT27, GT25, and GT23. The data size of the project saved in the GOT storage memory (ROM) is displayed.
[Operation Memory (RAM)]	This item appears for GT27, GT25, and GT23. The data size of the project expanded in the GOT operation memory (RAM) is displayed.
[Project Data]	This item appears for GT21. The data size of the project data is displayed.
[Buffering Area]	This item appears for GT21. The data size of the project saved in the buffering area is displayed.

## 11.12 Zooming and Scrolling the Monitor Screen of the GOT (Screen Gesture Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Zoom and scroll the screen while the user-created screen on the GOT is displayed.

Even though many objects are arranged on the screen, erroneous operation can be preventive by zooming the screen.

Zoom and scroll the screen after switching to the screen gesture mode.

The operation for the objects is not available except part of area of the screen during the screen gesture mode.

→ 11.12.1 Specification of the screen gesture function

11.12.2 How to use the screen gesture function (setting with GT Designer3)

11.12.3 How to use the screen gesture function (operating with the GOT)

11.12.4 Relevant settings

11.12.5 Precautions

### 11.12.1 Specification of the screen gesture function

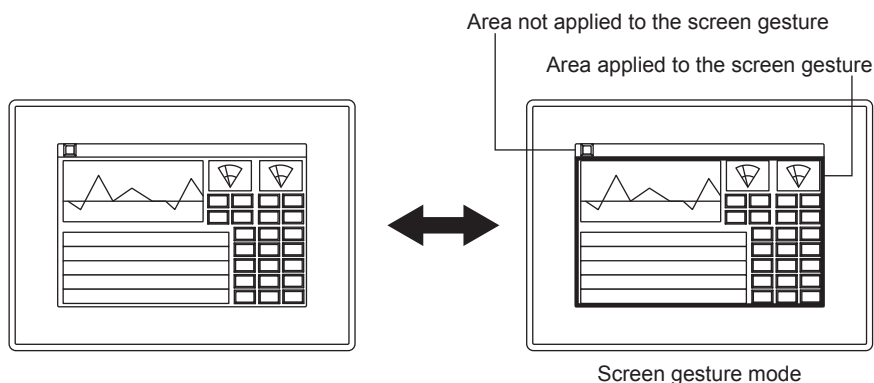

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 Screen gesture mode
- 2 Applicable screens to the screen gesture mode
- 3 Switching to and cancelling the screen gesture mode
- 4 Zooming and scrolling the screen
- 5 Displaying the screen during the screen gesture mode
- 6 Effect on other functions

## 1 Screen gesture mode

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Using the screen gesture mode to zoom and scroll the monitor screen of the GOT  
Zooming and scrolling the screen are available only on the area applied to the screen gesture.  
Switch to the screen gesture mode to display the frame for the area applied to the screen gesture.

The frame colors indicate which section of the enlarged screen is displayed.

### (1) Area applied to the screen gesture

The area to zoom and scroll the screen

The operation for the objects on the area applied to the screen gesture is not available.

The status of zooming and scrolling the screen during the screen gesture mode is kept even after the screen gesture mode is cancelled.

Switch the screen to reset the status of zooming and scrolling the screen.

### (2) Area not applied to the screen gesture

The area in which operating objects is enabled even in the screen gesture mode. Zooming and scrolling the screen are not available in this area.

The height of the area is 32 dots from the top edge of the screen by default. The height and position of the area are changeable.

To operate an object in the screen gesture mode, place the object in the screen gesture inactive area.

For how to set the screen gesture inactive area, refer to the following.

→2.7.1 ■ 1 [Basic] tab

## 2 Applicable screens to the screen gesture mode

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the applicable screens to the screen gesture mode.

- Base screen
- Superimpose window (only when it is displayed on the base screen.)
- Called screen (only when it is displayed on the base screen.)

Whether the screen gesture function is available or not is set by the project.

(The superimpose window and the called screen are applied to whether they are available for the destination screen to be displayed or not.)

→11.12.2 ■ 1 Enabling the screen gesture function

### ■ 3 Switching to and cancelling the screen gesture mode

- ⇒(1) Switch to the screen gesture mode.
- (2) Cancel the screen gesture mode.

#### (1) Switch to the screen gesture mode.

The following operation can switch to the screen gesture mode.

- Touch the key code switch.
  - ⇒11.12.2 ■ 2 Arranging the switch for switching to the screen gesture mode
  - 11.12.3 ■ 1 Switching the mode of the GOT to the screen gesture mode

#### (2) Cancel the screen gesture mode.

The screen gesture mode is cancelled by the operation and at the timing as follows.

- Touch the key code switch.
  - ⇒11.12.2 ■ 2 Arranging the switch for switching to the screen gesture mode
  - 11.12.3 ■ 1 Switching the mode of the GOT to the screen gesture mode
- Display the utility.
- Switch the screen (change of the screen switching device value).
- Display the system dialog.

### ■ 4 Zooming and scrolling the screen

- ⇒(1) Zoom the screen.
- (2) Scroll the screen.

#### (1) Zoom the screen.

The following operation can zoom the screen during the screen gesture mode.

- Pinch in and pinch out the screen.
  - ⇒11.12.3 ■ 2 Zooming the screen of the GOT

#### (2) Scroll the screen.

The following operation can scroll the screen during the screen gesture mode.

- Flick and slide the screen.
  - ⇒11.12.3 ■ 3 Scrolling the screen of the GOT

### ■ 5 Displaying the screen during the screen gesture mode

- ⇒(1) Display the screen.
- (2) Display the superimpose window and the called screen.
- (3) Display the overlap window and the key window.

#### (1) Display the screen.

Switch to the screen gesture mode to display the frame for the area applied to the screen gesture.

When the value of the screen switching device during the operations such as pinching in and flicking the screen is changed, the screen is switched after releasing fingers from the screen of the GOT.

Switching to the screen to cancel the screen gesture mode and reset the status of zooming and scrolling the screen.

**(2) Display the superimpose window and the called screen.**

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The superimpose window and the called screen are applied as part of the base screen of the destination display. When the base screen on the destination display is zoomed or scrolled, the status of zooming and scrolling the screen is applied to the superimpose window and the called screen. Even though the screen switching of the superimpose window is performed, the status of zooming and scrolling the screen is kept.

**(3) Display the overlap window and the key window.**

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Switch to the screen gesture mode not to display the overlap window and the key window. Cancel the screen gesture mode to display the overlap window and the key window at the original position again. The status of zooming and scrolling the screen is not applied to the overlap window and the key window. The status of zooming and scrolling the screen is not applied to the display position specification device of the overlap window either.

Example) Switch to the screen gesture mode during the display of overlap window 1.

**6 Effect on other functions**

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Numerical input and character string input
- (2) Video/RGB display object
- (3) Function for displaying the popup display
- (4) Hard copy
- (5) Remote personal computer operation (Serial)
- (6) VNC Server function
- (7) Video display function and multimedia function
- (8) Operation Log
- (9) SoftGOT-GOT link function
- (10) GOT internal device to notify the touch status of the GOT
- (11) Screen save

**(1) Numerical input and character string input**

When the mode is switched to the screen gesture mode during the numerical input and character string input, the input contents are canceled.

**(2) Video/RGB display object**

The input image is not displayed in the screen gesture mode.

To display the image, clear the screen gesture mode.

If the video/RGB display object overlaps the screen gesture inactive area, the input image is not displayed as well.

**(3) Function for displaying the popup display**

Popup display under the alarm popup display, VNC server function, SoftGOT-GOT link function, and others is also made during the screen gesture mode.

The display position switching is also available with a touch at the left edge of the popup display.

The display position is corrected so as not to overlap the area not applied to the screen gesture.

Example) Screen gesture inactive area set on the top edge of the screen

**(4) Hard copy**

When the hard copy is performed with the GOT screen zoomed or scrolled, the zoomed or scrolled screen is output.

**(5) Remote personal computer operation (Serial)**

Even though RGB screen (screen of personal computer) is touched with the screen zoomed or scrolled, the touched position is not sent to the personal computer correctly.

When using the remote personal computer operation function (Serial), do not use zooming and scrolling the screen while RGB screen (personal computer screen) is displayed on the GOT.

**(6) VNC Server function**

When VCN client obtains the authorization with communicating VCN client (such as a personal computer) with VCN server (GOT), the screen gesture mode is cancelled and the zoomed or scrolled screen is reset either.

The mode cannot be switched to the screen gesture mode while VCN client obtains the authorization.

**(7) Video display function and multimedia function**

The image input from the external device is not displayed during the screen gesture mode.

Cancel the screen gesture mode to display the image.

Zooming and scrolling the screen is not applied.

**(8) Operation Log**

The operation log includes switching to and cancelling the screen gesture mode.

The operation log does not include the operations during the screen gesture mode.

**(9) SoftGOT-GOT link function**

Even though switching to the screen gesture mode or, zooming and scrolling the screen is performed on the GOT, GT SoftGOT2000 communicating with the GOT is unaffected.

**(10) GOT internal device to notify the touch status of the GOT**

The following shows the action of the GOT internal device to notify the touch status of the GOT while the screen gesture function is used.

- Touch Status External Notification (X-coordinate) (GS654) and Touch Status External Notification (Y-coordinate) (GS655)

They are not operated during the screen gesture mode.

Cancel the screen gesture mode and touch the area applied to the screen gesture of the zoomed or scrolled screen to notify the coordinate applied to the zoomed or scrolled the screen.

- Touch Status External Notification (Touch Status) (GS656)

It is not operated during the screen gesture mode.

## (11)Screen save

Even though the status of the GOT is changed to the status of the screen save during the screen gesture mode, the screen gesture mode is kept.

### 11.12.2 How to use the screen gesture function (setting with GT Designer3)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ➔ ■ 1 Enabling the screen gesture function
- 2 Arranging the switch for switching to the screen gesture mode

#### ■ 1 Enabling the screen gesture function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The screen gesture function is enabled by default.

(In common with the object gesture function)

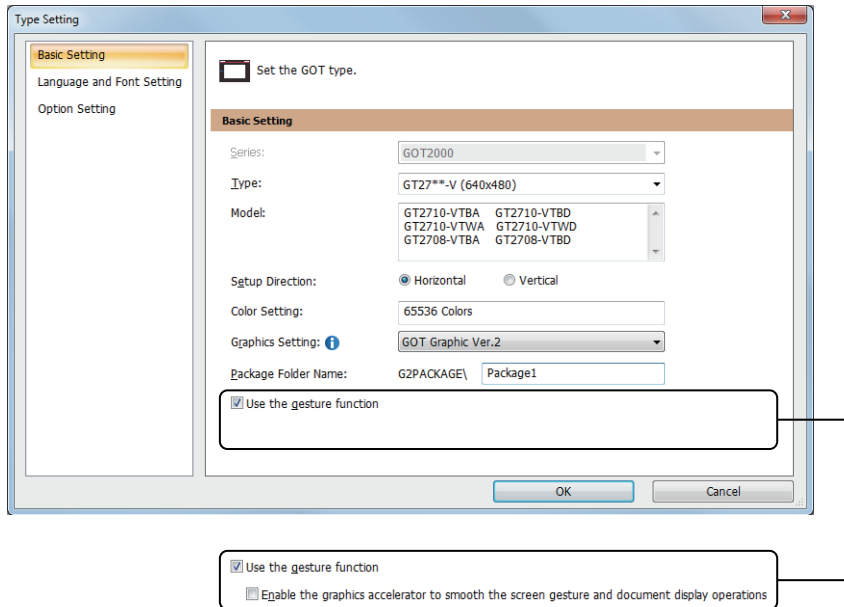

If the screen gesture function is not enabled, configure the setting according to the following procedure.

**Step 1** Select [Common] → [GOT Type Setting] from the menu to display the [Type Setting] dialog.

➔5.1.4 [Type Setting] dialog

**Step 2** Select [Use the gesture function] and click the [OK] button.

The screen gesture function is enabled.

#### GOT Graphic Ver.1

To smooth the operations, also select [Enable the graphics accelerator to smooth the screen gesture and document display operations].

Enabling the graphics accelerator may increase the GOT startup time.

In the screen gesture mode, the object display is not refreshed.

**Step 3** Set the switching method to the screen gesture mode.

- ➔ ■ 2 Arranging the switch for switching to the screen gesture mode

## ■2 Arranging the switch for switching to the screen gesture mode

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Even though the switch for switching to the screen gesture mode is arranged on the screen where using the screen gesture function is not set, the switch cannot be operated.

Configure the setting for using the screen gesture function.

→ ■ 1 Enabling the screen gesture function

**Step 1** Select [Object] → [Switch] → [Key Code Switch] from the menu to arrange a key code switch in the screen gesture inactive area on the screen, which uses the screen gesture function.

→6.5.1 Placing figures and objects

The position and size of the screen gesture inactive area are settable on the [Basic] tab in the [Screen Property] dialog.

To display the frame of the screen gesture inactive area on the screen editor, select [Display the screen gesture inactive area].

→2.7.1 ■ 1 [Basic] tab

**Step 2** Double-click the arranged key code switch to display the setting dialog.

**Step 3** Set the following and click the [OK] button to complete the setting.

- Select [Screen Gesture] in [Key Code Type].
- Select [Screen gesture mode switching] in [Code Setting].

## 11.12.3 How to use the screen gesture function (operating with the GOT)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

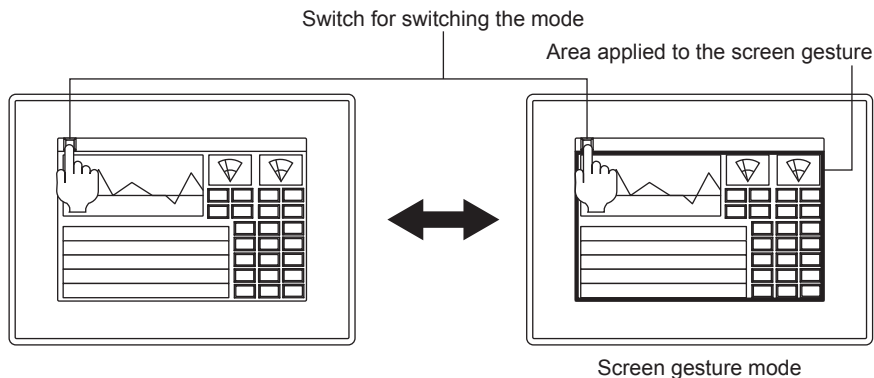

- ➔ ■ 1 Switching the mode of the GOT to the screen gesture mode
- 2 Zooming the screen of the GOT
- 3 Scrolling the screen of the GOT

### ■ 1 Switching the mode of the GOT to the screen gesture mode

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Touch the switch for switching the mode to switch to the screen gesture mode.

Switch to the screen gesture mode to display the frame for the area applied to the screen gesture.

Touch the switch for switching the mode during the screen gesture mode to cancel the screen gesture mode.

### ■ 2 Zooming the screen of the GOT

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Pinch in the screen to zoom out the screen and pinch out the screen to zoom in the screen.

Zooming out the screen is available to the screen in the zoomed-in the screen.

#### (1) Zoom out (pinch in) the screen.

**Step 1** Touch two positions as the center of the area to be zoomed out on the GOT screen.

**Step 2** Pinch in the screen by the finger toward the center of the two positions to zoom out the screen in the center of the two positions.

The screen cannot be zoomed out with less than the original size of the screen.

Display update of the object is cancelled during the operation.

#### (2) Zoom in (pinch out) the screen.

**Step 1** Touch two positions as the center of the area to be zoomed in on the GOT screen.

**Step 2** Pinch out the screen by the fingers from the center of the two positions outward to zoom in the screen in the center of the two positions.

The screen can be zoomed in up to four times of the screen with the original size.  
 The screen might blur by zooming in the screen.  
 Display update of the object is cancelled during the operation.

### (3) Full scale display

Touch the key code switch having the following settings to return the GOT screen to the actual size (100%) and to cancel the screen gesture mode.

- [Screen Gesture] is selected for [Key Code Type].
- [Full scale display (100%)] is selected in [Code Setting].

Arrange the key code switch used in the screen gesture mode in the screen gesture inactive area.

→ 11.12.2 ■ 2 Arranging the switch for switching to the screen gesture mode

## ■ 3 Scrolling the screen of the GOT

Flick or slide the screen of the GOT to scroll the screen.

### (1) Flick the screen.

Flick the screen to scroll the screen.

### (2) Slide the screen.

Move a figure with the figure touched on the screen to scroll the screen.

## 11.12.4 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the screen gesture function as required.  
The following shows the functions that are available by the relevant settings.

### ■ 1 GOT type settings

Select [Common] → [GOT Type Setting] from the menu to display the [GOT Type Setting] dialog.  
⇒5.1.4 [Type Setting] dialog

Function	Setting item
Enabling the gesture function	[Use the gesture function]
Smoothing the operations of the screen gesture function	<b>GOT Graphic Ver.1</b> [Enable the graphics accelerator to smooth the screen gesture and document display operations]

## 11.12.5 Precautions

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■ 1 Arranging the switch for switching to the screen gesture mode

The objects arranged in the area applied to the screen gesture cannot be operated during the screen gesture mode.

When the switch for switching the mode is arranged to the area applied to the screen gesture, after switching to the screen gesture mode, the mode cannot be cancelled by the switch for switching the mode.

Arrange the switch for switching the mode to the area not applied to the screen gesture.

⇒11.12.2 ■ 2 Arranging the switch for switching to the screen gesture mode

### ■ 2 Combination with the remote personal computer operation function (Serial)

Even though RGB screen (screen of personal computer) is touched with the screen zoomed or scrolled, the touched position is not sent to the personal computer correctly.

When using the remote personal computer operation function (Serial), do not use zooming and scrolling the screen while RGB screen (personal computer screen) is displayed on the GOT.

### ■ 3 Operating the GOT with a mouse

When the GOT is operated using a mouse with the USB mouse, the keyboard function, the VNC server function, and others, zooming the screen by pinching in or pinching out the screen cannot be performed.

## 11.13 Operating Objects by the Gesture (Object Gesture Function)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Scroll or zoom in and out the displayed contents of the objects by the gesture such as the flick.  
Example) Scroll the contents with the flick.

- 11.13.1 Specifications of the object gesture function
- 11.13.2 How to use the object gesture function (setting with GT Designer3)
- 11.13.3 How to use the object gesture function (operation with the GOT)
- 11.13.4 Relevant settings

### 11.13.1 Specifications of the object gesture function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 Objects operated by the gesture
- 2 Type of the gesture

#### ■ 1 Objects operated by the gesture

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the applicable functions to the object gesture function.

- Historical data list display
- Alarm display (user)
- Alarm display (system)
- Simple alarm display
- Historical trend graph
- Document display
- Video/RGB display object

## ■2 Type of the gesture

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the gesture used with the object gesture function.

- Flick
- Slide
- Pinch in
- Pinch out

The operation of the object by touch is not related to the setting of the object gesture function.

Whether displaying a cursor is enabled or not while the object is touched depends on the setting for the one-touch operation with each object.

### (1) Flick

Flick your finger on the screen.

### (2) Slide

Drag your finger across the screen.

### (3) Pinch in

Touch two positions and pinch in the screen by the fingers toward the center of the two positions.

### (4) Pinch out

Touch two positions and pinch out the screen by the fingers from the center of the two positions outward.

## 11.13.2 How to use the object gesture function (setting with GT Designer3)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

→ ■ 1 Enabling the object gesture function

### ■ 1 Enabling the object gesture function

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The object gesture function is enabled by default.

(In common with the screen gesture function)

If the object gesture function is not enabled, configure the setting according to the following procedure.

**Step 1** Select [Common] → [GOT Type Setting] Menu to display the [Type Setting] dialog.

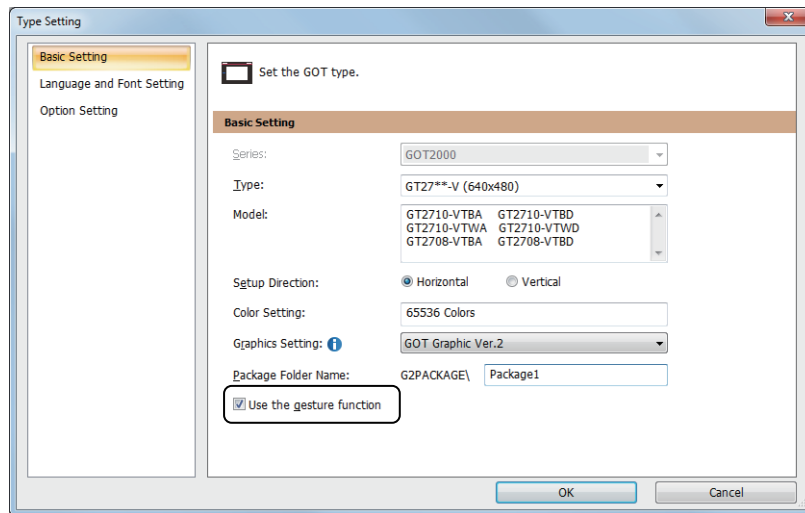

→ 5.1.4 [Type Setting] dialog

**Step 2** Select [Use the gesture function] and click the [OK] button.

The object gesture function is enabled.

The GOT operates as shown below during gesture operations.

- The object display is not refreshed during gesture operations.
- The document display appears in the foreground while you operate it by gestures.  
(Overlap windows and key windows appear behind the document display.)

To operate the video/RGB display object with the gesture operation, set the item as shown below.

- Select [Gesture Operation (Scaling/Scrolling)] for [Touch Mode] on the [Video/RGB Setting] tab in the [Video/RGB Display] dialog.

→ 8.27.4 ■ 1 [Video/RGB Setting] tab

### 11.13.3 How to use the object gesture function (operation with the GOT)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ➔ ■ 1 Operating the historical data list display
- 2 Operating the alarm display (user), alarm display (system), and simple alarm display
- 3 Operating the historical trend graph
- 4 Operating the document display
- 5 Operating the video/RGB display object

#### ■ 1 Operating the historical data list display

GT27 GT25 GT23 GT21 SoftGOT2000 GS

➔(1) Scroll

##### (1) Scroll

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Flick the historical data list display to scroll the displayed contents upward and downward.  
One flick scrolls the display for a half page.

- Flick the display upward.  
The display is scrolled downward.
- Flick the display downward.  
The display is scrolled upward.

Example) Scroll the display downward.

#### ■ 2 Operating the alarm display (user), alarm display (system), and simple alarm display

GT27 GT25 GT23 GT21 SoftGOT2000 GS

➔(1) Scroll

##### (1) Scroll

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Flick the alarm display (user), alarm display (system), and simple alarm display to scroll the displayed contents upward and downward.  
One flick scrolls the display for a half page.

- Flick the display upward.  
The display is scrolled downward.
- Flick the display downward.  
The display is scrolled upward.

Example) Scroll the display downward.

### ■3 Operating the historical trend graph

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ⇒(1) Scroll
- (2) Zooming in and out time axis

#### (1) Scroll

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Flick the historical trend graph to scroll the displayed contents.

One flick scrolls the display for a half page.

A direction of the flick depends on the setting of [Direction] of the historical trend graph.

#### (a) When selecting [Right] or [Left] with the [Direction] of the historical trend graph

- Flick the display leftward.  
The display is scrolled rightward.
- Flick the display rightward.  
The display is scrolled leftward.

#### (b) When selecting [Up] or [Down] with the [Direction] of the historical trend graph

- Flick the display upward.  
The display is scrolled downward.
- Flick the display downward.  
The display is scrolled upward.

Example) Scroll the display rightward.

#### (2) Zooming in and out time axis

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Pinch in or out the historical trend graph to zoom out or in time axis each.

The magnification factor for a pinch-in or pinch-out operation is selectable from among 2-fold, 4-fold, and 8-fold.

⇒8.21.4 ■ 4 [Extended] tab

You can enlarge the time axis until the graph displays two points.

The scope of reducing the time axis varies with the setting of [Shrink the graph to be less than its full scale].

When [Shrink the graph to be less than its full scale] is selected, the time axis can be reduced to a magnification of 1/128.

When [Shrink the graph to be less than its full scale] is deselected, the time axis can be reduced to the original magnification.

Example) Zoom in time axis.

## ■ 4 Operating the document display

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Scroll
- (2) Next page and previous page
- (3) Zooming in and out the document

### (1) Scroll

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Flick or slide your finger on the document display to scroll the document.  
The document display can be scrolled in eight directions as follows.

Example) Scroll the display leftward.

### (2) Next page and previous page

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Flick the display with the edge of the document displayed to change the page.

- (a) **When displaying the upper end of the document**  
Flick the page downward to change to the previous page. (Previous page)
- (b) **When displaying the bottom end of the document**  
Flick the page upward to change to the next page. (Next page)
- (c) **When displaying the left end of the document**  
Flick the page rightward to change to the previous page. (Previous page)
- (d) **When displaying the right end of the document**  
Flick the page leftward to change to the next page. (Next page)  
Example) Next page

### (3) Zooming in and out the document

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Pinching in or out the document display reduces or enlarges the document size.  
Example) Zoom in the document.

#### GOT Graphic Ver.2

The zoom behavior when the document display is pinched out or in varies depending on the document type.  
⇒8.26.6 [Document Display] dialog

- When the document type is set to [Document Converter Output File]  
Pinching in or out the document display switches the document size to large, medium, or small.  
One pinch in zooms out the displayed document by one size smaller than the current display size.  
One pinch out zooms in the displayed document by one size larger than the current display size.

- When the document type is set to [PDF File]  
Pinching in or out the document display reduces or enlarges the document size to a size at 25% to 400% magnification.

#### GOT Graphic Ver.1

The zoom behavior when the document display is pinched out or in varies depending on the document type and the graphics accelerator setting.

⇒5.1.4 [Type Setting] dialog  
8.26.6 [Document Display] dialog

- When the document type is set to [Document Converter Output File] and the graphics accelerator is disabled  
Pinching in or out the document display switches the document size to large, medium, or small.  
One pinch in zooms out the displayed document by one size smaller than the current display size.  
One pinch out zooms in the displayed document by one size larger than the current display size.

- When the document type is set to [PDF File] or when the document type is set to [Document Converter Output File] and the graphics accelerator is enabled  
Pinching in or out the document display reduces or enlarges the document size to a size at 25% to 400% magnification.

## ■ 5 Operating the video/RGB display object

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2705-V.

- ⇒(1) Scrolling the displayed image
- (2) Enlarging or reducing the displayed image

### (1) Scrolling the displayed image

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To scroll the displayed image, slide your finger across the video/RGB display object.

## (2) Enlarging or reducing the displayed image

GT27 GT25 GT23 GT21 SoftGOT2000 GS

To reduce or enlarge the displayed image (25% to 400%), pinch in or out on the video/RGB display object.

### 11.13.4 Relevant settings

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Set the relevant settings other than the specific settings for the object gesture function as required. The following shows the functions that are available by the relevant settings.

#### 1 GOT type settings

Select [Common] → [GOT Type Setting] from the menu to display the [GOT Type Setting] dialog.  
 ⇒5.1.4 [Type Setting] dialog

Function	Setting item
Enabling the gesture function	[Use the gesture function]
Smoothing the operations of the screen gesture function	<b>GOT Graphic Ver.1</b> [Enable the graphics accelerator to smooth the screen gesture and document display operations]

#### 2 GOT internal device

⇒12.1 GOT Internal Device

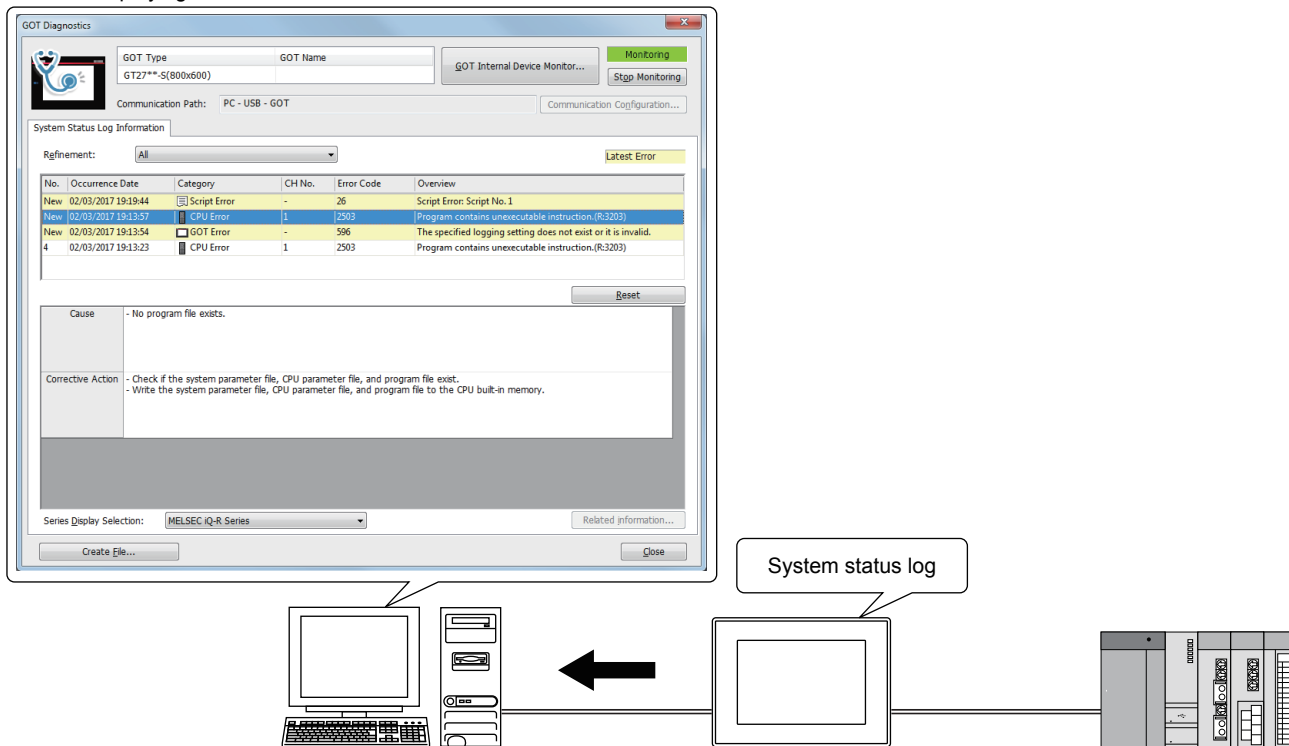

Function	Setting item
Disabling the object gesture function	GS1794.b0
Disabling the single touch operation of the object	GS1794.b1

## 11.14 Checking the Causes and Corrective Actions for an Error in the GOT (GOT Diagnostics)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

GT Designer3 obtains system status log data from the GOT.  
The causes and corrective actions for an error are displayed.  
You can monitor the GOT internal devices and change the device values as necessary.

Displaying the causes and corrective actions for an error

- ⇒ 11.14.1 Specifications of the GOT diagnostics
- 11.14.2 How to use the GOT diagnostics
- 11.14.3 GOT internal device monitor
- 11.14.4 Precautions
- 11.14.5 [GOT Diagnostics] dialog
- 11.14.6 [GOT Internal Device Monitor] window

### 11.14.1 Specifications of the GOT diagnostics

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### ■ 1 GOT diagnostics display target

The GOT diagnostics function displays the following items.

- System alarm (GOT error, CPU error, and network error)
- Script error (Project script, screen script, and object script)

#### ■ 2 Version of the standard system application

To perform the GOT diagnostics, the GOT requires a standard system application version 01.10.\*\*\* or later.

To perform the GOT internal device monitor, the GOT requires a standard system application version 01.20.\*\*\* or later.  
(Version 01.22.\*\*\* or later for GT21)

For information on how to check the version of the standard system application, refer to the following.

- ⇒ GOT2000 Series User's Manual (Utility)

### 3 Format of a saved file

The following shows the format of a saved file containing error information.

Example) CSV file

	A	B	C	D	E	F	G	H
1	Diagnosis Time							
2	GOT Date		GOT Time		PC Date		PC Time	
3	13/03/2015		11:14:19		13/03/2015		11:16:38	
4	GOT Type		GOT Name		Communication Path			
5	GT25**-(640x480)				PC - USB - GOT			
6	System Status Log Information							
7	No.	Occurrence Date	Category	CH No.	Error Code	Overview	Cause	Corrective Action
8	1	13/03/2015 11:14:19	Script Error	-	26	Script Error: Script No. 1	- Failed to access the file since data storage is not mounted or the SD card cover is open.	- Check if the data storage is mounted. - Check if the SD card cover is closed.
9	2	13/03/2015 11:14:12	GOT Error	-	307	The monitor device is not set.	- the monitor device of the object is not determined.	- Determine the monitor device of the object. - Check and correct the valid parameter drive settings made by the DIP switches.
10	3	13/03/2015 10:52:13	CPU Error	1	2200	MISSING PARA. There is no comment data.	There is no parameter file in the drive specified as valid parameter drive by the DIP switches. There is no parameter file at the program memory. Parameter file does not exist in all drives where parameters will be valid.	- Set the parameter file to the drive specified as valid parameter drive by the DIP switches. Set the parameter file to the program memory. Set a parameter file in a drive
11	4	13/03/2015 11:13:58	GOT Error	-	308	Download the comment.	- the comment file does not exist.	- Create the comment file and download it to the GOT.

#### 1) Date and time on the GOT

GOT date and time on which GT Designer3 obtained the last system log data

#### 2) Date and time on the personal computer

Personal computer date and time on which error information was saved to a file

#### 3) Connected GOT

Type and name of the connected GOT

#### 4) [Communication path]

Communication path between the personal computer and the GOT

#### 5) [No.]

Number indicating the order of displaying errors

#### 6) [Occurrence Date]

Date and time on which an error occurred

#### 7) [Category]

Error category

#### 8) [CH No.]

Number of the channel where an error occurred

#### 9) [Error Code]

Error code for a system alarm or script error

#### 10) [Overview]

Details of a system alarm or script error

#### 11) [Cause]

Causes of an error

#### 12) [Corrective Action]

Corrective actions for an error

## 11.14.2 How to use the GOT diagnostics

- ➔ ■ 1 Obtaining system status log data from the GOT and displaying error information
- 2 Saving the contents of the error list to a file

### ■ 1 Obtaining system status log data from the GOT and displaying error information

**Step 1** Connect the GOT to the personal computer.

For the communication path types, refer to the following.

➔4.1.1 Route for the data transfer

For the connection method, refer to the following.

➔4.3.1 Connecting the personal computer to the GOT

4.4.1 Connecting the personal computer and PLC CPU

**Step 2** Select [Diagnostics] → [GOT Diagnostics] from the menu to display the [Communication Configuration] dialog.

➔4.8.8 [Communication Configuration] dialog

If the [GOT Diagnostics] dialog appears, any of the following settings is configured.

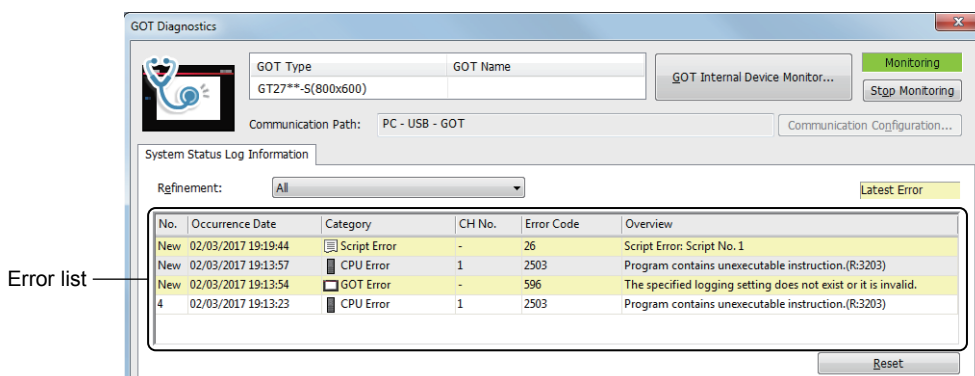

(Proceed to step 4.)

- On the [Operation] tab in the [Options] dialog, [Display the dialog of Communication Setting before displaying the dialog of Communicate with GOT/GOT Diagnostics] is cleared.
- In the [Communication Configuration] dialog, [Display the dialog of [Communication Configuration] the next time as well] is cleared.

**Step 3** Configure the setting according to the communication path between the GOT and the personal computer, and click the [OK] button to display the [GOT Diagnostics] dialog.

➔11.14.5 [GOT Diagnostics] dialog

**Step 4** Click the [Start Monitoring] button to obtain system status log data from the GOT and list the recorded errors in the error list.

**Step 5** Click an error in the error list to display its causes and corrective actions.

If an error with supplementary information is selected, click the [Related information] button to display a relevant page of GT Designer3 Help.

## ■2 Saving the contents of the error list to a file

The following shows the procedure for saving the contents of the error list displayed in the [GOT Diagnostics] dialog to a CSV or Unicode text file.

**Step 1** In the [GOT Diagnostics] dialog, obtain system status log data from the GOT.

⇒ 11.14.2 ■ 1 Obtaining system status log data from the GOT and displaying error information

**Step 2** Set the items as shown below.

- [Refinement]: Type of errors to be displayed in the error list
- [Series Display Selection]: This item appears when a system alarm (CPU error) of MITSUBISHI equipment is selected in the error list.

Select the controller series to which the display contents of [Overview], [Cause], and [Corrective Action] for the system alarm (CPU error) correspond.

Click the [Start Monitoring] button to automatically identify the series of the controller in which a selected error occurred.

⇒ 11.14.5 [GOT Diagnostics] dialog

Only the contents narrowed by the above items are output to a file.

**Step 3** Click the [Create File] button to display the [Save As] dialog.

**Step 4** Set [File name] and [Save as type], and click the [Save] button to save the contents of the error list.

For the format of the saved file, refer to the following.

⇒ 11.14.1 ■ 3 Format of a saved file

## 11.14.3 GOT internal device monitor

On GT Designer3, you can monitor the GOT internal devices and change the device values as necessary. You can import the sample free registration lists of the GOT internal devices related to specific functions.

### ■ 1 Specifications of the GOT internal device monitor

#### (1) Devices that can be monitored

You can monitor the GOT internal devices (GB, GD, and GS) and change their current values.

⇒ 12.1 GOT Internal Device

However, the current values of the following devices are not changeable.

- GB0 to GB63 (GB0 to GB38 and GB40 to GB63 for GT21)
- Write devices of the GOT special registers (GS)

#### (2) Specifications of the free registration list

Use a free registration list to manage the GOT internal devices to be monitored.

A created free registration list is retained after GT Designer3 exits.

Up to 32 free registration lists can be created.

Up to 32 characters are available for a free registration list name.

The following characters cannot be used in a free registration list name.

\\ / : ; \* ? " < > | .

Up to 6 free registration windows can be open simultaneously.

Up to 256 devices are registrable in one free registration list.

#### (3) Importing or exporting a free registration list

You can import or export a free registration list.

The CSV format and the Unicode text format are supported.

An exported free registration list is editable with spreadsheet software or others.

The following shows the layout of an exported free registration list.

1)	:DEV_MONT_VERSION		1		
2)	:LIST_TYPE		0		
3)	:LIST_NAME		Project_Screen_Script		
4)	:DEVICE_NUM		79		
5)	:NO	:DEVICE	:DEV_TYPE	:DISP_TYPE	:DEV_COMMENT
	0	GS14	BIN16	DEC	Script Common Information
	1	GS14.b0	BIT	BIN	Script Common Information: Error Occurrence Signal
	2	GS14.b7	BIT	BIN	Script Common Information: BCD Error Occurrence Signal
		6)	7)	8)	9)

##### 1) Version

Version of the free registration list.

##### 2) List type

Type of a list.

Fixed to 0.

##### 3) List name

Name of the free registration list.

For the name specifications, refer to the following.

⇒ (2) Specifications of the free registration list

##### 4) Number of devices

Number of the registered devices.

Up to 256 devices are registrable in one free registration list.

##### 5) No.

Registered device number.

##### 6) Device

Registered device.

##### 7) Data type

Data type of a device

- BIT: [Bit]

- BIN16: [Word [Signed]]
- BIN16\_Unsigned: [Word [Unsigned]/Bit String [16-bit]]
- BIN32: [Double Word [Signed]]
- BIN32\_Unsigned: [Double Word [Unsigned]/Bit String [32-bit]]

## 8) Display format

Display format of a device.

- BIN: [Binary]
- OCT: [Octal]
- DEC: [Decimal]
- HEX: [Hexadecimal]

## 9) Comment

Comment set for a device.

Up to 255 characters can be set for one comment.

## (4) Sample free registration lists

You can import the sample free registration lists of the GOT internal devices related to the following functions.

Function	File name of a sample list
Project script, screen script	1_Project_ScreenScript.txt
Object script	2_ObjectScript.txt
GOT operational authority	3_GOT_OperationalAuthority.txt
Server function	4_ServerFunction.txt
Client function	5_ClientFunction.txt
Device data transfer	6_DeviceDataTransfer.txt
File transfer function	7_FileTransfer.txt
Mail send function	8_MailFunction.txt
Recipe	9_Recipe.txt
Global label	10_Label.txt
VNC server function	11_VNC_Server.txt

The sample free registration lists are stored in the following directory when GT Designer3 is installed.

[(Path to the installation location of GT Designer3)\GTD3\_2000\App\SampleDevMonitor]

The sample lists for the project script, screen script, object script and GOT operational authority are imported automatically at the initial startup of the GOT internal device monitor.

## ■2 How to use the GOT internal device monitor

### (1) Monitoring GOT internal devices

The following shows the procedure for monitoring GOT internal devices.

**Step 1** Configure the settings to enable the GOT internal device monitor.

In the [GOT Setup] window ([GOT Internal Device Monitor]), select the following items.

- [Update the GOT internal device monitor setting]
- [Use GOT internal device monitor in the GOT diagnostics function]

To change the values of GOT internal devices by using the GOT internal device monitor, select [Allow GOT internal devices to be changed].

→5.3.7 Configuring the settings of the GOT internal device monitor ([GOT Internal Device Monitor])

**Step 2** Write package data to the GOT.

For the communication method between the personal computer (GT Designer3) and the GOT, refer to the following.

→4. COMMUNICATING WITH GOT

**Step 3** In the [GOT Diagnostics] dialog, start the GOT internal device monitor.

→11.14.5 [GOT Diagnostics] dialog

11.14.6 [GOT Internal Device Monitor] window

The starting method varies according to the status of the GOT diagnostics.

- While the GOT diagnostics is running  
Click the [GOT Internal Device Monitor] button to display the [GOT Internal Device Monitor] window.
- While the GOT diagnostics is not running

Click the [GOT Internal Device Monitor] button to display the [GOT Internal Device Monitor] window, and perform one of the following operations.

- Select [Online] → [Start] from the menu.
- Click the [Start] button on the toolbar.
- Click the [Start Monitoring] button in the [GOT Diagnostics] dialog.

**Step 4** Register the target GOT internal devices in a free registration list.

Monitoring starts upon the registration of the devices.

**Step 5** To change the current value of a GOT internal device, enter a new value in [Current Value].

The GOT internal device stores the new value upon the entering of the value.

## (2) Creating or editing a free registration list

Register a GOT internal device in a free registration list to monitor or change the current value of the device.

The following shows the procedure for creating or editing a free registration list.

**Step 1** Perform one of the following operations to display a free registration window.

- Select [Window] → [New Free Registration List] from the menu.
- Double-click [New] under [Free Reg] in the [Project] window.
- Double-click a target free registration list under [Free Reg] in the [Project] window.

For information on how to import a free registration list and add it as a new list, refer to the following.

→(3) Importing a free registration list

**Step 2** Register, edit or delete a GOT internal device in the free registration window.

→11.14.6 [GOT Internal Device Monitor] window

To rename a free registration list, select a target free registration list, and click it again or press the [F2] key on the keyboard.

To delete a device in a free registration list, select a target device, and press the [Delete] key on the keyboard.

## (3) Importing a free registration list

Import a free registration list file in the CSV or Unicode text format.

The following shows the procedure for importing a free registration list.

**Step 1** Perform one of the following operations in the [Project] window according to the import method.

- To import a free registration list and add it as a new list, select [New].
- To overwrite an existing free registration list with an imported list, select the target existing free registration list.
- To import multiple free registration lists, select [Free Reg] at the top of the tree.

**Step 2** Perform one of the following operations to display the [Open] dialog.

- Select [File] → [Import Free Registration List] from the menu.
- In the [Project] window, click the [Im] button.
- Right-click the item selected in step 1, and select [Import] from the menu.

**Step 3** Select a free registration list file and click the [Open] button to import the file.

When importing multiple files, you can import CSV files and Unicode text files together.

For the precautions for using Unicode text files, refer to the following.

→12.5 Precautions for Using Unicode Text File

## (4) Exporting one free registration list

The following shows the procedure for exporting one free registration list to a CSV or Unicode text file.

**Step 1** In the [Project] window, select one free registration list to be exported.

**Step 2** Perform one of the following operations to display the [Save As] dialog.

- Select [File] → [Export Free Registration List] from the menu.
- In the [Project] window, click the [Ex] button.
- Right-click the free registration list to be exported, and select [Export] from the menu.

**Step 3** Set [File name] and [Save as type], and click the [Save] button to export the free registration list.

## (5) Exporting all free registration lists

The following shows the procedure for exporting all free registration lists to CSV or Unicode text files.

**Step 1** In the [Project] window, select [Free Reg] at the top of the tree.

**Step 2** Perform one of the following operations to display a dialog where you can select a file format.

- Select [File] → [Export Free Registration List] from the menu.
- In the [Project] window, click the [Ex] button.

- Right-click [Free Reg] at the top of the tree, and select [Export] from the menu.
- Step 3** Select a file format and click the [OK] button to display the [Browse For Folder] dialog.
- Step 4** Select an export destination and click the [OK] button to export the free registration lists.

#### (6) Deleting a free registration list

The following shows the procedure for deleting a free registration list.

- Step 1** In the [Project] window, select a free registration list to be deleted.
- Step 2** Perform one of the following operations to display a confirmation dialog.
- Press the [Delete] key on the keyboard.
  - Right-click the free registration list to be deleted, and select [Delete] from the menu.
- Step 3** Click the [Yes] button to delete the list.

### 11.14.4 Precautions

#### ■ 1 Power saving function of the personal computer

Before performing the GOT diagnostics, disable the power saving function of the personal computer and Windows. For the details of the power saving function setting, refer to the manual of the personal computer or Windows Help.

#### ■ 2 Performing the GOT diagnostics while the FA transparent function is used

While the controller programming software communicates with a controller by using the FA transparent function, the GOT diagnostics cannot start.

To perform the GOT diagnostics, make sure that the FA transparent function is not in use.

#### ■ 3 System alarms (CPU errors and network errors) displayed in the GOT diagnostics and the controller status

In the GOT diagnostics, system alarms (CPU errors and network errors) are displayed based on the error history recorded in the GOT (System status log). Therefore, the alarms does not indicate the controller status.

To check the controller status, use one of the following methods.

- Using a diagnostics function of the controller programming software
  - ⇒ Manual for the programming software used
- Checking system alarms in the GOT utility
  - ⇒ GOT2000 Series User's Manual (Utility)

#### ■ 4 Resetting script error data

You cannot reset scrip error data in the following cases.

- The GOT displays a screen in which no script is set.
- The GOT displays the utility screen.

Reset scrip error data while the GOT displays a screen in which a script is set.

#### ■ 5 Changing the values of GOT internal devices

With the GOT internal device monitor, the values of GOT internal devices are changeable from GT Designer3. In such a case, the GOT may not behave as its operator expects.

To disable the changing of the device values from GT Designer3, deselect [Allow GOT internal devices to be changed] in the [GOT Setup] window ([GOT Internal Device Monitor]).

#### ■ 6 Precautions for exporting a free registration list

When a free registration list contains characters that cannot be represented in ASCII or Shift JIS code, export the list to a Unicode text file.

If you export the list to a CSV file, such characters are not output properly.

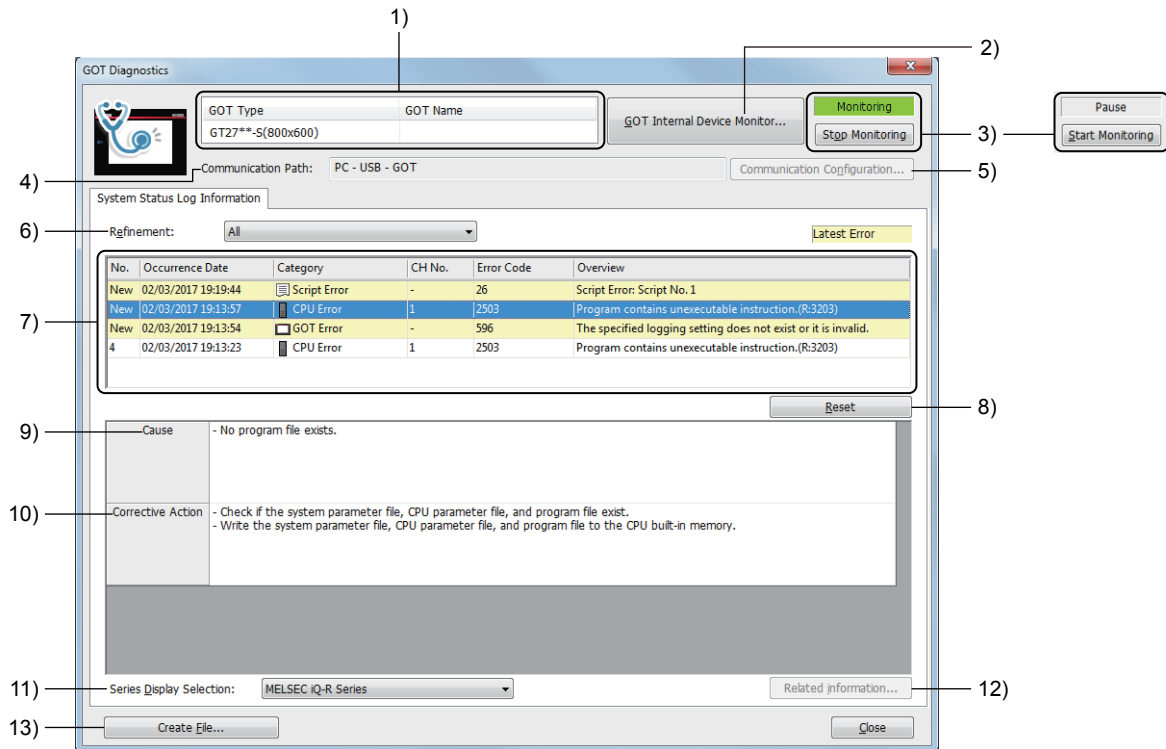

For the precautions for using Unicode text files, refer to the following.

- ⇒ 12.5 Precautions for Using Unicode Text File

## 11.14.5 [GOT Diagnostics] dialog

In this dialog, system status log data is obtained from the GOT and error information is listed. To display the dialog, select [Diagnostics] → [GOT Diagnostics] from the menu.

### 1) Connected GOT

Type and name of the connected GOT

### 2) [GOT Internal Device Monitor] button

Displays the [GOT Internal Device Monitor] window.  
 ⇒ 11.14.6 [GOT Internal Device Monitor] window

### 3) [Start Monitoring] button, [Stop Monitoring] button

Starts or stops the GOT diagnostics.

### 4) [Communication Path]

Communication path between the personal computer and the GOT

### 5) [Communication Configuration] button

Displays the [Communication Configuration] dialog.  
 Set the communication path between the personal computer and the GOT.  
 ⇒ 4.8.8 [Communication Configuration] dialog

### 6) [Refinement]

Select the category of errors to be displayed in the error list.  
 The following shows selectable items.

- [All]
- [GOT Error]
- [CPU Error]
- [Network Error]
- [Script Error]

### 7) Error list

Lists errors based on the system status data recorded in the GOT.  
 Errors are displayed in reverse chronological order. If the number of errors exceeds the maximum number of displayed errors, earlier errors are not displayed.  
 The latest errors in each category are indicated with [New] in the [No.] column.  
 The maximum number of displayed errors depends on the error type.

- System alarm (GOT error): 30
- System alarm (CPU error or network error): 30
- Script error (Project script or screen script): 15
- Object script error: 15

For the system alarm (GOT error), script error, and object script error, correct an error and click the [Reset] button to delete the error from the error list.

For the precautions on the system alarm, refer to the following.

→9.1.3 ■ 4 (4) Display of system alarms occurring in multiple channels

#### 8) [Reset] button

Resets error data in the GOT, and updates the error list.

Corrected system alarms (GOT errors) and script errors are deleted from the error list.

Others remain in the list.

For the precautions on the script error or object script error, refer to the following.

→9.9.12 ■ 1 (11) Script error control and GOT status

9.10.7 ■ 1 (10) Object script error control and GOT status

#### 9) [Cause]

Causes of an error selected in the error list

#### 10) [Corrective Action]

Corrective actions to correct an error selected in the error list

#### 11) [Series Display Selection]

This item appears when a system alarm (CPU error) of MITSUBISHI equipment is selected in the error list.

Select the controller series to which the display contents of [Overview], [Cause], and [Corrective Action] for the system alarm (CPU error) correspond.

Upon updating the error list, selecting a relevant error automatically identifies the series of the controller in which the error occurred.

The following shows selectable items.

- [MELSEC iQ-R Series]
- [MELSEC iQ-F Series]
- [MELSEC-Q Series Basic Model]
- [MELSEC-Q Series High-performance Model]
- [MELSEC-Q Series Universal Model]
- [MELSEC-L Series]
- [MELSEC-L Series Head Module]
- [MELIPC]

#### 12) [Related information] button

Displays GT Designer3 Help, showing a relevant page for an error selected in the error list.

This item appears when an error with supplementary information is selected in the error list.

#### 13) [Create File] button

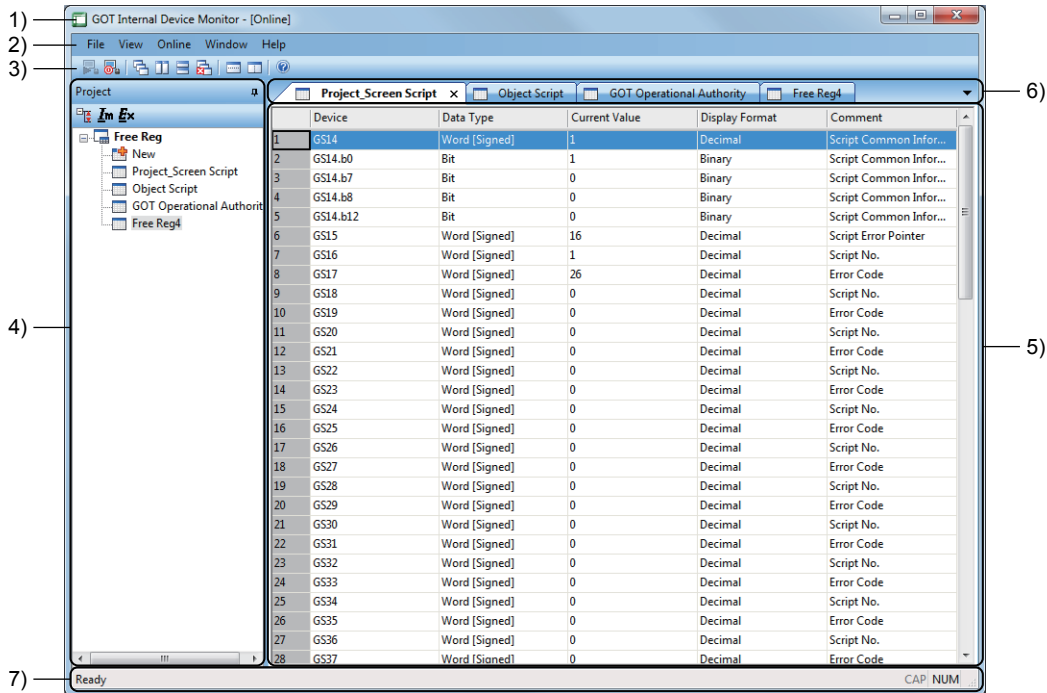

Saves the contents of the error list to a CSV or Unicode text file.

→11.14.1 ■ 3 Format of a saved file

## 11.14.6 [GOT Internal Device Monitor] window

In this window, monitor the GOT internal devices, and change the device values as necessary. To display the window, click the [GOT Internal Device Monitor] button in the [GOT Diagnostics] window.

### 1) Title bar

Displays the operation status of the GOT internal device monitor.

### 2) Menu bar

Displays the operation menus of the GOT internal device monitor.

→ ■ 1 Menus

### 3) Toolbar

Displays the operation buttons of the GOT internal device monitor.

→ ■ 2 Toolbar

### 4) [Project] window

Expand all button, collapse all button

- Expand all button, collapse all button

- Expands or collapses all items in the tree.

- [Im] button

- Import a free registration list file in the CSV or Unicode text format. For the procedure for importing a free registration list, refer to the following.

- 11.14.3 ■ 2 (3) Importing a free registration list

- [Ex] button

- Export a free registration list to a CSV or Unicode text file.

- For the procedure for exporting a free registration list, refer to the following.

- 11.14.3 ■ 2 (4) Exporting one free registration list

- 11.14.3 ■ 2 (5) Exporting all free registration lists

- [Free Reg]

- Displays created free registration list names.

- [New]

- Creates a free registration list.

### 5) Work window

An area in which free registration windows appear.

→ ■ 3 Free registration window

### 6) Editor tab

Displays the tabs corresponding to the windows opened in the work window.

To bring an open window to the foreground in the work window, select its tab.

• **Pull-down menu button**

Lists the open windows in the work window.  
To bring an open window to the foreground in the work window, select it from the pull-down menu.

7) **Status bar**

Displays the description of a selected menu.

■ **1 Menus**

(1) **[File]**

Menu	Description
[Import Free Registration List]	Import a free registration list file in the CSV or Unicode text format. For the procedure for importing a free registration list, refer to the following. → 11.14.3 ■ 2 (3) Importing a free registration list
[Export Free Registration List]	Export a free registration list to a CSV or Unicode text file. For the procedure for exporting a free registration list, refer to the following. → 11.14.3 ■ 2 (4) Exporting one free registration list 11.14.3 ■ 2 (5) Exporting all free registration lists
[Exit]	Ends the device monitor.

(2) **[View]**

Menu	Description
[Toolbar]	Displays or hides the toolbar.
[Status Bar]	Displays or hides the status bar.

(3) **[Online]**

Menu	Description
[Start]	Starts monitoring the GOT internal devices.
[Stop]	Stops monitoring the GOT internal devices.

(4) **[Window]**

Menu	Description
[New Free Registration List]	Create a free registration list.
[Cascade]	Displays open windows in a stack in the work window.
[Arrange Sideways]	Tiles open windows side by side in the work window.
[Arrange Lengthways]	Tiles open windows horizontally in the work window.
[Close Inactive Windows]	Closes all open windows except the selected one in the work window.
[New Horizontal Tab Group]	Splits the work window into panes horizontally. Puts the free registration window corresponding to a selected tab in a pane immediately underneath the current pane. Tabs are movable between the editor tabs of panes.
[New Vertical Tab Group]	Splits the work window into panes vertically. Puts the free registration window corresponding to a selected tab in the immediately right pane. Tabs are movable between the editor tabs of panes.

(5) **[Help]**

Menu	Description
[GT Designer3 Help]	Displays GT Designer3 Help.

## ■2 Toolbar

- 1) **[Start]**  
Starts the device monitor.
- 2) **[Stop]**  
Stops the device monitor.
- 3) **[Cascade]**  
Displays open windows in a stack in the work window.
- 4) **[Arrange Sideways]**  
Tiles open windows side by side in the work window.
- 5) **[Arrange Lengthways]**  
Tiles open windows horizontally in the work window.
- 6) **[Close Inactive Windows]**  
Closes all open windows except the selected one in the work window.
- 7) **[New Horizontal Tab Group]**  
Splits the work window into panes horizontally.  
Puts the free registration window corresponding to a selected tab in a pane immediately underneath the current pane.  
Tabs are movable between the editor tabs of panes.
- 8) **[New Vertical Tab Group]**  
Splits the work window into panes vertically.  
Puts the free registration window corresponding to a selected tab in the immediately right pane.  
Tabs are movable between the editor tabs of panes.
- 9) **[GT Designer3 Help]**  
Displays GT Designer3 Help.

### ■3 Free registration window

	1)	2)	3)	4)	5)
	Device	Data Type	Current Value	Display Format	Comment
1	GS14	Word [Signed]	1	Decimal	Script Common Infor...

### ■ 3 Without Power Supply (GB38)

With the external I/O function, the GB devices turn on when the power for the external device is not supplied.

### ■ 4 Clock Data Storage during ON (GB39)

While this device is on, the clock data is stored to GD0 to GD6. While this device is off, the clock data is not stored.

### ■ 5 Always ON (GB40)

Always ON

### ■ 6 Always OFF (GB41)

Always OFF

### ■ 7 ON When Screen Switching Occurs (GB42)

Turns on when switching the following screens occurs.

- Base screen
- Overlap window 1, 2, 3, 4, 5
- Superimpose window 1, 2
- When an overlap window is closed by opening a test window or others

You need to turn off this device.

#### **Point**

#### **Actions of the Always ON (GB40) and the Always OFF (GB41)**

Actions of the Always ON (GB40) and the Always OFF (GB41) are the same as those of b4 and b5 in the Common Information 1 (GS0), respectively.

## 12.1.2 GOT data register (GD)

GD devices are listed as follows.

Device	Function	Supported models
GD0 to GD2047	User area	
GD2048 to GD65535	User area	

### ■ 1 Storing the clock data to GD devices (for GT21 only)

While GB39 is on, the clock data is stored to GD0 to GD6.

For the details of the clock function, refer to the following.

⇒5.3.5 Setting the GOT time setting method ([Time Setting])

The following shows the data to be stored to each GD device.

GD device	Data to be stored
GD0	Second (0 to 59)
GD1	Minute (0 to 59)
GD2	Hour (0 to 23)
GD3	Date (1 to 31)
GD4	Month (1 to 12)
GD5	Year (2000 to 2099)
GD6	Day of the week (0 to 6)

While GB39 is on, GD0 to GD6 are not usable as the user area.

To use GD0 to GD6 as the user area, turn off GB39.

### ■ 2 Designation of a station number using GD (only for the temperature controller connection, inverter connection and servo amplifier connection)

If 100 to 115 is set for a station number. in the setting of device, a station number can be designated by the value of GD10 to GD25.

The monitor target station number can be changed by simply changing a device value.

For how to set the devices, refer to the following.

⇒6.1 Device Settings

#### (1) When a GD device is used together with the Station No. Switching device (GT27, GT25, and GT23)

The station No.switching device has priority.

**(2) When objects that monitor different channel numbers. are arranged on the same screen**

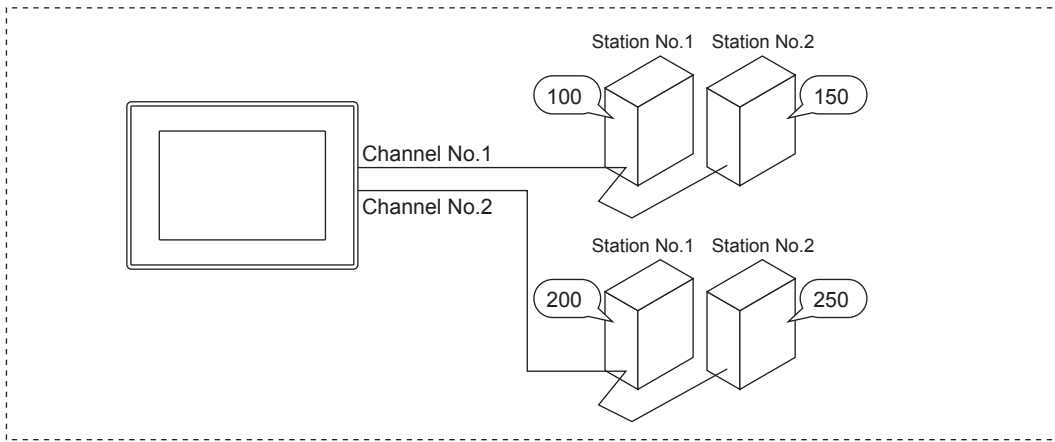

To monitor different station Nos. by individual objects, use GD10 to GD25.

If station No. switching devices are used, the monitor target station number of an unintended object may be changed.

(Especially when multiple switching target channel Nos. are set)

Example) When monitor target channel Nos. of station No. switching device are 1 and 2

The monitor target station Nos are switched at the timing of changing the value of GD10 to GD25.

(When using the Station No.Switching device)

(When GD (GD10 to GD25) is used)

## 12.1.3 GOT special register (GS)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The GOT special register includes the following two types.

Types	Range	Description
Write device	GS0 to GS383, GS640 to GS1791	Writing values by the GOT notifies a user of the status of GOT. → ■ 1 Write device list
Read device	GS384 to GS639, GS1792 to GS2047	Writing values by a user controls the behavior of GOT. → ■ 4 Read device list

### Point

#### Functions affected by GOT special register

Some GOT special registers affect multiple functions on the GOT.

For the relation between each GOT special register and GOT functions, refer to the following.

→ Settings related to each function

#### ■ 1 Write device list

Device	Function	Reference	Supported models
GS670	Number of Trigger Buffer Data	→12.1.3 ■ 3 (17) Number of Trigger Buffer Data (GS670)	GT27 GT25 GT23
GS671	Trigger Buffer Overflow Count	→12.1.3 ■ 3 (18) Trigger Buffer Overflow Count (GS671)	GT21 GS SoftGOT2000
GS672 to GS675	Trigger Buffer Overflow Flag per Job	→12.1.3 ■ 3 (19) Trigger Buffer Overflow Flag per Job (GS672 to GS675)	
GS676 to GS979	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS980	Touch Position Color Acquisition Complete signal	→12.1.3 ■ 3 (20) Touch Position Color Acquisition Complete signal (GS980)	GT27 GT25 GT23
GS981 to GS983	Touch Position Color	→12.1.3 ■ 3 (21) Touch Position Color (GS981 to GS983)	GT21 GS SoftGOT2000
GS984	Authorization Guarantee Status Notification signal	→12.1.3 ■ 3 (22) Authorization Guarantee Status Notification signal (GS984)	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS985 GS986	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS987	Executing File Transfer ID Notification	→12.1.3 ■ 3 (23) Executing File Transfer ID Notification (GS987)	GT27 GT25 GT23
GS988	Communicating FTP Server ID Notification	→12.1.3 ■ 3 (24) Communicating FTP Server ID Notification (GS988)	GT21 GS SoftGOT2000
GS989	File Transfer Error No.	→12.1.3 ■ 3 (25) File Transfer Error No. (GS989)	
GS990	File Transfer Status	→12.1.3 ■ 3 (26) File Transfer Status (GS990)	
GS991	Number of Transfer Target Files	→12.1.3 ■ 3 (27) Number of Transfer Target Files (GS991)	
GS992	Number of Transferred Files	→12.1.3 ■ 3 (28) Number of Transferred Files (GS992)	
GS993 to GS1009	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS1010	Recipe Status	→12.1.3 ■ 3 (29) Recipe Status(GS1010)	GT27 GT25 GT23
GS1011	Recipe Special Control Result	→12.1.3 ■ 3 (30) Recipe Special Control Result (GS1011)	GT21 GS SoftGOT2000
GS1012	Recipe Special Control No.	→12.1.3 ■ 3 (31) Recipe Special Control No. (GS1012)	
GS1013	Recipe Display (Record List) Target Recipe No.	→12.1.3 ■ 3 (32) Recipe Display (Record List) Target Recipe No. (GS1013)	GT27 GT25 GT23
GS1014	Recipe Display (Record List) Selected Record No.	→12.1.3 ■ 3 (33) Recipe Display (Record List) Selected Record No. (GS1014)	GT21 GS SoftGOT2000
GS1015 to GS1021	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS1022	Video File Maintenance Information	→12.1.3 ■ 3 (34) Video File Maintenance Information (GS1022)	GT27 GT25 GT23 GT21 GS SoftGOT2000

Device	Function	Reference	Supported models
GS1023	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS1024	USB Drive Common Information	→12.1.3 ■ 3 (35) USB Drive Common Information (GS1024)	GT27 GT25 GT23 GT21 GS SoftGOT2000  (Only available to GT2107-W of GT21 models)
GS1025	RGB Signal Input Status Notification	→12.1.3 ■ 3 (36) RGB Signal Input Status Notification (GS1025)	GT27 GT25 GT23
GS1026	RGB Signal Resolution (Horizontal)	→12.1.3 ■ 3 (37) RGB Signal Resolution (Horizontal) (GS1026)	GT21 GS SoftGOT2000
GS1027	RGB Signal Resolution (Vertical)	→12.1.3 ■ 3 (38) RGB Signal Resolution (Vertical) (GS1027)	
GS1028	RGB Signal Refresh Rate	→12.1.3 ■ 3 (39) RGB Signal Refresh Rate (GS1028)	
GS1029	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS1030	Video/RGB Display Object Status (CH1)	→12.1.3 ■ 3 (40) Video/RGB Display Object Status (CH1 to CH2) (GS1030, GS1035)	GT27 GT25 GT23
GS1031	Video/RGB Display Object Horizontal Resolution (CH1)	→12.1.3 ■ 3 (41) Video/RGB Display Object Horizontal Resolution (CH1 to CH2) (GS1031, GS1036)	GT21 GS SoftGOT2000
GS1032	Video/RGB Display Object Vertical Resolution (CH1)	→12.1.3 ■ 3 (42) Video/RGB Display Object Vertical Resolution (CH1 to CH2) (GS1032, GS1037)	
GS1033	Video/RGB Display Object Refresh Rate (CH1)	→12.1.3 ■ 3 (43) Video/RGB Display Object Refresh Rate (CH1 to CH2) (GS1033, GS1038)	
GS1034	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000
GS1035	Video/RGB Display Object Status (CH2)	→12.1.3 ■ 3 (40) Video/RGB Display Object Status (CH1 to CH2) (GS1030, GS1035)	GT27 GT25 GT23
GS1036	Video/RGB Display Object Horizontal Resolution (CH2)	→12.1.3 ■ 3 (41) Video/RGB Display Object Horizontal Resolution (CH1 to CH2) (GS1031, GS1036)	GT21 GS SoftGOT2000
GS1037	Video/RGB Display Object Vertical Resolution (CH2)	→12.1.3 ■ 3 (42) Video/RGB Display Object Vertical Resolution (CH1 to CH2) (GS1032, GS1037)	
GS1038	Video/RGB Display Object Refresh Rate (CH2)	→12.1.3 ■ 3 (43) Video/RGB Display Object Refresh Rate (CH1 to CH2) (GS1033, GS1038)	
GS1039	Use prohibited	-	GT27 GT25 GT23 GT21 GS SoftGOT2000

Device	Function	Reference	Supported models
GS1040	Wireless Processing Security Information	→12.1.3 ■ 3 (44) Wireless Processing Security Information (GS1040)	 (Except GT2505-V and GT25HS-V)
GS1041 to GS1059	Use prohibited	-	
GS1060	Wireless LAN Status Notification	→12.1.3 ■ 3 (45) Wireless LAN Status Notification (GS1060)	
GS1061	Reception Field Intensity Notification	→12.1.3 ■ 3 (46) Reception Field Intensity Notification (GS1061)	 (Except GT2505-V and GT25HS-V)
GS1062 to GS1066	Use prohibited	-	
GS1067 to GS1069	Access Point MAC Address Notification	→12.1.3 ■ 3 (47) Access Point MAC Address Notification(GS1067 to GS1069)	 (Except GT2505-V and GT25HS-V)

GS1471 to GS1499	Use prohibited	-	
GS1500	GOT Ethernet Setting Change Status	→12.1.3 ■ 3 (75) GOT Ethernet Setting Change Status (GS1500)	
GS1501 to GS1791	Use prohibited	-	
GS1792 to GS2047	Read device	→ ■ 4 Read device list	

## 2 Write device (GS0 to GS383)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### (1) Common Information1 (GS0)

b15	b14 to b11	b10	b9	b8	b7 to b6	b5	b4	b3	b2	b1	b0
-----	------------	-----	----	----	----------	----	----	----	----	----	----

- b0: Repeats turning on and off for every communication cycle (For channel No. 1) \*1
- b1: Turns on when the base or window screen is switched and remains on until a cycle of the on-screen setting processing is complete.  
(This applies to the station No. switching, security level change or language switching.)  
It is used to check (debug) the screen switch setting processing.
- b2: Turns on when the base or window screen is switched and remains on until a cycle of the trigger action processing for the project and screen display is complete.  
(This applies to the station No. switching, security level change or language switching.)  
It is used to activate the trigger action only once in switching the screen.
- b3: Turns on while the initial screen is displayed at power-on.  
It turns off when the base screen is switched over.
- b4: Always on
- b5: Always off
- b6 to b7: Use prohibited
- b8: Repeats turning on and off for every communication cycle (For channel No. 2) \*1
- b9: Repeats turning on and off for every communication cycle (For channel No. 3) \*1
- b10: Repeats turning on and off for every communication cycle (For channel No. 4) \*1
- b11 to b14: Use prohibited
- b15: Turns on in the screen gesture mode.

\*1 One cycle is the elapsed time for the GOT to read the objects on the current screen display and the data set in the common settings.

#### Point

#### Actions of b4 and b5 in the Common Information 1 (GS0)

Actions of b4 and b5 in the Common Information 1 (GS0) are the Always ON (GB40) and the Always OFF (GB41) respectively.

### (2) Base Screen Information (GS1)

b15 to b11	b10	b9	b8	b7 to b3	b2	b1	b0
------------	-----	----	----	----------	----	----	----

- b0: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 1)
- b1: Turns on when the base screen is switched and remains on until a cycle of the on-screen setting processing is complete.  
(This applies to the station No. switching, security level change or language switching.)  
It is used to check (debug) the screen switch setting processing.
- b2: Turns on when the base screen is switched and remains on until a cycle of the on-screen setting processing is complete. (This applies to the station No. switching, security level change or language switching.)  
It is used to activate the trigger action only once in switching the screen.
- b3 to b7: Use prohibited
- b8: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 2)
- b9: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 3)
- b10: Repeats turning on and off for every communication cycle while the base screen is displayed. (For channel No. 4)
- b11 to b15: Use prohibited

**(3) GOT ID No. (GS3)**

Notifies the GOT ID number.  
The notified GOT ID numbers range from 0 to 32767.  
Notifies 0 when no GOT ID number is used.

**(4) CC-Link G4 Station No.(CH1) (GS6)**

For the CC-Link connection (via G4), the station number of the connected AJ65BT-G4-S3 or AJ65BT-R2N is stored when the GOT is powered on.  
When the multi-channel function is used, the station number of channel No. 1 is stored.  
The station numbers of channel No. 2 to 4 are stored to GS361 to GS363.

**(5) GOT Multidrop Slave Station No. (CH1) (GS6)**

For the multidrop connection, the station number of the connected GOT is stored when the GOT is powered on.  
When the multi-channel function is used, the station number of channel No. 1 is stored.  
The station numbers of channel No. 2 to 4 are stored to GS361 to GS363.

**(6) 1 Second Binary Counter (GS7)**

Starts counting every second immediately after the power is switched on.  
Any given value can be written to this counter by a user to start the count from the written value.  
The obtained data are stored as binary data.  
It is used to check how long the time has elapsed from specific timing (operation and others).

**(7) Scan Time of Monitor (GS8)**

Stores the time (ms) of a complete processing cycle set on the display screen as binary data.  
Data will be updated when all of the processing set on the display screen is complete.  
An error of plus or minus 10 ms may be produced depending on the processing settings.  
Also, it does not apply to the objects that have not been processed by the security function.  
It is useful for load checking (debug) of the monitor processing.

**(8) Scan Counter of Monitor (GS10)**

Counts up the number of cycles every time the processing cycle set on the display screen is complete.  
It is used to check (debug) the number of scan of monitor.

**(9) Script Common Information (GS14)**

The following script types are supported: project script, screen script, and script part.  
Stores information of error occurrence.

- b0: Turns on in error occurrence
- b1 to b6: Use prohibited
- b7: Turns on in BCD error occurrence
- b8: Turns on in zero division error occurrence
- b9 to b11: Use prohibited
- b12: Turns on in communication error occurrence (including access to the device out of range)
- b13 to b15: Use prohibited

**(10)Script Error Pointer (GS15)**

The following script types are supported: project script and screen script.  
Stores a number showing the start device number of the devices where the latest error record is stored.  
Each error record is stored in two Script Error Data devices (GS16 to GS47).  
The value at GS15 is changed as shown below each time an error occurs.  
-1 → 16 → 18 → ... → 46 (The value is back to 16 and changes repeatedly.)  
The following shows the relationship between the value of GS15 and the storage location of the latest error record.

- When GS15 stores 16, the latest error record is stored in GS16 and GS17.
- When GS15 stores 46, the latest error record is stored in GS46 and GS47.

**(11)Script Error Data (GS16 to GS47)**

The following script types are supported: project script and screen script.  
Store the script numbers and error codes for the error-generated scripts.  
Two word devices are used for one error.  
If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.

### (12)Script Execute Pointer (GS48)

The following script types are supported: project script and screen script.

Stores the device number of the device where the latest script execution number is stored.

Each script execution number is stored in one Script Execute No. device (GS49 to GS79).

The value at GS48 changes as shown below each time the project script and the screen script are executed.

-1 → 49 → 50 → … → 79 (The value is back to 49 and changes repeatedly.)

The following shows the relationship between the value of GS48 and the storage location of the latest script execution number.

- When GS48 stores 49, the latest script execution number is stored in GS49.
- When GS48 stores 79, the latest script execution number is stored in GS79.

### (13)Script Execute No. (GS49 to GS79)

The following script types are supported: project script and screen script.

Store the script numbers of the executed scripts.

One word device is used for one script.

If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

### (14)Object Script Common Information (GS80)

Stores information of error occurrence.

- b0: Turns on in error occurrence
- b1 to b6: Use prohibited
- b7: Turns on in BCD error occurrence
- b8: Turns on in zero division error occurrence
- b9 to b11: Use prohibited
- b12: Turns on in communication error occurrence (including access to the device out of range)
- b13 to b15: Use prohibited

### (15)Object Script Error Pointer (GS81)

Stores a number showing the start device number of the devices where the latest error record is stored.

Each error record is stored in two Object Script Error Data devices (GS82 to GS113).

The value at GS81 changes as shown below each time an error occurs.

-1 → 82 → 84 → … → 112 (The value is back to 16 and changes repeatedly.)

The following shows the relationship between the value of GS81 and the storage location of the error code of the latest error.

- When GS81 stores 82, the latest error record is stored in GS82 and GS83.
- When GS81 stores 112, the latest error record is stored in GS112 and GS113.

### (16)Object Script Error Data (GS82 to GS113)

Store the script user ID numbers and error codes for the error-generated object scripts.

Two word devices are used for one error.

If the number of errors is 17 or more, the error records are overwritten starting from the oldest one.

### (17)Object Script Execute Pointer (GS114)

Stores the device number of the device where the latest script execution number is stored.

Each script execution number is stored in one Object Script Execute No. device (GS115 to GS145).

The value at GS114 changes as shown below each time an object script is executed.

-1 → 115 → 116 → … → 145 (The value is back to 115 and changes repeatedly.)

The following shows the relationship between the value of GS114 and the storage location of the latest script execution number.

- When GS114 stores 115, the latest script execution number is stored in GS115.
- When GS114 stores 145, the latest script execution number is stored in GS145.

### (18) Object Script Execute No. (GS115 to GS145)

Store the script numbers of the executed scripts.

One word device is used for one script.

If the number of the executed scripts is 32 or more, the script execution records are overwritten starting from the oldest one.

### (19) File operation function information (GS154)

The following script types are supported: project script and screen script.

Notifies the execution status of the file operation function.

- b0: Turns on during the executing for a file operation function.  
Turns off when the file operation function is completed.
- b1 to b14: Use prohibited
- b15: Turns on when an error occurs with a file operation function.  
The bit turns off when the next file operation function is completed normally.  
This bit does not turn off even if the Script Error Clear signal (GS384.b0) is turned on.

### (20) Latest Script Error Info Pointer (GS157)

The following script types are supported: project script, screen script, and script part.

Stores a number showing the devices where the latest error record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest error record by using the following expression.

- $GS392 + (GS157 \times 8)$

### (21) Latest Executed Script Pointer (GS158)

The following script types are supported: project script, screen script, and script part.

Stores a number showing the devices where the latest script execution record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest script execution record by using the following expression.

- $GS396 + (GS158 \times 8)$

### (22) Latest Object Script Error Info Pointer (GS159)

Stores a number showing the area where the latest object script error record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest error record by using the following expression.

- $GS432 + (GS159 \times 8)$

### (23) Latest Executed Object Script Pointer (GS160)

Stores a number showing the area where the latest object script execution record is stored.

Data type: Signed binary

Initial value: -1

Calculate the start device number of the devices storing the latest script execution record by using the following expression.

- $GS436 + (GS160 \times 8)$

**(24) Ethernet Port 2 GOT IP Address (GS194, GS195), Ethernet Port 1 GOT IP Address (GS198, GS199)**

Stores the GOT IP address that is specified for the GOT Ethernet interface in hexadecimal.  
The following shows the IP address to be stored to each device.

GOT	GOT IP address	Destination device
GT27, GT25-S, GT25-V (excluding GT2505-V)	GOT IP address for the Ethernet standard port	GS198, GS199
	GOT IP address for the Ethernet extended port	GS194, GS195
GT25-W	GOT IP address for Ethernet standard port 1	GS198, GS199
	GOT IP address for Ethernet standard port 2	GS194, GS195
GT2505-V, GT25HS-V, GT23, GT21	GOT IP address for the Ethernet standard port	GS198, GS199

Example) When the GOT IP address for the Ethernet standard port of GT27 is 192.168.3.18 (decimal)

**(25) Gateway Common Information (GS200)**

Notifies the common information of the gateway function

b15	b14	b13 to b12	b11	b10 to b5	b4	b3	b2	b1	b0
-----	-----	------------	-----	-----------	----	----	----	----	----

GT21 supports b1 and b2.

- b0: Turns on while the mail send function is ready.
- b1: Turns on while the FTP server function is ready.
- b2: Turns on when an FTP client is logged in.
- b3: ON while the server function is ready.
- b4: ON while the client function is ready.
- b5 to b10: Use prohibited
- b11: Turns on when an error occurs in the mail send function.
- b12 to b13: Use prohibited
- b14: Turns on when an error occurs in the server function.
- b15: Turns on when an error occurs in the client function.

**(26) Mail Send Function Error Counter (GS201)**

Counts the number of the errors that have occurred in the mail send function.

**(27) Mail Send Function Error Code (GS202)**

Stores the codes of the errors that have occurred in the mail send function.

The following shows the list of the error code to be stored.

Error code	Details of error and cause	Corrective action
2	No sender address is set for FROM.	Set the sender address for FROM. ⇒10.14 Sending a Mail from the GOT (Mail Send Function)
3	The SMTP server is not set.	Set the SMTP server. ⇒10.14 Sending a Mail from the GOT (Mail Send Function)
4	No receiver address is set for TO.	Set the receiver address for (TO). ⇒10.14 Sending a Mail from the GOT (Mail Send Function)
5	Mail address is improper.	Check that the mail addresses for FROM, TO, CC, and BCC are correct. (Example: Two-byte characters) ⇒10.14 Sending a Mail from the GOT (Mail Send Function)
6	Alarms may occur exceeding the number of mails that can be sent.	Check the number of alarms that have occurred. (Up to 16 mails can be sent at a time to notify the alarm.)

Error code	Details of error and cause	Corrective action
10	The connection with the SMTP server has been failed.	<ul style="list-style-type: none"> <li>• Check if the SMTP server functions normally.</li> <li>• Check if the IP address of the SMTP server is properly set.</li> <li>• Contact the network administrator to check the router address and the subnet mask, and then setup the GOT.</li> <li>• When the firewall is used on the network, contact the network administrator to check that port 25 is allowed.</li> </ul>
11	A timeout has occurred in the connection with the SMTP server.	<ul style="list-style-type: none"> <li>• Check if the SMTP server functions normally.</li> <li>• Set the longer sending timeout time. (GOT utility)</li> </ul>
12	The SMTP server notifies the error.	<ul style="list-style-type: none"> <li>• Check if the SMTP server functions normally.</li> <li>• Contact the network administrator to check that mails can be sent without the authentication including POP3.</li> </ul>

**(28)Mail Send Function Error Occurrence Date And Time (GS203 to GS205)**

Stores the day and the time of the error occurrence with BCD code.  
 Example) When the error occurrence date is 15:30:20 May 15, 2013

**(29)Mail Send Function Send Source (GS206)**

Notifies the type of the function that has caused the error in the mail sending process.

- 0: No error
- 1: User alarm observation
- 2 or more: Use prohibited

**(30)Number of Connected FTP Clients (GS208)**

Notifies the number of the clients connected to the FTP server.  
 Clients are counted when the OPEN command (an FTP command) is executed.

**(31)Server Function Error Counter (GS210)**

Counts the number of the errors that have occurred in the server function.

**(32)Server Function Error Code (GS211)**

Stores the codes of the errors that have occurred in the server function.  
 The following shows the list of the error code to be stored.

Error code	Details of error and cause	Corrective action
490	A script was used for monitoring the gate device that executed the script.	<ul style="list-style-type: none"> <li>• Change the monitor destination GOT specified in the script to another GOT.</li> <li>• Monitor the PLC devices directly without using the script.</li> </ul>
491	A station that does not exist was accessed.	Check the network number, the PLC station number, and the Ethernet settings of the monitor destination.
492	A communication timeout error has occurred.	<ul style="list-style-type: none"> <li>• Lengthen the value set for the timeout in the utility menu of the GOT.</li> <li>• Check the network. (Check if firewall exists, execute Ping, or take other actions.)</li> <li>• Check for cable disconnection, and check the module mounting status.</li> </ul>
493	A communication error has occurred.	<ul style="list-style-type: none"> <li>• Check for cable disconnection, and check the module mounting status.</li> <li>• Check the network. (Check if firewall exists, execute Ping, or take other actions.)</li> </ul>

**(33)Server Function Error Occurrence Date And Time (GS212 to GS214)**

Stores the day and the time of the error occurrence with BCD code.  
 Example) When the error occurrence date is 15:30:20 May 15, 2013

**(34)Server Function Error Client (GS215, GS216)**

Stores the IP address of the GOT (client) where the error occurred in hexadecimal.  
 Example) When the GOT IP address is 192.168.3.18 (decimal)

**(35)Client Function Error Counter (GS220)**

Counts the number of the errors that have occurred in the client function.

**(36)Client Function Error Code (GS221)**

Stores the codes of the errors that have occurred in the client function.  
 The following shows the list of the error code to be stored.

Error code	Details of error and cause	Corrective action
490	A script was used for monitoring the gate device that executed the script.	<ul style="list-style-type: none"> <li>Change the monitor destination GOT specified in the script to another GOT.</li> <li>Monitor the PLC devices directly without using the script.</li> </ul>
491	A station that does not exist was accessed.	Check the network number, the PLC station number, and the Ethernet settings of the monitor destination.
492	A communication timeout error has occurred.	<ul style="list-style-type: none"> <li>Lengthen the value set for the timeout in the utility menu of the GOT.</li> <li>Check the network. (Check if firewall exists, execute Ping, or take other actions.)</li> <li>Check for cable disconnection, and check the module mounting status.</li> </ul>
493	A communication error has occurred.	<ul style="list-style-type: none"> <li>Check for cable disconnection, and check the module mounting status.</li> <li>Check the network. (Check if firewall exists, execute Ping, or take other actions.)</li> </ul>

**(37)Client Function Error Occurrence Date And Time (GS222 to GS224)**

Stores the day and the time of the error occurrence with BCD code.  
 Example) When the error occurrence date is 15:30:20 May 15, 2013

**(38)Client Function Error Counter (GS225, GS226)**

Stores the IP address of the GOT (server) where the error occurred in hexadecimal.  
 Example) When the GOT IP address is 192.168.3.18 (decimal)

**(39)No. Of Faulty Stations (GS230)**

Stores the number of stations where CPU error was detected.

The station where error occurs can be checked with GS231 to GS238.

⇒(40) Ethernet Faulty Station Information (GS231 to GS238)

When the redundant setting is configured, these GS devices do not operate.

- b0 to b7: Stores the number of faulty stations.
- b8 to b15: Use prohibited

### Monitoring GS230 by numerical display

To monitor GS230 by numerical display and others, perform mask processing using data operation function as follows.

#### 6.5.5 4 Setting data operations

Example) Setting of numerical display (the [Operation/Script] tab)

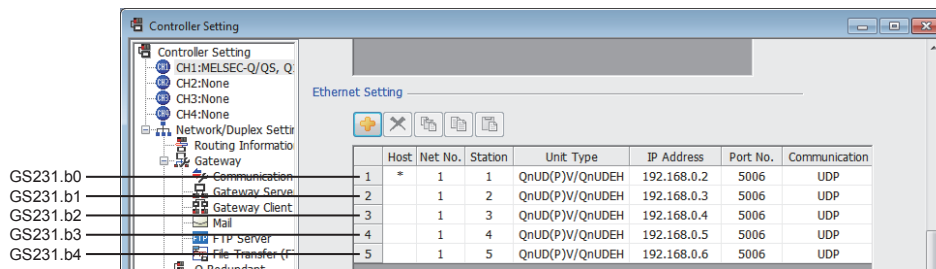

### (40) Ethernet Faulty Station Information (GS231 to GS238)

The bit for the Ethernet module with an error turns on.

0: No error

1: Error

When the Ethernet module has restored from the error, the bit turns off.

Device	Ethernet setting No.															
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
GS231	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
GS232	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
GS233	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33
GS234	64	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49
GS235	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65
GS236	96	95	94	93	92	91	90	89	88	87	86	85	84	83	82	81
GS237	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97
GS238	128	127	126	125	124	123	122	121	120	119	118	117	116	115	114	113

### (41) External Authentication Status Notification (GS240)

- b0: Turns on when the authentication by an external authentication device succeeds.  
Turns off when the login screen or operator re-authentication screen is displayed regardless of the authentication method.
- b1: Turns on when the authentication by an external authentication device fails.  
Turns off when the login screen or operator re-authentication screen is displayed regardless of the authentication method.
- b2 to b12: Use prohibited
- b13: Turns on while the login screen or operator re-authentication screen is displayed.
- b14: Turns on while the login screen for the authentication by an external authentication device is displayed.
- b15: Turns on while the external authentication ID input key window is displayed.

### Notifying the authentication mode by b13 and b14

The status of the Operator Authentication Reception signal and the External Authentication Reception signal notifies the user of the authentication mode currently being accepted.

Operator Authentication Reception signal (GS240.b13)	External Authentication Reception signal (GS240.b14)	Authentication mode
OFF	OFF	The operator authentication not accepted
ON	OFF	The password authentication accepted (operator name + password)
ON	ON	The external authentication accepted

This notifies the user of switching to the auxiliary authentication.

### (42)Insufficient Security Level Notification (GS241)

The bit turns on when the screen cannot be displayed because of the insufficient security level.

b15 to b13	b12	b11	b10	b9	b8	b7 to b5	b4	b3	b2	b1	b0
------------	-----	-----	-----	----	----	----------	----	----	----	----	----

- b0: Use prohibited
  - b1: Turns on when the overlap window 1 cannot be displayed.
  - b2: Turns on when the overlap window 2 cannot be displayed.
  - b3: Turns on when the superimpose window 1 cannot be displayed.
  - b4: Turns on when the superimpose window 2 cannot be displayed.
  - b5 to b7: Use prohibited
  - b8: Turns on when a called screen on the base screen cannot be displayed.
  - b9: Turns on when a called screen on the overlap window 1 cannot be displayed.
  - b10: Turns on when a called screen on the overlap window 2 cannot be displayed.
  - b11: Turns on when a called screen on the superimpose window 1 cannot be displayed.
  - b12: Turns on when a called screen on the superimpose window 2 cannot be displayed.
  - b13 to b15: Use prohibited
- b1 to b4 turn off when a screen is displayed.  
 b1 to b4 turn off when 0 is stored in a screen switching device.  
 b8 to b12 turn off when a called screen is displayed.

### (43)Incorrect Login (GS242)

b15 to b2	b1	b0
-----------	----	----

- b0: Turns on when an incorrect login is detected.  
Turns off upon the lapse of the set login block time or unlocking an operator account by logging in as the administrator.
- b1: Turns on when any operator account is locked.  
Turns off when no operator account is locked.
- b2 to b15: Use prohibited

### (44)Object Direct Input Reception Notification (GS243)

b15	b14 to b0
-----	-----------

- b1 to b14: Use prohibited
- b15: Turns on while an object is in the ready state for the data read by the barcode reader or RFID to be directly input.

### (45)SoftGOT-GOT Link Status Control/Notification (GS244)

b15 to b5	b4	b3	b2	b1	b0
-----------	----	----	----	----	----

When the GOT network interaction function is enabled, only GS244.b2 operates.

- b0: Turns on while GT SoftGOT2000 communicates with the GOT.
- b1: Turns on when the GOT or GT b2: SoftGOT2000 obtains the authorization.
- b2: Notifies whether the GOT or GT SoftGOT2000 is in use.

0: GOT

1: GT SoftGOT2000 (Changes to 0 if GT SoftGOT2000 does not communicate with the GOT.)

- b3: Turns on when the GOT obtains the exclusive authorization. (Always off for GT SoftGOT2000)
- b4: Turns on when the dedicated screen for the utility or the extended function is displayed. (Always off for GT SoftGOT2000)
- b5 to b15: Use prohibited

#### (46) Drive Accessibility (GS251)

b15 to b13	b12	b11	b10	b9	b8	b7 to b6	b5	b4	b3	b2	b1	b0
------------	-----	-----	-----	----	----	----------	----	----	----	----	----	----

Notifies whether each drive is accessible.

- b0: Turns on when data can be read and written from and to drive A.
- b1: Turns on when data can be read and written from and to drive B
- b2: Turns on when data can be read and written from and to drive E.
- b3: Turns on when data can be read and written from and to drive F
- b4: Turns on when data can be read and written from and to drive G.
- b5: Turns on when data can be read from drive N.
- b6 and b7: Use prohibited
- b8: Turns on when data forbids writing to drive A.
- b9: Turns on when data forbids writing to drive B
- b10: Turns on when data forbids writing to drive E.
- b11: Turns on when data forbids writing to drive F.
- b12: Turns on when data forbids writing to drive G.
- b13 to b15: Use prohibited

For the available drives by GOT model, refer to the following.

⇒ 1.2.7 Drive configuration of the target GOT for data transfer

#### (47) Error Detection Common Information (GS252)

b15 to b14	b13 to b12	b11 to b8	b7 to b0
------------	------------	-----------	----------

- b0 to b7: Use prohibited
- b8: Turns on when the video signal for CH1 is not input.  
The bit automatically turns off when the video signal for CH1 is input.
- b9: Turns on when the video signal for CH2 is not input.  
The bit automatically turns off when the video signal for CH2 is input.
- b10: Turns on when the video signal for CH3 is not input.  
The bit automatically turns off when the video signal for CH3 is input.
- b11: Turns on when the video signal for CH4 is not input.  
The bit automatically turns off when the video signal for CH4 is input.
- b12 to b13: Use prohibited
- b14: Turns on when the RGB signal for CH2 is not input.  
The bit automatically turns off when the RGB signal for CH2 is input.  
The bit turns off when b14 of the device specified for [Video/RGB Input Common] is turned off (to hide the RGB screen for CH2).  
For details, refer to the following.  
⇒ 10.7 Displaying Image from a Personal Computer on the GOT (RGB Display Function)
- b15: Turns on when the RGB signal for CH1 is not input.  
The bit automatically turns off when the RGB signal for CH1 is input.  
The bit turns off when b15 of the device specified for [Video/RGB Input Common] is turned off (to hide the RGB screen for CH1).  
For details, refer to the following.  
⇒ 10.7 Displaying Image from a Personal Computer on the GOT (RGB Display Function)

#### (48) Invalid Access from Ethernet Port 1, Invalid Access from Ethernet Port 2 (GS254)

b15 to b13	b12	b11 to b9	b8	b7 to b6	b5	b4	b3 to b2	b1	b0
------------	-----	-----------	----	----------	----	----	----------	----	----

Notifies an invalid write/read request from GT Designer3 while the writing or reading of package data is disabled with the Ethernet Port 1 Access Control or Ethernet Port 2 Access Control device (GS454).

The following shows the correspondence between the Ethernet interfaces and the bits.

GOT	Ethernet interface	Bit number
GT27, GT25-S, GT25-V (excluding GT2505-V)	Ethernet standard port	b0, b1, b8
	Ethernet extended port	b4, b5, b12
GT25-W	Ethernet standard port 1	b0, b1, b8
	Ethernet standard port 2	b4, b5, b12
GT2505-V, GT25HS-V, GT23, GT21	Ethernet standard port	b0, b1, b8

- b0: Available when the Prohibit System Package Write signal (GS454.b0) is on.  
Turns on when the GOT receives a write request of package data (containing system applications) from GT Designer3 through the corresponding Ethernet interface.  
When the Prohibit System Package Write signal (GS454.b0) turns off, this bit also turns off.
- b1: Available when the Prohibit Project Data Write signal (GS454.b1) is on.  
Turns on when the GOT receives a write request of package data (containing project data) from GT Designer3 through the corresponding Ethernet interface.  
When the Prohibit Project Data Write signal (GS454.b1) turns off, this bit also turns off.
- b2 to b3: Use prohibited
- b4: Available when the Prohibit System Package Write signal (GS454.b4) is on.  
Turns on when the GOT receives a write request of package data (containing system applications) from GT Designer3 through the corresponding Ethernet interface.  
When the Prohibit System Package Write signal (GS454.b4) turns off, this bit also turns off.
- b5: Available when the Prohibit Project Data Write signal (GS454.b5) is on.  
Turns on when the GOT receives a write request of package data (containing project data) from GT Designer3 through the corresponding Ethernet interface.  
When the Prohibit Project Data Write signal (GS454.b5) turns off, this bit also turns off.
- b6 to b7: Use prohibited
- b8: Available when the Prohibit Project Data Read signal (GS454.b8) is on.  
Turns on when the GOT receives a read request of package data from GT Designer3 through the corresponding Ethernet interface.  
When the Prohibit Project Data Read signal (GS454.b8) turns off, this bit also turns off.
- b9 to b11: Use prohibited
- b12: Available when the Prohibit Project Data Read signal (GS454.b12) is on.  
Turns on when the GOT receives a read request of package data from GT Designer3 through the corresponding Ethernet interface.  
When the Prohibit Project Data Read signal (GS454.b12) turns off, this bit also turns off.
- b13 to b15: Use prohibited  
    ➔ 12.1.3 ■ 5 (33) Ethernet Port 1 Access Control, Ethernet Port 2 Access Control (GS454)

#### (49) Intensity Notification (GS255)

b15	b14 to b0
-----	-----------

Stores the current intensity and the brightness adjustment mode of the GOT display section.

- b0 to b14: Store the current intensity.

Intensity	Notified value	Intensity	Notified value	Intensity	Notified value	Intensity	Notified value
1	1	9	109	17	117	25	125
2	102	10	3	18	118	26	126
3	103	11	111	19	5	27	127
4	104	12	112	20	120	28	7
5	2	13	113	21	121	29	129

Intensity	Notified value	Intensity	Notified value	Intensity	Notified value	Intensity	Notified value
6	106	14	4	22	122	30	130
7	107	15	115	23	6	31	131
8	108	16	116	24	124	32	8

For GT23

Intensity	Notified value	Intensity	Notified value	Intensity	Notified value	Intensity	Notified value
1	102	5	3	9	118	13	126
2	104	6	112	10	120	14	7
3	106	7	4	11	122	15	130
4	108	8	116	12	124	16	8

- b15: Sets the current brightness adjustment mode.  
The bit turns on when the brightness adjustment mode is set to the low intensity.  
The bit turns off when the brightness adjustment mode is set to normal.

The Intensity Notification is stored when the Intensity Control or the Intensity Control by the intensity adjustment function of the utility is performed.

For the details of the Intensity Control, refer to the following.

⇒ 12.1.3 ■ 5 (34) Intensity Control (GS455)

For the intensity adjustment function of the utility, refer to the following manual.

⇒ GOT2000 Series User's Manual (Utility)

#### (50)FA Transparent Status (GS256)

Notifies the status of the FA transparent function.

The relationship between the stored value and the FA transparent status is as indicated below.

0: Ordinary monitoring

1: In the transparent mode

2: In the pass-through mode

#### (51)Printer Status Information (GS258)

b15 to b4	b3	b2	b1	b0
-----------	----	----	----	----

For GT25-W, GT2505-V, GT23, and GT21, b3 is available only.

- b0: This bit is available when a PictBridge-compatible printer is used.  
Turns on when the printer is connected to the printer unit of the GOT.  
Turns off when the connection is disconnected.
- b1: This bit is available when a PictBridge-compatible printer is used.  
Turns on when a warning occurs while the printer is connected.  
Turns off after the error restoration.
- b2: This bit is available when a PictBridge-compatible printer is used.  
Turns on when a fatal error occurs while the printer is connected.  
Turns off after the error restoration.
- b3: This bit is available when a PictBridge-compatible printer, serial printer, or Ethernet printer is used.  
Turns on when the printer is ready to print.  
Turns off while the printer is starting up (including warming up), or printing is in progress.  
When printing cannot be executed while this signal is on, confirm that a function that executes printing (such as the hard copy function) completes the processing.  
You can confirm that the processing is completed by the Hard Copy Output signal (System signal 2-1.b7).
- b4 to b15: Use prohibited

#### (52)Ethernet Printer Error Info (GS259)

The following printers are supported: Ethernet printers.

Notifies the error code of the latest error that has occurred in the printer.

### (53)Integer ← → Real Number Conversion Status (GS260)

The following script types are supported: project script, screen script, and script part.

Stores the conversion completion notification and error occurrence status into each bit.

If the Conversion Start Indication (GS460.b15) is turned off (0), each bit becomes 0.

⇒ 12.1.3 ■ 5 (37) Conversion Start Indication (GS460)

- b0 to b13: Use prohibited
- b14: Turns on when error occurs during conversion processing by GOT.  
(Stores an error code in GS261)  
⇒ (54) Integer ← → Real Number Conversion Error Code (GS261)
- b15: Turns on when conversion is completed by GOT.

### (54)Integer ← → Real Number Conversion Error Code (GS261)

The following script types are supported: project script, screen script, and script part.

Stores the error during conversion.

Stores 0 when the conversion is completed normally.

Error codes stored in GS261 are as follows.

Error code	Description	Remarks
1	The Conversion Start Indication is not initialized.	The conversion processing is not executed.
2	The setting of the Conversion Start Indication is incorrectly configured.	
3	The number of devices is out of range.	
4	The device is out of range.	
5	The conversion source and destination are the same.	
6	Not used	-
7	Conversion error (such as an overflow)	The conversion processing continues.

### (55)System Alarm GOT Error Channel No. (GS262)

If a system alarm (GOT error) occurs, the corresponding channel No. is stored.

0 is stored when the system alarm is cleared.

With some system alarms, channel numbers are not stored.

For details, refer to the following manuals.

⇒ GOT2000 Series User's Manual (Utility)

### (56)System Alarm CPU Error Channel No. (GS263)

If a system alarm (CPU error) occurs, the corresponding channel No. is stored.

0 is stored when the system alarm is cleared.

### (57)System Alarm Network Error Channel No.(GS264)

If a system alarm (network error) occurs, the corresponding channel No. is stored.

0 is stored when the system alarm is cleared.

### (58)SNTP Time Synchronization Setting Status (GS265)

Notifies the status of the SNTP time synchronization setting.

The following shows the values to be stored.

0: No SNTP time synchronization setting or failure

1: Synchronizing with SNTP

### (59)SNTP Time Query Result (GS266 to GS272)

Stores the SNTP Time Query Result.

The following shows the values to be stored.

- GS266: The four-digit year data is stored.
- GS267: The month data, 01 to 12, is stored.
- GS268: The day data, 01 to 31, is stored.
- GS269: The hour data, 00 to 23, is stored.
- GS270: The minute data, 00 to 59, is stored.
- GS271: The second data, 00 to 59, is stored.

- GS272: The day-of-the-week data, 0 to 6, is stored.  
(0: Sunday 1: Monday 2: Tuesday 3: Wednesday 4: Thursday 5: Friday 6: Saturday)

### (60)Monitoring Interval Timeout Count (GS275)

The cumulative number of times that monitoring interval timeout has occurred is stored.  
If monitoring interval timeout occurs frequently, check the number of job settings and the trigger condition setting.

### (61)Document Display Status (GS276)

- b0: Turns on when a specified file is not displayable.  
Turns off when the file is displayed appropriately.  
For the cause of the display failure, refer to the following.  
    ⇒8.26.5 Precautions for a document display object
- b1: Turns on when a PDF file cannot be cached for display.  
Turns off when the cached PDF file is displayed.  
For the cause of the cache failure, refer to the following.  
    ⇒8.26.5 Precautions for a document display object
- b2: Turns on when a PDF document is displayed in high quality (144 dpi resolution).
- b3 to b15: Use prohibited

### (62)Notify Automatic Connection Status (GS277)

Notifies the communication status between the controllers supporting the automatic connection and the GOT.  
GT21 supports b0 to b3.

- b0: Turns on when the automatic connection is enabled in the setting of the controller (CH1).
- b1: Turns on when the automatic connection process is completed between the controller (CH1) and the GOT.
- b2: Turns on when the automatic connection is enabled in the setting of the controller (CH2).
- b3: Turns on when the automatic connection process is completed between the controller (CH2) and the GOT.
- b4: Turns on when the automatic connection is enabled in the setting of the controller (CH3).
- b5: Turns on when the automatic connection process is completed between the controller (CH3) and the GOT.
- b6: Turns on when the automatic connection is enabled in the setting of the controller (CH4).
- b7: Turns on when the automatic connection process is completed between the controller (CH4) and the GOT.
- b8 to b15: Use prohibited

### (63)Report Page Number (GS278)

Specify this device for a numerical print object on a report screen to output page numbers at the position where the object is placed.

### (64)Standard SD Card Information (GS279)

- b0: Turns on when an SD card is inserted into the standard SD card interface.  
Check the Drive Accessibility device (GS251) to see if the SD card is accessible.  
    ⇒12.1.3 ■ 2 (46) Drive Accessibility (GS251)
- b1 to b15: Use prohibited

### (65)Faulty Monitor Station signal (CH1 to CH14) (GS280, GS300, GS320, GS340)

- b0 to b7: Stores the number of faulty monitor stations with the Ethernet connection. (Except the Ethernet connection with a microcomputer)
- b8 to b15: Use prohibited

**(66) Faulty Station Information (CH1 to CH4) (GS281 to GS288, GS301 to GS308, GS321 to GS328, GS341 to GS348)**

If a communication error occurs in a station that is connected to the GOT by using an applicable connection type, the corresponding bit turns on. The applicable connection types are as follows: Ethernet connection, CC-Link IE Controller Network connection, CC-Link IE Field Network connection, temperature controller connection, inverter connection, and servo amplifier connection.

(For the multi-channel connection, the bit of the device corresponding to each channel No. (CH1 to CH4) turns on.)

0: No error

1: Error

When the faulty station is restored from the error, the bit turns off.

When the GOT is connected to the AZBIL temperature controller (DMC50), the specified station number of the DMC50 differs from the station numbers of the other controllers.

The following shows station numbers for each device.

**(a) When connecting other than the AZBIL temperature controller (DMC50)**

The station corresponding to each device differs according to whether the Ethernet connection is used or not.

- With the Ethernet connection: 1 to 128

Device				Ethernet setting No.

**Point**

(1) Range of detectable faulty stations

The GOT cannot detect errors with the station No. 128 or later, or the station number and the sub station 9-0 or later.

(2) Detecting a faulty station whose station number is specified with the value of a GOT data register

When an error occurs with the station number specified on GT Designer3, the operation differs according to the controller used.

(a) When using other than the AZBIL temperature controller (DMC50)

When an error occurs with the station number specified on GT Designer3, the own station number of the error temperature controller, inverter, or servo amplifier is detected.

(For example, when the station number specified on GT Designer3 is 110 and the own station number of the temperature controller or servo amplifier is 10, the bit for the station number 10 turns on.)

(b) When using the AZBIL temperature controller (DMC50)

When the station number is specified with the value of the GOT data register (GD), the GOT cannot detect errors.

For details of specifying station numbers, refer to the following.

→GOT2000 Series Connection Manual For GT Works3 Version1 for a controller used

(3) Restrictions on the CC-Link IE Field Network connection

If a submaster station exists on the network, use a CC-Link IE Field Network communication unit (GT15-J71GF13-T2) with software version C or later.

You can find the software version on the rating plate of the unit. Check the 10th digit of the serial number.

(4) Dealing with a faulty station

(a) Automatically stopping monitoring a faulty station

The GOT automatically stops monitoring a connected station where a communication timeout error occurs so as not to retard the monitoring of the other connected stations. (No setting is required.)

The following shows an example of the GOT operation when a communication error occurs in station No. 3.

Example) When the GOT is connected to a temperature controller

1) The GOT correctly communicates with controllers.

2) Communication time-out occurs with station No.3.  
 3) The GOT stops monitoring operations of station No.3.  
 4) The GOT checks if the communication time-out with station No.3 is cancelled.

5) Communication time-out with station No.3 is cancelled.  
 6) The GOT automatically restarts monitoring operations of station No.3.

(b) Disconnecting the specified station from the GOT with the GOT special register (GS)

You can disconnect the specified controller from the GOT by using the GOT special register (GS).

→ 12.1.3 ■ 5 (63) Monitor Station Disconnection (CH1 to CH4) (GS531 to GS538, GS541 to GS548, GS551 to GS558, GS561 to GS568)

Doing so helps avoid the occurrence of a communication timeout error even if the specified controller is removed for changing a module or other reasons. (No system alarm appears on the GOT.)

However, depending on the type of connection cables used, the GOT may not monitor the controllers that are connected to the removed one.

**(67) Channel Observation Notification Information (GS299, GS319, GS339, GS359)**

Notifies the communication status of each channel.

- b0: Turns on if a connection error occurs.
- b1 to b15: Use prohibited

**(68) GOT Network No./Station No. Notification (CH1 to CH4) (GS376 to GS383)**

When the GOT starts, the devices store a network number and a station number of the GOT connected with the Ethernet connection.

When the GOT is connected with other than the Ethernet connection, the devices store 0.

Device				Description
CH1	CH2	CH3	CH4	
GS376	GS378	GS380	GS382	Network number (1 to 239)
GS377	GS379	GS381	GS383	Station number (1 to 64)

### ■3 Write device (GS640 to GS1791)

- (1) **Error Device Data Transfer ID (GS642)**  
Stores the device data transfer ID with the executed device data if an error occurs during device data transfer.
- (2) **Device Data Transfer Error Count (GS643)**  
Stores the number of error times with the executed device data during the device data transfer. (Maximum 65535 times)  
When errors occur 65535 times or more, the value remains 65535.  
The device data transfer ID with the executed device data is stored in the error device data transfer ID.
- (3) **Device Data Transfer Processing Time (GS644)**  
Stores the device data transfer processing time for one time. (0 to 60000 (×10ms))  
Stores 60000 (×10ms) when the device data transfer processing time is 600 seconds or more.
- (4) **Device Data Transfer ID (GS645)**  
Stores the device data transfer ID with the executed device data transfer.
- (5) **Device Data Transfer Min. Processing Time (GS646)**  
Stores the minimum processing time in all of the processing times stored in the Device Data Transfer Processing Time (GS644).  
(0 to 60000 (×10ms))
- (6) **Device Data Transfer ID (Min. Processing Time) (GS647)**  
Stores the device data transfer ID with the executed device data transfer when GS646 stores the minimum processing time.
- (7) **Device Data Transfer Max. Processing Time (GS648)**  
Stores the maximum processing time in all of the processing times stored in the Device Data Transfer Processing Time (GS644).  
(0 to 60000 (×10ms))
- (8) **Device Data Transfer ID (Max. Processing Time) (GS649)**  
Stores the device data transfer ID with the executed device data transfer when GS648 stores the maximum processing time.
- (9) **Present Time (GS650 to GS635)**  
Stores the current time with BCD code.  
The day-of-the-week data, 0 to 6, is stored.  
(0: Sunday 1: Monday 2: Tuesday 3: Wednesday 4: Thursday 5: Friday 6: Saturday)  
Example) When the error occurrence date is 15:30:20 May 15, 2013 (Wednesday)

- (10) **Touch Status External Notification (X-coordinate) (GS654)**  
Stores the x-coordinate of touched position when the GOT screen is touched on.
- (11) **Touch Status External Notification (Y-coordinate) (GS655)**  
Stores the Y-coordinate of touched position when the GOT screen is touched on.

### (12) Touch Status External Notification (Touch Status) (GS656)

The following values are stored in the device depending on the touched screen types when the GOT screen is touched on.

- 0: Without touching
- 1: Touching on the base screen
- 2: Touching touchable objects on the base screen
- 11: Touching on the overlap window 1
- 12: Touching touchable objects on the overlap window 1
- 21: Touching on the overlap window 2
- 22: Touching touchable objects on the overlap window 2
- 31: Touching on the overlap window 3
- 32: Touching touchable objects on the overlap window 3
- 41: Touching on the overlap window 4
- 42: Touching touchable objects on the overlap window 4
- 51: Touching on the overlap window 5
- 52: Touching touchable objects on the overlap window 5
- 61: Touching on the video window
- 71: Touching on the key window
- 72: Touching touchable objects on the key window
- 81: Touching on the comment window
- 91: Touching on the popup display

### (13) Trigger Backup Processing Setting No. Notification (GS657)

The GOT notifies users of the trigger backup processing status.

Stores the trigger ID with the executing backup trigger setting during the trigger backup processing.

Stores 0 when the trigger backup processing is not executed.

### (14) Extended External Input Status Notification signal (GS658 to GS665)

When the 128-point input can be executed with the external I/O function, the bit for an input scan signal turns on.

When the 128-point input cannot be executed, the devices are always off.

To enable the 128-point input, turn on GS517.b0 (External I/O Function Notification/External I/O Control Function).

0: Signal off

1: Signal on

The following shows the devices for each bit.

Scan signal	Extended External Input Status Notification signal	External Input signal															
		X0	X1	X2	X3	X4	X5	X6	X7	X8	X9	XA	XB	XC	XD	XE	XF
XSCN0	GS658	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN1	GS659	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN2	GS660	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN3	GS661	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN4	GS662	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN5	GS663	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN6	GS664	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
XSCN7	GS665	b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15

#### Controlling a signal with controllers

The above signals can be controlled with controllers when the trigger action and the script function are used.

**(15)Sound Status Information (GS668)**

- b1 to b14: Use prohibited
- b15: Turns on with a jack disconnection when the sound output function is used. Turns off without a jack disconnection.

**(16)Sound File Number During Play (GS669)**

Stores the sound file number during the play in the device.  
When no sound file exists during the play, 0 is stored in the device.

**(17)Number of Trigger Buffer Data (GS670)**

Stores the number of the trigger buffer data.  
When many trigger buffer data is stored for a long time, the GOT becomes busy. As a result, some data may not be collected.  
Check the number of job settings for which the trigger buffering is enabled and the trigger condition setting.

**(18)Trigger Buffer Overflow Count (GS671)**

Stores the cumulative number of times that a trigger buffer overflow has occurred.  
The trigger buffer overflow means that the 129th trigger data is discarded without being buffered when 128 trigger data is already buffered.  
If a trigger buffer overflow occurs frequently, check the number of job settings for which the trigger buffering is enabled and the trigger condition setting.

**(19)Trigger Buffer Overflow Flag per Job (GS672 to GS675)**

Indicates the status of trigger buffer overflow for each job.  
When a trigger buffer overflow occurs for a job, the GOT internal device corresponding to the job turns on.  
The following shows the GOT internal devices corresponding to jobs from 1 to 64.

Device	Job	Correspondence of the jobs and the GOT internal devices															
		b0	b1	b2	b3	b4	b5	b6	b7	b8	b9	b10	b11	b12	b13	b14	b15
GS672	1 to 16	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
GS673	17 to 32	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
GS674	33 to 48	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48
GS675	49 to 64	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64

**(20)Touch Position Color Acquisition Complete signal (GS980)**

- b0: Turns on when the Touch Position Color (GS981 to 983) stores a value. Turning on the bit cancels the touch position color acquisition ready status. Turning off the Touch Position Color Acquisition Ready signal (GS630.b0) turns off the bit.
- b1 to b15: Use prohibited

**(21)Touch Position Color (GS981 to GS983)**

Notifies the color information at the touched position.  
The GOT acquires the color information with RGB. The following GOT special registers (GS) store the RGB values (0 to 255).

- R: GS981
- G: GS982
- B: GS983

Turning on the Touch Position Color Acquisition Ready signal (GS630.b0) stores -1 in R, G, and B each.  
After the signal (GS630.b0) turns on, the GOT acquires the color information at the first touch and release of the screen.

**(22)Authorization Guarantee Status Notification signal (GS984)**

When the authorization guarantee time is set in GT SoftGOT2000 or GOT, the remaining authorization guarantee time (seconds) is stored.

### (23)Executing File Transfer ID Notification (GS987)

Stores the file transfer setting ID of the file transfer setting in execution.

### (24)Communicating FTP Server ID Notification (GS988)

Stores the FTP server setting ID of the currently connected destination FTP server setting.

### (25)File Transfer Error No. (GS989)

Stores the error code of an error that occurred in the file transfer.

The following shows the list of the error code to be stored.

Error code	Details of error and cause	Corrective action
1	The connection to the FTP server has failed.	<ul style="list-style-type: none"><li>• Check the IP address of the FTP server.</li><li>• Check if a cable is connected.</li><li>• Check HUB connection status.</li><li>• Check if the FTP server is working on the target device.</li><li>• Check if the destination FTP server setting is configured properly.</li></ul>
2	Authentication of the FTP server has failed.	Check if the user name and password are correct.
3	FTP server is busy.	Wait until the FTP server recovers from the busy status. *1
4	FTP communication timeout	<ul style="list-style-type: none"><li>• Check if the communication line has not been physically interrupted.</li><li>• Check the communication congestion.</li></ul>
5	Access to the target file to be written has failed.	<ul style="list-style-type: none"><li>• Check if the write destination drive is enabled.</li><li>• Check if the write destination drive has enough available space.</li><li>• Check if the file is not write-prohibited.</li><li>• When using the GOT as the FTP server, check if the GOT is in the write enable mode.</li></ul>
6	Access to the target file to be read has failed.	<ul style="list-style-type: none"><li>• Check if the target file exists.</li><li>• Check whether the file name specified by the file transfer setting is correct or not.</li><li>• Check if the data storage has been installed on the GOT.</li><li>• Check if the SD card cover has been closed.</li><li>• Check that the SD card access switch is turned on.</li><li>• Check that the write protection for the SD card is canceled.</li></ul>
7	The file whose size exceeds the file size supported by the GOT was attempted to be transferred.	Check if the size of the transfer file is within 2GB.
10	<ul style="list-style-type: none"><li>• For the FTP transfer The GOT folder name is invalid.</li><li>• For the GOT internal transfer The transfer source folder name is invalid.</li></ul>	Check that the GOT folder name or the transfer source folder name does not contain invalid characters, such as two-byte characters.
11	The transfer file name is invalid.	Check if the transfer file name does not include invalid characters such as two-byte characters.
12	The transfer source folder and destination folder have the same path.	Set different paths to the transfer source folder and the transfer destination folder.
50	The drive specification on the PLC side is incorrect.	When a PLC is used as a FTP server, only drive 2 (Memory card (ROM)) is accessible. Check if the setting of [FTP Server Folder] specified in the [File Transfer Setting] dialog is correct.
100	The destination FTP server setting ID which does not exist has been specified.	<ul style="list-style-type: none"><li>• Check if the destination FTP server setting ID specified by [File transfer setting] is correct.</li><li>• Add the required destination FTP server setting.</li></ul>
200	Access to the storage device has failed when the file name or folder name is specified indirectly.	Check if the device setting used for the indirect specification is correct.
507	The total number of characters of the folder path and transfer file name exceeds the limit.	Check that the total number of the characters does not exceed the limit as shown below.
600 *2	The file transfer has been skipped because the total number of characters of the folder path and transfer file name exceeds the limit. (Only when the file is specified with a wildcard character)	<ul style="list-style-type: none"><li>• &lt;GOT folder path&gt;\&lt;Transfer file name&gt;: 78 characters or less (including backward slash marks)</li><li>• &lt;FTP server folder path&gt;\&lt;Transfer file name&gt;: 250 characters or less (including backward slash marks)</li><li>• &lt;Transfer source folder path&gt;\&lt;Transfer file name&gt;: 78 characters or less (including backward slash marks)</li><li>• &lt;Transfer destination folder path&gt;\&lt;Transfer file name&gt;: 78 characters or less (including backward slash marks)</li></ul>
601 *2	Since invalid characters had been used for the transfer file name, the transfer processing was skipped. (only when the file is specified with the wild card)	Check if the transfer file name does not include invalid characters such as two-byte characters.

Error code	Details of error and cause	Corrective action
602 *2	Since the write operation for the file had failed, the transfer processing was skipped. (only when the file is specified with the wild card)	<ul style="list-style-type: none"> <li>• Another function might have been using the transfer file. Transfer the file again.</li> <li>• Check if the write destination drive has enough available space.</li> </ul>
603 *2	Since the read operation for the file had failed, the transfer processing was skipped. (only when the file is specified with the wild card)	<ul style="list-style-type: none"> <li>• The file might have been deleted before being transferred. Check if all the files have been transferred to the destination folder.</li> <li>• Check if the data storage has been installed on the GOT.</li> <li>• Check if the SD card cover has been closed.</li> <li>• Check that the SD card access switch is turned on.</li> <li>• Check that the write protection for the SD card is canceled.</li> </ul>
606 *2	Since the file specified with the wild card had not existed, the file was not transferred. (only when the file is specified with the wild card)	Check if the specified file name is correct.
607 *2	The file whose size exceeds the file size supported by the GOT was attempted to be transferred. (only when the file is specified with the wild card)	Check if the size of the transfer file is within 2GB.
610 *2	Deleting the source file has failed.	Check if the source file is in the deletable status.

\*1 The status in which a request from the client cannot be accepted

\*2 Even if a warning is given, the file transfer process does not stop.

## (26)File Transfer Status (GS990)

Notifies the file transfer processing status.

b15	b14	b13 to b3	b2	b1	b0
-----	-----	-----------	----	----	----

- b0: Turns on when the GOT (FTP client) writes files to the FTP server, or the GOT transfers files within itself.
- b1: Turns on when the GOT (FTP client) reads files from the FTP server.
- b2: Notifies the connection mode of the GOT (FTP client) and the FTP server.  
ON: PASV mode  
OFF: PORT mode
- b3 to b13: Use prohibited
- b14: Turns on when the error with which the processing can be continued occurs during the file transfer.  
Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.
- b15: Turns on when the error with which the processing cannot be continued occurs during the file transfer.  
Files cannot be transferred while this signal is on.  
Turns off when the Clear File Transfer Error signal (GS401.b0) is turned on.

## (27)Number of Transfer Target Files (GS991)

Stores the total number of files to be transferred.

When the transfer file name is specified with the wild card, the total count includes the files which are not transferred due to an invalid number of characters for the folder name or other causes.

(However, the total count does not include only the files which have invalid names consisting of such as two-byte characters.)

Holds the device value until the processing for the next file transfer ID is started.

## (28)Number of Transferred Files (GS992)

Stores the total number of files which is completely transferred.

The total count includes the files which are not transferred due to the error or other causes.

Holds the device value until the processing for the next file transfer ID is started.

## (29)Recipe Status(GS1010)

b15	b14	b13 to b3	b2	b1	b0
-----	-----	-----------	----	----	----

Notifies the processing status of recipe data when the recipe data is manipulated using a special function switch ([Switch Action]: [Recipe Data Operation]).

⇒9.3.3 ■ 3 (4) Exporting a recipe file by using a special function switch (Recipe data operation)

- b0: Turns on when the recipe data is imported.
- b1: Turns on when the recipe data is exported.
- b2: Turns on when the recipe special control is executed.  
Turns off after the control is complete and the Execute Special Control signal (GS1800.b2) is turned off.
- b3 to b13: Use prohibited

- b14: Turns on after importing or exporting the recipe data is complete.  
Turns off when another recipe data manipulation is performed or the Clear Status Information signal (GS1800.b14) is turned on.  
→12.1.3 ■ 6 (6) Recipe Control (GS1800)
- b15: Turns on when importing or exporting the recipe data fails.  
Turns off when another recipe data manipulation is performed or the Clear Status Information signal (GS1800.b14) is turned on.  
→12.1.3 ■ 6 (6) Recipe Control (GS1800)

### (30)Recipe Special Control Result (GS1011)

Notifies the result of the recipe special control.  
Stores 0 if the control is complete.  
Stores a value other than 0 if an error occurs.  
For the error codes and corrective actions, refer to the following.  
→9.3.3 ■ 8 (12) Error code list

This device is reset to 0 upon turn-on of the Execute Special Control signal (GS1800.b2).

### (31)Recipe Special Control No. (GS1012)

Notifies the search result (record No.) of the recipe special control.  
This device is reset to 0 upon turn-on of the Execute Special Control signal (GS1800.b2).

### (32)Recipe Display (Record List) Target Recipe No. (GS1013)

Notifies the recipe number for the records displayed on the recipe display (record list).  
This device stores 0 in the following cases.

- No recipe display (record list) is placed on the screen.
- A nonexistent recipe setting is specified to be displayed on the recipe display (record list).
- The recipe display (record list) is not displayed because the display condition is unsatisfied or the security level is insufficient.

For information on how to link the recipe function with the recipe display (record list) by using GOT special registers, refer to the following.  
→9.3.3 ■ 9 Link with the recipe display (record list) by using GOT special registers

### (33)Recipe Display (Record List) Selected Record No. (GS1014)

Stores the record number selected on the recipe display (record list).  
This device stores 0 in the following cases.

- No recipe display (record list) is placed on the screen.
- A nonexistent recipe setting is specified to be displayed on the recipe display (record list).
- The recipe display (record list) is not displayed because the display condition is unsatisfied or the security level is insufficient.
- No cursor is displayed on the recipe display (record list).

For information on how to link the recipe function with the recipe display (record list) by using GOT special registers, refer to the following.  
→9.3.3 ■ 9 Link with the recipe display (record list) by using GOT special registers

### (34)Video File Maintenance Information (GS1022)

b15 to b8	b7	b6	b5	b4	b3	b2	b1	b0
-----------	----	----	----	----	----	----	----	----

Notifies the amount of usage of the CF card or the number of video files in the card in the multimedia unit while the Start Video File Information Notification signal (GS522.b1) is on.  
This function is usable only when [Enable] is selected and [Event Trigger Device] is set in [Before-After Event Recording Setting] on the [Recording Setting] tab of the [Multimedia] dialog.  
This device turns off upon the turn-off of the Start Video File Information Notification signal (GS522.b1).  
→12.1.3 ■ 5 (59) Special Control During Specific Function Execution (GS522)

- b0: Turns on when the amount of usage of the CF card reaches 60%.
- b1: Turns on when the amount of usage of the CF card reaches 80%.
- b2: Turns on when the number of video files in the CF card reaches 80.
- b3: Turns on when the number of video files in the CF card reaches 110.
- b4: Turns on when the number of video files in the CF card reaches 150.
- b5: Turns on when the number of video files in the CF card reaches 400.
- b6: Turns on when the number of video files in the CF card reaches 450.

- b7: Turns on when the number of video files in the CF card reaches 500.
- b8 to b15: Use prohibited

### (35)USB Drive Common Information (GS1024)

- b0: Turns on when the USB memory connected to drive E on the GOT is ready for removal after the USB Drive Common Control (GS1824.b0) turns on.
- b1: Turns on when the USB memory connected to drive F on the GOT is ready for removal after the USB Drive Common Control (GS1824.b1) turns on.
- b2: Turns on when the USB memory connected to drive B on the GOT is ready for removal after the USB Drive Common Control (GS1824.b2) turns on.
- b3: Turns on when the USB memory connected to drive G on the GOT is ready for removal after the USB Drive Common Control (GS1824.b3) turns on.
- b4: Turns on when the USB memory connected to drive E on the GOT is ready for removal after the USB Drive Common Control (GS1824.b4) turns on.
- b5: Turns on when the USB memory connected to drive F on the GOT is ready for removal after the USB Drive Common Control (GS1824.b5) turns on.
- b6: Turns on when the USB memory connected to drive B on the GOT is ready for removal after the USB Drive Common Control (GS1824.b6) turns on.
- b7: Turns on when the USB memory connected to drive G on the GOT is ready for removal after the USB Drive Common Control (GS1824.b7) turns on.
- b8: Turns on when the USB memory (drive E) connected to the USB interface on the GOT is ready for use.
- b9: Turns on when the USB memory (drive F) connected to the USB interface on the GOT is ready for use.
- b10: Turns on when the USB memory (drive B) connected to the USB interface on the GOT is ready for use.
- b11: Turns on when the USB memory (drive G) connected to the USB interface on the GOT is ready for use.
- b12: Turns on when the USB memory (drive E) connected to the USB interface on the GOT is ready for use.
- b13: Turns on when the USB memory (drive F) connected to the USB interface on the GOT is ready for use.
- b14: Turns on when the USB memory (drive B) connected to the USB interface on the GOT is ready for use.
- b15: Turns on when the USB memory (drive G) connected to the USB interface on the GOT is ready for use.

For the available drives by GOT model, refer to the following.

→ 1.2.7 Drive configuration of the target GOT for data transfer

### (36)RGB Signal Input Status Notification (GS1025)

Notifies the RGB signal input, supporting the resolution and the refresh rate of the RGB signal or not, and the RGB input unit status.

When the GT27-R2-Z is used, the device notifies the input status of the channel set for the input source of the RGB screen.

- b0: Turns on when the RGB signal is input.
- b1: Turns on when the GOT supports the input resolution and refresh rate.
- b2: Turns on when the RGB input unit operates normally.
- b3 to b15: Use prohibited

### (37)RGB Signal Resolution (Horizontal) (GS1026)

When GS1025.b0 turns on, the device stores the horizontal resolution (dots) of the RGB signal.

When the RGB signal does not exist or the resolution of the signal is unclear, the device stores 0.

### (38)RGB Signal Resolution (Vertical) (GS1027)

When GS1025.b0 turns on, the device stores the vertical resolution (dots) of the RGB signal.

When the RGB signal does not exist or the resolution of the signal is unclear, the device stores 0.

### (39)RGB Signal Refresh Rate (GS1028)

When GS1025.b0 turns on, the device stores the refresh rate (Hz) of the RGB signal.

When the RGB signal does not exist or the refresh rate of the signal is unclear, the device stores 0.

**(40)Video/RGB Display Object Status (CH1 to CH2) (GS1030, GS1035)**

Notifies information on the video/RGB display object.

- b0: Turns on when a signal is input.
- b1: Turns on when the target GOT supports the resolution and refresh rate indicated by input signals.
- b2: Turns on when the RGB input unit operates normally.
- b3 to b15: Use prohibited

**(41)Video/RGB Display Object Horizontal Resolution (CH1 to CH2) (GS1031, GS1036)**

Stores the horizontal resolution (dots) indicated by an input signal for the video/RGB display object.  
Stores 0 if no signal is input or the resolution cannot be identified.

**(42)Video/RGB Display Object Vertical Resolution (CH1 to CH2) (GS1032, GS1037)**

Stores the vertical resolution (dots) indicated by an input signal for the video/RGB display object.  
Stores 0 if no signal is input or the resolution cannot be identified.

**(43)Video/RGB Display Object Refresh Rate (CH1 to CH2) (GS1033, GS1038)**

Stores the refresh rate (Hz) indicated by an input signal for the video/RGB display object.  
Stores 0 if no signal is input or the refresh rate cannot be identified.

**(44)Wireless Processing Security Information (GS1040)**

Notifies operations executed via a wireless LAN.

- b0: Turns on when the GOT receives a write request of the package data (containing system applications) from GT Designer3 while the Prohibit System Package Write signal (GS1840.b0) is on.  
When the Prohibit System Package Write signal (GS1840.b0) turns off, this bit also turns off.
- b1: Turns on when the GOT receives a write request of the package data (containing project data) from GT Designer3 while the Prohibit Project Data Write signal (GS1840.b1) is on.  
When the Prohibit Project Data Write signal (GS1840.b1) turns off, this bit also turns off.
- b2 to b7: Use prohibited
- b8: Turns on when the GOT receives a read request of data from GT Designer3 while the Prohibit Project Data Read signal (GS1840.b8) is on.  
When the Prohibit Project Data Read signal (GS1840.b8) turns off, this bit also turns off.
- b9 to b15: Use prohibited

**(45)Wireless LAN Status Notification (GS1060)**

Notifies the information on the GOT wireless LAN function.

- b0: Turns on when the wireless LAN function is enabled.  
Turns off when the wireless LAN function is disabled.
- b1: Turns on when the GOT (operation mode: station) connects to the wireless LAN access point.
- b2: Notifies the GOT operation mode.  
0: Station  
1: Access point
- b3 to b15: Use prohibited

**(46)Reception Field Intensity Notification (GS1061)**

Stores a value (0 to 4) indicating the intensity of radio waves received by access points when the wireless LAN function is used.  
Zero indicates a disconnection, and the other values indicate the intensity of radio waves. The larger the value, the higher the intensity.

**(47) Access Point MAC Address Notification (GS1067 to GS1069)**

Stores the MAC address of the access point to which the GOT is connected in hexadecimal.

Example) When the MAC address is 78-2B-CB-AA-3F-C6 (16 bits)

Access Point MAC address: 78 - 2B - CB - AA - 3F - C6 (Hexadecimal)

**(48) Number of Connected Stations (GS1072)**

Stores the number of stations connected to the GOT (operation mode: access point) on a wireless LAN.

Stores 0 when the GOT operates as a station (operation mode: station) or the wireless LAN function is disabled.

**(49) Label Name Resolution Status (Common, CH1 to CH4) (GS1080, GS1081 to GS1084)**

Notifies the status of the label name resolution.

GS1080 notifies the status relevant to all channels.

GS1081 to GS1084 each notify the status of the corresponding channel (CH1 to CH4).

- b0: Use prohibited
- b1: Notifies that the label name resolution is being executed.  
For GS1080, this bit turns on while the label name resolution is being executed on any of the channels.  
For GS1081 to GS1084, this bit turns on while the label name resolution is being executed on the corresponding channel.
- b2: Notifies that the label name resolution completes.  
For GS1080, this bit turns on when the label name resolution completes on all the channels.  
For GS1081 to GS1084, this bit turns on when the label name resolution completes on the corresponding channel.
- b3: Notifies that the label name resolution is canceled.  
For GS1080, this bit turns on when the label name resolution is canceled on any of the channels.  
For GS1081 to GS1084, this bit turns on when the label name resolution is canceled on the corresponding channel.
- b4 to b14: Use prohibited
- b15: Notifies that an error has occurred during the label name resolution.  
For GS1080, this bit turns on when a label name resolution error occurs on any of the channels.  
For GS1081 to GS1084, this bit turns on when a label name resolution error occurs on the corresponding channel.  
For how to use the bits, refer to the following.

→ 6.1.3 ■ 4 (3) Label name resolution performed by a user

**(50) HMS Communication Module Version (GS1110 to GS1111)**

Stores the version of the HMS communication module used.

Example) When the communication module version is 01.02.01

**(51) HMS Communication Module Error Details (GS1112 to GS1113)**

- GS1112.b0 to b7: Store an exception code of the network object.
- GS1112.b8 to b15: Store an exception code of the Anybus object.
- GS1113.b0 to b7: Store the Anybus status.
- GS1113.b8 to b15: Store the error code of an Anybus message.

### (52)VNC Server Operation Status Notification (GS1230)

- b0: Turns on while the VNC server communicates with the VNC client.
- b1: Turns on when the VNC client is allowed to display the VNC server screen and to remotely operate the VNC server.  
Turns off when the VNC client is allowed to only display the VNC server screen.
- b2: Turns on when the VNC client holds the authorization.  
Turns off when the VNC server holds the authorization.
- b3 to b14: Use prohibited
- b15: Turns on when the authorization exists in the client side.  
Turns off when the server side holds the authorization.

### (53)Communicating VNC Client Information Notification (GS1231, GS1232)

Stores the IP address of the VNC client communicating with the VNC server in hexadecimal.

Example) When the IP address of the VNC client is 192.168.3.10 (Decimal)

### (54)VNC Server Authorization Guarantee Status Notification (GS1233)

Stores the remaining authorization guarantee time (second).

### (55)Insufficient Security Level Notification (GS1241)

Turns on when the screen cannot be displayed because of the insufficient security level.

- b0: Turns on when the overlap window 3 cannot be displayed.
- b1: Turns on when the overlap window 4 cannot be displayed.
- b2: Turns on when the overlap window 5 cannot be displayed.
- b3 to b7: Use prohibited
- b8: Turns on when a called screen on the overlap window 3 cannot be displayed.
- b9: Turns on when a called screen on the overlap window 4 cannot be displayed.
- b10: Turns on when a called screen on the overlap window 5 cannot be displayed.
- b11 to b15: Use prohibited

### (56)Report Output Status: Print Date/Time (Year) (GS1271)

Specify this device for a numerical print object on a report screen to output the date (year) on which the file print function prints a report.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

### (57)Report Output Status: Print Date/Time (Month) (GS1272)

Specify this device for a numerical print object on a report screen to output the date (month) on which the file print function prints a report.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

### (58)Report Output Status: Print Date/Time (Day) (GS1273)

Specify this device for a numerical print object on a report screen to output the date (day) on which the file print function prints a report.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

**(59)Report Output Status: Print Date/Time (Hour) (GS1275)**

Specify this device for a numerical print object on a report screen to output the time (hour) at which the file print function prints a report.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

**(60)Report Output Status: Print Date/Time (Minute) (GS1276)**

Specify this device for a numerical print object on a report screen to output the time (minute) at which the file print function prints a report.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

**(61)Report Output Status: Print Date/Time (Second) (GS1277)**

Specify this device for a numerical print object on a report screen to output the time (second) at which the file print function prints a report.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

**(62)Report Output Status: Total Number of Pages (GS1278)**

Specify this device for a numerical print object on a report screen to output the total number of pages at the position where the object is placed.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

**(63)Report Output Status: Operator Name (GS1279)**

Specify this device for a text print object on a report screen to output the name of the operator who prints a report using the file print function.

This device is activated only when the report function outputs data to a file.

This device is activated on a report screen only.

**(64)Number of Connected GOT Mobile Function Clients (GS1400)**

Stores the number of clients connected to the server (GOT).

**(65)GOT Mobile Function Connection Status (GS1401)**

b15 to b6	b5	b4	b3	b2	b1	b0
-----------	----	----	----	----	----	----

Notifies the connection status between the server (GOT) and each client.

- b0: Use prohibited
- b1: Turns on when client 1 connects to the server (GOT).
- b2: Turns on when client 2 connects to the server (GOT).
- b3: Turns on when client 3 connects to the server (GOT).
- b4: Turns on when client 4 connects to the server (GOT).
- b5: Turns on when client 5 connects to the server (GOT).
- b6 to b15: Use prohibited

**(66)Authorization Status Information (GS1460)**

b15 to b2	b1	b0
-----------	----	----

Notifies the information on the authorization of the GOT network interaction function.

This device is activated in an applicable GOT in the control group.

- b0: Turns on when the equipment obtains the authorization.
- b1: Turns on when the equipment displays a screen in which the authorization control is enabled.
- b2 to b15: Use prohibited

**(67)Master GOT IP Address (GS1461 to GS1462)**

Store the IP address of the master GOT in hexadecimal when GS1460.b0 turns on.  
 Store 0 when GS1460.b0 is off.  
 These devices are activated in an applicable GOT in the control group.  
 Example) When the IP address of the master GOT is 192.168.3.18 (decimal)

**(68)Time Elapsed from Authorization Acquisition (GS1463)**

Stores the time (second) elapsed since GS1460.b0 turned on.  
 If the time exceeds 65536 seconds, the value update stops.  
 Stores 0 when GS1460.b0 is off.  
 This device is activated in an applicable GOT in the control group.

**(69)Authorization Guarantee Time (GS1464)**

Stores the remaining authorization guarantee time (second) when GS1460.b0 is on.  
 Stores 0 when GS1460.b0 is off.  
 This device is activated in an applicable GOT in the control group.

**(70)Authorization Management Information (GS1465)**

Notifies the information on the authorization of the GOT network interaction function.  
 This device is activated in the master GOT in the control group.

- b0: Turns on when any equipment in the control group obtains the authorization.
- b1: Turns on when equipment except the master GOT in the control group is prohibited from obtaining the authorization (when GS1796.b0 is on).
- b2: Turns on when all pieces of equipment including the master GOT in the control group are prohibited from obtaining the authorization (when GS1796.b2 is on).
- b3 to b15: Use prohibited

**(71)Authorized Equipment IP Address (GS1466 to GS1467)**

Store the IP address of the authorized equipment when GS1465.b0 turns on.  
 Store 0 when GS1465.b0 is off.  
 These devices are activated in the master GOT in the control group.  
 Example) When the IP address of the authorized equipment is 192.168.3.19 (decimal)

**(72)Authorized Equipment Type (GS1468)**

Stores the type of the authorized equipment when GS1465.b0 turns on.

Stored value	Type
0	GOT
1	GT SoftGOT2000
2	GOT Mobile function client

When GS1465.b0 is off, 0 is stored.  
 This device is activated in the master GOT in the control group.

### (73)Authorized Equipment ID Information (GS1469)

Stores the ID number of the authorized equipment when GS1465.b0 turns on.  
The value to be stored varies depending on the type of the authorized equipment.

Type	Value to be stored
GOT	GOT ID number (1 to 32767)
GT SoftGOT2000	GT SoftGOT2000 module number (1 to 32767)
GOT Mobile function client	GOT Mobile function client number (1 to 5)

When GS1465.b0 is off, 0 is stored.  
This device is activated in the master GOT in the control group.

### (74)Authorization Use Time (GS1470)

Stores the time (second) elapsed since GS1465.b0 turned on.  
If the time exceeds 65536 seconds, the value update stops.  
When GS1465.b0 is off, 0 is stored.  
This device is activated in the master GOT in the control group.

### (75)GOT Ethernet Setting Change Status (GS1500)

Notifies the status of the GOT Ethernet setting change.

- b0: Turns on while the Ethernet setting is being changed.  
When the Execute GOT Ethernet Setting Change signal (GS1901.b0) turns off, this bit also turns off.
- b1: Turns on when the Ethernet setting change has completed.
- b2: Turns on when changes are made in the Ethernet setting by using the GOT Ethernet Setting Change devices (GS1900 to GS1908).  
Restart the GOT to apply the new Ethernet setting.
- b3 to b14: Use prohibited
- b15: Turns on when an error occurs during the Ethernet setting change.

For the details of the GOT Ethernet Setting Change devices (GS1900 to GS1908), refer to the following.  
→ 12.1.3 ■ 6 (22) GOT Ethernet Setting Change (GS1900 to GS1908)

## ■ 4 Read device list

Device	Function	Reference	Supported models
GS0 to GS383	Write device	→ ■ 1 Write device list	GT27 GT25 GT23 GT21 GS SoftGOT2000

## ■ 5 Read device (GS384 to GS639)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### (1) Script Common Control (GS384)

The following script types are supported: project script, screen script, and script part.  
 Notifies the information common to project scripts and screen scripts.

- b0: When this bit is turned on, the script error records are cleared as shown below.  
 GS14.b0, b7, b8, and b12 store 0.  
 GS15 stores -1.  
 GS16 to GS47 store 0.
- b1: When this bit is turned on, the script aborted due to an error is re-executed.
- b2 to b15: Use prohibited

For the precautions on the script error, refer to the following.  
 ⇒9.9.12 ■ 1 (11) Script error control and GOT status

### (2) Script Monitoring Time (GS385)

The following script types are supported: project script, screen script, and script part.  
 Specify the monitoring time of a project script, screen script, or script of a script parts object in seconds.  
 If a script does not end after a lapse of the specified time, the script is aborted.  
 The setting range is [1] (second) to [300] (seconds).  
 If an invalid value is specified, 10 seconds are assumed.

### (3) Project/Screen Script Initial Operation (GS386)

Set whether to run a project script, screen script, or script of a script parts object upon screen switching or others applicable processes.

- When GS386 stores 0, the script runs.
- When GS386 stores a nonzero value, the script does not run.

This setting is applied to the project scripts, screen scripts, and script parts where the following trigger types are set.

- [Rise]:  
 When the trigger device is on, the script runs upon screen switching or other applicable processes.
- [Fall]:  
 When the trigger device is off, the script runs upon screen switching or other applicable processes.
- [Rise/Fall]:  
 When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Example) When a screen script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for base screen 2  
 After base screen 1 is switched to base screen 2, if the trigger device (X1000) turns on, the screen script set for base screen 2 is executed.

The following processes trigger applicable scripts to run.

**(a) Project script**

- When the GOT is powered on or when the GOT returns from offline

**(b) Screen script**

- Screen switching

The script set for the destination screen runs upon screen switching.

If [Perform script initial operation (screen/object) only when switching screens] is deselected in the [Script] dialog, each of the following processes triggers the relevant script to run.

→9.9.5 ■ 4 [Option] tab

- Security switching
- Language switching
- System language switching
- Station No. switching

When the station No. switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.

- Offset switching

Only the screen scripts are executed.

On a screen having a script setting, when offset switching occurs in any device of the screen, the script is executed.

**(4) Object Script Common Control (GS387)**

Notifies the information common to object scripts.

b15 to b2	b1	b0
-----------	----	----

- b0: When this bit is turned on, the object script error records are cleared as shown below.

GS80.b0, b7, b8, and b12 store 0.

GS81 stores -1.

GS82 to GS113 store 0.

- b1: When this bit is turned on, the object script aborted due to an error is re-executed.
- b2 to b15: Use prohibited

For the precautions on the object script error, refer to the following.

→9.10.7 ■ 1 (10) Object script error control and GOT status

**(5) Object Script Monitoring Time (GS388)**

Specify the monitoring time of an object script in seconds.

If a script does not end after a lapse of the specified time, the script is aborted.

The setting range is [1] (second) to [300] (seconds).

If an invalid value is specified, 10 seconds are assumed.

**(6) Object Script Initial Operation (GS389)**

Set whether to run an object script upon screen switching or others applicable processes.

- When GS389 stores 0, the object script runs.
- When GS389 stores a nonzero value, the object script does not run.

This setting is applied to the object scripts where the following trigger types are set.

- [Rise]:

When the trigger device is on, the script runs upon screen switching or other applicable processes.

- [Fall]:

When the trigger device is off, the script runs upon screen switching or other applicable processes.

- [Rise/Fall]:

When the trigger device is on or off, the script runs upon screen switching or other applicable processes.

Example) When the object script ([Trigger Type]: [Rise], [Trigger Device]: X1000) is set for a switch on base screen 2

After base screen 1 is switched to base screen 2, if the trigger device (X1000) turns on, the object script of the switch on base screen 2 is executed.

The following processes trigger applicable scripts to run.

- Screen switching

The script set for the destination screen runs upon screen switching.

If [Perform script initial operation (screen/object) only when switching screens] is deselected in the [Script] dialog, each of the following processes triggers the relevant script to run.

⇒9.9.5 ■ 4 [Option] tab

- Security switching
- Language switching
- System language switching
- Station No. switching

When the station No. switching devices are set by screen type, the scripts that are set for the screens of the target screen type are executed.

### (7) File Operation Data Storage Order (GS390)

The following script types are supported: project script, screen script, and script part.

Select the order in which data is stored when using the file\_read or file\_write function in a script.

[Low-->High]: Stores data from the lower-order bytes.

[High-->Low]: Stores data from the higher-order bytes.

Alternatively, you can configure the data storage order setting on GT Designer3.

This setting becomes invalid when GS390 stores 1 or 2.

The following shows examples of settings.

- When GS390 stores 0, data is stored in the order specified on GT Designer3.
- When GS390 stores 1, data is stored from the lower-order bytes.
- When GS390 stores 2, data is stored from the higher-order bytes.
- When GS390 stores 3 or more, data is stored in the order specified on GT Designer3.

### (8) Start GD Device for Script Error Info Notification (GS392)

The following script types are supported: project script, screen script, and script part.

Specify the start device number of the GD devices to store error records.

Data type: Unsigned binary

### (9) Number of Script Error Info Outputs (GS394)

The following script types are supported: project script, screen script, and script part.

Specify the maximum number of error records.

Data type: Unsigned binary

The setting range is 0 to 5000.

If the device stores 0, no error record will be stored.

If the device stores 5001 or more, up to 5000 records will be stored.

GS395.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.

The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. ⇒9.9.14 ■ 3 (5) List of script execution error codes

Storage device	Item	Description
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 1: Project script • 2: Screen script (set for a base screen) • 3: Screen script (set for a window screen) • 4: Script part
GD1002	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1003	Script number or object ID number	The device stores a script number or object ID number according to the script type. • For project scripts and screen scripts: script number • For script parts: object ID number
GD1004	Execution order number	Script execution order number specified on GT Designer3 The device stores any of the following values according to the script type. • For project scripts: 1 to 256 • For screen scripts: 1 to 256 (per screen) • For script parts: 1 to 16 (per script parts object)
GD1005	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. • 200: Base screen • 210: Superimpose window 1 • 220: Superimpose window 2 • 310: Overlap window 1 • 320: Overlap window 2 • 330: Overlap window 3 • 340: Overlap window 4 • 350: Overlap window 5 If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. • When a base screen is called, 1 is added. • When a window screen is called, 2 is added. Example) When a window screen is called from overlap window 3 330 + 2 = 332 The device stores 0 for a project script.
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

### (10) Script Error Info Output Common Control (GS395)

The following script types are supported: project script, screen script, and script part.

- b0: When this bit is turned on, storing error records starts.  
When this bit is turned off, storing error records ends.
- b1: Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS394.  
When this bit is turned on, storing error records stops.  
When this bit is turned off, storing error records continues by overwriting the oldest record.
- b2 to b7: Use prohibited
- b8: When this bit is turned on, the project script error records are not stored.
- b9: When this bit is turned on, the screen script error records are not stored.
- b10: When this bit is turned on, the script error records of script parts objects are not stored.
- b11: When this bit is turned on, the records of warnings that do not abort a script are not stored.
- b12 to b15: Use prohibited

### (11) Start GD Device for Script Event Notification (GS396)

The following script types are supported: project script, screen script, and script part.

Specify the start device number of the GD devices to store script execution records.

Data type: Unsigned binary

## (12)Number of Script Event Outputs (GS398)

The following script types are supported: project script, screen script, and script part.  
Specify the maximum number of script execution records.

Data type: Unsigned binary

The setting range is 0 to 5000.

If the device stores 0, no script execution record will be stored.

If the device stores 5001 or more, up to 5000 records will be stored.

GS399.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.

The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• 1: Project script</li> <li>• 2: Screen script (set for a base screen)</li> <li>• 3: Screen script (set for a window screen)</li> <li>• 4: Script part</li> </ul>
GD1001	Screen number	Number of the screen for which the script is set. The device stores 0 for a project script.
GD1002	Script number or object ID number	The device stores a script number or object ID number according to the script type. <ul style="list-style-type: none"> <li>• For project scripts and screen scripts: script number</li> <li>• For script parts: object ID number</li> </ul>
GD1003	Execution order number	Script execution order number specified on GT Designer3 The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• For project scripts: 1 to 256</li> <li>• For screen scripts: 1 to 256 (per screen)</li> <li>• For script parts: 1 to 16 (per script parts object)</li> </ul>
GD1004	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"> <li>• 200: Base screen</li> <li>• 210: Superimpose window 1</li> <li>• 220: Superimpose window 2</li> <li>• 310: Overlap window 1</li> <li>• 320: Overlap window 2</li> <li>• 330: Overlap window 3</li> <li>• 340: Overlap window 4</li> <li>• 350: Overlap window 5</li> </ul> <p>If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type.</p> <ul style="list-style-type: none"> <li>• When a base screen is called, 1 is added.</li> <li>• When a window screen is called, 2 is added.</li> </ul> <p>Example) When a window screen is called from overlap window 3 330 + 2 = 332</p> <p>The device stores 0 for a project script.</p>
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

### (13)Script Event Output Common Control (GS399)

The following script types are supported: project script, screen script, and script part.

- b0: When this bit is turned on, storing script execution records starts.  
When this bit is turned off, storing script execution records ends.
- b1: Specifies the operation to be performed when the number of executed scripts has exceeded the maximum number of script execution records specified with GS398.  
When this bit is turned on, storing script execution records stops.  
When this bit is turned off, storing script execution records continues by overwriting the oldest record.
- b2 to b7: Use prohibited
- b8: When this bit is turned on, the project script execution records are not stored.
- b9: When this bit is turned on, the screen script execution records are not stored.
- b10: When this bit is turned on, the script execution records of script parts objects are not stored.
- b11 to b15: Use prohibited

### (14)Gateway Common Control (GS400)

Controls the FTP server function.

GT21 supports b2 and b8.

- b0 to b1: Use prohibited
- b2: When this bit is turned on, all FTP clients connected to the FTP server are forcibly disconnected.
- b3 to b7: Use prohibited
- b8: When this bit is turned on, binary files (\*.G2 □) become readable from all the FTP clients that are connected to the FTP server.
- b9 to b10: Use prohibited
- b11: When this bit is turned on, the error occurring in the mail send function is cleared. (GS200.b11 and GS201 to GS206 are cleared.)
- b12 to b13: Use prohibited
- b14: When this bit is turned on, the error occurring in the server function is cleared. (GS200.b14 and GS210 to GS216 are cleared.)
- b15: When this bit is turned on, the error occurring in the client function is cleared. (GS200.b15 and GS220 to GS226 are cleared.)

### (15)File Transfer Control (GS401)

- b0: When this bit is turned on, the error generated in the file transfer is cleared.  
The following signals turn off when GS401.b0 is turned on.  
Warning signal (GS990.b14)  
File Transfer Error signal (GS990.b15)
- b1 to b15: Use prohibited

### (16)File Transfer Timeout Time (GS402)

Set the timeout period for FTP communication in units of seconds.

If a script does not end after the lapse of the timeout period, the script processing is aborted.

The setting range is [1] (second) to [300] (seconds).

If the set value falls outside the setting range, the timeout period defaults to 3 seconds.

### (17)Maximum Number of Connected FTP Clients (GS404)

Specify the number of FTP clients connectable to the FTP server.

The setting range is 1 to 4.

If an invalid value is specified, 1 is assumed.

Changing the number of connectable FTP clients does not affect the already-connected FTP clients.

**(18)GOT Information Output Common Control (GS405)**

For GT2505-V and GT25HS-V, b0 and b1 are available.

- b0: When this bit is turned on, the GOT serial number is output to the devices specified with GS406.  
If 10 word devices cannot be reserved, the output is not executed.
- b1: When this bit is turned on, the MAC address of the Ethernet standard port or Ethernet standard port 1 is output to the devices specified with GS408.  
If 3 word devices cannot be reserved, the output is not executed.
- b2: When this bit is turned on, the MAC address of the Ethernet extended port or Ethernet standard port 2 is output to the devices specified with GS410.  
If 3 word devices cannot be reserved, the output is not executed.
- b3: When this bit is turned on, the MAC address of the wireless LAN interface is output to the devices specified with GS412.  
If 3 word devices cannot be reserved, the output is not executed.  
The output may not be executed upon startup of the GOT, and therefore check that the Wireless LAN Status Notification signal (GS1060.b0) is on and then execute the output.
- b4 to b15: Use prohibited

**(19)Serial No. Output Destination (GS406)**

Specify the start device number of the GOT data registers (GD) to store the GOT serial number.  
Ten GD devices, starting from the specified device, are used to store the GOT serial number.

**(20)Ethernet Port 1 MAC Address Destination (GS408)**

Specify the start device number of the GOT data registers (GD) to store the MAC address of the Ethernet standard port or Ethernet standard port 1.  
Three GD devices, starting from the specified device, are used to store the MAC address.

**(21)Ethernet Port 2 MAC Address Destination (GS410)**

Not available to GT2505-V and GT25HS-V.  
Specify the start device number of the GOT data registers (GD) to store the MAC address of the Ethernet extended port or Ethernet standard port 2.  
Three GD devices, starting from the specified device, are used to store the MAC address.

**(22)Wireless LAN Interface MAC Address Destination (GS412)**

Not available to GT2505-V and GT25HS-V.  
Specify the start device number of the GOT data registers (GD) to store the MAC address of the wireless LAN interface.  
Three GD devices, starting from the specified device, are used to store the MAC address.

**(23)Start GD Device for Object Script Error Info Notification (GS432)**

Specify the start device number of the GD devices to store error records.  
Data type: Unsigned binary

**(24)Number of Object Script Error Info Outputs (GS434)**

Specify the maximum number of error records.  
Data type: Unsigned binary  
The setting range is 0 to 5000.  
If the device stores 0, no error record will be stored.  
If the device stores 5001 or more, up to 5000 records will be stored.  
GS435.b1 specifies the operation to be performed when the number of errors has exceeded the maximum number of error records.  
The following shows an example of how an error record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Error code	Error code of an error. For the error details and corrective actions, refer to the following. →9.10.9 ■ 3 (5) List of object script execution error codes
GD1001	Script type	Number that shows a script type. The device stores any of the following values according to the script type. • 10: Display object script or switch object script • 11: Input object script

Storage device	Item	Description
GD1002	Screen number	Number of the screen where the object is placed.
GD1003	Object ID number	ID number of the object where a script error has occurred.
GD1004	Use prohibited	The device stores 0.
GD1005	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"> <li>• 200: Base screen</li> <li>• 210: Superimpose window 1</li> <li>• 220: Superimpose window 2</li> <li>• 310: Overlap window 1</li> <li>• 320: Overlap window 2</li> <li>• 330: Overlap window 3</li> <li>• 340: Overlap window 4</li> <li>• 350: Overlap window 5</li> <li>• 400: User-created key window</li> <li>• 500: Dialog window substituted for a system message</li> </ul> If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. <ul style="list-style-type: none"> <li>• When a base screen is called, 1 is added.</li> <li>• When a window screen is called, 2 is added.</li> </ul> Example) When a window screen is called from overlap window 3 330 + 2 = 332
GD1006	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1007	Use prohibited	The device stores 0.

**(25)Object Script Error Info Output Common Control (GS435)**

- b0: When this bit is turned on, storing error records starts.  
When this bit is turned off, storing error records ends.
- b1: Specifies the operation to be performed when the number of errors has exceeded the maximum number of error records specified with GS434.  
When this bit is turned on, storing error records stops.  
When this bit is turned off, storing error records continues by overwriting the oldest record.
- b2 to b10: Use prohibited
- b11: When this bit is turned on, the records of warnings that do not abort a script are not stored.
- b12 to b15: Use prohibited

**(26)Start GD Device for Object Script Event Notification (GS436)**

Specify the start device number of the GD devices to store script execution records.  
Data type: Unsigned binary

**(27)Number of Object Script Event Outputs (GS438)**

Specify the maximum number of script execution records.  
Data type: Unsigned binary  
The setting range is 0 to 5000.  
If the device stores 0, no script execution record will be stored.  
If the device stores 5001 or more, up to 5000 records will be stored.  
GS439.b1 specifies the operation to be performed when the number of the executed scripts has exceeded the maximum number of script execution records.  
The following shows an example of how a script execution record is stored in eight word devices starting from GD1000.

Storage device	Item	Description
GD1000	Script type	Number that shows a script type. The device stores any of the following values according to the script type. <ul style="list-style-type: none"> <li>• 10: Display object script or switch object script</li> <li>• 11: Input object script</li> </ul>
GD1001	Screen number	Number of the screen where the object is placed.
GD1002	Object ID number	ID number of the object where a script error has occurred.
GD1003	Use prohibited	The device stores 0.

Storage device	Item	Description
GD1004	Screen type	Type of the screen for which the script is set. The device stores any of the following values according to the screen type. <ul style="list-style-type: none"> <li>• 200: Base screen</li> <li>• 210: Superimpose window 1</li> <li>• 220: Superimpose window 2</li> <li>• 310: Overlap window 1</li> <li>• 320: Overlap window 2</li> <li>• 330: Overlap window 3</li> <li>• 340: Overlap window 4</li> <li>• 350: Overlap window 5</li> <li>• 400: User-created key window</li> <li>• 500: Dialog window substituted for a system message</li> </ul> If the script is set for a called screen, the device stores a value by adding a number to the number showing the calling screen type. <ul style="list-style-type: none"> <li>• When a base screen is called, 1 is added.</li> <li>• When a window screen is called, 2 is added.</li> </ul> Example) When a window screen is called from overlap window 3 $330 + 2 = 332$
GD1005	Number of the displayed base screen	Number of the base screen that is displayed when the script runs.
GD1006	Use prohibited	The device stores 0.
GD1007	Use prohibited	The device stores 0.

### (28)Object Script Event Output Common Control (GS439)

- b0: When this bit is turned on, storing script execution records starts.  
When this bit is turned off, storing script execution records ends.
- b1: Specifies the operation to be performed when the number of executed scripts has exceeded the maximum number of script execution records specified with GS438.  
When this bit is turned on, storing script execution records stops.  
When this bit is turned off, storing script execution records continues by overwriting the oldest record.
- b2 to b15: Use prohibited

### (29)Exclusive Authorization Control (GS447)

- b0: When this bit is turned on, the GOT obtains the exclusive authorization.  
It cannot be used in GT SoftGOT2000.
- b1 to b15: Use prohibited

### (30)RGB Display Common Control (GS449)

- b0: When this bit is turned on, the RGB screen is displayed at the center of the GOT screen .  
When this bit is turned off, the RGB screen is displayed at position set by the RGB display position (b13) of [Video/RGB Input Common] device.  
 ➔ 10.6.4 ■ 8 Setting items of [Video/RGB Input Common] device
- b1 to b15: Use prohibited

### (31)Monitor Common Control (GS450)

- GT21 supports b15 only.
- b0: When this bit is turned on, a confirm message is displayed after numerical or text data (numerical input or text input) is input .
  - b1: Controls the displaying methods of the message displayed when an numeric value exceeding the valid range is input.  
Turning on displays a message during the numerical input.  
Turning off displays a message after the numeric value is input.

- b2: When this bit is turned on, the system signal 1-1.b4 (Numeric Value Input Read Complete signal), system signal 2-1.b4 (Numeric Value Input signal), [Numeric Value Input Number], [Current Cursor Display User ID], and [Previous Cursor Display User ID] on the [Environmental Setting] dialog (System information) are activated during the input as well.
- b3: When this bit is turned on, 0 is stored into [Current Cursor Display Object], [Previous Cursor Display Object], [Current Cursor Display User ID], and [Previous Cursor Display User ID] on the [Environmental Setting] dialog (System information) when a cursor is erased.
- b4: When this bit is turned on, the KANA-KANJI conversion function is activated when the text input is used.
- b5: When this bit is turned on, the key window is forcibly closed if the input condition (the trigger condition or security level for the object) is not satisfied during a value or text input.
- b6: When this bit is turned on, the key window for inputting binary values is displayed for the numerical input whose format is binary.
- b7: When this bit is turned on, the key window for inputting octal values is displayed for the numerical input whose format is octal.
- b8: When this bit is turned on, the parts display or parts movement can use BMP and JPEG files in the data storage as a part.

Turning off displays parts registered by GT Designer3.

When [Show image files in the memory card at the time of specifying Parts No. 9001-9999] is available in the [Parts Setting] dialog, a BMP or JPEG file in the data storage is used as a part regardless of the on and off status of this signal.

#### ⇒8.8 Placing a Parts Display

- b9: When this bit is turned on, the GOT retains the state of the historical trend graph displayed before screen switching and displays the same graph state after switching back to the graph screen.

#### ⇒8.21 Placing a Historical Trend Graph

- b10: When this bit is turned on, the upper and lower limit symbols on the trend graph and the historical trend graph are hidden.
- b11: Use prohibited
- b12: Controlling the timing when the bit alternate or bit reset, or bit reset, or screen switching and station No. switching are set to the touch switch.

#### ⇒8.2 Placing a Touch Switch

- b13: When this bit is turned on, the data storage stores the history of the screen switching.
- b14: When this bit is turned on, the screen switching mode is switched from the previous mode to the history mode.
- b15: While this bit is on, touching an alarm once in the alarm display (user) displays the detail screen. While this bit is off, touching an alarm twice in the alarm display (user) displays the detail screen.

When GS450.b15 is on

When GS450.b15 is off

### (32)Auto Screen Save Time (GS451)

Stores the time before closing (OFF) the monitor screen in screen save function.

Stores the value by 1 to 60 (Min).

(To store value higher than 60, store it as 60)

The changed value is validated after canceling the screen save when a value is changed during the screen save.

#### Point

#### Relationship between GS451 and GOT utility (screen save time)

If value other than 0 is stored in GS451, the screen save time set in GOT utility will be invalidated.

To validate the screen save time of utility, store 0 in GS451.

### (33)Ethernet Port 1 Access Control, Ethernet Port 2 Access Control (GS454)

b15 to b13	b12	b11 to b9	b8	b7 to b6	b5	b4	b3 to b2	b1	b0
------------	-----	-----------	----	----------	----	----	----------	----	----

Controls the operations through an Ethernet network.

The Ethernet interface corresponding to each bit varies by GOT model.

The following shows the correspondence between the Ethernet interfaces and the bits.

GOT	Ethernet interface	Bit number
GT27, GT25-S, GT25-V (excluding GT2505-V)	Ethernet standard port	b0, b1, b8
	Ethernet extended port	b4, b5, b12
GT25-W	Ethernet standard port 1	b0, b1, b8
	Ethernet standard port 2	b4, b5, b12
GT2505-V, GT25HS-V, GT23, GT21	Ethernet standard port	b0, b1, b8

- b0: Turn on this bit to disable the writing of package data (containing system applications) through the corresponding Ethernet interface.
- b1: Turn on this bit to disable the writing of package data (containing project data) through the corresponding Ethernet interface.
- b2 and b3: Use prohibited
- b4: Turn on this bit to disable the writing of package data (containing system applications) through the corresponding Ethernet interface.
- b5: Turn on this bit to disable the writing of package data (containing project data) through the corresponding Ethernet interface.
- b6 and b7: Use prohibited
- b8: Turn on this bit to disable the reading of data through the corresponding Ethernet interface.
- b9 to b11: Use prohibited
- b12: Turn on this bit to disable the reading of data through the corresponding Ethernet interface.
- b13 to b15: Use prohibited

### (34) Intensity Control (GS455)

b15	b14 to b0
-----	-----------

Sets the intensity and the brightness adjustment mode of the GOT display section.

- b0 to b14: When the bits store a setting value, the intensity of the backlight changes to the one corresponding to the setting value.

The setting value ranges from 1 to 8, or 101 to 132.

Intensity	Setting value	Intensity	Setting value	Intensity	Setting value	Intensity	Setting value
1	1 or 101	9	109	17	117	25	125
2	102	10	3 or 110	18	118	26	126
3	103	11	111	19	5 or 119	27	127
4	104	12	112	20	120	28	7 or 128
5	2 or 105	13	113	21	121	29	129
6	106	14	4 or 114	22	122	30	130
7	107	15	115	23	6 or 123	31	131
8	108	16	116	24	124	32	8 or 132

For GT23

Intensity	Setting value	Intensity	Setting value	Intensity	Setting value	Intensity	Setting value
1	102	5	3 or 110	9	118	13	126
2	104	6	112	10	120	14	7 or 128
3	106	7	4 or 114	11	122	15	130
4	108	8	116	12	124	16	8 or 132

If 0 and 9 to 100, or 133 or more is set, the setting for the intensity adjustment function for the utility is applied.

- b15: When the bit turns on, the brightness adjustment mode is set to the low intensity.

To set the brightness adjustment mode to the low intensity, install the version E or later of BootOS on the GOT.

The intensity of the GOT can be confirmed by the Intensity Notification (GS255).

→ 12.1.3 ■ 2 (49) Intensity Notification (GS255)

For the specifications of the GOT display section, refer to the following.

→ GOT2000 Series User's Manual (Hardware)

#### Point

##### (1) Setting value changed by the Intensity Control (GS455)

The Intensity Control (GS455) changes the setting value of the intensity temporarily.

If the GOT is turned off after the setting value is changed by the Intensity Control (GS455), the value is returned to the value set in the utility.

##### (2) Stored setting value

For the projects converted from GOT1000 projects, you can use the stored setting value without changing the Intensity Control (GS455) setting.

Since the intensity is controlled in eight levels, the setting value ranges from 1 to 8.

### (35)Character Code Control (GS456)

The character code used for the text display or the text input is changeable.

This device is enabled only when the character code is determined by the system language.

If you change the character code, the KANJI region for the kanji characters displayed on the text display or the text input is also changed.

The character code is changed to one corresponding to the stored value as shown below.

Stored value	Character code	KANJI region of displayed kanji characters	Supported models
0	ASCII code, Shift JIS code	Japanese	
1	Shift JIS code	Japanese	
2	ASCII code	Japanese	
3	GB code	Chinese (Simplified)	
4	KS code	Japanese	
5	BIG5	Chinese (Traditional)	

For the GOT models other than GT21, a new character code is reflected to the GOT screen at any of the following timing.

- Switching screens (Switching to a key window or dialog window is excluded.)
- Switching security levels or operator accounts
- Switching languages
- Switching station numbers
- Switching buffer memory unit numbers
- Executing the function (redraw\_screen()) of the object script

For GT21, a new character code is reflected to the GOT screen in real time.

#### (a) Applied KANJI region

If the GOT does not have a font corresponding to the KANJI region for a selected character code, the KANJI region for the standard font is applied.

The following is an example in using the GOT that has only Japanese as the standard font (standard).

If the character code is changed to GB code, the KANJI region of the displayed kanji characters is set to Japanese.

#### (b) How to reflect the new setting at the GOT startup

You can reflect the new setting at the GOT startup by using the object script.

Example) When changing the character code to GB code at the GOT startup

On the screen displayed at the GOT startup, place an object where the following object script is set.

Setting item for the script	Setting details
Trigger type	[Rise]
Trigger device	GS0.b4 (Common Information1: Always ON signal)
Script	[w:GS456] = 3; redraw_screen();

### (36)Pass-through Transparent Stop Control (GS457)

When 1 is set at this area, pass-through transparent stop request is performed.

By using this area, the user can expedite recovery from the pass-through transparent recovery waiting status.

This area is effective only when 2 (pass-through mode in operation) is set for FA transparent status (GS256).

0: No stop request

1: No stop request

### (37) Conversion Start Indication (GS460)

The following script types are supported: project script, screen script, and script part.

- b0: With Integer ← → Real Number Conversion, converting unsigned 16-bit binary data to real numbers is specified.
- b1: With Integer ← → Real Number Conversion, converting signed 16-bit binary data to real numbers is specified.
- b2 and b3: Use prohibited
- b4: With Integer ← → Real Number Conversion, converting real numbers to unsigned 16-bit binary data is specified.
- b5: With Integer ← → Real Number Conversion, converting real numbers to signed 16-bit binary data is specified.
- b6 to b14: Use prohibited
- b15: With Integer ← → Real Number Conversion, the conversion start is indicated.

### (38) Number of Conversion Devices (GS461)

The following script types are supported: project script, screen script, and script part.

With Integer ← → Real Number Conversion, the number of conversion devices is specified.

1 to 4096 conversion devices can be specified.

### (39) Conversion Source Head Device No. (GS462)

The following script types are supported: project script, screen script, and script part.

With Integer ← → Real Number Conversion, the head device No. of GOT internal device (GD) that stores the value before conversion is specified.

### (40) Conversion Destination Head Device No. (GS463)

The following script types are supported: project script, screen script, and script part.

With Integer ← → Real Number Conversion, the value after conversion is stored and the head device No. of GOT internal device (GD) is specified.

### (41) Storage Error Value (GS464)

The following script types are supported: project script, screen script, and script part.

With Integer ← → Real Number Conversion, if conversion error occurs, the device value to be stored in the conversion destination device is specified.

### (42) Remote Personal Computer Operation (Ethernet) Common Control (GS465)

Set whether to display the operation buttons on the personal computer screen on the GOT, and specify the display magnification of the personal computer screen.

The setting is applied when the GOT displays the personal computer screen with the remote personal computer operation function (Ethernet).

For the details of the remote personal computer operation function (Ethernet), refer to the following.

→ 10.3 Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Ethernet))

- b0: When this bit is turned on, the [CAD] button is hidden.
- b1: When this bit is turned on, the [C+E] button is hidden.
- b2: When this bit is turned on, the [KBD] button is hidden.
- b3: When this bit is turned on, the zoom in button and the zoom out button are hidden.
- b4: Use prohibited
- b5: Specifies the display magnification of the personal computer screen to be applied when b3 is turned on.  
When this bit is turned on, the display magnification specified on GT Designer3 is applied.  
When this bit is turned off, the display magnification is fixed to 100%.
- b6: When this bit is turned on, the click switching button is hidden.
- b7 to b15: Use prohibited

### (43)Unit of Drive Free Space (GS466)

Specify the unit of values to be stored in the Drive Empty Capacity Information devices of the system information.

⇒5.2.5 ■ 1 (14) Drive Empty Capacity Information

This setting applies to all the drives when the system information is updated.

The setting range is 0 to 2.

If you set a value outside the setting range, each target device stores a value in bytes.

Stored value	Unit	Remarks
0	byte	Each target device notifies up to 2 GB free space.
1	Kbyte	Each target device notifies up to 2 TB free space. (1 Kbyte = 1024 bytes) The fractional portion is rounded off. Example) For 1.1 Kbytes of free space, 1 is stored.
2	Mbyte	Each target device notifies up to 2 PB free space. (1 Mbyte = 1024 Kbytes) The fractional portion is rounded off. Example) For 1.2 Mbytes of free space, 1 is stored.

If you change the specified unit, the maximum size of free space to be notified is changed. Note that the capacity of the data storage usable in the GOT remains unchanged.

### (44)Monitor Common Control 2 (GS467)

b15 to b1	b0
-----------	----

- b0: When this bit is turned on, the cursor moves to a different alarm on the alarm display (user) after the alarm under the cursor is deleted.

The cursor display position after the deletion varies with the displayed contents on the alarm display (user).

If an alarm is displayed below the deleted alarm, the cursor moves to this alarm after the deletion.

If all the other alarms are displayed above the deleted alarm, the cursor moves to the alarm at the bottom after the deletion.

If all the alarms are deleted, the cursor is hidden after the deletion.

When this bit is off, the cursor is hidden.

- b1 to b15: Use prohibited

### (45)Kanji Region Control (GS468)

The KANJI region used for the text display or text input is changeable.

This setting is applied to all the text displays and text inputs where [Character Code] is set to [Unicode].

The KANJI region is changed according to the stored value as shown below.

Stored value	KANJI region
0	Not changed
1	Japanese
2	Simplified Chinese
3	Traditional Chinese

For the GOT models other than GT21, a new KANJI region is reflected to the GOT screen at any of the following timing.

- Switching screens (Switching to a key window or dialog window is excluded.)
- Switching security levels or operator accounts
- Switching languages
- Switching station numbers
- Switching buffer memory unit numbers
- Executing the function (redraw\_screen()) of the object script

For GT21, a new KANJI region is reflected to the GOT screen in real time.

If the GOT has no font corresponding to the new KANJI region, the KANJI region for an installed standard font is applied.

**(a) How to reflect the new setting at the GOT startup**

You can reflect the new setting at the GOT startup by using the object script.

Example) When changing the KANJI region to Simplified Chinese at the GOT startup

On the screen displayed at the GOT startup, place an object where the following object script is set.

Setting item for the script	Setting details
Trigger type	[Rise]
Trigger device	GS0.b4 (Common Information1: Always ON signal)
Script	[w:GS468] = 2; redraw_screen();

**(46)GT SoftGOT2000 Common Control (GS500)**

- b0: When this bit is turned on, the dialog for exiting the GT SoftGOT2000 is displayed. If exiting is canceled in the displayed dialog, the signal turns off.
- b1: When this bit is turned on, GT SoftGOT2000 is displayed in the full screen mode. When this bit is turned off, the full screen mode of GT SoftGOT2000 is canceled.
- b2: When this bit is turned on, the [File Information in PLC] dialog is displayed.
- b3 to b15: Use prohibited

**(47)Application Start signal (GS501, GS502)**

b0 to b15: When this bit is turned on, the application assigned to each bit by GT SoftGOT2000 runs.

**(48)GT SoftGOT2000 Full Screen Size (Width) (GS503)**

With the full screen mode function of GT SoftGOT2000, set the width of GT SoftGOT2000 monitor screen (320 to 1920 dots).

When the set value is 320 or less, the value is processed as 320. When the set value is 1920 or more, the value is processed as 1920.

**(49)GT SoftGOT2000 Full Screen Size (Height) (GS504)**

With the full screen mode function of GT SoftGOT2000, set the height of GT SoftGOT2000 monitor screen (240 to 1200 dots).

When the set value is 240 or less, the value is processed as 240. When the set value is 1200 or more, the value is processed as 1200.

**(50)Advanced Application Start signal (GS505, GS506 to GS507)**

Using a value in GS505 and any bit from GS506 to GS507 starts an application on GT SoftGOT2000.

For setting the devices from GS505 to 507 as a trigger of the application, refer to the following manual.

→GT SoftGOT2000 Version1 Operating Manual

**(a) GS505**

Stores a value used for starting the application. (1 to 255)

**(b) GS506 to 507**

b0 to b15: When this bit is turned on, the application assigned to each bit according to a value stored in GS505.

**(51)Device Data Transfer Information (GS510)**

- b0: When this bit is turned on, the device stores 0 in the Error Device Data Transfer ID (GS642) and the Device Data Transfer Error Count (GS643).
- b1: When this bit is turned on, the device stores 0 in the Device Data Transfer Processing Time (GS644), the Device Data Transfer Min. Processing Time (GS646), and the Device Data Transfer Max. Processing Time (GS648).
- b2 to b15: Use prohibited

### (52) Touch Status Communication Control (GS511)

- b0: When this bit is turned on, the touch status is output to the personal computer. When this bit is turned off, the touch status is not output to the personal computer.
- b1 to b15: Use prohibited

**Point**

#### For using the Touch Status Communication Control

To use the Touch Status Communication Control, the system application (extended function) for the remote personal computer operation (Serial) is required.

For details of the remote personal computer operation (Serial), refer to the following.

→ 10.4 Operating a Personal Computer by Using the GOT (Remote Personal Computer Operation (Serial))

### (53) Time Change Information (GS512)

- b0: When this bit is turned on, the GOT clock data is changed to the data set for the Changed Time (GS513 to GS516).
- b1 to b15: Use prohibited

### (54) Changed Time (GS513 to GS516)

Stores the current time with BCD code.

The valid date range is from January 1, 2000 to December 31, 2099.

The day-of-the-week data, 0 to 6, is stored.

(0: Sunday 1: Monday 2: Tuesday 3: Wednesday 4: Thursday 5: Friday 6: Saturday)

Example) When the error occurrence date is 15:30:20 May 15, 2013 (Wednesday)

### (55) External I/O Function Notification/External I/O Control Function (GS517)

- b0: When this bit is turned on, the 128-point input can be executed with the external I/O function. When this bit is turned off, the 16-point input can be executed.
- b1 to b15: Use prohibited

**Point**

#### 128-point input

Without the 128-point input (when the above device turns off), the GOT internal device turns on when the 16-point input is executed with the input terminal.

With the 128-point input (when the above device turns on), the 16-point input with the input terminal is used with the 8-point scan signal and the 128-point input (16 × 8) is performed.

For connection diagrams of each signal with the external I/O function, refer to the following manual.

→ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)  
For GT Works3 Version1

### (56) Sound Output Common Control (GS518)

- b0: Turn on this bit to stop the current playback.
- b1: Turn on this bit to stop the current playback and cancel all standby sound files.

- b2: Turn on this bit to mute the sound.
- b3 to b15: Use prohibited

### (57) Buffering And File Access Control (GS520)

- b0: When this bit is turned on, the whole data in the buffering area is stored in the destination drive at the timing of the rising edge.
- b1 to b15: Use prohibited

### (58) Trigger Backup Data Send Delay (GS521)

The backup/restore function can set the delay time for backup communication intervals. Setting of the delay time can reduce the load of other processes (such as monitoring objects) with the backup process. The delay time set by the set value is listed as follows.

Set value	Delay time
0	None
1 to 100	Set value × 5 (ms)
101 or more	500 (ms)

#### Point

#### Setting of Trigger Backup Data Send Delay

Backup communication times are longer than a default when the Trigger Backup Data Send Delay is set. Set the suitable delay time to match the processing condition of backup function and others (such as monitoring objects).

### (59) Special Control During Specific Function Execution (GS522)

For GT21, b2 is available only.

- b0: When this bit is turned on, during the backup/restore function execution, processing by the alarm functions, the logging function, and others and device monitoring stop, and only the backup and restore process is executed.
- b1: When this bit is turned on, the GOT notifies the amount of usage of the CF card and the number of video files in the card in the multimedia unit by using the Video File Maintenance Information (GS1022).

→ 12.1.3 ■ 3 (34) Video File Maintenance Information (GS1022)

This function is usable only when [Enable] is selected and [Event Trigger Device] is set in [Before-After Event Recording Setting] on the [Recording Setting] tab of the [Multimedia] dialog.

- b2: When this bit is on, the character code is changed to Unicode and data is tab-delimited during a binary-to-CSV conversion or the creation of a CSV file.

Turn on this bit before executing the following operations.

Converting a binary file (alarm log file, logging file, recipe file, or operation log file) to a CSV file

Writing/reading data to/from a recipe file in CSV format

Reading a CSV file from drive C or D of the GOT with a personal computer

(GT21 only)

Copying a CSV file from drive C or D to any other drive

(GT21 only)

Make sure that this bit is on when you execute the following operations using the CSV file that has been converted from another format or created during the turn-on of the bit.

Converting the CSV file to a binary file

Performing an operation that uses the CSV file as a recipe file

- b3: When this bit is turned on, all buttons except the [List] and [Latest] buttons are disabled on the [Operation Log Information] screen of the utility.

- b4: When this bit is turned on, the printing operations are disabled on the [Print file list display] screen of the file print function in the utility.

- b5 to b15: Use prohibited

## (60) Document Display Common Control (GS523)

- b0: When this bit is turned on, PDF files are not cached, and the cached PDF files are not displayed and updated.
- b1: When this bit is turned on, the search history file is not created or updated.
- b2: When this bit is turned on, an A4 or smaller PDF document is displayed in high quality (144 dpi resolution).  
When this bit is turned off, a PDF document is displayed in standard quality (72 dpi resolution).
- b3 to b15: Use prohibited

## (61) Report Common Control (GS524)

- b0: This bit is activated when [Output Timing] is set to [At the time of data collection] in the [Screen Property] dialog for a report screen.  
While this bit is on, automatic page breaks are disabled and the footer is not output to a report when the number of output lines reaches the set value of [Page Lines] in the [Report Setting] dialog.  
If [Insert a page break before an output] is selected in the [Report Setting] dialog, a page break will be inserted according to the previously output contents even after automatic page breaks are disabled.  
To enable automatic page breaks again, restart the GOT.
- b1: This bit is activated when [Output Timing] is set to [At the time of data collection] in the [Screen Property] dialog for a report screen.  
When this bit is turned on while GS524.b0 is on, a page break is inserted.  
If a footer is set in the previously output report screen, the footer will be printed and then a page break will be inserted.
- b2: This bit is activated when [Output Timing] is set to [When trigger condition is satisfied] in the [Screen Property] dialog for a report screen.  
When this bit is turned on, the data stored in a temporary file is output upon satisfaction of the output trigger condition.  
If the number of collections of data stored in the file is less than or equal to the set value of [Number of repeats] in the [Screen Property] dialog for a report screen, the number of repeats will be assumed to be the number of collections of data decreased by one.
- b3 to b15: Use prohibited

## (62) Network No. For Monitor Station Disconnected (CH1 to CH4) (GS530, GS540, GS550, GS560)

Controls the disconnection and the connection of the monitor stations by the station.

- b0 to b7: the network No. for the station to be disconnected is specified. (0 to 239)  
One network No. can be specified per channel.
- b8 to b15: Use prohibited

The devices are enabled only when the following communication drivers are used.

- [Serial(MELSEC)]
- [AJ71QC24, MELDAS C6\*]
- [AJ71C24/UC24]
- [Bus(A/QnA)]
- [Bus(Q)]
- [CC-Link(G4)]

Specify the station to be disconnected by using the following GOT special registers.

- ➔ 12.1.3 ■ 5 (63) Monitor Station Disconnection (CH1 to CH4) (GS531 to GS538, GS541 to GS548, GS551 to GS558, GS561 to GS568)

**(63) Monitor Station Disconnection (CH1 to CH4) (GS531 to GS538, GS541 to GS548, GS551 to GS558, GS561 to GS568)**

Each bit corresponds to a station number when one of the following communication drivers is used. Turning on a bit disconnects the corresponding station from the GOT.

- [Ethernet(MITSUBISHI ELECTRIC), Gateway]
- [Ethernet(FX), Gateway]
- [Ethernet(FREQROL), Gateway]
- [MELSERVO-J4,J3,J2S/M,JE]
- [Ethernet(MELSERVO), Gateway]
- [FREQROL 500/700/800,SENSORLESS SERVO]
- [FREQROL 800]
- [IAI ROBO CYLINDER]
- [IAI X-SEL]
- [azbil SDC/DMC]
- [azbil DMC50]
- [OMRON THERMAC/INPANEL NEO]
- [Shinko Technos Controller]
- [CHINO Controllers(MODBUS)]
- [FUJI Temperature Controller/Digital Controller]
- [YOKOGAWA GREEN/UT100/UT2000/UTAdvanced]
- [RKC SR Mini HG(MODBUS)]
- [MEI Nexgenie]
- [Ethernet(SLMP), Gateway]
- [MODBUS/RTU Master]
- [MODBUS/TCP Master, Gateway]

For the multi-channel connection, the target bit of the device corresponding to each channel No. (CH1 to CH4) turns on.

1: Disconnected

0: Connected

When the GOT is connected to the AZBIL temperature controller (DMC50), the specified station number of the DMC50 differs from the station numbers of the other models.

The following shows the station numbers for each device.

**(a) When connecting models other than the AZBIL temperature controller (DMC50)**

The station corresponding to each device differs according to whether the Ethernet connection is used or not.

- With the Ethernet connection: 1 to 128

Device				Ethernet setting No.

GS 538	GS 548	GS 558	GS 568	8-15	8-14	8-13	8-12	8-11	8-10	8-9	8-8	8-7	8-6	8-5	8-4	8-3	8-2	8-1	8-0

**Point**

(1) Error station

When an error station is disconnected from the GOT, the temperature controller and servo amplifier faulty station information corresponding to the disconnected station turns off.

→(66) Faulty Station Information (CH1 to CH4) (GS281 to GS288, GS301 to GS308, GS321 to GS328, GS341 to GS348)

(2) Restrictions

- The GOT cannot disconnect the station number 128 or later, or the station number and the sub station number 9-0 or later.
- The stations with the station numbers specified on GT Designer3 cannot be disconnected using the device of the temperature controller and servo amplifier monitor station disconnection.

For details of specifying station numbers, refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)  
For GT Works3 Version1

## (64)Channel Shutdown Control (CH1 to CH4) (GS539, GS549, GS559, GS569)

Communication of each channel is prohibited.

When this signal turns on, the Channel Observation Notification Information (GS299, GS319, GS339, GS359) for the channel whose communication is prohibited turns off.

→12.1.3 ■ 2 (67) Channel Observation Notification Information (GS299, GS319, GS339, GS359)

- b0: While the bit is on, communication of each channel is prohibited.

- b1 to b15: Use prohibited

## (65)MODBUS Communication Control Function (GS570 to GS576, GS590 to GS596, GS597 to GS603, GS604 to GS610, GS611 to GS617)

When some controllers do not comply with the specifications, this function enables the GOT to reduce the communication delay in the MODBUSnetwork.

When the MODBUS/RTU master connection or the MODBUS/TCP master connection is used, each device enables a function code, or operates as shown below.

The MODBUS Communication Control Function contains two types: the MODBUS Communication Control Function (Common) and the MODBUS Communication Control Function (CH1 to CH4). For the MODBUS Communication Control Function (Common), the device values are applied to all relevant channels. For the MODBUS Communication Control Function (CH1 to CH4), the device values are applied to each applicable channel.

Use GS579 to determine which type of the MODBUS Communication Control Function is applied.

→(66) Channel Setting of MODBUS Communication Control Function (GS579)

When applicable devices store a value as shown below, the GOT operates with the values specified in the communication setting of the utility.

- For the MODBUS Communication Control Function (Common), GS571 to GS576 each store 0.

- For the MODBUS Communication Control Function (CH1), GS591 to GS596 each store 0.

- For the MODBUS Communication Control Function (CH2), GS598 to GS603 each store 0.

- For the MODBUS Communication Control Function (CH3), GS605 to GS610 each store 0.

- For the MODBUS Communication Control Function (CH4), GS612 to GS617 each store 0.

Device					Function
Common	CH1	CH2	CH3	CH4	
GS570.b0	GS590.b0	GS597.b0	GS604.b0	GS611.b0	When the bit turns on, the function code 0Fh (write multiple coils) is not available.
GS570.b1	GS590.b1	GS597.b1	GS604.b1	GS611.b1	When the bit turns on, the function code 10h (write multiple registers) is not available.
GS570.b2 to b15	GS590.b2 to b15	GS597.b2 to b15	GS604.b2 to b15	GS611.b2 to b15	Use prohibited
GS571	GS591	GS598	GS605	GS612	Set the maximum number of devices (1 to 2000) for a message with function code 01h (read coils). When 0 is set, the maximum number of devices is set as shown below. • MODBUS/TCP: 1000 • MODBUS/RTU: 2000 When a value other than the above is set, the maximum number of devices is 2000.
GS572	GS592	GS599	GS606	GS613	Set the maximum number of devices (1 to 2000) for a message with function code 02h (read input relays). When 0 is set, the maximum number of devices is set as shown below. • MODBUS/TCP: 1000 • MODBUS/RTU: 2000 When a value other than the above is set, the maximum number of devices is 2000.
GS573	GS593	GS600	GS607	GS614	Set the maximum number of devices (1 to 125) for a message with function code 03h (read holding registers). When a value other than 1 to 125 is set, the maximum number of devices is 125.
GS574	GS594	GS601	GS608	GS615	Set the maximum number of devices (1 to 125) for a message with the function code 04h (read input registers). When a value other than 1 to 125 is set, the maximum number of devices is 125.

Device					Function
Common	CH1	CH2	CH3	CH4	
GS575	GS595	GS602	GS609	GS616	Set the maximum number of devices for a message with the function code 0Fh (write multiple coils). The following shows the setting range of the maximum number of device points. • MODBUS/TCP: 1 to 800 • MODBUS/RTU: 1 to 1968 When 0 is set, the maximum number of devices is 800. When a value other than the above is set, the maximum value in the setting range is applied.
GS576	GS596	GS603	GS610	GS617	Set the maximum number of devices for a message with the function code 10h (write multiple registers). The following shows the setting range of the maximum number of devices. • MODBUS/TCP: 1 to 100 • MODBUS/RTU: 1 to 123 When 0 is set, the maximum number of devices is 100. When a value other than the above is set, the maximum value in the setting range is applied.

**Point**

**(1) Function codes supported by the GOT**

For function codes supported by the GOT, refer to the following.

⇒ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)  
 For GT Works3 Version1

**(2) Setting MODBUS Communication Control Function**

Set the MODBUS Communication Control Function at the GOT startup with the project script or others.  
 Do not change the setting after the communication starts.

The communication error may occur.

Setting example of project script

**(66) Channel Setting of MODBUS Communication Control Function (GS579)**

The MODBUS Communication Control Function setting can be selected for each channel.

GT SoftGOT2000 supports b0 only.

GT21 supports b0 and b1.

⇒ (65) MODBUS Communication Control Function (GS570 to GS576, GS590 to GS596, GS597 to GS603, GS604 to GS610, GS611 to GS617)

• b0: The MODBUS Communication Control Function for CH1 can be selected.

Turning on this bit applies the MODBUS Communication Control Function (CH1) (GS590 to GS596).

Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).

- b1: The MODBUS Communication Control Function for CH2 can be selected.  
Turning on this bit applies the MODBUS Communication Control Function (CH2) (GS597 to GS603).  
Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).
- b2: The MODBUS Communication Control Function for CH3 can be selected.  
Turning on this bit applies the MODBUS Communication Control Function (CH3) (GS604 to GS610).  
Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).
- b3: The MODBUS Communication Control Function for CH4 can be selected.  
Turning on this bit applies the MODBUS Communication Control Function (CH4) (GS611 to GS617).  
Turning off this bit applies the MODBUS Communication Control Function (Common) (GS570 to GS576).
- b4 to b15: Use prohibited

### (67)Microcomputer Connection Extended Setting (CH1 to CH4) (GS580 to GS583)

GT21 supports GS580.b0 and GS581.b0.

- b0: For the microcomputer connection (serial), when the bit turns on, if the data format of the message format is Format 12 or 13, communication packets are fully compatible with those of the Digital Electronics Corporation's memory link method.

(ON: Fully compatible, OFF: Partly compatible)

For the details on the message format of the microcomputer connection (serial), refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

- b1 to b7: Use prohibited
- b8: For the microcomputer connection (Ethernet), when the bit turns on, if the data format of the message format is Format 3 or 4, communication packets are fully compatible with those of the GOT-F900 series microcomputer connection.

(ON: Fully compatible, OFF: Partly compatible)

For the details on the message format of the microcomputer connection (Ethernet), refer to the following.

→GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

- b9 to b15: Use prohibited

### (68)Touch Position Color Acquisition Ready signal (GS630)

- b0: Turning on the bit makes the GOT ready for acquiring the color information at the touched position on the GOT screen. In this status, even when an object or others is touched, the object or others does not function.  
Turning off the bit without acquiring the color information cancels the status.
- b1 to b15: Use prohibited

### (69)GOT Reset Control (GS639)

GT21 supports b15.

- b0 to b13: Use prohibited
- b14: When the bit is turned on, all the GOT functions exit. (The GOT power can be turned off safely.)
- b15: When the bit is turned on, the software reset for the GOT is performed at the rising edge timing.

## ■ 6 Read device (GS1792 to GS2047)

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### (1) VNC Server Function Control (GS1792)

- b0: When the bit is turned on, the device disables communication from the VNC client.
- b1: When the bit is turned on, the device disables operations from the VNC client.
- b2 to b7: Use prohibited
- b8: When the bit is turned on, the authorization guarantee time for the VNC server function is disabled.
- b9 to b15: Use prohibited

### (2) Gesture Common Control (GS1794)

- b0: When the bit turns on, the object gesture function becomes disabled.  
The single touch operation of the object remains enabled.
- b1: When the bit turns on, the single touch operation of the object becomes disabled.  
The object gesture function remains enabled.
- b2 to b15: Use prohibited

### (3) Authorization Status Control (GS1795)

Controls the authorization of the GOT network interaction function.

This device is activated in an applicable GOT in the control group.

- b0: When this bit turns on, the automatic acquisition of the authorization becomes disabled.  
On unauthorized equipment, even if you switch a screen to another screen in which the authorization control is enabled, the equipment cannot automatically obtain the authorization.
- b1 to b15: Use prohibited

### (4) Authorization Management Control (GS1796)

Controls the authorization of the GOT network interaction function.

This device is activated in the master GOT in the control group.

- b0: When this bit turns on, equipment except the master GOT in the control group becomes prohibited from obtaining the authorization.  
The authorized equipment (other than the master GOT) loses the authorization.  
When the bit is used in combination with b1, the authorization can be released during the authorization guarantee time.
- b1: When this bit turns on, the authorization guarantee time becomes invalid.
- b2: When this bit turns on, all pieces of equipment including the master GOT in the control group become prohibited from obtaining the authorization.  
The authorized equipment loses the authorization.  
When the bit is used in combination with b1, the authorization can be released during the authorization guarantee time.
- b3 to b15: Use prohibited

### (5) Log Viewer Common Control (GS1797)

Specify the behavior of the log viewer.

- b0: When this bit is turned on, the access authentication and the remote password authentication set for the connected controller are performed automatically if the controller IP address is identical to the one connected in the last session.  
The automatic authentication is performed with the user name and password used in the last session.  
At the first startup of the log viewer, the automatic authentication is not performed because no user name and password are recorded.

When you start the log viewer with the special function switch (log viewer), the switch setting overrides the setting of this bit.

- b1 to b15: Use prohibited

### (6) Recipe Control (GS1800)

- b0 to b1: Use prohibited
- b2: When this bit is turned on, the recipe special control is executed.
- b3 to b13: Use prohibited
- b14: When this bit is turned on, the Operation Completed signal (GS1010.b14) and the Operation Error signal (GS1010.b15) turn off.
  - 12.1.3 ■ 3 (29) Recipe Status(GS1010)
- b15: Use prohibited

### (7) Recipe Special Control Action (GS1801)

Specify the control action. The action varies with the stored value.

- 0: Resets the Recipe Special Control Result device (GS1011) and the Recipe Special Control No. device (GS1012) to 0.
- 1: Reads a record from the target recipe data into GOT data registers (GD).
- 2: Overwrites the values of a record in the target recipe data with the values of GOT data registers (GD).
- 4: Outputs recipe information to GOT data registers (GD).
- 5: Searches the target recipe data based on the values of GOT data registers (GD).

### (8) Recipe Special Control Target Type (GS1802)

Specify the target of the recipe special control.

- b0: When this signal is turned on, record information (record No., record attribute, and record name) is set as the control target.
- b1: When this signal is turned on, the update date and time of a record is set as the control target.
- b2: When this signal is turned on, the device values of a record are set as the control target.
- b3: When this signal is turned on, device comments are set as the control target.
- b4 to b15: Use prohibited

### (9) Recipe Special Control Start GD Device No. (GS1803)

Specify the start device number of the GOT internal devices (GD) to be used.

### (10) Recipe Special Control Recipe No. (GS1805)

Specify the recipe number of a target recipe setting.

### (11) Recipe Special Control Record No. (GS1806)

Specify the record number of a target record.

### (12) Recipe Special Control Row No. (GS1807)

Specify the start row of a record as necessary.

Subtract 1 from a target row number, and then set the result as the value of GS1807.

Example 1) To specify row No. 1, set GS1807 to 0.

Example 2) To specify row No. 65536, set GS1807 to 65535.

### (13) Recipe Special Control Points (GS1808)

Specify the number of target rows of a record as necessary.

Starting from the row specified with GS1807, the specified number of rows are targeted for the recipe special control.

### (14) SD Card Access Switch Status Control (GS1820)

- b0: When the bit is turned on, the control for GS1820.b1 is enabled.  
When the bit is turned off, the control for GS1820.b1 is disabled.
- b1: When the bit is turned on, the access to the SD card is allowed.
- b2 to b15: Use prohibited

### (15)USB Drive Common Control (GS1824)

- b0: When the bit is turned on, the USB memory connected to drive E on the GOT can be removed.
- b1: When the bit is turned on, the USB memory connected to drive F on the GOT can be removed.
- b2: When the bit is turned on, the USB memory connected to drive B on the GOT can be removed.
- b3: When the bit is turned on, the USB memory connected to drive G on the GOT can be removed.
- b4: When the bit is turned on, the USB memory connected to drive E on the GOT can be removed.
- b5: When the bit is turned on, the USB memory connected to drive F on the GOT can be removed.
- b6: When the bit is turned on, the USB memory connected to drive B on the GOT can be removed.
- b7: When the bit is turned on, the USB memory connected to drive G on the GOT can be removed.
- b8 to b15: Use prohibited

For the available drives by GOT model, refer to the following.

→1.2.7 Drive configuration of the target GOT for data transfer

### (16)Wireless Access Control (GS1840)

Controls the operations through a wireless LAN.

- b0: When this bit is turned on, writing the package data (containing system applications) is disabled through a wireless LAN.
- b1: When this bit is turned on, writing the package data (containing project data) is disabled through a wireless LAN.
- b2 to b7: Use prohibited
- b8: When this bit is turned on, reading data is disabled through a wireless LAN.
- b9 to b15: Use prohibited

### (17)Label Name Resolution Control (GS1880)

- b0: Use prohibited
- b1: When this bit is turned on, the label name resolution is performed.
- b2: While this bit is on, executing the label name resolution resolves the label names that have been unresolved in the past resolution during the PLC initial processing.  
This operation does not resolve the unresolved label names resulting from the nonexistence of the relevant labels on the PLC side, and system alarm 328 occurs. Accordingly, you can find out which cause is responsible for the unresolved label names.  
→6.1.3 ■ 5 (2) Precautions for the label name resolution
- b3 to b15: Use prohibited

For how to use the bits, refer to the following.

→6.1.3 ■ 4 (3) Label name resolution performed by a user

### (18)Prioritize Touch Switch Operation Control (GS1885)

Prioritizes touch switch operations or the processing being executed.

This device is available only when a communication driver of [SHARP JW] is used.

- b0: When this bit turns on, operations of the touch switches to monitor CH1 are prioritized.
- b1: When this bit turns on, operations of the touch switches to monitor CH2 are prioritized.
- b2: When this bit turns on, operations of the touch switches to monitor CH3 are prioritized.
- b3: When this bit turns on, operations of the touch switches to monitor CH4 are prioritized.
- b4 to b15: Use prohibited

### (19)GOT Mobile File Operation Security Level (GS1892)

Specify a security level with which file manipulations are allowed in the GOT Mobile function, ranging from 0 to 15.

If an invalid value is specified, 0 is assumed.

If 0 is specified, file manipulations are allowed without operator authentication and level authentication.

## (20)GOT Mobile Common Control (GS1896)

Specify the behavior of the GOT Mobile function.

- b0: When this bit is turned on, the URL parameter (initscreen) is enabled.  
    ⇒ ■ 3 Usage
- b1: When this bit is turned on, file manipulations with the file manager are enabled.
- b2 to b15: Use prohibited

## (21)Time to Force Mobile Momentary Switch OFF (GS1899)

Set the time from when communication is lost between the GOT and a client until when the GOT forcibly turns off the touch switch being touched on the client.

If a touch switch is released on a client after the client loses communication with the GOT, the GOT does not recognize the release.

After a specified time (default: 3 seconds) elapses, the GOT forcibly turns off the touch switch.

The following shows the setting range.

Device value	Time to force the touch switch off
0 to 2, 31 or more	3000 ms (3 seconds)
3 to 30	300 ms to 3000 ms (Settable in units of 100 ms)

## (22)GOT Ethernet Setting Change (GS1900 to GS1908)

Change the GOT Ethernet setting without using the utility.

### Point

#### Precautions for changing the Ethernet setting

Make sure to restart the GOT after you change the Ethernet setting by using the GOT Ethernet Setting Change devices (GS1900 to GS1908).

Even though the new Ethernet setting is displayed in the utility, the GOT does not operate with the new setting until you restart the GOT.

The following shows the procedure for changing the Ethernet setting.

- Step 1** Specify the category of an Ethernet setting item by using the GOT Ethernet Setting Change Category device (GS1900).  
    ⇒(23) GOT Ethernet Setting Change Category (GS1900)
- Step 2** Store a new value to the New GOT Ethernet Setting device (GS1903 to GS1908) that corresponds to the Ethernet setting item to be changed.  
    ⇒(26) New GOT Ethernet Setting (GS1903 to GS1908)
- Step 3** Turn on the relevant bit of the GOT Ethernet Setting Change Item device (GS1902) that corresponds to the New GOT Ethernet Setting device storing the new value.  
    ⇒(25) GOT Ethernet Setting Change Item (GS1902)
- Step 4** Turn on the Execute GOT Ethernet Setting Change signal (GS1901.b0) to execute the Ethernet setting change.  
    ⇒(24) Execute GOT Ethernet Setting Change (GS1901)
- Step 5** After the setting change has completed, the GOT Ethernet Setting Change Completed signal (GS1500.b1) and the GOT Ethernet Setting Changed signal (GS1500.b2) turn on.  
    ⇒12.1.3 ■ 3 (75) GOT Ethernet Setting Change Status (GS1500)  
    Restart the GOT.

Example) When the GOT IP address for the Ethernet standard port of GT27 is changed to 200.50.1.254 (decimal)

**Step 1** Store 1 to GS1900.

**Step 2** Store new values to GS1903 and GS1904 as shown below.

**Step 3** Turn on GS1902.b0.

**Step 4** Turn on GS1901.b0 to execute the Ethernet setting change.

**Step 5** After the setting change has completed, GS1500.b1 and GS1500.b2 turn on.  
 Restart the GOT.

For the details of the devices (GS1900 to GS1908) used for changing the GOT Ethernet setting, refer to the following.

- (23) GOT Ethernet Setting Change Category (GS1900)
- (24) Execute GOT Ethernet Setting Change (GS1901)
- (25) GOT Ethernet Setting Change Item (GS1902)
- (26) New GOT Ethernet Setting (GS1903 to GS1908)

### (23)GOT Ethernet Setting Change Category (GS1900)

Specify the category of an Ethernet setting item to be changed.

The following shows the correspondence between the setting values and the categorized Ethernet setting items.

GOT	Setting value	Categorized Ethernet setting items
GT27, GT25-S, GT25-V (excluding GT2505-V)	1	<ul style="list-style-type: none"> <li>• GOT IP address for the Ethernet standard port</li> <li>• Subnet mask for the Ethernet standard port</li> <li>• Default gateway</li> </ul>
	2	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Host station</li> <li>• GOT network number</li> <li>• GOT station number</li> </ul>
	3	<ul style="list-style-type: none"> <li>• GOT IP address for the wireless LAN interface</li> <li>• Subnet mask for the wireless LAN interface</li> </ul>
	4	<ul style="list-style-type: none"> <li>• GOT IP address for the Ethernet extended port</li> <li>• Subnet mask for the Ethernet extended port</li> <li>• Setting to disable the Ethernet extended port</li> </ul>
	5	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• Network number for a controller</li> </ul>
	6	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• Station number of a controller</li> </ul>
	7	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• IP address of a controller</li> </ul>

GOT	Setting value	Categorized Ethernet setting items
GT25-W	1	<ul style="list-style-type: none"> <li>• GOT IP address for Ethernet standard port 1</li> <li>• Subnet mask for Ethernet standard port 1</li> <li>• Default gateway</li> </ul>
	2	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Host station</li> <li>• GOT network number</li> <li>• GOT station number</li> </ul>
	3	<ul style="list-style-type: none"> <li>• GOT IP address for the wireless LAN interface</li> <li>• Subnet mask for the wireless LAN interface</li> </ul>
	4	<ul style="list-style-type: none"> <li>• GOT IP address for Ethernet standard port 2</li> <li>• Subnet mask for Ethernet standard port 2</li> <li>• Default gateway</li> </ul>
	5	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• Network number for a controller</li> </ul>
	6	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• Station number of a controller</li> </ul>
	7	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• IP address of a controller</li> </ul>
GT2505-V, GT25HSV, GT23, GT21	1	<ul style="list-style-type: none"> <li>• GOT IP address for the Ethernet standard port</li> <li>• Subnet mask for the Ethernet standard port</li> <li>• Default gateway</li> </ul>
	2	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Host station</li> <li>• GOT network number</li> <li>• GOT station number</li> </ul>
	3	Invalid
	4	
	5	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• Network number for a controller</li> </ul>
	6	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• Station number of a controller</li> </ul>
	7	<ul style="list-style-type: none"> <li>• Channel number</li> <li>• Setting number in the Ethernet controller setting</li> <li>• IP address of a controller</li> </ul>

#### (24)Execute GOT Ethernet Setting Change (GS1901)

- b0: Turning on the bit executes the Ethernet setting change. The item to be changed is specified by using the GOT Ethernet Setting Change Category device (GS1900) and the GOT Ethernet Setting Change Item device (GS1902).
- b1 to b15: Use prohibited

## (25)GOT Ethernet Setting Change Item (GS1902)

b15 to b5	b4	b3	b2	b1	b0
-----------	----	----	----	----	----

Set an Ethernet setting item to be changed. The category of the item is specified by using the GOT Ethernet Setting Change Category device (GS1900).

- b0 to b4: Turning on the bit sets the corresponding Ethernet setting item to be changed.

The following shows the correspondence between the bits and the Ethernet setting items.

When GS1900 stores 1, 2, 3 or 4

GOT	GS1902	Ethernet setting item to be changed			
		When GS1900 stores 1	When GS1900 stores 2	When GS1900 stores 3	When GS1900 stores 4
GT27 GT25-S GT25-V (excluding GT2505-V)	b0	GOT IP address for the Ethernet standard port	Channel number	GOT IP address for the wireless LAN interface	GOT IP address for the Ethernet extended port
	b1	Use prohibited	Host station	Use prohibited	Use prohibited
	b2	Subnet mask for the Ethernet standard port	GOT network number	Subnet mask for the wireless LAN interface	Subnet mask for the Ethernet extended port
	b3	Use prohibited	GOT station number	Use prohibited	Use prohibited
	b4	Default gateway	Use prohibited		Setting to disable the Ethernet extended port

## (26)New GOT Ethernet Setting (GS1903 to GS1908)

The device that corresponds to the Ethernet setting item to be changed stores a new value.

When the Execute GOT Ethernet Setting Change signal (GS1901.b0) is turned on, the Ethernet setting is updated with the new value.

The following shows the correspondence between the devices and the Ethernet setting items.

When GS1900 stores 1, 2, 3 or 4

GOT	New GOT Ethernet Setting device	Ethernet setting item			
		When GS1900 stores 1	When GS1900 stores 2	When GS1900 stores 3	When GS1900 stores 4
GT27 GT25-S GT25-V (excluding GT2505-V)	GS1903	GOT IP address for the Ethernet standard port	Channel number	GOT IP address for the wireless LAN interface	GOT IP address for the Ethernet extended port
	GS1904		Host station		
	GS1905	Subnet mask for the Ethernet standard port	GOT network number	Subnet mask for the wireless LAN interface	Subnet mask for the Ethernet extended port
	GS1906		GOT station number		
	GS1907	Default gateway	Use prohibited	Use prohibited	Setting to disable the Ethernet extended port
	GS1908				Use prohibited
GT25-W	GS1903	GOT IP address for Ethernet standard port 1	Channel number	GOT IP address for the wireless LAN interface	GOT IP address for Ethernet standard port 2
	GS1904		Host station		
	GS1905	Subnet mask for Ethernet standard port 1	GOT network number	Subnet mask for the wireless LAN interface	Subnet mask for Ethernet standard port 2
	GS1906		GOT station number		
	GS1907	Default gateway	Use prohibited	Use prohibited	Setting to disable Ethernet standard port 2
	GS1908				Use prohibited
GT2505-V GT25HS-V GT23 GT21	GS1903	GOT IP address for the Ethernet standard port	Channel number	Use prohibited	Use prohibited

	GS1906		GOT station number		
	GS1907	Default gateway	Use prohibited		
	GS1908				

When GS1900 stores 5, 6, or 7

GOT	New GOT Ethernet Setting device	Ethernet setting item		
		When GS1900 stores 5	When GS1900 stores 6	When GS1900 stores 7
All models	GS1903	Channel number	Channel number	Channel number
	GS1904	Setting number in the Ethernet controller setting	Setting number in the Ethernet controller setting	Setting number in the Ethernet controller setting
	GS1905	Network number for a controller	Station number of a controller	IP address of a controller
	GS1906	Use prohibited	Use prohibited	

The following shows how to set a new value.

**(a) When the GOT Ethernet Setting Change Category device (GS1900) stores 1**

Set new values in hexadecimal for the following items.

- GOT IP address for the Ethernet standard port or Ethernet standard port 1
- Subnet mask for the Ethernet standard port or Ethernet standard port 1
- Default gateway

The following shows the setting range of each item. (Decimal)

- GOT IP address: 0.0.0.0 to 223.255.255.255
- Subnet mask and default gateway: 0.0.0.0 to 255.255.255.255

If you do not use the subnet mask or default gateway, set the item to 0.0.0.0.

Example) When the GOT IP address for the Ethernet standard port of GT27 is changed to 192.168.3.18 (decimal)

**(b) When the GOT Ethernet Setting Change Category device (GS1900) stores 2**

- Channel number

Set the channel number of a controller for which the host station, GOT network number, or GOT station number is changed.

The setting range is 1 to 4.

- Host station, GOT network number, and GOT station number

Set the host station, GOT network number, or GOT station number for the controller connected to the specified channel.

The following shows the setting range of each item.

Host station: 1 to 128

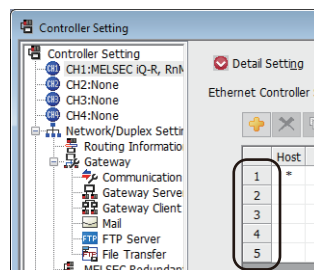

GOT network number: The setting range depends on the controller used.

GOT station number: The setting range depends on the controller used.

For details, refer to the following.

⇒ GOT2000 Series Connection Manual for a controller used

To set the host station, specify a setting number existing in the Ethernet controller setting.

**(c) When the GOT Ethernet Setting Change Category device (GS1900) stores 3**

Set the GOT IP address or subnet mask for the wireless LAN interface in hexadecimal.

The following shows the setting range of each item. (Decimal)

- GOT IP address: 0.0.0.0 to 223.255.255.255
- Subnet mask: 0.0.0.0 to 255.255.255.255

If you do not use the subnet mask, set the item to 0.0.0.0.

Example) When the GOT IP address for the wireless LAN interface of GT27 is changed to 192.168.4.20 (decimal)

**(d) When the GOT Ethernet Setting Change Category device (GS1900) stores 4**

Set the GOT IP address or subnet mask for the Ethernet extended port or Ethernet standard port 2 in hexadecimal with GS1903 to GS1906.

The following shows the setting range of each item. (Decimal)

- GOT IP address: 0.0.0.0 to 223.255.255.255
- Subnet mask: 0.0.0.0 to 255.255.255.255

If you do not use the subnet mask, set the item to 0.0.0.0.

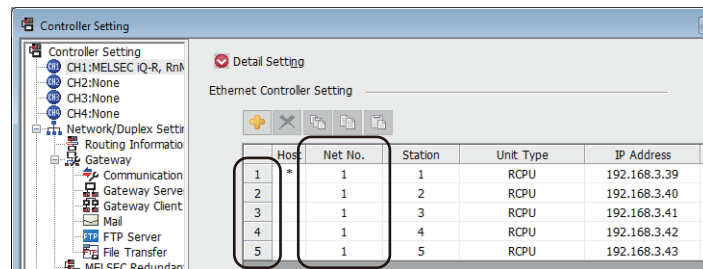

Example) When the GOT IP address for the Ethernet extended port of GT27 is changed to 192.168.3.18 (decimal)

Set whether to disable the Ethernet extended port or Ethernet standard port 2 with GS1907.

To disable the Ethernet extended port or Ethernet standard port 2, turn on GS1907.b0.

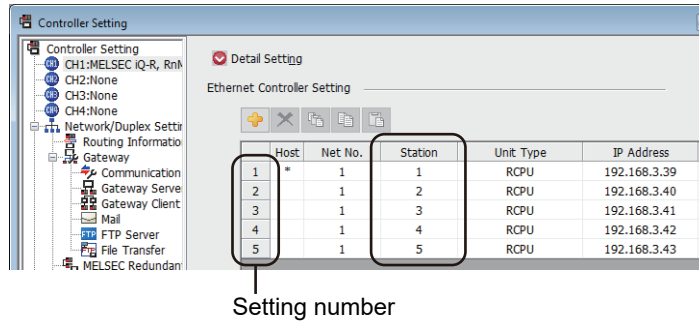

**(e) When the GOT Ethernet Setting Change Category device (GS1900) stores 5**

Setting number

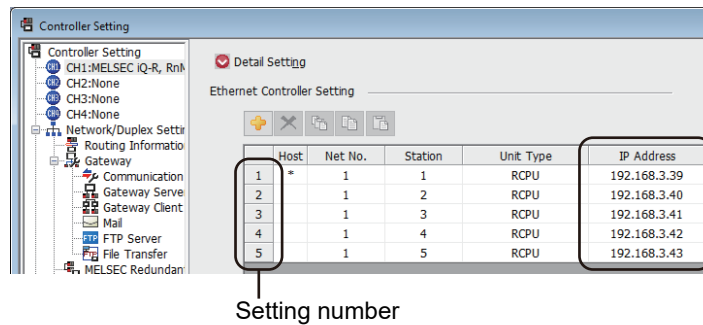

- Channel number and the setting number in the Ethernet controller setting  
Set the channel number and setting number of a controller for which the network number is changed.  
The following shows the setting range of each item.  
Channel number: 1 to 4  
Setting number in the Ethernet controller setting: 1 to 128
- Network number for a controller  
Set the network number for a controller.  
The setting range varies with the controller.  
For details, refer to the following.  
⇒GOT2000 Series Connection Manual for a controller used

(f) When the GOT Ethernet Setting Change Category device (GS1900) stores 6

- Channel number and the setting number in the Ethernet controller setting  
Set the channel number and setting number of a controller whose station number is changed. The following shows the setting range of each item.  
Channel number: 1 to 4  
Setting number in the Ethernet controller setting: 1 to 128
- Station number of a controller  
Set the station number of a controller. The setting range varies with the controller. For details, refer to the following.  
⇒ GOT2000 Series Connection Manual for a controller used

(g) When the GOT Ethernet Setting Change Category device (GS1900) stores 7

- Channel number and the setting number in the Ethernet controller setting  
Set the channel number and setting number of a controller whose IP address is changed. The following shows the setting range of each item.  
Channel number: 1 to 4  
Setting number in the Ethernet controller setting: 1 to 128
- IP address of a controller  
Set the IP address of a controller in hexadecimal. The setting range is 0.0.0.0 to 223.255.255.255 (decimal).  
Example) When the IP address of a controller is changed to 192.168.3.45 (decimal)

(27) Full-screen Display Control signal (GS1998)

When the Extended Control signal (b7) of the video and RGB input common device is on, the Full-screen Display Control signal specifies the video window or the RGB screen to be displayed in full-screen size. For the setting other than the following values, the operation is the same as when 0 is stored.

0: Does not display the video window in full-screen size. (The size of the video window or the RGB screen corresponds to the setting of each video window or the RGB screen.)

1 to 4: Displays the specified number of video window in full-screen size.

5: Displays the RGB screen in full-screen size.

**(28)Video Window 1 to 4 and RGB Screen Extended Control signal (GS1999 to GS2006, GS2009 to GS2016, GS2019 to GS2026, GS2029 to GS2036, GS2039 to GS2045)**

While the Extended Control signal (b7) of the video and RGB input common device is on, configure the setting for video windows 1 to 4 or the RGB screen.

The default display position of the video window is the upper left corner of the GOT screen.

Device					Function
Video window 1	Video window 2	Video window 3	Video window 4	RGB window	
GS1999	GS2009	GS2019	GS2029	*1	Specify the channel No. of the video window.
GS2000	GS2010	GS2020	GS2030	GS2039	Specify the display magnification of the video window or RGB screen. The display size, which is specified in the display size setting (width and height) for the video window or RGB screen, is used as the reference. <ul style="list-style-type: none"> <li>• 7: 400%</li> <li>• 8: 200%</li> <li>• 0: 100%</li> <li>• 1: 87.5%</li> <li>• 2: 75%</li> <li>• 3: 62.5%</li> <li>• 4: 50%</li> <li>• 5: 37.5%</li> <li>• 6: 25%</li> <li>• Other than the above: 100%</li> </ul>
GS2001	GS2011	GS2021	GS2031	GS2040	Specify the display size (width) of the video window or RGB screen in dots by using the size at 100% magnification as the reference. The actual display size (width) of the video window or RGB screen is enlarged or reduced according to the set display magnification. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2002	GS2012	GS2022	GS2032	GS2041	Specify the display size (height) of the video window or RGB screen in dots by using the size at 100% magnification as the reference. The actual display size (height) of the video window or RGB screen is enlarged or reduced according to the set display magnification. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2003	GS2013	GS2023	GS2033	GS2042	Using the upper left corner of the GOT screen as the origin point of coordinates, specify the display position (X coordinate) of the video window or RGB screen in dots. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2004	GS2014	GS2024	GS2034	GS2043	Using the upper left corner of the GOT screen as the origin point of coordinates, specify the display position (Y coordinate) of the video window or RGB screen in dots. Specify the display magnification within a range of the lower resolution in the video image or the GOT.
GS2005	GS2015	GS2025	GS2035	GS2044	Specify the origin point (X coordinate) of the clip area of the video image. Specify the display magnification within a range of the resolution of the video image.
GS2006	GS2016	GS2026	GS2036	GS2045	Specify the origin point (Y coordinate) of the clip area of the video image. Specify the display magnification within a range of the resolution of the video image.

\*1 Specify a channel number with b14 and b15 of the device specified for [Video/RGB Input Common].

- 27 [CLPA]
- 28 [MODBUS]
- 29 [ODVA]
- 30 [PROFIBUS]
- 31 [Others]

### ■ 1 [MITSUBISHI ELECTRIC]

Set the channel of the controller to be connected with the GOT.

#### (1) Setting

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Refer to the following to configure the settings.

#### **Point**

##### **Channel No. 2 to 4**

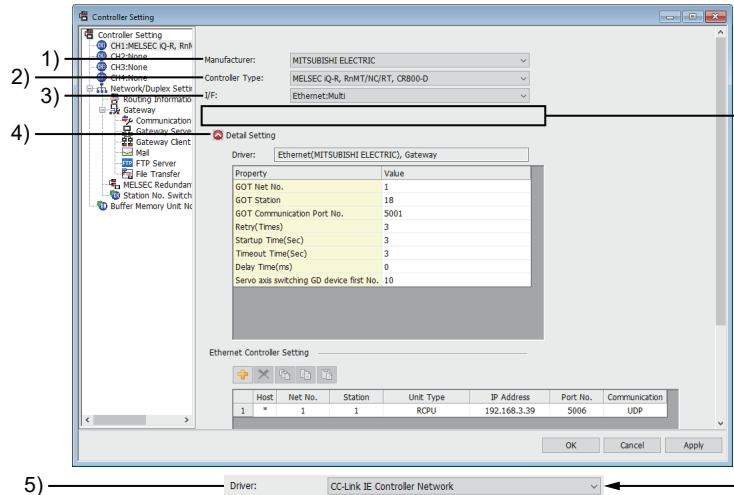

Set channel No. 2 to 4 when using the multi-channel function.

For the details of the multi-channel function, refer to the following.

- ➔ GOT2000 Series Connection Manual (Mitsubishi Products) for GT Works3 Version1

## (2) Setting item

The following shows the setting items.

### 1) [Manufacturer]

Select [MITSUBISHI ELECTRIC].

Select the manufacturer of the controller connected to the GOT.

### 2) [Controller Type]

The following table lists available controllers.

Controller type	Model name
[MELSEC iQ-R, RnMT/NC/RT, CR800-D]	R00CPU, R01CPU, R02CPU, R04CPU, R08CPU, R16CPU, R32CPU, R120CPU R16MTCPU, R32MTCPU, R64MTCPU R08PCPU, R16PCPU, R32PCPU, R120PCPU R08SFCPU, R16SFCPU, R32SFCPU, R120SFCPU R08PSFCPU, R16PSFCPU, R32PSFCPU, R120PSFCPU R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, R120ENCPU R12CCPU-V MR-J4(W)-*B(-RJ) *1 MR-J4-GF(-RJ) *1 MR-JE-*B *1 MR-JE-*BF *1 CNC C80(R16NCCPU-S1) CR800-R(R16RTCPU), CR800-D FR-A800, FR-A800-E FR-F800, FR-F800-E FR-A800-GF FR-E700-NE

[FREQROL 800]	FR-A800, FR-A800-E, FR-A800 Plus FR-F800, FR-F800-E FR-B (A800 specification), FR-B3 (A800 specification)
[FREQROL 800/E700NE(Batch monitor)]	FR-A800 FR-A800-E FR-F800 FR-F800-E FR-A800-GF FR-E700-NE
[Laser Displacement Sensor MH11]	MH11CTMF-N, MH11CTMF-NNA, MH11CTMF-P, MH11CTMF-PNA

\*1 The controller is connectable to the GOT through a motion controller or a simple motion module.

### 3) [I/F]

Available interfaces differ depending on the GOT used.

Set [I/F] according to the interface used and the position of the communication unit mounted on the GOT.

### 4) [Detail Setting]

Configure the settings including the baud rate and the data length of the communication driver used.

### 5) [Driver]

This item appears when communication drivers are selectable according to the settings of [Controller Type] and [I/F].

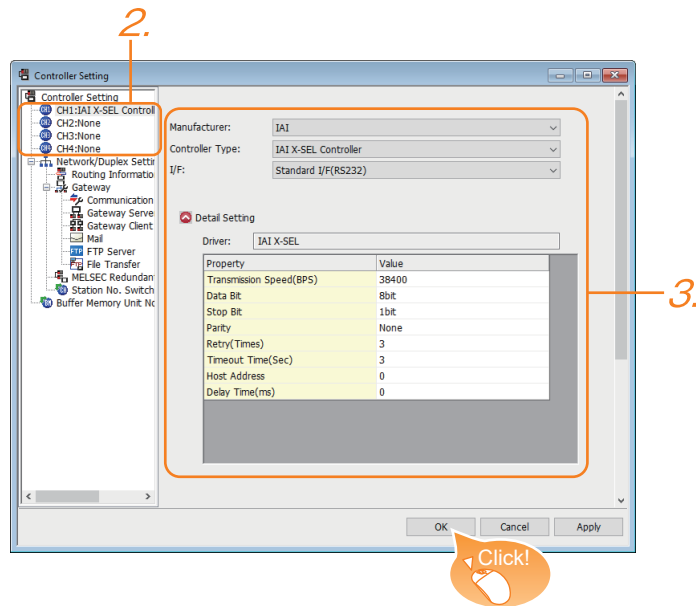

Select the communication driver to be written to the GOT.

Refer to the following to configure the setting.

⇒GOT2000 Series Connection Manual (Mitsubishi Products) for GT Works3 Version1

## ■ 2 [IAI]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [IAI]
- [Controller Type]  
When connecting to X-SEL, SSEL, ASEL, or PSEL: [IAI X-SEL Controller]  
When connecting to PCON, ACON, SCON, or ERC2: [IAI ROBO CYLINDER]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

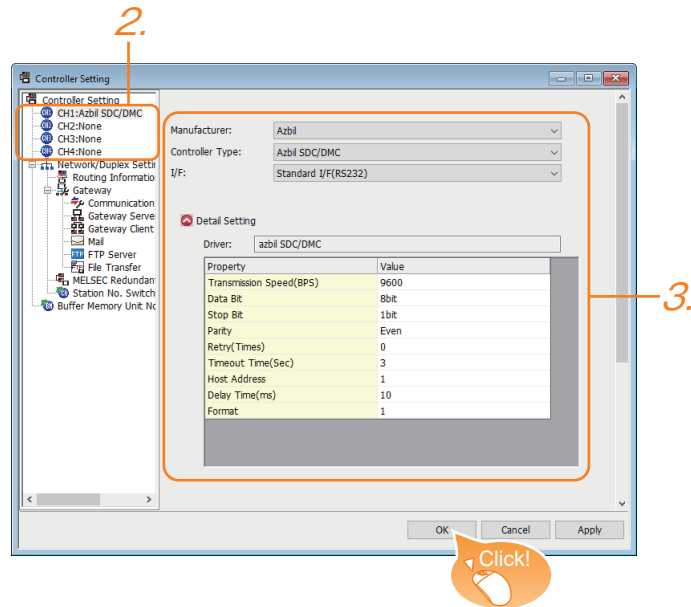

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

### ■3 [Azbil]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [Azbil]
- [Controller Type]  
When connecting to DMC50 or AHC2001: [Azbil DMC50]  
When connecting to the models other than DMC50]: [Azbil SDC/DMC]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

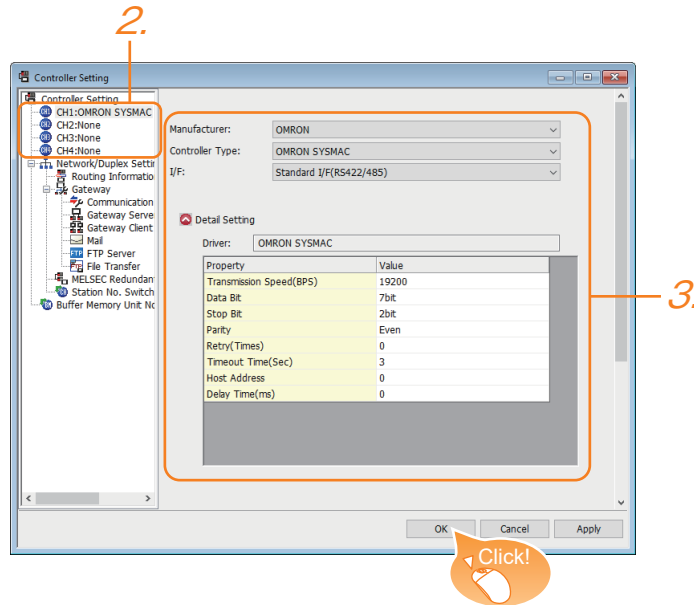

#### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 4 [OMRON]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [OMRON]
- [Controller Type]: select either of the following according to the model to be connected.  
[OMRON SYSMAC]  
[OMRON NJ/NX]  
[OMRON THERMAC/INPANEL NEO]  
[OMRON Digital Temperature Controller]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

### Point

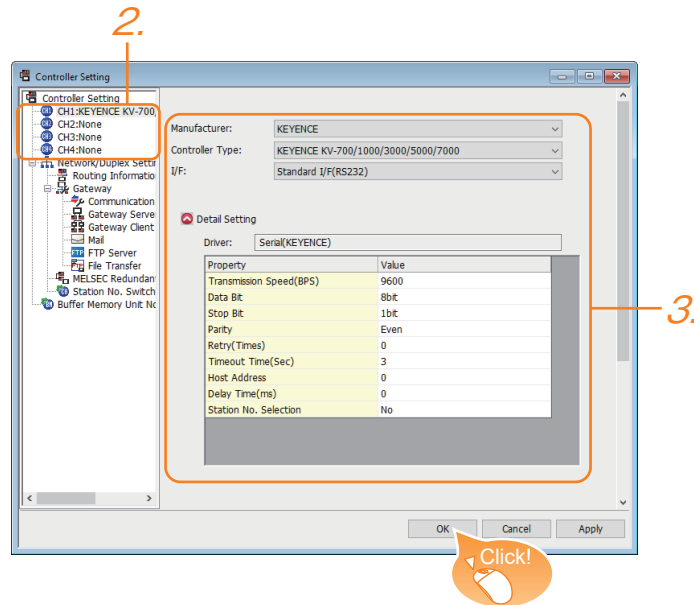

The controller setting can be checked in [I/F Communication Setting].

For details, refer to the following.

⇒ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■5 [KEYENCE]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [KEYENCE]
  - [Controller Type]: [KEYENCE KV-700/1000/3000/5000/7000]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

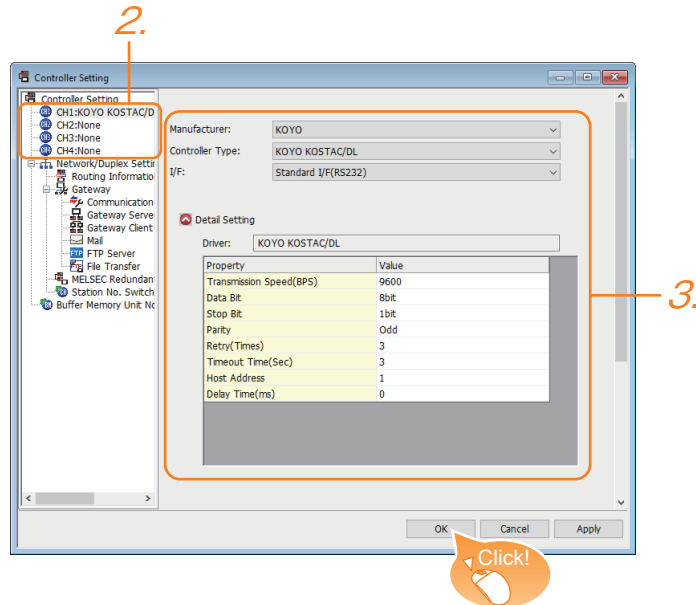

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 6 [KOYO]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [KOYO]
  - [Controller Type]: [KOYO KOSTAC/DL]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

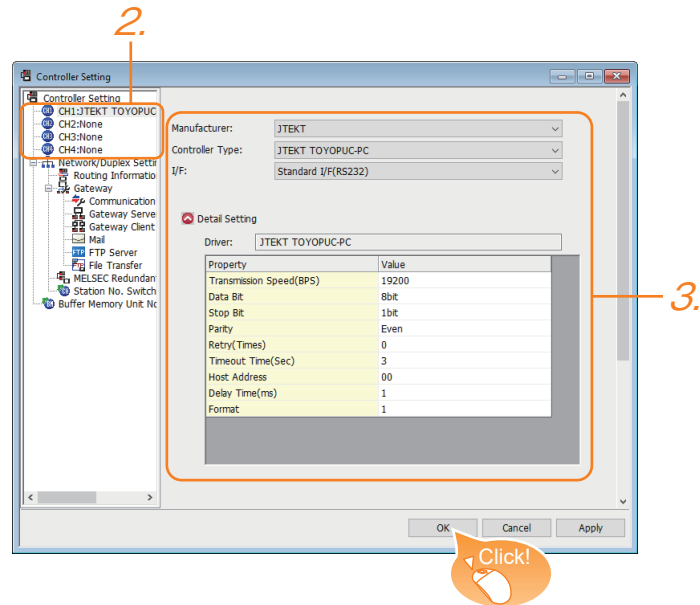

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■7 [JTEKT]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [JTEKT]
  - [Controller Type]: [JTEKT TOYOPUC-PC]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

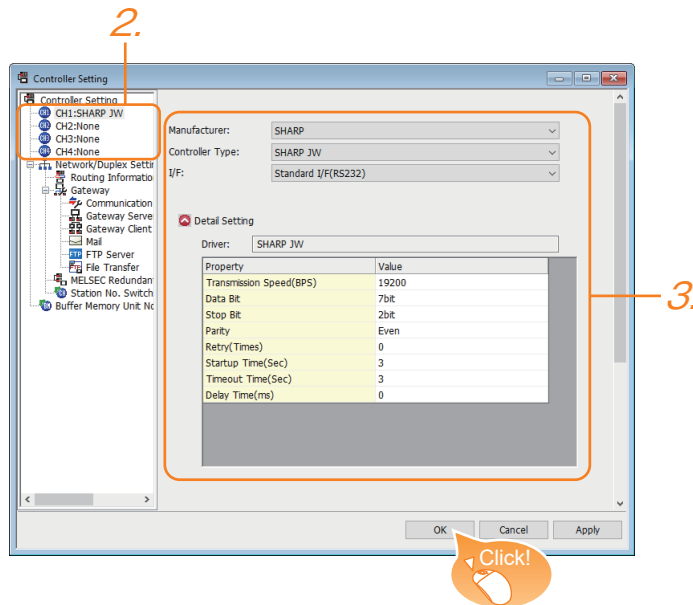

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 8 [SHARP]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [SHARP]
- [Controller Type]: [SHARP JW]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

### Point

The controller setting can be checked in [I/F Communication Setting].

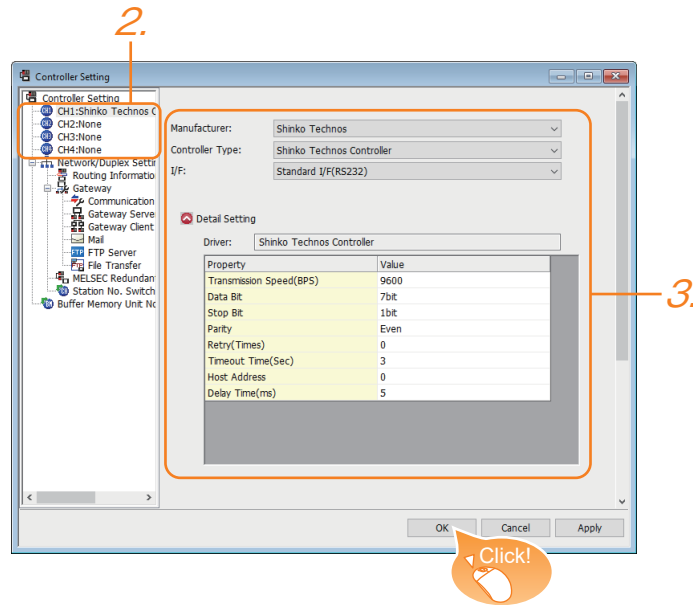

For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■9 [SHINKO]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [SHINKO]
  - [Controller Type]: [Shinko Technos Controller]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

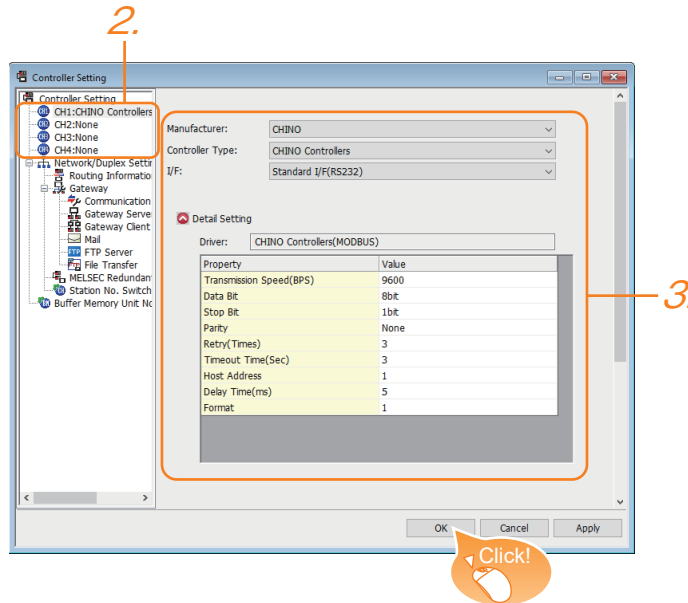

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 10 [CHINO]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [CHINO]
  - [Controller Type]: [CHINO Controller]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

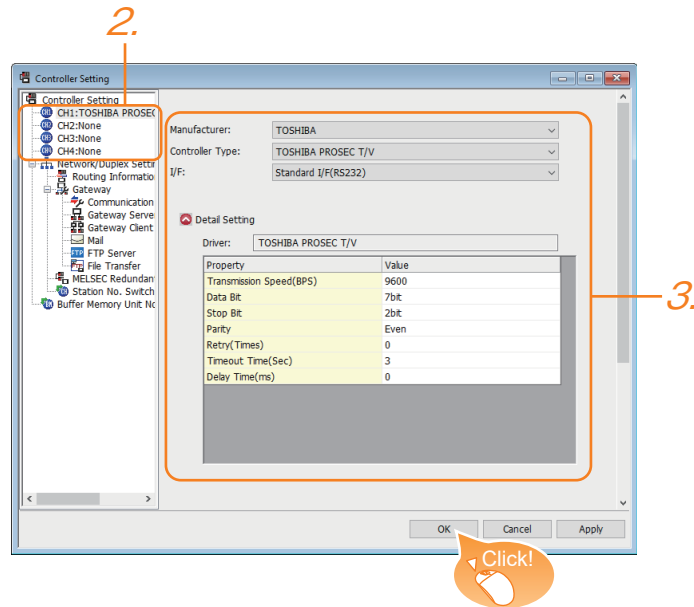

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■11 [TOSHIBA]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [TOSHIBA]
- [Controller Type]: select either of the following according to the model to be connected.  
[TOSHIBA PROSEC T/V]  
[TOSHIBA Unified Controller nv]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

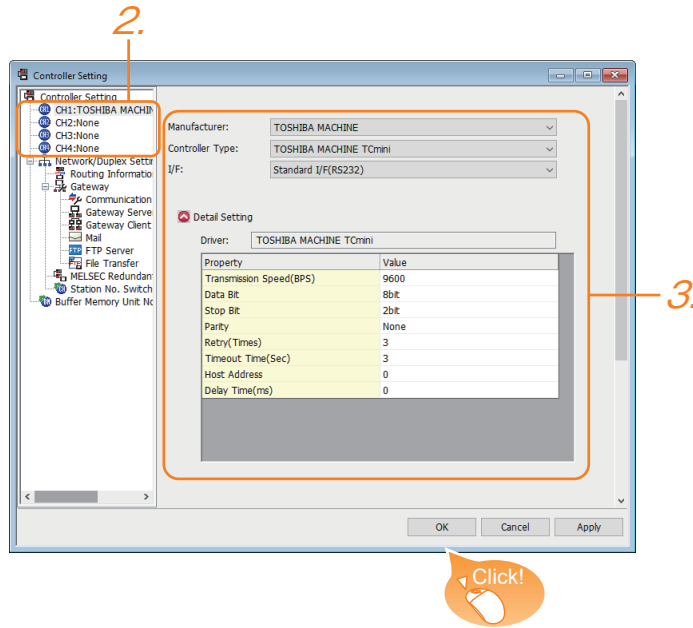

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## 12 [TOSHIBA MACHINE]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [TOSHIBA MACHINE]
  - [Controller Type]: [TOSHIBA MACHINE TCmini]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

### Point

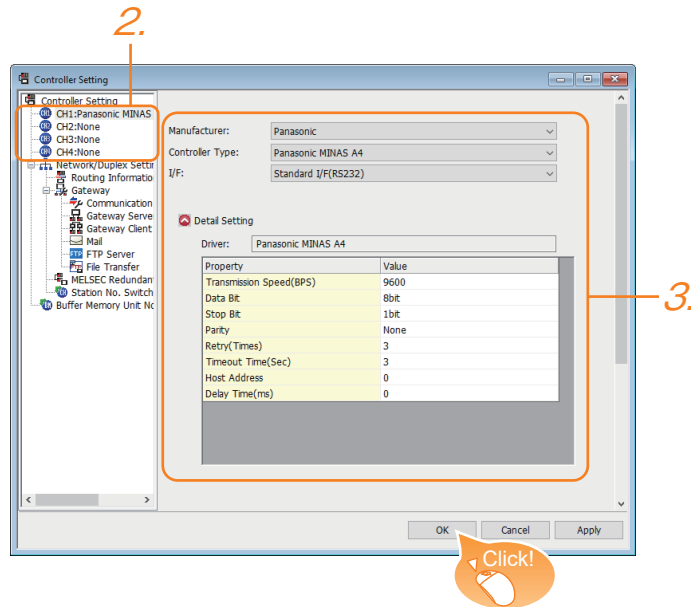

The controller setting can be checked in [I/F Communication Setting].

For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 13 [PANASONIC]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [Panasonic]
  - [Controller Type]: select either of the following according to the model to be connected.  
[Panasonic MEWNET-FP]  
[Panasonic FP7]  
[Panasonic MINAS A4]  
[Panasonic MINAS A5]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

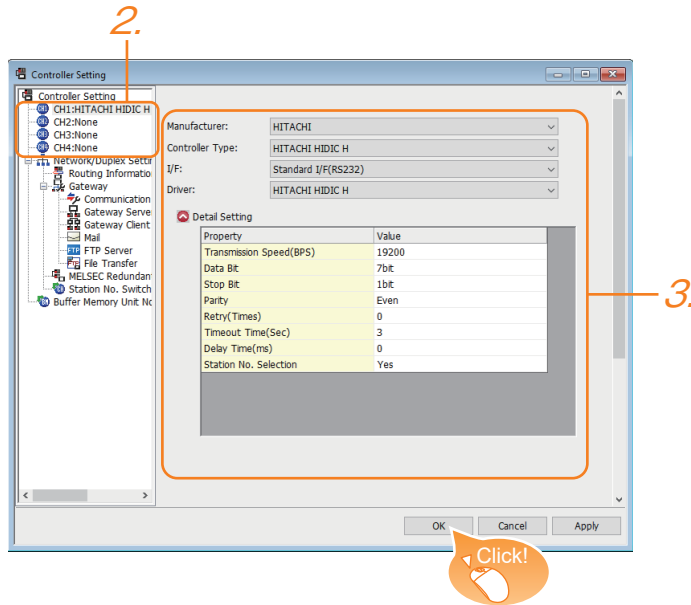

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 14 [HITACHI]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [HITACHI]
- [Controller Type]: select either of the following according to the model to be connected.  
[HITACHI HIDIC H]  
[HITACHI S10mini/S10V]
- [I/F]: The interface to be used
- [Driver]: This item appears when [Controller Type] is set to [HITACHI HIDIC H].  
[HITACHI HIDIC H]  
[HITACHI HIDIC H (Protocol2)]
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

### Point

The controller setting can be checked in [I/F Communication Setting].

For details, refer to the following.

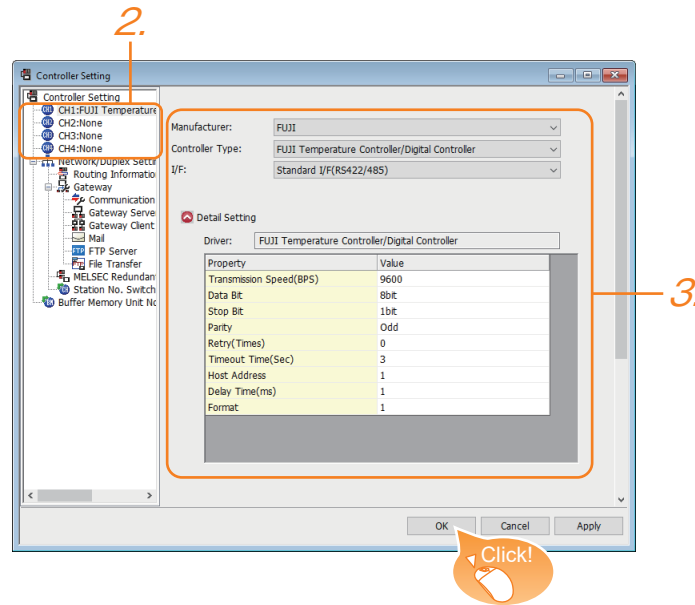

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 15 [Hirata HNC]

For the setting details, contact our company.

## ■ 16 [FUJI]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [FUJI]
  - [Controller Type]: select either of the following according to the model to be connected.  
[FUJI MICREX-F]  
[FUJI Temperature Controller/Digital Controller]  
[FUJI MICREX-SX SPH]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

### Point

The controller setting can be checked in [I/F Communication Setting].

For details, refer to the following.

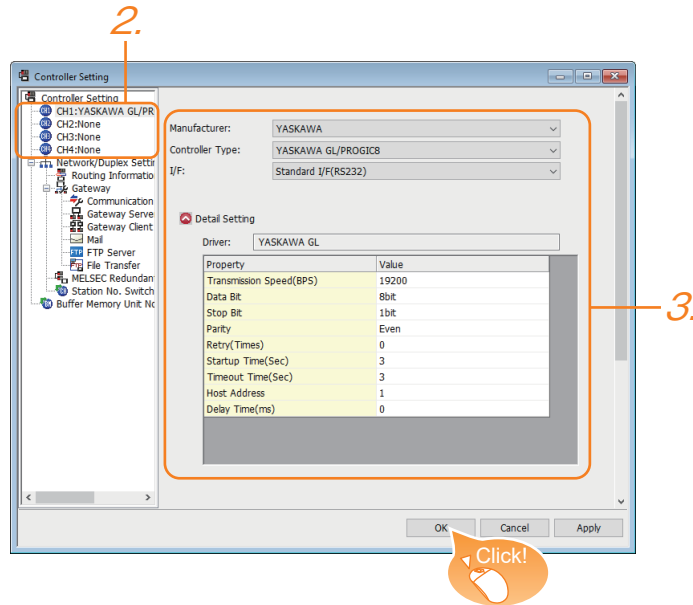

→ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 17 [Muratec]

For the setting details, contact our company.

## ■ 18 [YASKAWA]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [YASKAWA]
- [Controller Type]: select either of the following according to the model to be connected.  
[YASKAWA GL/PROGIC8]  
[YASKAWA CP9200(H)]  
[YASKAWA CP9300MS(MC compatible)]  
[YASKAWA MP2000/MP900/CP9200SH]  
[YASKAWA MP3000]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

### Point

The controller setting can be checked in [I/F Communication Setting].

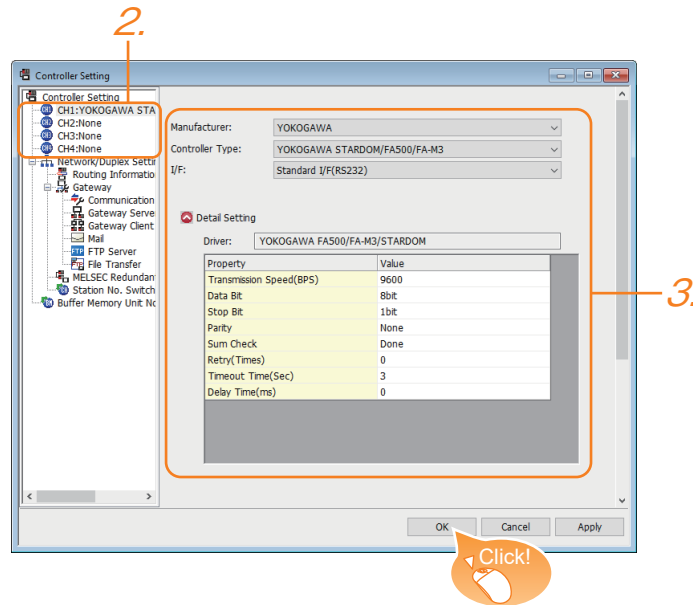

For details, refer to the following.

⇒ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■19 [YOKOGAWA]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [YOKOGAWA]
  - [Controller Type]: select either of the following according to the model to be connected.  
[YOKOGAWA STARDOM/FA500/FA-M3]  
[YOKOGAWA GREEN/UT100/UT2000/UTAdvanced]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

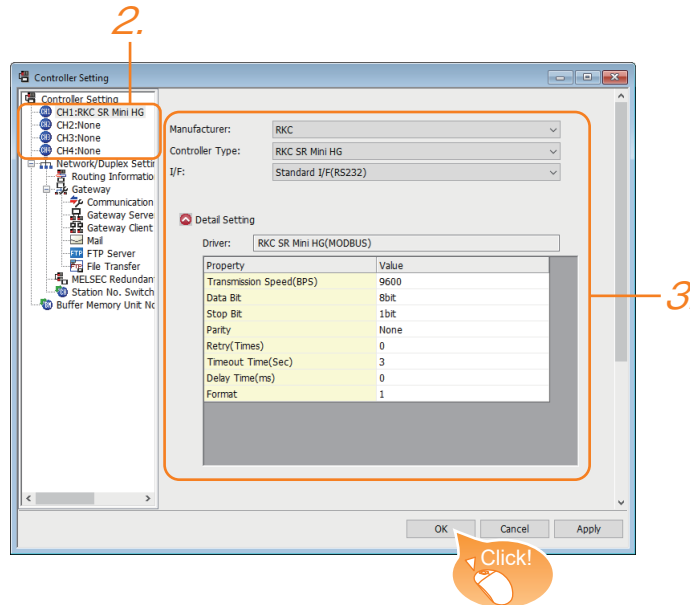

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 20 [RKC]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [RKC]
  - [Controller Type]: [RKC SR Mini HG]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

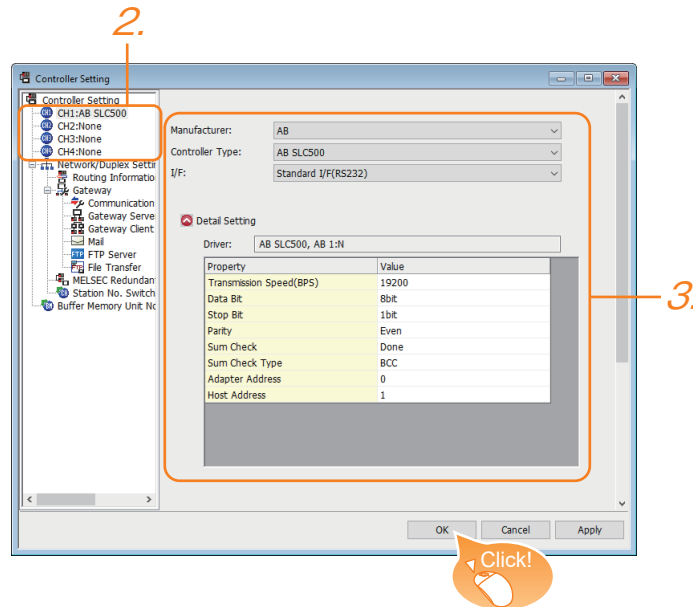

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■21 [AB]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [AB]
  - [Controller Type]: select either of the following according to the model to be connected.  
[AB SLC500]  
[AB MicroLogix]  
[AB MicroLogix (Extended)]  
[AB Control/CompactLogix]  
[AB Control/CompactLogix(Tag)]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

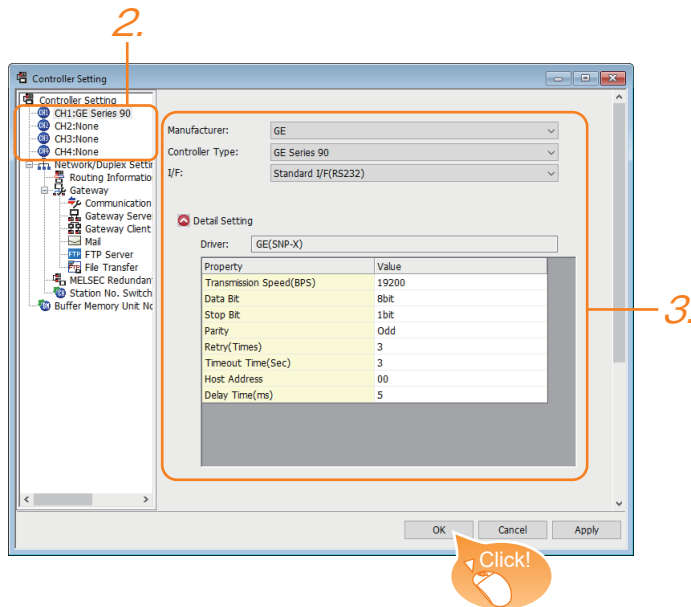

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## 22 [GE]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [GE]
  - [Controller Type]: [GE Series 90]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

### Point

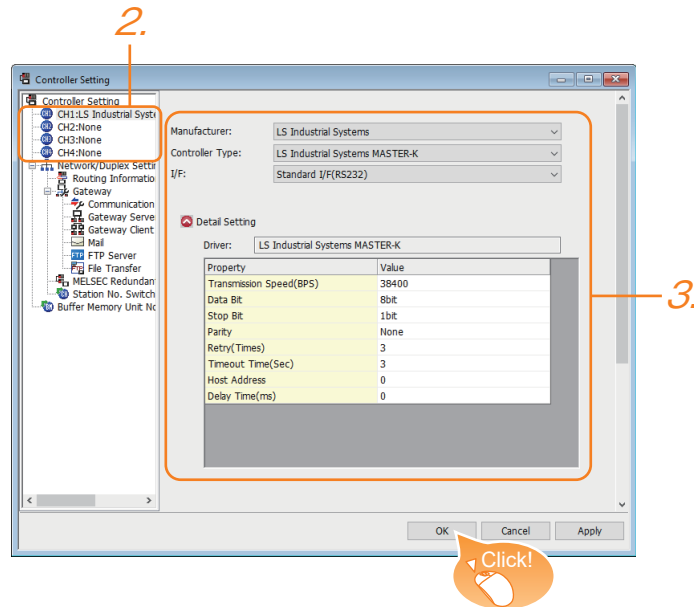

The controller setting can be checked in [I/F Communication Setting].

For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■23 [LS IS]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [LS IS]
  - [Controller Type]: [LS Industrial Systems MASTER-K]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

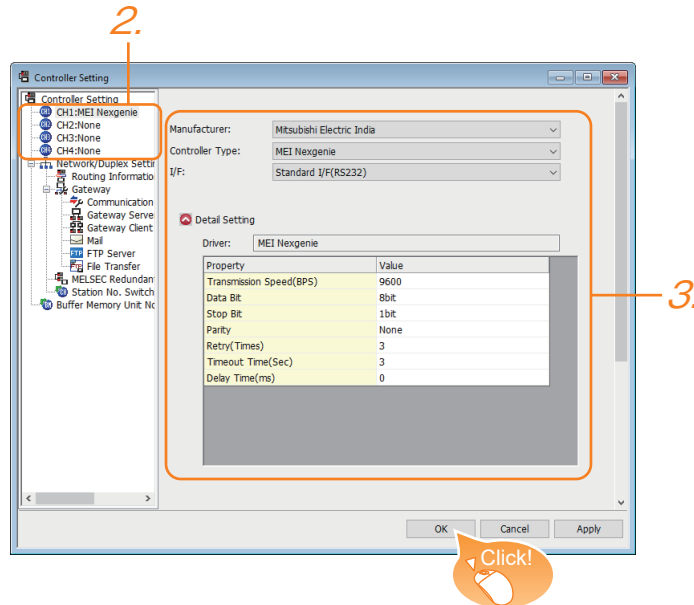

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 24 [Mitsubishi Electric India]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [Mitsubishi Electric India]
  - [Controller Type]: [MEI Nexgenie]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

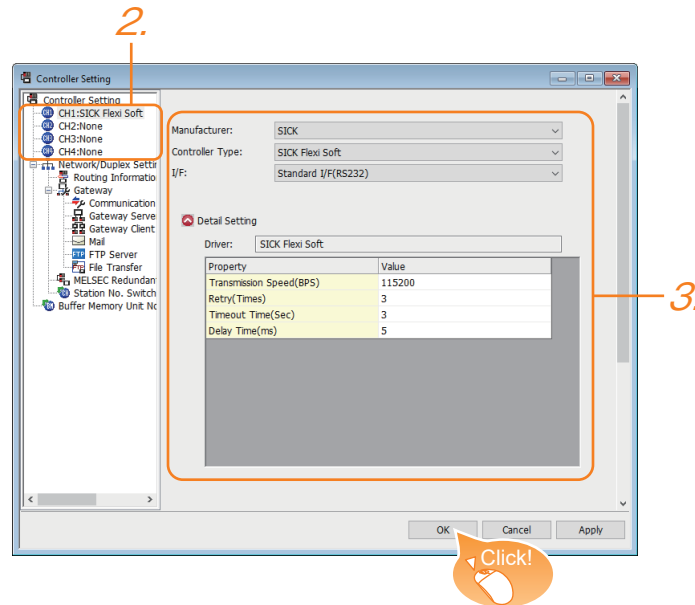

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 2) for GT Works3 Version1

## ■25 [SICK]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [SICK]
  - [Controller Type]: [SICK Flexi Soft]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

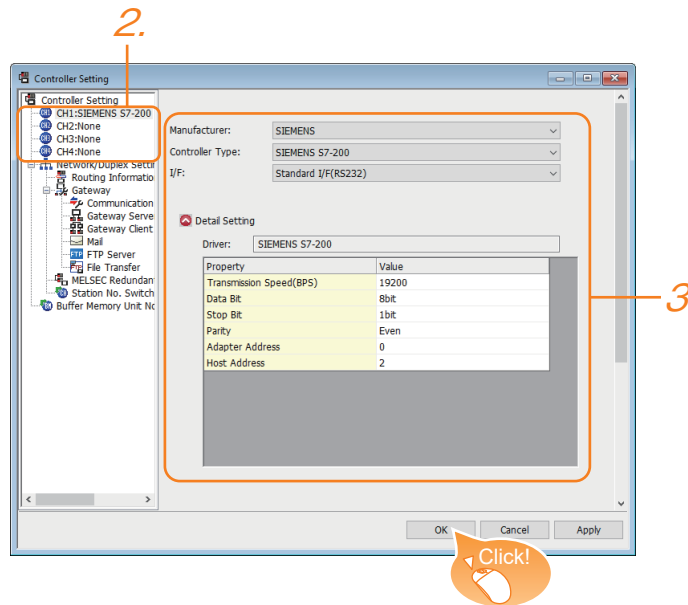

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■ 26 [SIEMENS]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [SIEMENS]
- [Controller Type]: select either of the following according to the model to be connected.  
[SIEMENS S7-200]  
[SIEMENS S7-200(CN/SMART)]  
[SIEMENS S7-300/400]  
[SIEMENS S7(Ethernet)]  
[SIEMENS OP(Ethernet)]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

### Point

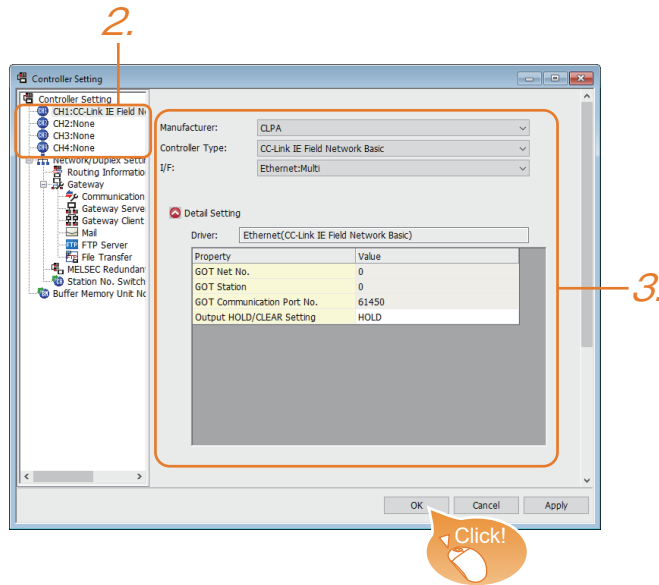

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■27 [CLPA]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [CLPA]
  - [Controller Type]: select either of the following according to the model to be connected.  
[CC-Link IE Field Network Basic]  
[SLMP]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

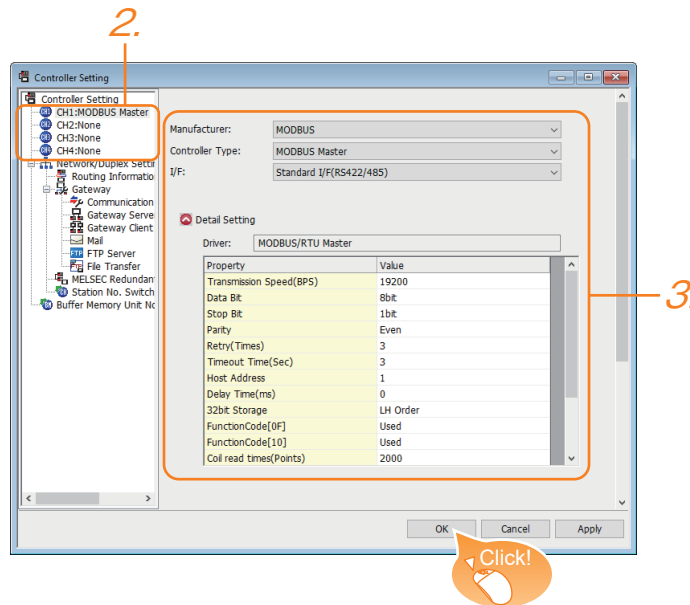

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

- GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

## ■ 28 [MODBUS]

Set the channel of the controller to be connected with the GOT.

**Step 1** Select [Common] → [Controller Setting] from the menu.

**Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.

**Step 3** Set the following items.

- [Manufacturer]: [MODBUS]
- [Controller Type]: select one of the following items according to the controller to be connected.  
[MODBUS Master]  
[MODBUS Slave]
- [I/F]: The interface to be used
- [Detail Setting]: Configure the settings according to the use environment.

**Step 4** When you have completed the setting, click the [OK] button.

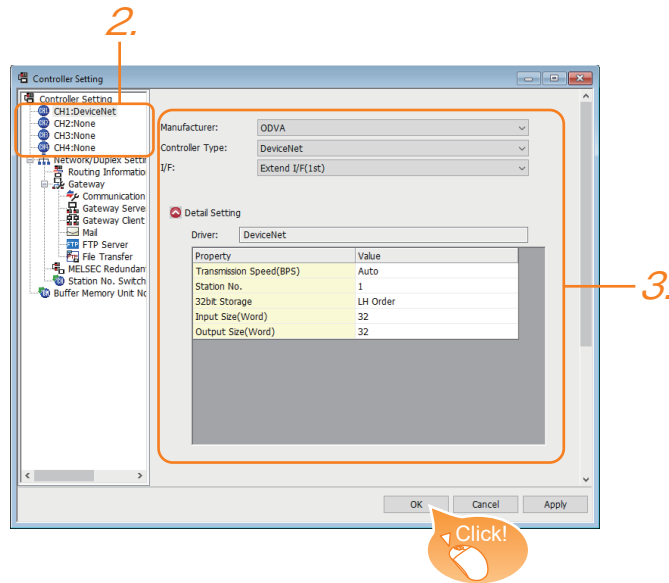

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

→ GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

## ■29 [ODVA]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [ODVA]
  - [Controller Type]: [DeviceNet]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

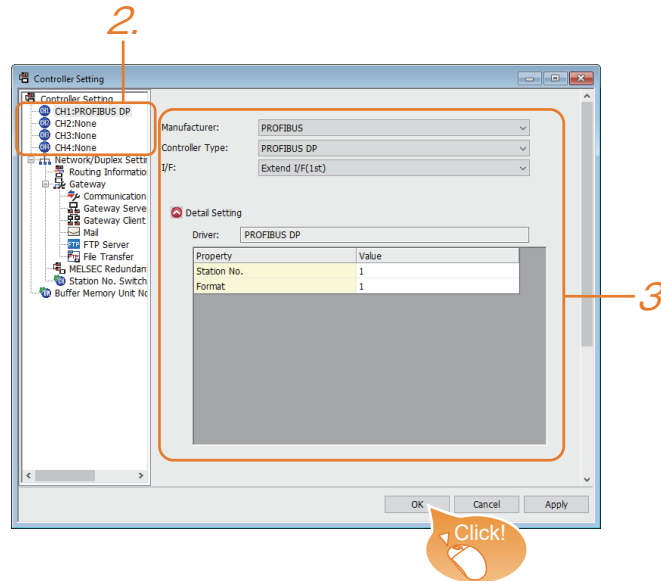

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

- GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

## ■ 30 [PROFIBUS]

Set the channel of the controller to be connected with the GOT.

- Step 1 Select [Common] → [Controller Setting] from the menu.
- Step 2 The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3 Set the following items.
  - [Manufacturer]: [PROFIBUS]
  - [Controller Type]: [PROFIBUS DP]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4 When you have completed the setting, click the [OK] button.

### Point

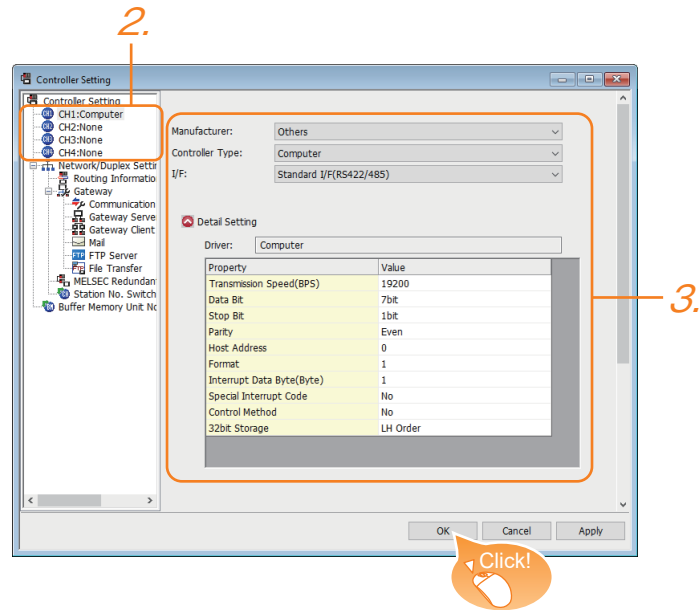

The controller setting can be checked in [I/F Communication Setting].

For details, refer to the following.

- ⇒ GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals) For GT Works3 Version1

## ■31 [Others]

Set the channel of the controller to be connected with the GOT.

- Step 1** Select [Common] → [Controller Setting] from the menu.
- Step 2** The [Controller Setting] window appears. select the channel No. to be used from the list menu.
- Step 3** Set the following items.
- [Manufacturer]: [Other]
  - [Controller Type]: [Computer]
  - [I/F]: The interface to be used
  - [Detail Setting]: Configure the settings according to the use environment.
- Step 4** When you have completed the setting, click the [OK] button.

### Point

The controller setting can be checked in [I/F Communication Setting].  
For details, refer to the following.

⇒GOT2000 Series Connection Manual (Non-Mitsubishi Products 1) for GT Works3 Version1

	Current value monitor (PV) *5	PV1 to PV143	x	x	

\*1 For the maximum number of devices when an extended SRAM cassette is installed, refer to the following.

→MELSEC iQ-R CPU Module User's Manual (Application)

\*2 Monitoring or writing is not possible in the continuous device designation mode.

\*3 For the servo amplifier, if a real number is written to a virtual device, only the integer portion of the number is stored into the device.

If the data type of the virtual servo amplifier device is set to [Real], the value after the writing may differ from the one before the writing.

Additionally, the monitoring process may take a longer time.

Therefore, select one of the following items as the data type of the virtual device.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN 32]

When you use the value of the virtual servo amplifier device, remember that only the integer portion of the value is stored in the device.

To display a real number on the numerical display or numerical input object, set [Format] to [Real] and select [Adjust Decimal Point Range] in the object setting.

\*4 For monitoring the multiple CPU high speed transmission memory, the CPU buffer memory access device (HG) for RCP is monitored.

The CPU buffer memory access device (G) is not monitored.

\*5 Only reading is possible.

\*6 Only writing is possible.

\*7 The device No. must be set in multiples of 16.

\*8 Use the following virtual devices to write data to the RAM of a servo amplifier.

- PA, PN: 1 to 32
- PB, PE, PF: 1 to 64
- PC: 1 to 80
- PD, PL: 1 to 48
- POS, SPD, ACT, DCT, DWL, AUX: 1 to 255

Use the following virtual devices to write data to the EEPROM of a servo amplifier.

- PA, PN: 1001 to 1032
- PB, PE, PF: 1001 to 1064
- PC: 1001 to 1080
- PD, PL: 1001 to 1048
- POS, SPD, ACT, DCT, DWL, AUX: 1001 to 1255

\*9 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*10 The word specification of bit devices is not available.

\*11 The bit specification of word devices is not available.

\*12 If a bit-specified word device is used in the random read processing, GT SoftGOT2000 or GT Simulator3 uses the value of the bit device in block No. 0 only.

The bit device status depends on the SFC program status (active or inactive). When the SFC program is inactive, the bit device is off (stores 0).

If a step relay (S) is used in the random read processing, specify the relevant step relay (block) (BLS) on GT SoftGOT2000 or GT Simulator3.

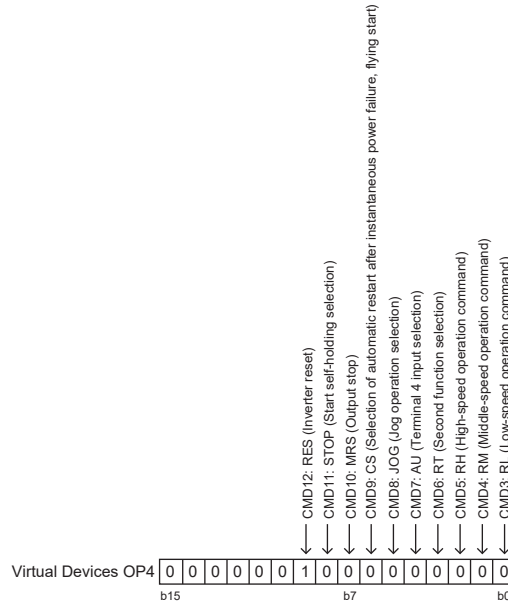

\*13 Available to MR-J4-GF(-RJ) and MR-J4-\*B(-RJ).

\*14 The following devices are initially invalid because the GOT cannot control the devices via a network: CMD8 (Jog operation selection), CMD9 (Selection of automatic restart after instantaneous power failure, flying start), CMD11 (Start self-holding selection), and CMD12 (Inverter reset).

Write values to parameters Pr.185, Pr.186, Pr.188, and Pr.189 that correspond to the above virtual devices. Doing so controls CMD8, CMD9, CMD11, and CMD12.

\*15 To set CMD8, CMD9, CMD11, or CMD12, write an appropriate value to OP4.

As shown in the figure below, operation modes are assigned to each bit of OP4. The following shows an example of setting CMD12 (Inverter reset).

Write 1 to the bit (corresponding to CMD12) of OP4. In this example, OP4 must store 0200H. Convert 0200H to a decimal value (512), and then write 512 to OP4.

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

- Bit device
  - Only writing is possible.
  - [Alternate] of a bit switch cannot be used.
  - Use [Momentary], [Set], and [Reset] for bit switch actions.
- Word device and double-word device
  - Only writing is possible.
  - Numerical input cannot be used.
  - Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

#### Servo amplifier request

Virtual device name	Item	Symbol
SP0	Status display data clear	-
SP1	Current alarm clear	-
SP2	Alarm history clear	-
SP3	External input signal prohibited	-
SP4	External output signal prohibited	-
SP5	External input signal resumed	-
SP6	External output signal resumed	-

## Operation mode selection

Virtual device name	Item	Symbol
OM0	Normal mode (not test operation mode)	-
OM1	JOG operation	-
OM2	Positioning operation	-
OM4	Output signal (DO) forced output	-
OM5	Single-step feed operation <sup>*1</sup>	-

\*1 Only available to MR-J4-GF(-RJ).

## Instruction demand (for test operation)

Virtual device name	Item	Symbol
TMB1	Temporary stop command	-
TMB2	Test operation (positioning operation) start command.	-
TMB3	Forward rotation direction	-
TMB4	Reverse rotation direction	-
TMB5	Restart for remaining distance	-
TMB6	Remaining distance clear.	-

## One-touch tuning instruction

Virtual device name	Item	Symbol
OTI0	One-touch tuning start command (Basic mode)	-
OTI1	One-touch tuning start command (High mode)	-
OTI2	One-touch tuning start command (Low mode)	-
OTI3	One-touch tuning stop command	-
OTI4	Return to initial value	-
OTI5	Return to value before adjustment	-

## Basic setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PA1, PA1001	Operation mode <sup>*3</sup>	**STY

PC70 to PC75, PC1070 to PC1075	For manufacturer setting	-
PC76, PC1076	Function selection C-E <sup>*2</sup>	*COPE
PC77, PC1077	Internal torque limit 2 <sup>*2</sup>	TL2
PC78 to PC80, PC1078 to PC1080	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-GF(-RJ).

\*3 Only available to MR-J4-\*B(-RJ).

\*4 Available to MR-J4-GF(-RJ) and MR-J4-\*B(-RJ).

#### I/O setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PD1, PD1001	Input signal automatic on selection 1 <sup>*2</sup>	*DIA1
PD2, PD1002	Input signal automatic on selection 2 <sup>*5</sup>	*DIA2
PD3, PD1003	Input device selection 1 <sup>*6</sup>	*DI1
PD4, PD1004	Input device selection 2 <sup>*6</sup>	*DI2
PD5, PD1005	Input device selection 3 <sup>*6</sup>	*DI3
PD6, PD1006	For manufacturer setting	-
PD7, PD1007	Output device selection 1	*DO1
PD8, PD1008	Output device selection 2 <sup>*4</sup>	*DO2
PD9, PD1009	Output device selection 3 <sup>*4</sup>	*DO3

Virtual device name	Item	Symbol <sup>*1</sup>
PD10, PD1010	For manufacturer setting	-
PD11, PD1011	Input filter setting	*DIF
PD12, PD1012	Function selection D-1	*DOP1
PD13, PD1013	Function selection D-2	*DOP2
PD14, PD1014	Function selection D-3	*DOP3
PD15, PD1015	Driver communication setting <sup>*3</sup>	*IDCS
PD16, PD1016	Driver communication setting - Master - Transmit data selection 1 <sup>*3</sup>	*MD1
PD17, PD1017	Driver communication setting - Master - Transmit data selection 2 <sup>*3</sup>	*MD2
PD18 to PD19, PD1018 to PD1019	For manufacturer setting	-
PD20, PD1020	Driver communication setting - Slave - Master axis No. selection 1 <sup>*3</sup>	*SLA1
PD21 to PD29, PD1021 to PD1029	For manufacturer setting	-
PD30, PD1030	Master-slave operation - Torque command coefficient on slave <sup>*3</sup>	TLC
PD31, PD1031	Master-slave operation - Speed limit coefficient on slave <sup>*3</sup>	VLC
PD32, PD1032	Master-slave operation - Speed limit adjusted value on slave <sup>*3</sup>	VLL
PD33 to PD36, PD1033 to PD1036	For manufacturer setting	-
PD37, PD1037	Touch probe function selection	*TPOP
PD38 to PD40, PD1038 to PD1040	For manufacturer setting	-
PD41, PD1041	Function selection D-4	*DOP4
PD42 to PD48, PD1042 to PD1048	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-GF(-RJ).

\*3 Only available to MR-J4-\*B(-RJ).

\*4 Available to MR-J4-\*B(-RJ), MR-J4-GF(-RJ), and MR-JE-\*BF.

\*5 Available to MR-J4-\*B(-RJ) and MR-JE-\*BF.

\*6 Available to MR-J4-GF(-RJ) and MR-JE-\*BF.

#### Positioning control parameters

Virtual device name	Item	Symbol <sup>*1</sup>
PT01	Command mode selection	*CTY
PT02	For manufacturer setting	-
PT03	Feeding function selection	*FTY
PT04	For manufacturer setting	-
PT05	Home position return speed	ZRF
PT06	Creep speed	CRF
PT07	Home position shift distance	ZST
PT08	For manufacturer setting	-
PT09	Travel distance after proximity dog	DCT
PT10	Stopper type home position return stopper time	ZTM
PT11	ZTT Stopper type home position return torque limit value	ZTT
PT12	Rough match output range	CRP
PT13 to PT14	For manufacturer setting	-
PT15	Software limit +	LMPL
PT16	Software limit +	LMPH
PT17	Software limit -	LMNL
PT18	Software limit -	LMNH

Virtual device name	Item	Symbol <sup>*1</sup>
PT19	Position range output address +	*LPPL
PT20	Position range output address +	*LPPH
PT21	Position range output address -	*LNPL
PT22	Position range output address -	*LNPH
PT23 to PT28	For manufacturer setting	-
PT29	Function selection T-3	*TOP3
PT30 to PT33	For manufacturer setting	-
PT34	Point table default	*PDEF
PT35 to PT40	For manufacturer setting	-
PT41	Home position return inhibit function selection	ORP
PT42 to PT44	For manufacturer setting	-
PT45	Home position return type	HMM
PT46 to PT48	For manufacturer setting	-
PT49	Acceleration time constant	STA
PT50	Deceleration time constant	STB
PT51	S-pattern acceleration/deceleration time constant	STC
PT52 to PT54	For manufacturer setting	-
PT55	Function selection T-8	*TOP8
PT56	Home position return acceleration time constant	HMA
PT57	Home position return deceleration time constant	HMB
PT58 to PT61	For manufacturer setting	-
PT62	Remote register-based position/speed specifying method selection	*DSS
PT63 to PT64	For manufacturer setting	-
PT65	Jog speed command	PVC
PT66	For manufacturer setting	-
PT67	Speed limit	VLMT
PT68	For manufacturer setting	-
PT69	Home position shift distance (extension parameter)	ZSTH
PT70	For manufacturer setting	-
PT71	Travel distance after proximity dog (extension parameter)	DCTH
PT72 to PT80	For manufacturer setting	-

<sup>\*1</sup> For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

#### Linear servo motor/DD motor setting parameters

Virtual device name	Item	Symbol <sup>*1</sup>
PL1, PL1001	Linear servo motor/DD motor function selection 1	**LIT1
PL2, PL1002	Linear encoder resolution - Numerator	**LIM
PL3, PL1003	Linear encoder resolution - Denominator	**LID
PL4, PL1004	Linear servo motor/DD motor function selection 2	*LIT2
PL5, PL1005	Position deviation error detection level	LB1
PL6, PL1006	Speed deviation error detection level	LB2
PL7, PL1007	Torque/thrust deviation error detection level	LB3
PL8, PL1008	Linear servo motor/DD motor function selection 3	*LIT3
PL9, PL1009	Magnetic pole detection voltage level	LPWM
PL10 to PL16, PL1010 to PL1016	For manufacturer setting	-
PL17, PL1017	Magnetic pole detection - Minute position detection method - Function selection	LTSTS

Virtual device name	Item	Symbol *1
PL18, PL1018	Magnetic pole detection - Minute position detection method - Identification signal amplitude	IDLV
PL19 to PL48, PL1019 to PL1048	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

#### Network setting parameters (MR-J4-GF(-RJ) only)

Virtual device name	Item	Symbol*1
PN01	For manufacturer setting	-
PN02	Communication error detection time	CERT
PN03	Communication mode setting for CC-Link IE communication	**NEMD
PN04	CC-Link IE communication network number	**NENO
PN05	Communication error detection frequency setting	CERI
PN06	Function selection N-1	NOP1
PN07 to PN32	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

#### Status display

Virtual device name	Item	Symbol
ST0	Cumulative feedback pulses	-
ST1	Servo motor speed	-
ST2	Droop pulses	-
ST3	Cumulative command pulses	-
ST4	Command pulse frequency	-
ST5 to ST6	For manufacturer setting	-
ST7	Regenerative load ratio	-
ST8	Effective load ratio	-
ST9	Peak load ratio	-
ST10	Instantaneous torque	-
ST11	Position within one-revolution	-
ST12	ABS counter	-
ST13	Load to motor inertia ratio	-
ST14	Regenerative load ratio	-
ST15	Effective load ratio	-
ST16	Load side encoder droop pulses *1	-
ST17	Load-side encoder information 1	-
ST18	Load-side encoder information 2	-
ST19	Analog monitor output voltage 1	-
ST20	Analog monitor output voltage 2	-
ST21	AB phase output pulse F/B integrated value	-
ST22	Temperature of servo motor thermistor	-
ST23	Servo motor-side cumulative feedback pulses (before gear)	-
ST24	Electrical angle	-
ST25 to ST29	For manufacturer setting	-
ST30	Motor/load side position difference *1	-
ST31	Motor/load side speed difference *1	-

Virtual device name	Item	Symbol
ST32	Encoder inside temperature	-
ST33	Settling time	-
ST34	Oscillation detection frequency	-
ST35	Number of tough drive operations	-
ST36 to ST39	For manufacturer setting	-
ST40	Unit power consumption	-
ST41	Unit total power consumption	-
ST42	Position actual value <sup>*1</sup>	-
ST43	Command position <sup>*1</sup>	-
ST44	Command remaining distance <sup>*1</sup>	-
ST45	Point table No. <sup>*1</sup>	-
ST46 to ST48	For manufacturer setting	-

<sup>\*1</sup> Only available to MR-J4-GF(-RJ).

#### Extension setting No.2 parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PE1, PE1001	Fully closed loop function selection 1 <sup>*2</sup>	**FCT1
PE2, PE1002	For manufacturer setting	-
PE3, PE1003	Fully closed loop function selection 2 <sup>*2</sup>	*FCT2
PE4, PE1004	Fully closed loop control - Feedback pulse electronic gear 1 - Numerator <sup>*2</sup>	**FBN
PE5, PE1005	Fully closed loop control - Feedback pulse electronic gear 1 - Denominator <sup>*2</sup>	**FBD
PE6, PE1006	Fully closed loop control - Speed deviation error detection level <sup>*2</sup>	BC1
PE7, PE1007	Fully closed loop control - Position deviation error detection level <sup>*2</sup>	BC2
PE8, PE1008	Fully closed loop dual feedback filter <sup>*2</sup>	DUF
PE9, PE1009	For manufacturer setting	-
PE10, PE1010	Fully closed loop function selection 3 <sup>*2</sup>	FCT3
PE11 to PE33, PE1011 to PE1033	For manufacturer setting	-
PE34, PE1034	Fully closed loop control - Feedback pulse electronic gear 2 - Numerator <sup>*2</sup>	**FBN2
PE35, PE1035	Fully closed loop control - Feedback pulse electronic gear 2 - Denominator <sup>*2</sup>	**FBD2
PE36 to PE40, PE1036 to PE1040	For manufacturer setting	-
PE41, PE1041	Function selection E-3	EOP3
PE42 to PE43, PE1042 to PE1043	For manufacturer setting	-
PE44, PE1044	Lost motion compensation positive-side compensation value selection	LMCP
PE45, PE1045	Lost motion compensation negative-side compensation value selection	LMCN
PE46, PE1046	Lost motion filter setting	LMFLT
PE47, PE1047	Torque offset	TOF
PE48, PE1048	Lost motion compensation function selection	*LMOP
PE49, PE1049	Lost motion compensation timing	LMCD
PE50, PE1050	Lost motion compensation non-sensitive band	LMCT
PE51 to PE64, PE1051 to PE1064	For manufacturer setting	-

<sup>\*1</sup> For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

<sup>\*2</sup> Available to MR-J4-GF(-RJ) and MR-J4-\*B(-RJ).

### Extension setting No.3 parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PF1, PF1001	For manufacturer setting	-
PF2, PF1002	Function selection F-2 <sup>*2</sup>	*FOP2
PF3 to PF5, PF1003 to PF1005	For manufacturer setting	-
PF6, PF1006	Function selection F-5	*FOP5
PF7 to PF11, PF1007 to PF1011	For manufacturer setting	-
PF12, PF1012	Electronic dynamic brake operating time	DBT
PF13 to PF17, PF1013 to PF1017	For manufacturer setting	-
PF18, PF1018	STO diagnosis error detection time <sup>*4</sup>	*STOD
PF19, PF1019	Friction trouble prediction compen. coefficient 1 <sup>*3</sup>	TSL
PF20, PF1020	Friction trouble prediction compen. coefficient 2 <sup>*3</sup>	TIC
PF21, PF1021	Drive recorder switching time setting	DRT
PF22, PF1022	For manufacturer setting	-
PF23, PF1023	Vibration tough drive - Oscillation detection level	OSCL1
PF24, PF1024	Vibration tough drive function selection	*OSCL2
PF25, PF1025	SEMI-F47 function - Instantaneous power failure detection time	CVAT
PF26 to PF30, PF1026 to PF1030	For manufacturer setting	-
PF31, PF1031	Machine diagnosis function - Friction judgement speed	FRIC
PF32 to PF33, PF1032 to PF1033	For manufacturer setting	-
PF34, PF1034	Machine diagnosis function selection <sup>*3</sup>	*MFP
PF35 to PF39, PF1035 to PF1039	For manufacturer setting	-
PF40, PF1040	Machine trouble prediction parameter <sup>*3</sup>	MFPP
PF41, PF1041	Trouble prediction motor total move distance <sup>*3</sup>	FPMT
PF42, PF1042	Friction trouble prediction average characteristic <sup>*3</sup>	PAV
PF43, PF1043	Friction trouble prediction standard deviation <sup>*3</sup>	PSD
PF44, PF1044	For manufacturer setting	-
PF45, PF1045	Vibration trouble prediction average characteristic <sup>*3</sup>	VAV
PF46, PF1046	Vibration trouble prediction standard deviation <sup>*3</sup>	VSC
PF47 to PF48, PF1047 to PF1048	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-\*B(-RJ).

\*3 Only available to MR-J4-GF(-RJ).

\*4 Available to MR-J4-GF(-RJ) and MR-JE-\*BF.

### Alarm (extended for MELSERVO-J4-\*A)

Virtual device name	Item	Symbol
ALM0	Current alarm number	-
ALM1	Detailed data of current alarms	-
ALM11	Servo status(alarm) Cumulative feedback pulses	-
ALM12	Servo status(alarm) Servo motor speed	-
ALM13	Servo status(alarm) Droop pulses	-
ALM14	Servo status(alarm) cumulative command pulses	-
ALM15	Servo status(alarm) command pulse frequency	-
ALM16 to ALM17	For manufacturer setting	-
ALM18	Servo status(alarm) regenerative load ratio	-
ALM19	Servo status(alarm) effective load ratio	-
ALM20	Servo status(alarm) peak load ratio	-

Virtual device name	Item	Symbol
ALM21	Servo status(alarm) Instantaneous torque	-
ALM22	Servo status(alarm) Within one-revolution position(1 pulse unit)	-
ALM23	Servo status(alarm) ABS counter	-
ALM24	Servo status(alarm) load inertia moment ratio	-
ALM25	Servo status(alarm) Bus voltage	-
ALM26	Servo status(alarm) Load-side cumulative feedback pulses	-
ALM27	Servo status(alarm) Load side encoder droop pulses * <sup>1</sup>	-
ALM28	Servo status(alarm) Load-side encoder information 1	-
ALM29	Servo status(alarm) Load-side encoder information 2	-
ALM30	Servo status(alarm) Analog monitor output voltage 1	-
ALM31	Servo status(alarm) Analog monitor output voltage 2	-
ALM32	Servo status(alarm) AB phase output pulse F/B integrated valu	-
ALM33	Servo status(alarm) Temperature of servo motor thermistor	-
ALM34	Servo status(alarm) Servo motor-side cumulative feedback pulses (before gear)	-
ALM35	Servo status(alarm) Electrical angle	-
ALM36 to ALM40	For manufacturer setting	-
ALM41	Servo status(alarm) Motor/load side position difference * <sup>1</sup>	-
ALM42	Servo status(alarm) Motor/load side speed difference * <sup>1</sup>	-
ALM43	Servo status(alarm) Internal temperature of encoder	-
ALM44	Servo status(alarm) Setting time	-
ALM45	Servo status(alarm) Oscillation detection frequency	-
ALM46	Servo status(alarm) Number of tough drives	-
ALM47 to ALM50	For manufacturer setting	-
ALM51	Servo status(alarm) Unit power consumption	-
ALM52	Servo status(alarm) Unit total power consumption	-
ALM53	Servo status(alarm) Position actual value * <sup>1</sup>	-
ALM54	Servo status(alarm) Command position * <sup>1</sup>	-
ALM55	Servo status(alarm) Command remaining distance * <sup>1</sup>	-
ALM56	Servo status(alarm) Point table No. * <sup>1</sup>	-
ALM57 to ALM59	For manufacturer setting	-
ALM200	Alarm number from Alarm History most recent alarm	-
ALM201	Alarm number from Alarm History 1st alarm in past	-
ALM202	Alarm number from Alarm History 2nd alarm in past	-
ALM203	Alarm number from Alarm History 3rd alarm in past	-
ALM204	Alarm number from Alarm History 4th alarm in past	-
ALM205	Alarm number from Alarm History 5th alarm in past	-
ALM206	Alarm number from Alarm History 6th alarm in past	-
ALM207	Alarm number from Alarm History 7th alarm in past	-
ALM208	Alarm number from Alarm History 8th alarm in past	-
ALM209	Alarm number from Alarm History 9th alarm in past	-
ALM210	Alarm number from Alarm History 10th alarm in past	-
ALM211	Alarm number from Alarm History 11th alarm in past	-
ALM212	Alarm number from Alarm History 12th alarm in past	-
ALM213	Alarm number from Alarm History 13th alarm in past	-
ALM214	Alarm number from Alarm History 14th alarm in past	-

Virtual device name	Item	Symbol
ALM215	Alarm number from Alarm History 15th alarm in past	-
ALM220	Alarm occurrence time in alarm history most recent alarm	-
ALM221	Alarm occurrence time in alarm history 1st alarm in past	-
ALM222	Alarm occurrence time in alarm history 2nd alarm in past	-
ALM223	Alarm occurrence time in alarm history 3rd alarm in past	-
ALM224	Alarm occurrence time in alarm history 4th alarm in past	-

ALM253	Detailed alarm from Alarm History 13th alarm in past	-
ALM254	Detailed alarm from Alarm History 14th alarm in past	-
ALM255	Detailed alarm from Alarm History 15th alarm in past	-

\*1 Only available to MR-J4-GF(-RJ).

#### Point table (position)

Virtual device name	Item	Symbol
POS1 to POS255	Point table/position data No. 1 to No. 255	-
POS1001 to POS1255	Point table/position data No. 1 to No. 255 (EEPROM)	-

#### Point table (speed)

Virtual device name	Item	Symbol
SPD1 to SPD255	Point table/speed data No. 1 to No. 255	-
SPD1001 to SPD1255	Point table/speed data No. 1 to No. 255 (EEPROM)	-

Point table (acceleration time constant)

Virtual device name	Item	Symbol
ACT1 to ACT255	Point table/acceleration time constant No. 1 to No. 255	-
ACT1001 to ACT1255	Point table/acceleration time constant No. 1 to No. 255 (EEPROM)	-

Point table (deceleration time constant)

Virtual device name	Item	Symbol
DCT1 to DCT255	Point table/deceleration time constant No. 1 to No. 255	-
DCT1001 to DCT1255	Point table/deceleration time constant No. 1 to No. 255 (EEPROM)	-

Point table (dwell)

Virtual device name	Item	Symbol
DWL1 to DWL255	Point table/dwell No. 1 to No. 255	-
DWL1001 to DWL1255	Point table/dwell No. 1 to No. 255 (EEPROM)	-

Point table (auxiliary function)

Virtual device name	Item	Symbol
AUX1 to AUX255	Point table/auxiliary function No. 1 to No. 255	-
AUX1001 to AUX1255	Point table/auxiliary function No. 1 to No. 255 (EEPROM)	-

Machine diagnosis data

Virtual device name	Item	Symbol
MD0	Machine diagnosis data parameter number	-
MD1	Machine diagnosis data shift judgment(test mode)	-
MD2	Machine diagnosis data status	-
MD3	Machine diagnosis data coulomb friction torque in positive direction	-
MD4	Machine diagnosis data friction torque at rated speed in positive direction	-
MD5	Machine diagnosis data coulomb friction torque in negative direction	-
MD6	Machine diagnosis data friction torque at rated speed in negative direction	-
MD7	Machine diagnosis data oscillation frequency(motor is stopped)	-
MD8	Machine diagnosis data vibration level(motor is stopped)	-
MD9	Machine diagnosis data oscillation frequency(motor is operating)	-
MD10	Machine diagnosis data vibration level(motor is operating)	-
MD11	Machine diagnosis data rated speed *1	-
MD12	Machine diagnosis data friction based fault prediction prepare status *1	-
MD13	Machine diagnosis data vibration based fault prediction prepare status *1	-
MD14	Machine diagnosis data motor total move distance *1	-
MD15	Machine diagnosis data friction trouble prediction Upper threshold *1	-
MD16	Machine diagnosis data friction trouble prediction Lower threshold *1	-
MD17	Machine diagnosis data vibration level threshold *1	-

Virtual device name	Item	Symbol
MD18	Machine diagnosis data trouble prediction status *1	-

\*1 Only available to MR-J4-GF(-RJ).

#### One-touch tuning data

Virtual device name	Item	Symbol
OTS0	One-touch tuning status confirmation	-
OTS1	Error code list	-
OTS2	Setting time	-
OTS3	Overshoot amount	-

#### External input

Virtual device name	Item	Symbol
DI0	Input device statuses 1	-
DI1	Input device statuses 2	-
DI2	Input device statuses 3	-
DI3	External input pin statuses	-
DI4	Statuses of input devices switched on through communication 1	-
DI5	Statuses of input devices switched on through communication 2	-
DI6	Statuses of input devices switched on through communication 3 *1	-

\*1 Only available to MR-J4-GF(-RJ).

#### External output

Virtual device name	Item	Symbol
DO0	Output device statuses 1	-
DO1	Output device statuses 2	-
DO2*1	Output device statuses 3	-
DO3	For manufacturer setting	-
DO4	External output pin statuses	-

\*1 Only available to MR-J4-GF(-RJ).

#### Life Diagnosis

Virtual device name	Item	Symbol
ALD0	Cumulative power-on time	-
ALD1	Number of inrush current switching times	-

#### Input signal for test operation (for test operation)

Virtual device name	Item	Symbol
TMI0	Input signal for test operation 1	-
TMI1	Input signal for test operation 2	-
TMI2	Input signal for test operation 3	-

#### Forced output of signal pin (for test operation)

Virtual device name	Item	Symbol
TMO0	Forced output from signal pin	-

Set data (for test operation)

Virtual device name	Item	Symbol
TMD0	Writes the speed(test mode)	-
TMD1	Writes the acceleration/deceleration time constant (test mode)	-
TMD3	Writes the moving distance (test mode)	-

The following shows the correspondences between the virtual inverter devices used in the GOT and the inverter data.

## Parameters (32-bit)

The virtual device numbers used in the GOT correspond to the inverter parameter numbers.

For the inverter parameters, refer to the following.

➔Manual of the inverter used

### Point

#### (1) When setting 8888 or 9999 to a parameter (32-bit) (LPr) of an inverter

Values 8888 and 9999 are used for particular purposes.

From the GOT, if you set 8888 or 9999 to a parameter (32-bit) that can accept a value with a fractional part, you are recommended to set the data type to [Real].

#### (2) Precautions for specifying LPr900 to LPr933 (Calibration parameter), or LPr934 and LPr935 (PID display)

If you specify LPr900 to LPr933 (Calibration parameter), or LPr934 and LPr935 (PID display), whether the value below must be written to SP108 (Second parameter changing) depends on the specified device number and inverter model.

Value to be written to SP108	Description
H00	Offset/gain
H01	Analog
H02	Analog value at terminal

- \*1 Available for the file register of block No. switched with the RSET instruction.
- \*2 For the servo amplifier, if a real number is written to a virtual device, only the integer portion of the number is stored into the device.  
If the data type of the virtual servo amplifier device is set to [Real], the value after the writing may differ from the one before the writing.  
Additionally, the monitoring process may take a longer time.  
Therefore, select one of the following items as the data type of the virtual device.
  - [Signed BIN16]
  - [Unsigned BIN16]
  - [Signed BIN32]
  - [Unsigned BIN 32]
 When you use the value of the virtual servo amplifier device, remember that only the integer portion of the value is stored in the device.  
To display a real number on the numerical display or numerical input object, set [Format] to [Real] and select [Adjust Decimal Point Range] in the object setting.
- \*3 The device No. must be set in multiples of 16.
- \*4 Only reading is possible.
- \*5 Only writing is possible.
- \*6 Use the following virtual devices to write data to the RAM of a servo amplifier.
  - PA: 1 to 32
  - PB, PC, PE: 1 to 64
  - PD, PF, PL: 1 to 48
 Use the following virtual devices to write data to the EEPROM of a servo amplifier.
  - PA: 1001 to 1032
  - PB, PC, PE: 1001 to 1064
  - PD, PF, PL: 1001 to 1048
- \*7 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)
- \*8 The word specification of bit devices is not available.
- \*9 The bit specification of word devices is not available.
- \*10 The target device of the host station can be monitored only. Monitoring the target device of any other station causes a system error.

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

- Bit device  
Only writing is possible.  
[Alternate] of a bit switch cannot be used.  
Use [Momentary], [Set], and [Reset] for bit switch actions.
- Word device and double-word device  
Only writing is possible.  
Numerical input cannot be used.  
Use a word switch for writing.

For the correspondences between the virtual devices used in the GOT and the data of a servo amplifier or inverter, refer to the following.

#### Servo amplifier request

Virtual device name	Item	Symbol
SP0	Status display data clear	-
SP1	Current alarm clear	-
SP2	Alarm history clear	-
SP3	External input signal prohibited	-
SP4	External output signal prohibited	-

PA21, PA1021	Function selection A-3	*AOP3
PA22, PA1022	Position control composition selection <sup>*2</sup>	**PCS
PA23, PA1023	Drive recorder arbitrary alarm trigger setting	DRAT

Virtual device name	Item	Symbol <sup>*1</sup>
PA24, PA1024	Function selection A-4	AOP4
PA25, PA1025	One-touch tuning - Overshoot permissible level	OTHOV
PA26, PA1026	Function selection A-5	*AOP5
PA27, PA1027	Hot-line forced stop function <sup>*3</sup>	*HTL
PA28 to PA32, PA1028 to PA1032	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-\*B(-RJ).

\*3 Only available to MR-JE-\*B.

#### Gain filter parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PB1, PB1001	Adaptive tuning mode (adaptive filter II)	FILT
PB2, PB1002	Vibration suppression control tuning mode (advanced vibration suppression control II)	VRFT
PB3, PB1003	Torque feedback loop gain	TFBGN
PB4, PB1004	Feed forward gain	FFC
PB5, PB1005	For manufacturer setting	-
PB6, PB1006	Load to motor inertia ratio/load to motor mass ratio	GD2
PB7, PB1007	Model loop gain	PG1
PB8, PB1008	Position loop gain	PG2
PB9, PB1009	Speed loop gain	VG2
PB10, PB1010	Speed integral compensation	VIC
PB11, PB1011	Speed differential compensation	VDC
PB12, PB1012	Overshoot amount compensation	OVA
PB13, PB1013	Machine resonance suppression filter 1	NH1
PB14, PB1014	Notch shape selection 1	NHQ1
PB15, PB1015	Machine resonance suppression filter 2	NH2
PB16, PB1016	Notch shape selection 2	NHQ2
PB17, PB1017	Shaft resonance suppression filter	NHF
PB18, PB1018	Low-pass filter setting	LPF
PB19, PB1019	Vibration suppression control 1 - Vibration frequency	VRF11
PB20, PB1020	Vibration suppression control 1 - Resonance frequency	VRF12
PB21, PB1021	Vibration suppression control 1 - Vibration frequency damping	VRF13
PB22, PB1022	Vibration suppression control 1 - Resonance frequency damping	VRF14
PB23, PB1023	Low-pass filter selection	VFBF
PB24, PB1024	Slight vibration suppression control	*MVS
PB25, PB1025	Function selection B-1	*BOP
PB26, PB1026	Gain switching function	*CDP
PB27, PB1027	Gain switching condition	CDL
PB28, PB1028	Gain switching time constant	CDT
PB29, PB1029	Load to motor inertia ratio/load to motor mass ratio after gain switching	GD2B
PB30, PB1030	Position loop gain after gain switching	PG2B
PB31, PB1031	Speed loop gain after gain switching	VG2B
PB32, PB1032	Speed integral compensation after gain switching	VICB
PB33, PB1033	Vibration suppression control 1 - Vibration frequency after gain switching	VRF11B

Virtual device name	Item	Symbol <sup>*1</sup>
PB34, PB1034	Vibration suppression control 1 - Resonance frequency after gain switching	VRF12B
PB35, PB1035	Vibration suppression control 1 - Vibration frequency damping after gain switching	VRF13B
PB36, PB1036	Vibration suppression control 1 - Resonance frequency damping after gain switching	VRF14B
PB37 to PB44, PB1037 to PB1044	For manufacturer setting	-
PB45, PB1045	Command notch filter	CNHF
PB46, PB1046	Machine resonance suppression filter 3	NH3
PB47, PB1047	Notch shape selection 3	NHQ3
PB48, PB1048	Machine resonance suppression filter 4	NH4
PB49, PB1049	Notch shape selection 4	NHQ4
PB50, PB1050	Machine resonance suppression filter 5	NH5
PB51, PB1051	Notch shape selection 5	NHQ5
PB52, PB1052	Vibration suppression control 2 - Vibration frequency	VRF21
PB53, PB1053	Vibration suppression control 2 - Resonance frequency	VRF22
PB54, PB1054	Vibration suppression control 2 - Vibration frequency damping	VRF23
PB55, PB1055	Vibration suppression control 2 - Resonance frequency damping	VRF24
PB56, PB1056	Vibration suppression control 2 - Vibration frequency after gain switching	VRF21B
PB57, PB1057	Vibration suppression control 2 - Resonance frequency after gain switching	VRF22B
PB58, PB1058	Vibration suppression control 2 - Vibration frequency damping after gain switching	VRF23B
PB59, PB1059	Vibration suppression control 2 - Resonance frequency damping after gain switching	VRF24B
PB60, PB1060	Model loop gain after gain switching	PG1B
PB61 to PB64, PB1061 to PB1064	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

#### Extension setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PC1, PC1001	Error excessive alarm level	ERZ
PC2, PC1002	Electromagnetic brake sequence output	MBR
PC3, PC1003	Encoder output pulse selection	*ENRS
PC4, PC1004	Function selection C-1	**COP1
PC5, PC1005	Function selection C-2	**COP2
PC6, PC1006	Function selection C-3	*COP3
PC7, PC1007	Zero speed	ZSP
PC8, PC1008	Overspeed alarm detection level	OSL
PC9, PC1009	Analog monitor output 1	MOD1
PC10, PC1010	Analog monitor output 2	MOD2
PC11, PC1011	Analog monitor 1 offset	MO1
PC12, PC1012	Analog monitor 2 offset	MO2
PC13, PC1013	Analog monitor - Feedback position output standard data - Low <sup>*2</sup>	MOSDL
PC14, PC1014	Analog monitor - Feedback position output standard data - High <sup>*2</sup>	MOSDH
PC15 to PC16, PC1015 to PC1016	For manufacturer setting	-
PC17, PC1017	Function selection C-4	**COP4

Virtual device name	Item	Symbol <sup>*1</sup>
PC18, PC1018	Function selection C-5	*COP5
PC19, PC1019	For manufacturer setting	-
PC20, PC1020	Function selection C-7	*COP7
PC21, PC1021	Alarm history clear	*BPS
PC22 to PC23, PC1022 to PC1023	For manufacturer setting	-
PC24, PC1024	Forced stop deceleration time constant	RSBR
PC25, PC1025	For manufacturer setting	-
PC26, PC1026	Function selection C-8 * <sup>2</sup>	**COP8
PC27, PC1027	Function selection C-9 * <sup>2</sup>	**COP9
PC28, PC1028	For manufacturer setting	-
PC29, PC1029	Function selection C-B	*COPB
PC30, PC1030	For manufacturer setting	-
PC31, PC1031	Vertical axis freefall prevention compensation amount	RSUP1
PC32 to PC37, PC1032 to PC1037	For manufacturer setting	-
PC38, PC1038	Error excessive warning level	ERW
PC39 to PC64, PC1039 to PC1064	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-\*B(-RJ).

#### I/O setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PD1, PD1001	For manufacturer setting	-
PD2, PD1002	Input signal automatic on selection 2 * <sup>2</sup>	*DIA2
PD3, PD1003	Input device selection 1 * <sup>3</sup>	*DI1
PD4, PD1004	Input device selection 2 * <sup>3</sup>	*DI2
PD5, PD1005	Input device selection 3 * <sup>3</sup>	*DI3
PD6, PD1006	For manufacturer setting	-
PD7, PD1007	Output device selection 1	*DO1
PD8, PD1008	Output device selection 2 * <sup>2</sup>	*DO2
PD9, PD1009	Output device selection 3 * <sup>2</sup>	*DO3
PD10, PD1010	For manufacturer setting	-
PD11, PD1011	Input filter setting	*DIF
PD12, PD1012	Function selection D-1	*DOP1
PD13, PD1013	Function selection D-2	*DOP2
PD14, PD1014	Function selection D-3	*DOP3
PD15, PD1015	Driver communication setting	*IDCS
PD16, PD1016	Driver communication setting - Master - Transmit data selection 1	*MD1
PD17, PD1017	Driver communication setting - Master - Transmit data selection 2	*MD2
PD18 to PD19, PD1018 to PD1019	For manufacturer setting	-
PD20, PD1020	Driver communication setting - Slave - Master axis No. selection 1	*SLA1
PD21 to PD29, PD1021 to PD1029	For manufacturer setting	-
PD30, PD1030	Master-slave operation - Torque command coefficient on slave	TLC
PD31, PD1031	Master-slave operation - Speed limit coefficient on slave * <sup>2</sup>	VLC
PD32, PD1032	Master-slave operation - Speed limit adjusted value on slave	VLL

Virtual device name	Item	Symbol <sup>*1</sup>
PD33 to PD48, PD1033 to PD1048	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Available to MR-J4-\*B(-RJ) and MR-JE-\*BF.

\*3 Only available to MR-JE-\*BF.

#### Extension setting No.2 parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PE1, PE1001	Fully closed loop function selection 1 <sup>*2</sup>	**FCT1
PE2, PE1002	For manufacturer setting	-
PE3, PE1003	Fully closed loop function selection 2 <sup>*2</sup>	*FCT2
PE4, PE1004	Fully closed loop control - Feedback pulse electronic gear 1 - Numerator <sup>*2</sup>	**FBN
PE5, PE1005	Fully closed loop control - Feedback pulse electronic gear 1 - Denominator <sup>*2</sup>	**FBD
PE6, PE1006	Fully closed loop control - Speed deviation error detection level <sup>*2</sup>	BC1
PE7, PE1007	Fully closed loop control - Position deviation error detection level <sup>*2</sup>	BC2
PE8, PE1008	Fully closed loop dual feedback filter <sup>*2</sup>	DUF
PE9, PE1009	For manufacturer setting	-
PE10, PE1010	Fully closed loop function selection 3 <sup>*2</sup>	FCT3
PE11 to PE33, PE1011 to PE1033	For manufacturer setting	-
PE34, PE1034	Fully closed loop control - Feedback pulse electronic gear 2 - Numerator <sup>*2</sup>	**FBN2
PE35, PE1035	Fully closed loop control - Feedback pulse electronic gear 2 - Denominator <sup>*2</sup>	**FBD2
PE36 to PE40, PE1036 to PE1040	For manufacturer setting	-
PE41, PE1041	Function selection E-3	EOP3
PE42 to PE43, PE1042 to PE1043	For manufacturer setting	-
PE44, PE1044	Lost motion compensation positive-side compensation value selection	LMCP
PE45, PE1045	Lost motion compensation negative-side compensation value selection	LMCN
PE46, PE1046	Lost motion filter setting	LMFLT
PE47, PE1047	Torque offset	TOF
PE48, PE1048	Lost motion compensation function selection	*LMOP
PE49, PE1049	Lost motion compensation timing	LMCD
PE50, PE1050	Lost motion compensation non-sensitive band	LMCT
PE51 to PE64, PE1051 to PE1064	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-\*B(-RJ).

#### Extension setting No.3 parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PF1, PF1001	For manufacturer setting	-
PF2, PF1002	Function selection F-2 <sup>*2</sup>	*FOP2
PF3 to PF5, PF1003 to PF1005	For manufacturer setting	-
PF6, PF1006	Function selection F-5	*FOP5
PF7 to PF11, PF1007 to PF1011	For manufacturer setting	-
PF12, PF1012	Electronic dynamic brake operating time	DBT

Virtual device name	Item	Symbol <sup>*1</sup>
PF13 to PF17, PF1013 to PF1017	For manufacturer setting	-
PF18, PF1018	STO diagnosis error detection time	*STOD
PF19 to PF20, PF1019 to PF1020	For manufacturer setting	-
PF21, PF1021	Drive recorder switching time setting	DRT
PF22, PF1022	For manufacturer setting	-
PF23, PF1023	Vibration tough drive - Oscillation detection level	OSCL1
PF24, PF1024	Vibration tough drive function selection	*OSCL2
PF25, PF1025	SEMI-F47 function - Instantaneous power failure detection time	CVAT
PF26 to PF30, PF1026 to PF1030	For manufacturer setting	-
PF31, PF1031	Machine diagnosis function - Friction judgement speed	FRIC
PF32 to PF48, PF1032 to PF1048	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 Only available to MR-J4-\*B(-RJ).

\*3 Available to MR-J4-\*B(-RJ) and MR-JE-\*BF.

#### Linear servo motor/DD motor setting parameters

Virtual device name	Item	Symbol <sup>*1</sup>
PL1, PL1001	Linear servo motor/DD motor function selection 1	**LIT1
PL2, PL1002	Linear encoder resolution - Numerator	**LIM
PL3, PL1003	Linear encoder resolution - Denominator	**LID
PL4, PL1004	Linear servo motor/DD motor function selection 2	*LIT2
PL5, PL1005	Position deviation error detection level	LB1
PL6, PL1006	Speed deviation error detection level	LB2
PL7, PL1007	Torque/thrust deviation error detection level	LB3
PL8, PL1008	Linear servo motor/DD motor function selection 3	*LIT3
PL9, PL1009	Magnetic pole detection voltage level	LPWM
PL10 to PL16, PL1010 to PL1016	For manufacturer setting	-
PL17, PL1017	Magnetic pole detection - Minute position detection method - Function selection	LTSTS
PL18, PL1018	Magnetic pole detection - Minute position detection method - Identification signal amplitude	IDLV
PL19 to PL48, PL1019 to PL1048	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

## Status display

Virtual device name	Item	Symbol
ST0	Cumulative feedback pulses	-

### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set when a word device is specified with a bit.

When setting the buffer memory, set the buffer memory address in the space for the device number.

Item	Description
	<p>Can be set only when any of the following devices is selected.</p> <ul style="list-style-type: none"> <li>• Servo amplifier request (SP)</li> <li>• Operation mode selection (OM)</li> <li>• Instruction demand (for test operation) (TMB)</li> <li>• One-touch tuning instruction (OTI)</li> <li>• Basic setting parameter (PA)</li> <li>• Gain filter parameter (PB)</li> <li>• Extension setting parameter (PC)</li> <li>• I/O setting parameter (PD)</li> <li>• Positioning control parameters (PT)</li> <li>• Linear servo motor/DD motor setting parameters (PL)</li> <li>• Network setting parameters (PN)</li> <li>• Status display (ST)</li> <li>• Extension setting No.2 parameter (PE)</li> <li>• Extension setting No.3 parameter (PF)</li> <li>• Alarm (Current alarm J4A extend) (ALM)</li> <li>• Alarm (Alarm history J4A extend) (ALM)</li> <li>• Point table (position) (POS)</li> <li>• Point table (speed) (SPD)</li> <li>• Point table (acceleration time constant) (ACT)</li> <li>• Point table (deceleration time constant) (DCT)</li> <li>• Point table (dwell) (DWL)</li> <li>• Point table (auxiliary function) (AUX)</li> <li>• Machine diagnosis data (MD)</li> <li>• One-touch tuning data (OTS)</li> <li>• External input (DI)</li> <li>• External output (DO)</li> <li>• Life Diagnosis (ALD)</li> <li>• Input signal for test operation (for test operation) (TMI)</li> <li>• Forced output of signal pin (for test operation) (TMO)</li> <li>• Set data (for test operation) (TMD)</li> </ul>
[Unit No.]	Can be set only when [Simple Motion(SSCNET III/H)] is selected. Set this item to monitor the simple motion module.
[Axis No.]	<p>Set the axis number to monitor.</p> <p>The following shows the setting range.</p> <ul style="list-style-type: none"> <li>• [1] to [64]: The axis number is specified directly.</li> <li>• [100] to [115]: The axis number is specified with the value of a GOT data register (GD). *1*2</li> </ul>
[SFC Block No.]	Can be set only when a step relay (block) (BLS) is selected. Set the block number of the step relay (block).
[Block]	Can be set when the extended file register (ER) is selected. Set the block number of the extended file register.

[Motion Controller(SSCNET III/H)], [Simple Motion(SSCNET III/H)], [Master Unit(CCIEF)]  
\*3

Item	Description
[Unit top I/O]	Can be set when the buffer memory (BM) is selected. Set the start I/O number of the buffer memory for the intelligent function module. Set the first 2 digits of the 3-digit start I/O number.
[Unit No.]	Set this item when using the buffer memory (G). Set the start I/O number of the buffer memory for the intelligent function module. Set the first 2 digits of the 3-digit start I/O number.
[Network No.n]	Can be set only when any of the following devices is selected. The set value is assigned to "n" of the device name. <ul style="list-style-type: none"> <li>• Link input(Link direct)(JnX)</li> <li>• Link output(Link direct)(JnY)</li> <li>• Link relay(Link direct)(JnB)</li> <li>• Link special relay(Link direct)(JnSB)</li> <li>• Link register(Link direct)(JnW)</li> <li>• Link special register(Link direct)(JnSW)</li> </ul> Device display example 1-1/1 J1-X0000 └─When 1 is specified for [Network No.n], 1 is assigned to "n" of device name JnX.
[Setting items (for calibration parameters)]	This item is settable only when a parameter (32-bit) ranging from LPr900 to LPr935 is selected. *4 The following shows selectable items. <ul style="list-style-type: none"> <li>• [Bias/gain value]</li> <li>• [Analog input value]</li> </ul>

\*1 To use GOT data registers (GD) to specify an axis number, set [Servo axis switching GD device first No.] in the [Controller Setting] window.

⇒5.5.1 ■ 4 [Controller Setting]

When using GT SoftGOT2000, set [Servo axis switching GD device first No.] in the [Communication Setup] window.

⇒GT SoftGOT2000 Version1 Operating Manual

The following shows the relationship between axis numbers and GOT data registers (GD).

Example) When [Servo axis switching GD device first No.] is set to 10

Sixteen consecutive devices, starting from GD10, are set to specify an axis number.

Axis number	GOT data register (GD)	Setting range
100	GD10	[1] to [64] (Setting a value outside the above range causes a device range error.)
101	GD11	
:	:	
114	GD24	
115	GD25	

GD10 to GD25 may also be used to specify the monitoring targets, such as the station number of an inverter, for the other channels.

In such a case, do not specify the same GD devices with [Servo axis switching GD device first No.].

\*2 Upon startup, the GOT monitors axis No. 0 until a valid value is set to the applicable GD device.

If you set this GD device on the screen that appears upon the GOT startup, a device range error may occur.

Set this GD device on a screen other than the one appearing upon the GOT startup.

\*3 The setting is fixed to [Master Unit(CCIEF)] when a PN, PT, POS, SPD, ACT, DCT, DWL, or AUX device is selected.

\*4 When LPr900 or LPr901 (Calibration parameter) is specified, selecting [Bias/gain value] or [Analog input value] does not affect the display on the object.

## 2) [Information]

Displays the type and setting range of the device selected in [Device].

## 3) [Network]

Set the station No. of the destination controller for monitoring.

Item	Description
[CPU No.]	Set the CPU No. of the controller to be monitored.
[Host]	Select this item to monitor the station connected with the GOT.
[Other]	Select this when monitoring other controller. Then, set the station number and network number of the controller to be monitored. <ul style="list-style-type: none"> <li>• [Network No.]: Set the network No.</li> <li>• [Station No.]: Set the station number.</li> </ul>

Item	Description
[Control System/Standby System]	<p>Can be set only when [Use the function of MELSEC Redundant] is selected in [MELSEC Redundant] of the [Controller Setting] window.</p> <p>The following shows the items to be selected.</p> <ul style="list-style-type: none"> <li>• [Control System]</li> <li>• [Standby System]</li> </ul> <p>Display example of the standby system device</p> <p>1-1/1-S W0.b0   [-S] is displayed for a device of the standby system.</p> <p>→5.5.3 Configuring the setting of the MELSEC redundant function</p>

#### 4) [Switch to the device comment dialog] button

Reading the device comment data created by GX Developer and confirming the device comment/device name is available during device setting.

For how to use the device comment reference, refer to the following.

→6.1.5 ■ 5 Device comment setting dialog

#### (a) Setting CPU No.

- When monitoring a single CPU system  
Set the CPU No. to [0].
- When monitoring a multiple CPU system  
Set the CPU No. to any of [0] to [4].  
When [0] is set, the monitoring target differs depending on the connection method.

Connection method	Monitoring target
· Direct CPU connection · Ethernet connection (when using the Ethernet port built in the CPU)	Connected PLC CPU
· Bus connection · Serial communication connection · MELSECNET connection · Ethernet connection (when using the Ethernet module) · CC-Link connection	Control CPU

- When GT SoftGOT2000 on the PC CPU module is connected using the bus connection  
Do not specify 0 for [CPU No.]  
When 0 is specified, the monitoring target is set to the PC CPU module that cannot be monitored.
- When monitoring an inverter  
Make sure to specify 0 for [CPU No.].

#### (b) When monitoring link relay (B) and link register (W) assigned in link parameter and network parameter

Set device link relay (B) and link register (W) running cyclic communication as [Host].

If it is set as [Other] in the network setting, the cyclic transmission will be changed to the transient transmission irrespective of the network type, resulting in delay of the object display.

#### (c) When monitoring a cyclic device

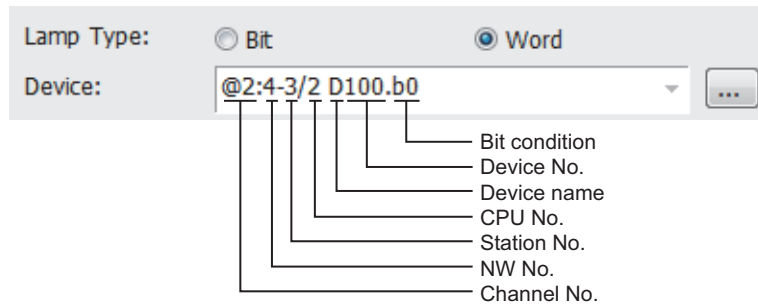

Set RX, RY, RWw, RWr, LB, or LW as [Host].

**(d) Setting device by inputting directly from keyboard**

When setting it by inputting directly from the keyboard, set the items as follows:

- Devices other than the buffer memory (BM, G), motion controller device, simple motion module device, and step relay (block) (BLS)

The applicable devices of the motion controller and the simple motion module are as follows: SP, OM, TMB, OTI, PA, PB, PC, PD, PL, ST, PE, PF, ALM, MD, OTS, DI, DO, ALD, TMI, TMO, and TMD.

- Buffer memory (BM)

- Buffer memory (G)

- Device of the motion controller or the simple motion module

When a device of the motion controller is selected

When a device of the simple motion module is selected

- Step relay (block) (BLS)

### (1) [Data Type] and [Format] settings when specifying a virtual servo amplifier device

In the object setting or other settings, [Data Type] and [Format] must be set according to the notation in which the corresponding servo amplifier data is represented.

For the notation in which the servo amplifier data is represented, refer to the following.

- Instruction manual for the servo amplifier used
- MR Configurator2 HELP

Set [Data Type] and [Format] according to the notation as shown below.

- Decimal notation (positive values only)
  - [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 65536 or more)
  - [Format]: [Unsigned Decimal]
- Decimal notation (positive and negative values)
  - [Data Type]: [Signed BIN16] ([Signed BIN32] for -32769 or less, and 32768 or more)
  - [Format]: [Signed Decimal]
- Hexadecimal notation
  - [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more)
  - [Format]: [Hexadecimal]
- Decimal point notation (positive values only)
  - [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] as necessary)
  - [Format]: [Real]
  - [Digits (Integral)]: Set the number of digits in the integral portion.
  - [Digits (Fractional)]: Set the number of digits in the fractional portion.
  - [Adjust Decimal Point Range]: Selected
- Decimal point notation (positive and negative values)
  - [Data Type]: [Signed BIN16] ([Signed BIN32] as necessary)
  - [Format]: [Real]
  - [Digits (Integral)]: Set the number of digits in the integral portion.
  - [Digits (Fractional)]: Set the number of digits in the fractional portion.
  - [Adjust Decimal Point Range]: Selected
- When the notation varies by digit
  - [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more)
  - [Format]: [Hexadecimal]

On the [Operation/Script] tab, select [Data Operation] for [Operation Type], and set [Bit Mask] or [Bit Shift].

	Current value monitor (PV) *12	PV1 to PV143	×	×	

\*1 Do not set a file register by GT Designer3 when executing multiple programs with the file of the file register set at [Use the same file name as the program.] by the PLC parameter of GX Developer. Otherwise, read or write at GOT will be erroneous.

\*2 Available for the file register of block No. switched with the RSET instruction.

\*3 Available for the file register of block No. of file name switched with the QDRSET instruction.

\*4 The GOT treats them in units of 32k (32767 points).

\*5 For the servo amplifier, if a real number is written to a virtual device, only the integer portion of the number is stored into the device.

If the data type of the virtual servo amplifier device is set to [Real], the value after the writing may differ from the one before the writing.

Additionally, the monitoring process may take a longer time.

Therefore, select one of the following items as the data type of the virtual device.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN 32]

When you use the value of the virtual servo amplifier device, remember that only the integer portion of the value is stored in the device.

To display a real number on the numerical display or numerical input object, set [Format] to [Real] and select [Adjust Decimal Point Range] in the object setting.

\*6 Do not use the local device set in a MELSEC-Q system.

Otherwise normal monitoring is not performed.

\*7 GT SoftGOT2000 cannot monitor the device.

\*8 Even though Universal model QCPU processes 64-bit data, the GOT cannot monitor the 64-bit data.

\*9 ZR1042432 to ZR4184063 cannot be used for GT SoftGOT2000.

\*10 The GOT can only read data from the device for the QS001CPU.

\*11 To write data to the consecutive devices of a Q172DR(CR750-Q), use the Q172DR(CR750-Q) with firmware version R6b or later.

\*12 Only reading is possible.

\*13 Only writing is possible.

\*14 The device No. must be set in multiples of 16.

\*15 Use the following virtual devices to write data to the RAM of a servo amplifier.

- PA: 1 to 32
- PB, PE, PF: 1 to 64
- PC: 1 to 80
- PD, PL: 1 to 48
- POS, SPD, ACT, DCT, DWL, AUX: 1 to 255

Use the following virtual devices to write data to the EEPROM of a servo amplifier.

- PA: 1001 to 1032
- PB, PE, PF: 1001 to 1064
- PC: 1001 to 1080
- PD, PL: 1001 to 1048
- POS, SPD, ACT, DCT, DWL, AUX: 1001 to 1255

\*16 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*17 The word specification of bit devices is not available.

\*18 The bit specification of word devices is not available.

\*19 The following devices are initially invalid because the GOT cannot control the devices via a network: CMD8 (Jog operation selection), CMD9 (Selection of automatic restart after instantaneous power failure, flying start), CMD11 (Start self-holding selection), and CMD12 (Inverter reset).

Write values to parameters Pr.185, Pr.186, Pr.188, and Pr.189 that correspond to the above virtual devices.

Doing so controls CMD8, CMD9, CMD11, and CMD12.

\*20 To set CMD8, CMD9, CMD11, or CMD12, write an appropriate value to OP4.  
 As shown in the figure below, operation modes are assigned to each bit of OP4.  
 The following shows an example of setting CMD12 (Inverter reset).

Write 1 to the bit (corresponding to CMD12) of OP4.  
 In this example, OP4 must store 0200H.  
 Convert 0200H to a decimal value (512), and then write 512 to OP4.

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

- Bit device
  - Only writing is possible.
  - [Alternate] of a bit switch cannot be used.
  - Use [Momentary], [Set], and [Reset] for bit switch actions.
- Word device and double-word device
  - Only writing is possible.
  - Numerical input cannot be used.
  - Use a word switch for writing.

For the correspondences between the virtual devices of a servo amplifier or inverter used in the GOT and the data of the servo amplifier or inverter, refer to the following.

	Buffer memory (Intelligent function module) (G) <sup>*10*11</sup>	G0 to G65535	○	○		
	Ww <sup>*10*11</sup>	Ww0 to Ww1FFF	○	○	Hexadecimal number	
	Wr <sup>*10*11</sup>	Wr0 to Wr1FFF	○	○		
Remote register (LW)	LW0 to LW1FFFF	○	○			
Word-specified bit devices <sup>*6</sup> (Except timer, counter, and retentive timer.)	Setting range of each bit device	Refer to each bit device.			-	

\*1 Do not set a file register by GT Designer3 when executing multiple programs with the file of the file register set at [Use the same file name as the program.] by the PLC parameter of GX Developer. (With exceptions of MELSEC-QnA) Otherwise, read or write at GOT will be erroneous.

\*2 Available for the file register of block No. switched with the RSET instruction.

\*3 Available for the file register of block No. of file name switched with the QDRSET instruction.

\*4 The GOT treats them in units of 32k (32767 points).

\*5 The bit specification of word devices is not available.

\*6 The device No. must be set in multiples of 16.

\*7 When monitoring MELDAS C6/64, if a word device outside the range is set, the value will be indefinite. If a bit device outside the range is set, the object may not be displayed or the set function may fail to operate. Check the set device using the device list of GT Designer3.

\*8 Devices used by the MELDAS C6/64 system cannot be used.

\*9 Do not use the local device set in a MELSEC-Q system. Otherwise normal monitoring is not performed.

\*10 This cannot be monitored when the GOT multi-drop is connected.

\*11 This is not supported by GT21.

\*12 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 ➔10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*13 The word specification of bit devices is not available.

	Current value monitor (PV) <sup>*8</sup>	PV1 to PV143	×	×	

\*1 Do not set a file register by GT Designer3 when executing multiple programs with the file of the file register set at [Use the same file name as the program.] by the PLC parameter of GX Developer. Otherwise, read or write at GOT will be erroneous.

\*2 Available for the file register of block No. switched with the RSET instruction.

\*3 Available for the file register of block No. of file name switched with the QDRSET instruction.

\*4 The GOT treats them in units of 32k (32767 points).

\*5 For the servo amplifier, if a real number is written to a virtual device, only the integer portion of the number is stored into the device.

If the data type of the virtual servo amplifier device is set to [Real], the value after the writing may differ from the one before the writing.

Additionally, the monitoring process may take a longer time.

Therefore, select one of the following items as the data type of the virtual device.

- [Signed BIN16]
- [Unsigned BIN16]
- [Signed BIN32]
- [Unsigned BIN 32]

When you use the value of the virtual servo amplifier device, remember that only the integer portion of the value is stored in the device.

To display a real number on the numerical display or numerical input object, set [Format] to [Real] and select [Adjust Decimal Point Range] in the object setting.

\*6 Do not use the local device set in a MELSEC-L system.

Otherwise normal monitoring is not performed. (D32768 or later can be used for data register (D).)

\*7 This cannot be monitored when the GOT multi-drop is connected.

\*8 Only reading is possible.

\*9 Only writing is possible.

\*10 The device No. must be set in multiples of 16.

\*11 Use the following virtual devices to write data to the RAM of a servo amplifier.

- PA: 1 to 32
- PB, PE, PF: 1 to 64
- PC: 1 to 80
- PD, PL: 1 to 48
- POS, SPD, ACT, DCT, DWL, AUX: 1 to 255

Use the following virtual devices to write data to the EEPROM of a servo amplifier.

- PA: 1001 to 1032
- PB, PE, PF: 1001 to 1064
- PC: 1001 to 1080
- PD, PL: 1001 to 1048
- POS, SPD, ACT, DCT, DWL, AUX: 1001 to 1255

\*12 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*13 The word specification of bit devices is not available.

\*14 The bit specification of word devices is not available.

\*15 The following devices are initially invalid because the GOT cannot control the devices via a network: CMD8 (Jog operation selection), CMD9 (Selection of automatic restart after instantaneous power failure, flying start), CMD11 (Start self-holding selection), and CMD12 (Inverter reset).

Write values to parameters Pr.185, Pr.186, Pr.188, and Pr.189 that correspond to the above virtual devices.

Doing so controls CMD8, CMD9, CMD11, and CMD12.

\*16 To set CMD8, CMD9, CMD11, or CMD12, write an appropriate value to OP4.

As shown in the figure below, one operation mode is assigned to one bit of OP4.

The following shows an example of setting CMD12 (Inverter reset).

Write 1 to the bit (corresponding to CMD12) of OP4.  
 In this example, OP4 must store 0200H.  
 Convert 0200H to a decimal value (512), and then write 512 to OP4.

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

- Bit device  
 Only writing is possible.  
 [Alternate] of a bit switch cannot be used.  
 Use [Momentary], [Set], and [Reset] for bit switch actions.
- Word device and double-word device  
 Only writing is possible.  
 Numerical input cannot be used.  
 Use a word switch for writing.

For the correspondences between the virtual devices used in the GOT and the data of a servo amplifier or inverter, refer to the following.

\*1 In the computer link connection, the bit specification writing of the word device to the ER29-0 (block 29 of the extension file register) or later of A3ACPU, A3UCPU, A4UCPU is not available.

When the bit specification writing of the word device is required, use the range of block No. 0 to 28.

\*2 In the computer link connection, writing to the index register (such as the touch switch function and numerical input function) is not available.

\*3 Only the intelligent function module on the station connected to GOT can be specified.

Set the buffer memory within the address range of the buffer memory existing in the intelligent function module.

\*4 The device No. must be set in multiples of 16.

\*5 If the special internal relay (M) is converted to the word device, treat 9000 of the device No. as 0 and set in multiples of 16.  
Example) M9000, M9016, M9240

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
→ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*7 The word specification of bit devices is not available.

\*8 The bit specification of word devices is not available.

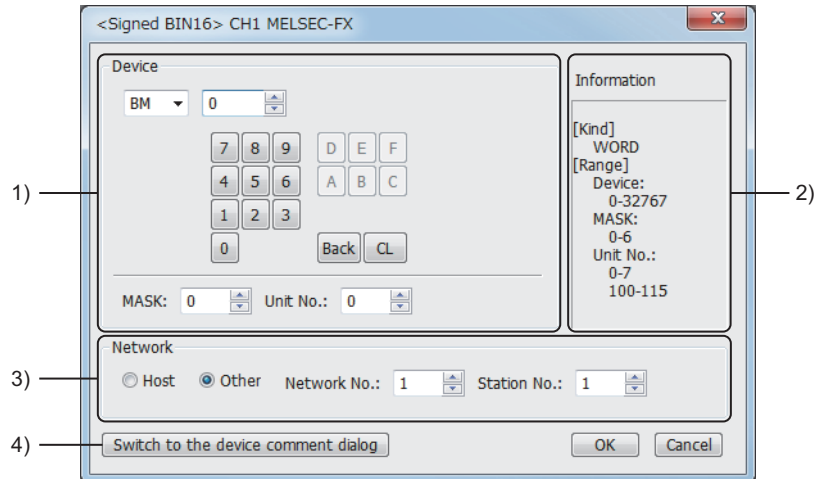

## 7 [MELSEC-FX]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog
- (2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

When setting the buffer memory, set the buffer memory address in the space for the device number.

Item	Description
[Mask]	Set this item when using the buffer memory of the FX CPU. Set the mask type when only the specific bit of the buffer memory is monitored or written. →(b) Mask type setting
[Unit No.]	Set this item when using the buffer memory of the FX CPU. Set the unit number of special function units or special function blocks to be monitored or written. →(c) Unit No.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the station number of the controller to be monitored.

Item	Description
[Host]	Select this item to monitor the station connected with the GOT.
[Other]	Select this when monitoring other controller. Then, set the station number and network number of the controller to be monitored. <ul style="list-style-type: none"> <li>• [Network No.]: Set the network No.</li> <li>• [Station No.]: Set the station number.</li> </ul>

#### 4) [Switch to the device comment dialog] button

Reading the device comment data created by GX Developer and confirming the device comment and device name are available during device setting.

For how to use the device comment reference, refer to the following.

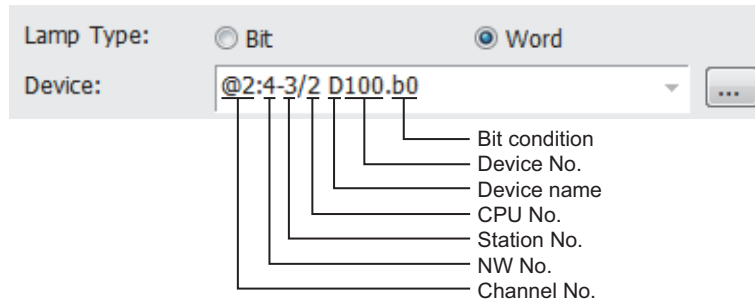

- 6.1.5 ■ 5 Device comment setting dialog

#### (a) Setting device by inputting directly from keyboard

When setting it by inputting directly from the keyboard, set the items as follows:

- Devices other than the buffer memory (BM)

- Buffer memory (BM)

### (b) Mask type setting

Set the mask type when only the specific bit of the buffer memory is monitored or written.

- Mask type 0  
The buffer memory value is monitored or written.
- Mask type 1  
16 bits  
Only b0 to b3 of the buffer memory is monitored or written.  
Example)

When monitoring BM0 = 4321H with the mask type 1, the monitored value = 0001H.

When writing the input value (4321H) to BM0 = 0000H with the mask type 1, BM0 = 0001H.

- 32 bits  
Only b0 to b3 and b16 to b19 of the buffer memory is monitored or written.  
Example)

When monitoring BM0 = 87654321H with the mask type 1, the monitored value = 00050001H.

When writing the input value (87654321H) to BM0 = 00000000H with the mask type 1, BM0 = 00050001H.

- Mask type 2

16 bits

Only b4 to b7 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 4321H with the mask type 2, the monitored value = 0002H.

When writing the input value (4321H) to BM0 = 0000H with the mask type 2, BM0 = 0010H

32 bits

Only b4 to b7 and b20 to b23 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 87654321H with the mask type 2, the monitored value = 00060002H.

When writing the input value (87654321H) to BM0 = 00000000H with the mask type 2, BM0 = 00500010H.

- Mask type 3

16 bits

Only b8 to b11 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 4321H with the mask type 3, the monitored value = 0003H.

When writing the input value (4321H) to BM0 = 0000H with the mask type 3, BM0 = 0100H

32 bits

Only b8 to b11 and b28 to b31 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 87654321H with the mask type 3, the monitored value = 00070003H.

When writing the input value (87654321H) to BM0 = 00000000H with the mask type 3, BM0 = 00050001H.

- Mask type 4

16 bits

Only b12 to b15 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 4321H with the mask type 4, the monitored value = 0004H.

When writing the input value (4321H) to BM0 = 0000H with the mask type 4, BM0 = 1000H

32 bits

Only b12 to b15 and b28 to 31 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 87654321H with the mask type 4, the monitored value = 00080004H.

When writing the input value (87654321H) to BM0=00000000H with the mask type "4", BM0=50001000H.

- Mask type 5

16 bits

Only b0 to b7 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 4321H with the mask type 5, the monitored value = 0021H.

When writing the input value (4321H) to BM0 = 0000H with the mask type 5, BM0 = 0021H.

32 bits

Only b0 to b7 and b16 to b13 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 87654321H with the mask type 5, the monitored value = 00650021H.

When writing the input value (87654321H) to BM0=00000000H with the mask type 5, BM0=00650021H.

• Mask type 6

16 bits

Only b8 to b15 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 4321H with the mask type 6, the monitored value = 0043H.

When writing the input value (4321H) to BM0 = 0000H with the mask type 6, BM0 = 2100H

32 bits

Only b8 to b15 and b24 to b31 of the buffer memory is monitored or written.

Example)

When monitoring BM0 = 87654321H with the mask type 6, the monitored value = 00870043H.

When writing the input value (87654321H) to BM0=00000000H with the mask type 6, BM0=65002100H.

### (c) Unit No.

Set the unit number of special function units or special function blocks to be monitored or written.  
 The unit number (No.0 to No.7) is assigned to the units or blocks in order of distance from the main unit.  
 For details of the unit number, refer to the following.

→ User's Manual (Hardware) of the MELSEC-FX used

- Direct specification  
 When setting devices, directly specify the unit number (No.0 to No.7) of special function units or special function blocks to be monitored or written.
- Indirect specification  
 When setting devices, indirectly specify the unit number of special function units or special function blocks to be monitored or written using the 16-bit GOT internal registers (GD10 to GD25).  
 When specifying the unit number at 100 to 115 on GT Designer3, the value of device corresponding to the unit number (GD10 to GD25) is the unit number of the special function unit or special function block.

Unit No.	Corresponding device	Setting range
100	GD10	[0] to [7] If a value is set out of the range above, a device range error occurs. If the unit number which does not exist is set, a communication timeout error occurs.
101	GD11	
:	:	
114	GD24	
115	GD25	

### (2) Device range

○ : Available, × : Unavailable

Device name		Setting range	EG device *8	MX Component *8	Device No. representation
Bit device	Input (X)	X0 to X377	○	○	Octal number
	Output (Y)	Y0 to Y377	○	○	
	Auxiliary relay (M)	M0 to M7679	○	○	Decimal number
	Auxiliary relay (M)	M8000 to M8511	○	○	
	State (S)	S0 to S4095	○	○	
	Timer contact (T)	T0 to T511	○	○ *9	
	Counter contact (C)	C0 to C255	○	○ *9	
Bit-specified word device *1 (Except the timer (set value) and counter (set value))		Setting range of each word device	Refer to each word device.		-

Device name		Setting range	EG device *8	MX Component *8	Device No. representation
Word device	Data register (D)	D0 to D7999	○	○	Decimal number
	Special data register (D)	D8000 to D8511	○	○	
	Timer (current value) (T)	T0 to T511	○	○	
	Counter (current value) (C) *4	C0 to C255	○	○	
	Timer (current value)(TS) *3*5*7	TS0 to TS511	○	○	
	Counter (current value) (CS) *4*5*7	CS0 to CS255	○	○	
	File register (R)	R0 to R32767	○	○	
	Index register (V)	V0 to V7	○	○ *10	
	Index register (Z)	Z0 to Z7	○	○ *10	
	Buffer memory (Special function units/ blocks)(BM) *6	Unit No.	0 to 7 (Indirect specification: 100 to 115)	○	
		Mask	0 to 6	○	○
Device		BM0 to BM32767	○	○	
Word-specified bit devices *2 (Except the timer contact and counter contact)		Setting range of each bit device	Refer to each bit device.		-

\*1 When executing the touch switch function that has been set during the bit specification of the word device, do not write any data to the word device through the sequence program.

\*2 The device No. must be set in multiples of 16.

\*3 Only 16-bit (1-word) specification is allowed.

\*4 For CS0 to CS199 and C0 to C199, only 16-bit (1-word) specification is allowed.  
For CS200 to CS255 and C200 to C255, only 32-bit (2-word) specification is allowed.

\*5 Monitoring or writing is not possible in the continuous device designation mode.  
In addition, setting values of the timer and counter, which are not used for the program, cannot be monitored.  
If monitoring is executed, a reading error occurs.

\*6 Can be used only for special blocks or special units compatible with FX2N, FX3U, FX3G. (Except FX0N-3A, FX2N-2AD, FX2N-2DA)

\*7 GT SoftGOT1000 and GT Simulator3 cannot monitor the set values.

\*8 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*9 The word specification of bit devices is not available.

\*10 The bit specification of word devices is not available.

## Point

### (1) How to select a keyword protection level

For equipment that is allowed to operate the FX PLC on line, 3 levels of protection level can be set.  
When performing monitoring or changing settings with any on-line equipment is required, set a password with referring to the following.

#### (a) When setting keyword only

Select a protection level by the initial letter of keyword.  
All operation protect: Set a keyword with initial letter of A, D to F, or 0 to 9.  
Read and Incorrect write protection :Set a keyword with initial letter of B.  
Incorrect write protection :Set a keyword with initial letter of C.

#### (b) Set a keyword with initial letter of C.

Select a protection level by [Registration condition].

### (2) Monitoring availability at each keyword protection level

Device monitoring availability at each keyword protection level is shown in the following.

Item	When registering keyword only			When registering keyword and second keyword			Keyword not registered or protection cancelled
	All operation protect	Read /Incorrect write protection	Incorrect write protect	All on-line operation protect	Read/write protect	Write protect	
Monitoring devices	○	○	○	×	○	○	○
Changing devices	T, C set value and file register (D1000 and the following)	×	×	×	○	○	○
	Other than above	○	○	○	×	○	○

### (3) Difference between all online operations prohibition and all operations prohibition

When specifying all online operations prohibited, displaying devices and inputting data with a programming tool or GOT are all prohibited.

When all operations are prohibited, displaying devices and inputting data with the GOT are enabled while all operations using a programming tool are prohibited.

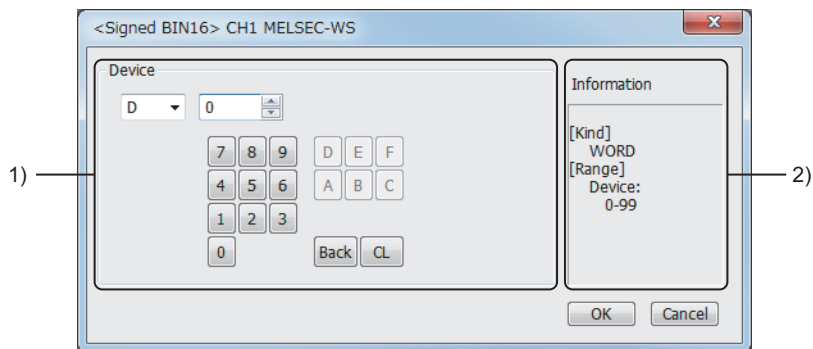

## 8 [MELSEC-WS]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog
- (2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

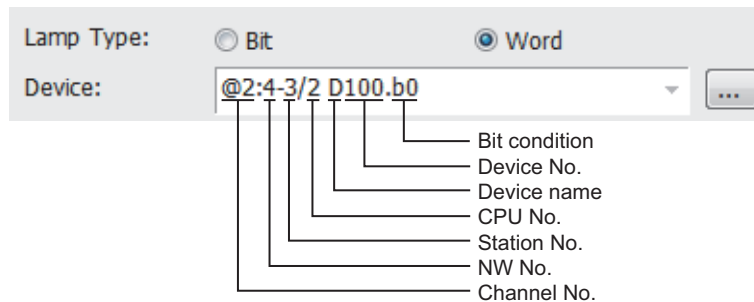

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

### (a) Setting device by inputting directly from keyboard

When setting it by inputting directly from the keyboard, set the items as follows:

**(b) Device settings of MELSEC-WS**

- Input (I), Output(Q)

- Logic result (LQ), Logic input (LI)

- EFI input (EI)

- EFI output (EQ)

**(c) Engineering software for MELSEC-WS and device representation of GT Designer3**

The engineering software for MELSEC-WS and the device representation of GT Designer3 are different. Set the device by referring to the following table.

Device name	GT Designer3	Engineering software for MELSEC-WS
I <sup>*1</sup>	I □ □ . △ □ □ (1-12(Dec)): Module number △ (1-8): Input position	▲ ▲ ▲ ▲ [□ □],I ▲ ▲ ▲ ▲ : I/O model name (such as XTIO and XTDI) □ □ (1-12(Dec)): Module number △ (1-8): Input position
Q <sup>*1</sup>	Q □ □ . △ □ □ (1-12(Dec)): Module number △ (1-8): Input position	▲ ▲ ▲ ▲ [□ □],Q ▲ ▲ ▲ ▲ : I/O model name (such as XTIO and XTDI) □ □ (1-12(Dec)): Module number △ (1-8): Input position
LQ <sup>*1</sup>	LQ □ . △ □ (0-3): Byte number △ (0-7): Bit position	▲ ▲ □ . △ ▲ ▲ : Result □ (0-3): Byte number △ (0-7): Bit position
LI <sup>*1</sup>	LI □ . △ □ (0-3): Byte number △ (0-7): Bit position	▲ ▲ ▲ ▲ [0]. □ . △ ▲ ▲ ▲ ▲ : CPU type (CPU0, CPU1) □ (0-3): Byte number △ (0-7): Bit position
EI <sup>*1</sup>	EI ○ □ △ ○ (1-2): EFI number □ (1-3): Device number △ (0-3): Byte number	▲ ▲ ▲ ▲ [0].EFI ○ : □ ,Byte △ ▲ ▲ ▲ ▲ : CPU type (CPU0, CPU1) ○ (1-2): EFI number □ (1-3): Device number △ (0-3): Byte number

Device name	GT Designer3	Engineering software for MELSEC-WS
EQ *1	EQ ◯ △ ◯ (1-2): EFI number △ (0-2): Byte number	▲ ▲ ▲ ▲ [0].EFI ◯ :1,Byte △ ▲ ▲ ▲ ▲ : CPU type (CPU0, CPU1) ◯ (1-2): EFI number △ (0-2): Byte number
D	D △ △ △ △ (0-99(Dec)): Byte number	RS232 data (Safety controller to RS232)
W	W △ △ △ △ (0-49(Dec)): Word number Word virtualization of D device W0 = (D1(Higher-order bits), D0(Lower-order bits))	GOT independent device (Not available)
LD	LD △ △ (0-3): Byte number	RS232 data (Safety controller to RS232)
LW	LW △ △ (0-1): Word number Word virtualization of LD device LW0 = (LD1(Higher-order bits), LD0(Lower-order bits))	GOT independent device (Not available)

\*1 When the mapping position is changed by the MELSEC-WS engineering software, a mismatch occurs between virtual devices on GOT and MELSEC-WS mapping devices.

When mapping is changed, use D devices or LD devices.

#### (d) When using offset specification

When devices are set with using the offset function, the device values are as follows.

##### • Input (I)

Offset	+0	+1	+2	+3	+4	+5	+6	+7
+0	I1.1	I1.2	I1.3	I1.4	I1.5	I1.6	I1.7	I1.8

##### • Output (Q)

Offset	+0	+1	+2	+3	+4	+5	+6	+7
+0	Q1.1	Q1.2	Q1.3	Q1.4	Q1.5	Q1.6	Q1.7	Q1.8

##### • Logic result (LQ)

Offset	+0	+1	+2	+3	+4	+5	+6	+7
+0	LQ0.0	LQ0.1	LQ0.2	LQ0.3	LQ0.4	LQ0.5	LQ0.6	LQ0.7

##### • Logic result (LI)

Offset	+0	+1	+2	+3	+4	+5	+6	+7
+0	LI0.0	LI0.1	LI0.2	LI0.3	LI0.4	LI0.5	LI0.6	LI0.7

##### • EFI input (EI)

Offset	+0	+1	+2	+3
+0	EI110	EI111	EI112	EI113

##### • EFI output (EQ)

Offset	+0	+1	+2
+0	EQ10	EQ11	EQ12

## (2) Device range

○ : Available, ×: Unavailable

Device name <sup>*1</sup>		Setting range	EG device <sup>*2</sup>	MX Component <sup>*2</sup>	Device No. representation
Bit device	Input (I)	I1.1 to I12.8	×	×	Decimal + Decimal
	Output (Q)	Q1.1 to Q12.8	×	×	
	Logic result (LQ)	LQ0.0 to LQ3.7	×	×	
	Logic input (LI)	LI0.0 to LI3.7	×	×	
	Bit-specified word device		Setting range of each word device	Refer to each word device.	
Word device	Data (byte) (D)	D0 to D99	○	○	Decimal number
	Data (word) (W)	W0 to W49	○	○	
	EFI input(byte) (EI)	EI110 to EI233	○	○	Decimal + Decimal + Decimal
	EFI output(byte) (EQ)	EQ10 to EQ22	○	○	Decimal + Decimal
	Logic input (byte) (LD)	LD0 to LD3	○	○	Decimal number
	Logic input (word) (LW)	LW0 to LW1	○	○	Decimal number

\*1 The GOT can only read data from all the devices.

\*2 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

### (2) Device range

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Not available to GT2105-Q.

For the device range when the GOT is connected to the MELSEC iQ-R series, refer to the following.

- 12.2.2 ■ 1 (2) Device range

○ : Available, ×: Unavailable

Device name		Setting range	EG device *2	MX Component *2	Device No. representation	
Bit device	Internal relay (M)	M0 to M161882111	○	○	Decimal number	
	Link relay (B)	B0 to B9A61FFF	○	○	Hexadecimal number	
	Special relay (SM)	SM0 to SM4095	○	○	Decimal number	
	Link direct	Link input (JnX)	JnX0 to JnX3FFF	○	○	Hexadecimal number
		Link output (JnY)	JnY0 to JnY3FFF	○	○	
		Link special relay (JnSB)	JnSB0 to JnSB1FF	○	○	
Bit-specified word device		Setting range of each word device	Refer to each word device.		-	
Word device	Data register (D)	D0 to D10117631	○	○	Decimal number	
	Special data register (SD)	SD0 to SD4095	○	○	Decimal number	
	Link register (W)	W0 to W9A61FFF	○	○	Hexadecimal number	
	Extension file register (ZR)	ZR0 to ZR10027007	○	○	Decimal number	
	CPU buffer memory access device(U3E0G)		U3E0G0 to U3E0G199999	○	○	Decimal number
	Link direct	Link register (JnW)	JnW0 to JnW1FFFF	○	○	Hexadecimal number
		Link special register (JnSW)	JnSW0 to JnSW1FF	○	○	
	Word-specified bit devices *1		Setting range of each bit device	Refer to each bit device.		-

\*1 The device No. must be set in multiples of 16.

\*2 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

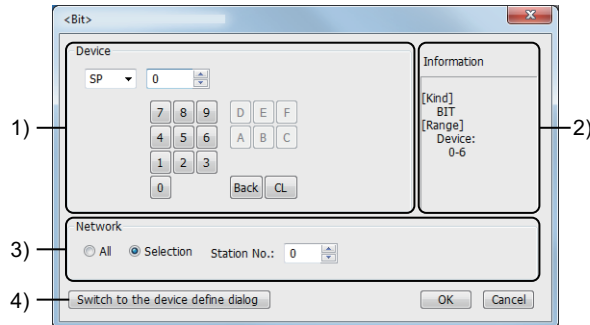

## 10 [MELSERVO-J2M-P8A]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog
- (2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[All]	Select this item when writing data to all servo amplifiers connected. During a monitoring, the servo amplifier of the station number 0 is monitored. (When inputting data by the numerical Input, the data is written to all servo amplifiers connected during inputting and the servo amplifier of the station number 0 is monitored during other than inputting (displaying).)
[Selection]	Select this item when monitoring the servo amplifier of the specified station No. The following shows the items to be selected. • [0] to [31] The servo amplifier of the station number specified is monitored. • [100] to [115]: Specify the station number of the servo amplifier to be monitored with the GOT data register (GD). <sup>*1</sup>

\*1 The following shows the relationship between the station No. of the servo amplifier and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [31] (If a value out of the range above is set, a timeout error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

#### 4) [Switch to the device definition screen] button

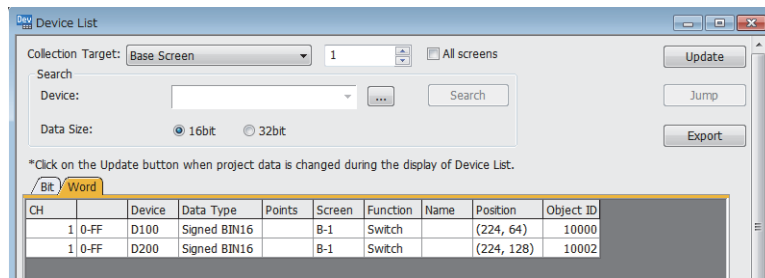

Click this button, the dialog, which indicates the correspondence between the GOT virtual device for a servo amplifier and the definition of the servo amplifier, appears.

Clicking the button displays the dialog box indicating the correspondence between the GOT virtual device for a servo amplifier and the definition of servo amplifier.

→6.1.5 ■ 6 Device definition setting dialog

**(1) When selecting [All] in the Network setting**

The network No. 0 and the station number FF are displayed on the device list and during the printing. (Device List screen)

**(2) Monitoring servo amplifier**

Carefully read the manual of servo amplifier to be connected and fully understand the operating procedures before monitoring.

Before operation, check the parameter settings. Improper settings may cause some machines to perform unexpected operation.

The parameter settings must not be changed excessively. Operation will be insatiable.

**(3) Parameters with \* in front of its abbreviated name**

For the parameter with \* in front of its abbreviated name, powering off the servo amplifier after setting then on makes the parameter valid.

**(4) Data length of a virtual device**

Set the data length of a virtual device as shown below.

- PRM, ST, AL, PA, PB, PC, PD, POS, SPD, ACT, DCT, DWL, AUX: 16 bits or 32 bits (depends on the data of servo amplifier)
- DI, DO, TMI, TMO, TMD: 32 bits

If the above data length was not set, data would not be set to the servo amplifier correctly or the GOT can not monitor normally.

**(a) Monitoring**

- When the 16-bit data is handled as 32-bit data, the upper 16 bits are displayed as 0.
- When the 32-bit data is handled as 16-bit data, the lower 16 bits only are displayed as 0.

**(b) Writing**

The GOT writes within the range of data length set. Note that the servo amplifier responds correctly while the written data is invalid in the servo amplifier side when the written data is out of the range of values which can be set by the servo amplifier.

**(5) Memory area for writing parameters**

Parameters are written to RAM or EEPROM of the servo amplifier.

**(a) When written to RAM**

Remember that written parameters are cleared when power supply to the servo amplifier is turned off.

**(b) When written to EEPROM**

Written parameters are not cleared even when power supply to the servo amplifier is turned off.

However, there are limits in the number of writing to EEPROM.

If the data is frequently updated (more than once in an hour), write the parameters to the RAM.

For details, refer to the manual of the servo amplifier used.

**(6) [Data Type] and [Format] settings when specifying a virtual servo amplifier device**

In the object setting or other settings, [Data Type] and [Format] must be set according to the notation in which the corresponding servo amplifier data is represented.

For the notation in which the servo amplifier data is represented, refer to the following.

⇒ Instruction manual for the servo amplifier used

MR Configurator2 HELP

Set [Data Type] and [Format] according to the notation as shown below.

- Decimal notation (positive values only)
- [Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 65536 or more)

[Format]: [Unsigned Decimal]

- Decimal notation (positive and negative values)  
[Data Type]: [Signed BIN16] ([Signed BIN32] for -32769 or less, and 32768 or more)  
[Format]: [Signed Decimal]
- Hexadecimal notation  
[Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more)  
[Format]: [Hexadecimal]
- Decimal point notation  
[Data Type]: [Real]  
[Format]: [Real]  
[Digits (Integral)]: Set the number of digits in the integral portion.  
[Digits (Fractional)]: Set the number of digits in the fractional portion.
- When the notation varies by digit  
[Data Type]: [Unsigned BIN16] ([Unsigned BIN32] for 0x10000 or more)  
[Format]: [Hexadecimal]  
On the [Operation/Script] tab, select [Data Operation] for [Operation Type], and set [Bit Mask] or [Bit Shift].

## (2) Device range

Refer to the following manual for parameters.  
 ⇒Manual of the servo amplifier used

○ : Available, ×: Unavailable

Virtual device name *2		Setting range	EG device*4	MX Component*4	Device No. representation
Bit device	Servo amplifier request (SP)	SP1 to SP2	×	×	Decimal number
	Operation mode selection (OM)	OM0, OM4	×	×	
Word device	Basic parameter(PRM)*1, expansion parameter (PRM)*1	PRM0 to PRM29 PRM1000 to PRM1029	○	×	
	Status display (ST)*3	ST0 to ST2	○	×	
	Alarm (current alarm) (AL)*3	AL0 AL11 to AL13	○	×	
	Alarm (alarm history) (AL)*3	AL200 to AL205 AL210 to AL215 AL230 to AL235	○	×	
	External input (DI)*3	DI0 to DI2	×	×	
	External output (DO)*3	DO0 to DO1	×	×	
Double-word device	Forced output of signal pin (for test operation) (TMO)	TMO0	×	×	Decimal number

\*1 Use PRM0 to PRM29 when writing parameters to the servo amplifier RAM.

Use PRM1000 to PRM1029 when writing parameters to the servo amplifier E<sup>2</sup>PROM.

\*2 The GOT cannot read or write data from /to consecutive devices.

\*3 Only reading is possible.

\*4 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 ⇒10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, and TMO devices.

### (a) Bit device

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

### (b) Word device and double-word device

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

- Servo amplifier request

Virtual device name	Item	Symbol
SP1	Current alarm clear	-

	Forced output of signal pin (for test operation) (TMO)	TMO0	×	×	
	Set data (for test operation) (TMD)	TMD0 to TMD2	×	×	

\*1 Use PRM0 to PRM84 when writing parameters to the servo amplifier RAM.

Use PRM1000 to PRM1084 when writing parameters to the servo amplifier EEPROM.

\*2 The GOT cannot read or write data from /to consecutive devices.

\*3 Only reading is possible.

\*4 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
→ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

#### (a) Bit device

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

#### (b) Word device and double-word device

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

\*1 Use the following devices to write data to the RAM of a servo amplifier.

- PRM: 0 to 90
- POS, SPD, ACT, DCT, DWL, or AUX: 1 to 31

Use the following devices to write data to the E2PROM of a servo amplifier.

- PRM: 1000 to 1090
- POS, SPD, ACT, DCT, DWL, or AUX: 1001 to 1031

\*2 The GOT cannot read or write data from /to consecutive devices.

\*3 Only reading is possible for DI0 to DI1.

\*4 Only reading is possible.

\*5 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs

(Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

**(a) Bit device**

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

**(b) Word device and double-word device**

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

Set data (for test operation) (TMD)	TMD0 to TMD2	×	×		

\*1 PRM0 to PRM90 are used when writing parameters to the servo amplifier RAM.

PRM1000 to PRM1090 are used when writing parameters to E<sup>2</sup>PROM with the servo amplifier.

\*2 The GOT cannot read or write data from /to consecutive devices.

\*3 Use the integer number when writing parameters to Rx.

\*4 Only reading is possible for DI0 to DI1.

\*5 Only reading is possible.

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

**(a) Bit device**

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

**(b) Word device and double-word device**

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

\*1 Use 1 to 50 of PA, PB, PC, PD, and PO when the GOT writes data to RAM of the servo amplifier.

Use 1001 to 1050 of PA, PB, PC, PD, and PO when the GOT writes data to EEPROM of the servo amplifier.

\*2 The GOT cannot read or write data from /to consecutive devices.

\*3 Only reading is possible for DI0 to DI1.

\*4 Only reading is possible.

\*5 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

#### (a) Bit device

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

## (b) Word device and double-word device

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

### • Servo amplifier request

Point table (auxiliary function) (AUX) *1	AUX1 to AUX255 AUX1001 to AUX1255	○	×		
Point table (M code) (MCD) *1*2	MCD1 to MCD255 MCD1001 to MCD1255	○	×		

Virtual device name *4		Setting range	EG device *6	MX Component *6	Device No. representation
Double-word device	Input signal for test operation (for test operation) (TMI)	TMI0 to TMI2	×	×	Decimal number
	Forced output of signal pin (for test operation) (TMO)	TMO0 to TMO1	×	×	
	Set data (for test operation) (TMD)	TMD0 to TMD1 TMD3	×	×	

\*1 Use the following devices to write data to the RAM of a servo amplifier.

- PA: 1 to 19
- PB: 1 to 45
- PC: 1 to 50
- PD: 1 to 30
- PO: 1 to 35
- POS, SPD, ACT, DCT, DWL, AUX, or MCD: 1 to 255

Use the following devices to write data to the E2PROM of a servo amplifier.

- PA: 1001 to 1019
- PB: 1001 to 1045
- PC: 1001 to 1050
- PD: 1001 to 1030
- PO: 1001 to 1035
- POS, SPD, ACT, DCT, DWL, AUX, or MCD: 1001 to 1255

\*2 MCD cannot be used as a real number.

\*3 The GOT can only read data from the device.

\*4 The GOT cannot read or write data from /to consecutive devices.

\*5 For DI0 to DI4, the GOT can only read data from devices.

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- ⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

#### (a) Bit device

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

#### (b) Word device and double-word device

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

##### • Servo amplifier request

Virtual device name	Item	Symbol
SP0	Status display data clear	-
SP1	Current alarm clear	-
SP2	Alarm history clear	-
SP3	External input signal prohibited	-
SP4	External output signal prohibited	-
SP5	External input signal resumed	-
SP6	External output signal resumed	-

##### • Operation mode selection

Virtual device name	Item	Symbol
OM0	Normal mode (not test operation mode)	-
OM1	JOG operation	-
OM2	Positioning operation	-
OM3	Motorless operation	-
OM4	Output signal (DO) forced output	-
OM5	One step sending	-

• Instruction demand (for test operation)

Virtual device name	Item	Symbol
TMB1	Temporary stop command	-
TMB2	Test operation (positioning operation) start command	-
TMB3	Forward rotation direction	-
TMB4	Reverse rotation direction	-
TMB5	Restart for remaining distance	-
TMB6	Remaining distance clear	-

• Basic setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PA1, PA1001	Control mode	*STY
PA2, PA1002	Regenerative brake option	*REG
PA3, PA1003	Absolute position detection system *ABS	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Feeding function selection	*FTY
PA6, PA1006	Electronic gear numerator	*CMX
PA7, PA1007	Electronic gear denominator	*CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit	TLP
PA12, PA1012	Reverse rotation torque limit	TLN
PA13, PA1013	For manufacturer setting	-
PA14, PA1014	Rotation direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16 to PA18, PA1016 to PA1018	For manufacturer setting	-
PA19, PA1019	Parameter block	*BLK

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

• Gain filter parameter

Virtual device name	Item	Symbol <sup>*1</sup>

	Machine diagnosis data (MD) *3	MD0 to MD11	×	×	
	One-touch tuning data (OTS) *3	OTS0 to OTS3	×	×	
External input (DI) *4	DI0 to DI2	×	×		
External output (DO) *3	DO0 to DO1	×	×		

Virtual device name *2	Setting range	EG device *6	MX Component *6	Device No. representation
Double-word device	Life Diagnosis (ALD) *3	ALD0 to ALD1	x	x
	Input signal for test operation (for test operation) (TMI)	TMI0	x	x
	Forced output of signal pin (for test operation) (TMO)	TMO0	x	x
	Set data (for test operation) (TMD)	TMD0 to TMD1 TMD3	x	x

\*1 Use 1 to 80 of PA, PB, PC, PD, PE, PF, and PL when the GOT writes data to the RAM of a servo amplifier.

Use 1001 to 1080 of PA, PB, PC, PD, PE, PF, and PL when the GOT writes data to the EEPROM of a servo amplifier.

\*2 The GOT cannot read or write data from /to consecutive devices.

\*3 The GOT can only read data from the device.

\*4 Only reading is available for DI0 to DI1.

\*5 The GOT can only write data to the device.

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

#### (a) Bit device

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

#### (b) Word device and double-word device

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows correspondences between virtual devices for servo amplifier and data of the servo amplifier used with the GOT.

##### • Servo amplifier request

Virtual device name	Item	Symbol
SP0	Status display data clear	-
SP1	Current alarm clear	-
SP2	Alarm history clear	-
SP3	External input signal prohibited	-
SP4	External output signal prohibited	-
SP5	External input signal resumed	-
SP6	External output signal resumed	-

##### • Operation mode selection

Virtual device name	Item	Symbol
OM0	Normal mode (not test operation mode)	-
OM1	JOG operation	-
OM2	Positioning operation	-
OM4	Output signal (DO) forced output	-

##### • Instruction demand (for test operation)

Virtual device name	Item	Symbol
TMB1	Temporary stop command	-
TMB2	Test operation (positioning operation) start command	-
TMB3	Forward rotation direction	-
TMB4	Reverse rotation direction	-
TMB5	Restart for remaining distance	-
TMB6	Remaining distance clear	-

• One-touch tuning instruction

Virtual device name	Item	Symbol
OT10	One-touch tuning start command(Basic mode)	-
OT11	One-touch tuning start command(High mode)	-
OT12	One-touch tuning start command(Low mode)	-
OT13	One-touch tuning stop command	-
OT14	Return to initial value	-
OT15	Return to value before adjustment	-

• Basic setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PA1, PA1001	Operation mode	*STY
PA2, PA1002	Regenerative brake option	*REG
PA3, PA1003 <sup>*2</sup>	Absolute position detection system *ABS	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Number of command input pulses per revolution	*FBP
PA6, PA1006	Elec. gear numerator (Cmd. pls. magnification num.)	CMX
PA7, PA1007	Elec. gear denominator (Cmd. pls. magnification den.)	CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit	TLP
PA12, PA1012	Reverse rotation torque limit	TLN
PA13, PA1013	Command pulse input form	*PLSS
PA14, PA1014	Rotation direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16, PA1016	Encoder output pulses 2	*ENR2
PA17 to PA18, PA1017 to PA1018	For manufacturer setting	-
PA19, PA1019	Parameter block	*BLK
PA20, PA1020	Tough drive setting	*TDS
PA21, PA1021	Function selection A-3	*AOP3
PA22, PA1022	For manufacturer setting	-
PA23, PA1023	Drive recorder arbitrary alarm trigger setting	DRAT
PA24, PA1024	Function selection A-4	*AOP4
PA25, PA1025	One-touch tuning - Overshoot permissible level	OTHOV
PA26, PA1026 <sup>*2</sup>	Function selection A-5	*AOP5
PA27 to PA32, PA1027 to PA1032	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

\*2 MELSERVO-JE is equivalent to MELSERVO-J4. However, they have differences in the parameter function.

For using the MELSERVO-JE series, refer to the following.

⇒MELSERVO-JE Series Servo Amplifier Instruction Manual

• Gain filter parameter

	Input signal for test operation (for test operation) (TMI)	TMI0 to TMI2	×	×	
	Forced output of signal pin (for test operation) (TMO)	TMO0	×	×	
	Set data (for test operation) (TMD)	TMD0 to TMD1 TMD3	×	×	

\*1 The GOT can only write data to the device.

\*2 Use the following devices to write data to the RAM of a servo amplifier.

- PA or PO: 1 to 32
- PB or PE: 1 to 64
- PC: 1 to 80
- PD, PF, PL, or PT: 1 to 48
- POS, SPD, ACT, DCT, DWL, AUX, or MCD: 1 to 255

Use the following devices to write data to the E2PROM of a servo amplifier.

- PA or PO: 1001 to 1032
- PB or PE: 1001 to 1064
- PC: 1001 to 1080
- PD, PF, PL, or PT: 1001 to 1048
- POS, SPD, ACT, DCT, DWL, AUX, or MCD: 1001 to 1255

\*3 The GOT cannot read or write data from /to consecutive devices.

\*4 The GOT can only read data from the device.

\*5 MCD cannot be used as a real number.

\*6 Only reading is available for DI0 to DI3.

\*7 Use the integer number when writing parameters to Rx.

\*8 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 → 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

#### (a) Bit device

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

#### (b) Word device and double-word device

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

• Servo amplifier request

Virtual device name	Item	Symbol
SP0	Status display data clear	-
SP1	Current alarm clear	-
SP2	Alarm history clear	-
SP3	External input signal prohibited	-
SP4	External output signal prohibited	-
SP5	External input signal resumed	-
SP6	External output signal resumed	-

• Operation mode selection

Virtual device name	Item	Symbol
OM0	Normal mode (not test operation mode)	-
OM1	JOG operation	-
OM2	Positioning operation	-
OM4	Output signal (DO) forced output	-
OM5	Single-step feed operation	-

• Instruction demand (for test operation)

Virtual device name	Item	Symbol
TMB1	Temporary stop command	-
TMB2	Test operation (positioning operation) start command.	-
TMB3	Forward rotation direction	-
TMB4	Reverse rotation direction	-
TMB5	Restart for remaining distance	-
TMB6	Remaining distance clear.	-

• One-touch tuning instruction

Virtual device name	Item	Symbol
OT10	One-touch tuning start command (Basic mode)	-
OT11	One-touch tuning start command (High mode)	-
OT12	One-touch tuning start command (Low mode)	-
OT13	One-touch tuning stop command	-
OT14	Return to initial value	-
OT15	Return to value before adjustment	-

• Basic setting parameter

Virtual device name	Item	Symbol *1
PA1, PA1001	Operation mode	*STY
PA2, PA1002	Regenerative option	*REG
PA3, PA1003	Absolute position detection system	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Number of command input pulses per revolution	*FBP
PA6, PA1006	Electronic gear numerator (command pulse multiplication numerator)/Number of gear teeth on machine side	*CMX
PA7, PA1007	Electronic gear denominator (command pulse multiplication denominator)/Number of gear teeth on servo motor side	*CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP

Virtual device name	Item	Symbol <sup>*1</sup>
PA11, PA1011	Forward rotation torque limit/positive direction thrust limit	TLP
PA12, PA1012	Reverse rotation torque limit/negative direction thrust limit	TLN
PA13, PA1013	Command pulse input form	*PLSS
PA14, PA1014	Rotation direction selection/travel direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16, PA1016	Encoder output pulses 2	*ENR2
PA17, PA1017	Servo motor series setting	*MSR
PA18, PA1018	Servo motor type setting	*MTY
PA19, PA1019	Parameter writing inhibit	*BLK
PA20, PA1020	Tough drive setting	*TDS
PA21, PA1021	Function selection A-3	*AOP3
PA22, PA1022	Position control structure selection	*PCS
PA23, PA1023	Drive recorder arbitrary alarm trigger setting	DRAT
PA24, PA1024	Function selection A-4	AOP4
PA25, PA1025	One-touch tuning - Overshoot permissible level	OTHOV
PA26, PA1026	Function selection A-5	*AOP5
PA27 to PA32, PA1027 to PA1032	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

• Gain filter parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PB1, PB1001	Adaptive tuning mode (adaptive filter II)	FILT
PB2, PB1002	Vibration suppression control tuning mode (advanced vibration suppression control II)	VRFT
PB3, PB1003	Position command acceleration/deceleration time constant (position smoothing)	PST
PB4, PB1004	Feed forward gain	FFC
PB5, PB1005	For manufacturer setting	-
PB6, PB1006	Load to motor inertia ratio/load to motor mass ratio	GD2
PB7, PB1007	Model loop gain	PG1
PB8, PB1008	Position loop gain	PG2
PB9, PB1009	Speed loop gain	VG2
PB10, PB1010	Speed integral compensation	VIC
PB11, PB1011	Speed differential compensation	VDC
PB12, PB1012	Overshoot amount compensation	OVA
PB13, PB1013	Machine resonance suppression filter 1	NH1
PB14, PB1014	Notch shape selection 1	NHQ1
PB15, PB1015	Machine resonance suppression filter 2	NH2
PB16, PB1016	Notch shape selection 2	NHQ2
PB17, PB1017	Shaft resonance suppression filter	NHF
PB18, PB1018	Low-pass filter setting	LPF
PB19, PB1019	Vibration suppression control 1 - Vibration frequency	VRF11
PB20, PB1020	Vibration suppression control 1 - Resonance frequency	VRF12
PB21, PB1021	Vibration suppression control 1 - Vibration frequency damping	VRF13
PB22, PB1022	Vibration suppression control 1 - Resonance frequency damping	VRF14
PB23, PB1023	Low-pass filter selection	VFBF
PB24, PB1024	Slight vibration suppression control	*MVS

Virtual device name	Item	Symbol *1
PB25, PB1025	Function selection B-1	*BOP1
PB26, PB1026	Gain switching function	*CDP
PB27, PB1027	Gain switching condition	CDL
PB28, PB1028	Gain switching time constant	CDT
PB29, PB1029	Load to motor inertia ratio/load to motor mass ratio after gain switching	GD2B
PB30, PB1030	Position loop gain after gain switching	PG2B
PB31, PB1031	Speed loop gain after gain switching	VG2B
PB32, PB1032	Speed integral compensation after gain switching	VICB
PB33, PB1033	Vibration suppression control 1 - Vibration frequency after gain switching	VRF1B
PB34, PB1034	Vibration suppression control 1 - Resonance frequency after gain switching	VRF2B
PB35, PB1035	Vibration suppression control 1 - Vibration frequency damping after gain switching	VRF3B
PB36, PB1036	Vibration suppression control 1 - Resonance frequency damping after gain switching	VRF4B
PB37 to PB44, PB1037 to PB1044	For manufacturer setting	-
PB45, PB1045	Command notch filter	CNHF
PB46, PB1046	Machine resonance suppression filter 3	NH3
PB47, PB1047	Notch shape selection 3	NHQ3
PB48, PB1048	Machine resonance suppression filter 4	NH4
PB49, PB1049	Notch shape selection 4	NHQ4
PB50, PB1050	Machine resonance suppression filter 5	NH5
PB51, PB1051	Notch shape selection 5	NHQ5
PB52, PB1052	Vibration suppression control 2 - Vibration frequency	VRF21
PB53, PB1053	Vibration suppression control 2 - Resonance frequency	VRF22
PB54, PB1054	Vibration suppression control 2 - Vibration frequency damping	VRF23
PB55, PB1055	Vibration suppression control 2 - Resonance frequency damping	VRF24
PB56, PB1056	Vibration suppression control 2 - Vibration frequency after gain switching	VRF21B
PB57, PB1057	Vibration suppression control 2 - Resonance frequency after gain switching	VRF22B
PB58, PB1058	Vibration suppression control 2 - Vibration frequency damping after gain switching	VRF23B
PB59, PB1059	Vibration suppression control 2 - Resonance frequency damping after gain switching	VRF24B
PB60, PB1060	Model loop gain after gain switching	PG1B
PB61 to PB64, PB1061 to PB1064	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

• Extension setting parameter

Virtual device name	Item	Symbol *1
PC1, PC1001	JOG operation acceleration time constant/Acceleration time constant 1	STA
PC2, PC1002	JOG operation deceleration time constant/Deceleration time constant 1	STB

• Machine diagnosis data

Virtual device name	Item	Symbol
MD0	Machine diagnosis data parameter number	-
MD1	Machine diagnosis data shift judgment(test mode)	-
MD2 *1	Machine diagnosis data status	-
MD3 *2	Machine diagnosis data coulomb friction torque in positive direction	-
MD4 *2	Machine diagnosis data friction torque at rated speed in positive direction	-
MD5 *2	Machine diagnosis data coulomb friction torque in negative direction	-
MD6 *2	Machine diagnosis data friction torque at rated speed in negative direction	-
MD7 *2	Machine diagnosis data oscillation frequency(motor is stopped)	-
MD8 *2	Machine diagnosis data vibration level(motor is stopped)	-
MD9 *2	Machine diagnosis data oscillation frequency(motor is operating)	-
MD10 *2	Machine diagnosis data vibration level(motor is operating)	-
MD11	Machine diagnosis data rated speed	-

\*1 While the servo amplifier is estimating the corresponding machine status in the machine diagnosis, do not write data to the parameters of the servo amplifier from another GOT.

Doing so may cause the servo amplifier to malfunction.

\*2 When MD2 indicates that the servo amplifier does not complete the machine diagnosis (is estimating or warning of the machine status), do not monitor MD3 to MD6 (friction states) and MD7 to MD10 (vibration/oscillation states).

To start monitoring those devices upon the estimation completion, set [Trigger] in the applicable object settings.

• One-touch tuning data

Virtual device name	Item	Symbol
OTS0	One-touch tuning status confirmation	-
OTS1	Error code list	-
OTS2	Setting time	-

Virtual device name	Item	Symbol
OTS3	Overshoot amount	-

- External input

Virtual device name	Item	Symbol
TMO0	Forced output from signal pin	-

- Set data (for test operation)

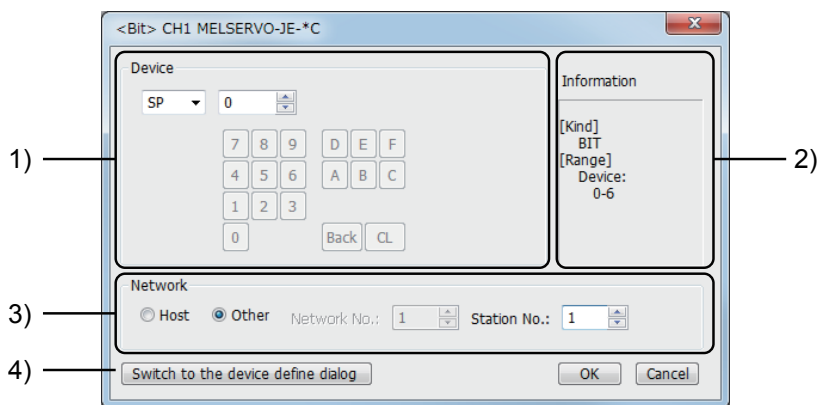

Virtual device name	Item	Symbol
TMD0	Writes the speed(test mode)	-
TMD1	Writes the acceleration/deceleration time constant (test mode)	-
TMD3	Writes the moving distance (test mode)	-

## 19 [MELSERVO-JE-\*C]

- (1) Device setting dialog
- (2) Device range

### (1) Device setting dialog

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[Host]	Monitors the controller set as the host station.
[Other]	Monitors the controller set as a different station. After selecting the item, set the station number of the controller to be monitored.

#### 4) [Switch to the device definition screen] button

Displays the device definition setting dialog.

- 6.1.5 ■ 6 Device definition setting dialog

## (2) Device range

For details of parameters, refer to the following manual.

→ Manual of the servo amplifier used

○ : Available, × : Unavailable

Virtual device name *2		Setting range	EG device*6	MX Component*6	Device No. representation
Bit device	Servo amplifier request (SP) *5	SP0 to SP6	×	×	Decimal number
	Operation mode selection (OM) *5	OM0 to OM2 OM4 to OM5	×	×	
	Instruction demand (for test operation) (TMB) *5	TMB1 to TMB6	×	×	
	One-touch tuning instruction (OTI) *5	OTI0 to OTI5	×	×	
Word device	Basic setting parameter(PA) *1	PA1 to PA32 PA1001 to PA1032	○	×	Decimal number
	Gain filter parameter (PB) *1	PB1 to PB64 PB1001 to PB1064	○	×	
	Extension setting parameter(PC) *1	PC1 to PC80 PC1001 to PC1080	○	×	
	I/O setting parameter (PD) *1	PD1 to PD48 PD1001 to PD1048	○	×	
	Extension setting No.2 parameter (PE) *1	PE1 to PE64 PE1001 to PE1064	○	×	
	Extension setting No.3 parameter (PF) *1	PF1 to PF48 PF1001 to PF1048	○	×	
	Positioning control parameters (PT) *1	PT1 to PT80 PT1001 to PT1080	○	×	
	Network setting parameters (PN) *1	PN1 to PN48 PN1001 to PN1048	×	×	
	Status display (ST) *3	ST0 to ST48	○	×	
	Alarm (AL)*3	ALM0 to ALM1 ALM11 to ALM59 ALM200 to ALM215 ALM220 to ALM235 ALM240 to ALM255	○	×	
	Machine diagnosis data (MD) *3	MD0 to MD11	×	×	
	One-touch tuning data (OTS) *3	OTS0 to OTS3	×	×	
	External input (DI) *4	DI0 to DI6	×	×	
External output (DO) *3	DO0 to DO4	×	×		
Double-word device	Current position latch data (LD) *3	LD0 to LD1	×	×	Decimal number
	General-purpose register (Rx) (RR) *1	RR1 to RR4 RR1001 to RR1004	×	×	
	General-purpose register (Dx) (RD)	RD1 to RD4	×	×	
	Life Diagnosis (ALD) *3	ALD0 to ALD1	×	×	
	Input signal for test operation (for test operation) (TMI) *5	TMI0 to TMI2	×	×	
	Forced output of signal pin (for test operation) (TMO) *5	TMO0	×	×	
	Set data (for test operation) (TMD) *5	TMD0 to TMD1 TMD3	×	×	

\*1 Use 1 to 80 of PA, PB, PC, PD, PE, PF, PT, PN, and RR when the GOT writes data to RAM of a servo amplifier.

Use 1001 to 1080 of PA, PB, PC, PD, PE, PF, PT, PN, and RR when the GOT writes data to E2PROM of a servo amplifier.

\*2 The GOT cannot read or write data from or to consecutive devices.

\*3 The GOT can only read data from the device.

\*4 Only reading is available for DI0 to DI3.

Only double-word data is writable to DI4 to DI6.

\*5 The GOT can only write data to the device.

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 →10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the precautions for SP, OM, TMB, TMI, TMO and TMD devices.

**(a) Bit device**

Only writing is possible.

[Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

**(b) Word device and double-word device**

Only writing is possible.

Numerical input cannot be used.

Use a word switch for writing.

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data.

• Servo amplifier request

Virtual device name	Item	Symbol
SP0	Status display data clear	-
SP1	Current alarm clear	-
SP2	Alarm history clear	-
SP3	External input signal prohibited	-
SP4	External output signal prohibited	-
SP5	External input signal resumed	-
SP6	External output signal resumed	-

• Operation mode selection

Virtual device name	Item	Symbol
OM0	Normal mode (not test operation mode)	-
OM1	JOG operation	-
OM2	Positioning operation	-
OM4	Output signal (DO) forced output	-
OM5	Single-step feed operation	-

• Instruction demand (for test operation)

Virtual device name	Item	Symbol
TMB1	Temporary stop command	-
TMB2	Test operation (positioning operation) start command.	-
TMB3	Forward rotation direction	-
TMB4	Reverse rotation direction	-
TMB5	Restart for remaining distance	-
TMB6	Remaining distance clear.	-

• One-touch tuning instruction

Virtual device name	Item	Symbol
OT10	One-touch tuning start command (Basic mode)	-
OT11	One-touch tuning start command (High mode)	-
OT12	One-touch tuning start command (Low mode)	-
OT13	One-touch tuning stop command	-
OT14	Return to initial value	-
OT15	Return to value before adjustment	-

• Basic setting parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PA1, PA1001	Operation mode	*STY
PA2, PA1002	Regenerative option	*REG
PA3, PA1003	Absolute position detection system	*ABS
PA4, PA1004	Function selection A-1	*AOP1
PA5, PA1005	Number of command input pulses per revolution	*FBP
PA6, PA1006	Electronic gear numerator	*CMX
PA7, PA1007	Electronic gear denominator	*CDV
PA8, PA1008	Auto tuning mode	ATU
PA9, PA1009	Auto tuning response	RSP
PA10, PA1010	In-position range	INP
PA11, PA1011	Forward rotation torque limit	TLP
PA12, PA1012	Reverse rotation torque limit	TLN
PA13, PA1013	Command pulse input form	*PLSS
PA14, PA1014	Rotation direction selection	*POL
PA15, PA1015	Encoder output pulses	*ENR
PA16, PA1016	Encoder output pulses 2	*ENR2
PA17 to PA18, PA1017 to PA1018	For manufacturer setting	-
PA19, PA1019	Parameter writing inhibit	*BLK
PA20, PA1020	Tough drive setting	*TDS
PA21, PA1021	Function selection A-3	*AOP3
PA22, PA1022	For manufacturer setting	-
PA23, PA1023	Drive recorder arbitrary alarm trigger setting	DRAT
PA24, PA1024	Function selection A-4	AOP4
PA25, PA1025	One-touch tuning - Overshoot permissible level	OTHOV
PA26, PA1026	Function selection A-5	*AOP5
PA27, PA1027	For manufacturer setting	-
PA28, PA1028	Function selection A-6	*AOP6
PA29 to PA32, PA1029 to PA1032	For manufacturer setting	-

\*1 For the parameters prefixed by an asterisk (\*), setting becomes effective when the power is turned off once and back on after setting the parameter data.

• Gain filter parameter

Virtual device name	Item	Symbol <sup>*1</sup>
PB1, PB1001	Adaptive tuning mode (adaptive filter II)	FILT

MD8 <sup>*2</sup>	Machine diagnosis data vibration level(motor is stopped)	-
MD9 <sup>*2</sup>	Machine diagnosis data oscillation frequency(motor is operating)	-
MD10 <sup>*2</sup>	Machine diagnosis data vibration level(motor is operating)	-

Virtual device name	Item	Symbol
MD11	Machine diagnosis data rated speed	-

\*1 While the servo amplifier is estimating the corresponding machine status in the machine diagnosis, do not write data to the parameters of the servo amplifier from another GOT.

Doing so may cause the servo amplifier to malfunction.

\*2 When MD2 indicates that the servo amplifier does not complete the machine diagnosis (is estimating or warning of the machine status), do not monitor MD3 to MD6 (friction states) and MD7 to MD10 (vibration/oscillation states).

To start monitoring those devices upon the estimation completion, set [Trigger] in the applicable object settings.

(1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

1) [Device]

Set the device name, device number, and bit number.  
The bit number can be set only when a word device is specified with a bit.

2) [Information]

Displays the type and setting range of the device selected in [Device].

3) [Network]

Set the monitor target of the set device.

Item	Description
[Station No.]	Monitors the inverter of the specified station No. The following shows the setting range. • [0] to [31] To monitor the Inverter of the specified station No. • [100] to [115] Specifies the station No. of the inverter to be monitored by the value of GOT data register (GD). <sup>*1</sup>

\*1 The following shows the relationship between the station No. of the inverter and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [31] (If a value outside the range above is set, a device range error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

#### 4) [Switch to the device definition screen] button

Displays the device definition setting dialog.

→6.1.5 ■ 6 Device definition setting dialog

#### (2) Device range

#### Inverter data

For details of parameters, refer to the following manual.

→Manual of the inverter used

○ : Available, ×: Unavailable

Virtual device name		Setting range	EG device <sup>*6</sup>	MX Component <sup>*6</sup>	Device No. representation
Bit device	Inverter status monitor(RS) <sup>*3</sup>	0-0 RS0 to 0-31 RS15 0-100 RS0 to 0-115 RS15	×	×	Decimal number
	Run command (WS) <sup>*4*5</sup>	0-0 WS0 to 0-31 WS15 0-100 WS0 to 0-115 WS15	×	×	
Word device	Alarm definition (A) <sup>*2*3</sup>	0-0 A0 to 0-31 A7 0-100 A0 to 0-115 A7	○	×	Decimal number
	Parameter (Pr) <sup>*1*2</sup>	0-0 Pr0 to 0-31 Pr1500 0-100 Pr0 to 0-115 Pr1500	○	×	
	Programmed operation (PG) <sup>*1*2</sup>	0-0 PG0 to 0-31 PG89 0-100 PG0 to 0-115 PG89	○	×	
	Special parameter (SP) <sup>*2*4*5</sup>	0-0 SP108 to 0-31 SP127 0-100 SP108 to 0-115 SP127	○	×	

\*1 Specify a PG device (Programmed operation) or Pr device (Parameter).

Do not specify PG devices (PG0 to PG89) and Pr devices (Pr900 to Pr905) together on one screen.

\*2 Only 16-bit (1-word) specification is allowed.

\*3 The GOT can only read data from the device.

\*4 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the multispeed operation (W3 to W7, SP121, SP122) cannot be used.

For using the multi-speed operation, follow either of the operations below.

- Connect the GOT to the RS-485 terminal and set the operation mode to the NET operation mode (Computer link operation mode), and then operate the inverter.

- Change the motor speed with the set frequency (SP109, SP110), and then operate the inverter with the forward or reverse rotation (WS1, WS2, SP121, SP122).

\*5 Only writing is possible for WS devices.

More than one WS cannot turn on at once. (Except the turned on WS device, the other WS devices turn off.)

The bits of SP122 (word device) are assigned to WS0 to WS7, and the bits of SP121 (word device) are assigned to WS8 to WS15.

When more than one WS turns on at once, convert the values for the bit devices that are assigned to the word device into values for the word device. Write the converted values into SP122 or SP121.

- Setting High speed operation command (WS5), Middle speed operation command (WS4), and Low speed operation command (WS3)

To set WS5, WS4, or WS3, write an appropriate value to virtual device SP122.

As shown in the figure below, operation modes are assigned to each bit of SP122.

The following shows an example for Forward rotation command (WS1) and Low speed operation command (WS3).

Write 1 to the bits (corresponding to WS1 and WS3) of SP122.

In this example, SP122 must store 000AH.

Convert 000AH to a decimal value (10), and then write 10 to SP122.

- Setting the JOG operation command (WS8), Selection of automatic restart after instantaneous power failure command (WS9), Start self-holding selection command (WS10), and Reset command (WS11)

To set WS8, WS9, WS10, or WS11, write an appropriate value to virtual device SP121.

As shown in the figure below, operation modes are assigned to each bit of SP121.

The following shows an example of setting the Reset command (WS11)

Write 1 to the bit (corresponding to WS11) of SP121.

In this example, SP121 must store 0800H.

Convert 0800H to a decimal value (2048), and then write 2048 to SP121.

When using a WS device, [Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

The following shows the correspondences between the virtual devices used in the GOT and the inverter data.

### (a) Inverter status monitor

The settable devices differ according to the inverter used.  
For the settable devices of each inverter, refer to the following.

⇒Manual of the inverter used

Example) When using the FR-A700 series

Virtual device name	Description <sup>*1</sup>
RS0	Inverter running (RUN)
RS1	Forward rotation (STF)
RS2	Reverse rotation (STR)
RS3	Up to frequency (SU)
RS4	Overload (OL)
RS5	Instantaneous power failure (IPF)
RS6	Frequency detection (FU)
RS7	Alarm occurrence
RS15	Alarm occurrence

\*1 The parameters may be changed for the inverter.

To use the devices, check the parameters and set the parameters as required.

⇒Manual of the inverter used

### (b) Run command

The settable devices differ according to the inverter used.  
For the settable devices of each inverter, refer to the following.

⇒Manual of the inverter used

Example) When using the FR-A700 series

Virtual device name	Description <sup>*1</sup>
WS0	Current input selection (AU)
WS1	Forward rotation (STF)
WS2	Reverse rotation (STR)
WS3	Low speed operation (RL) (Current input selection (AU) for FR-F500 series)
WS4	Middle speed operation (RM)
WS5	High speed operation (RH)
WS6	Second function selection (RT)
WS7	Output stop (MRS)
WS8 <sup>*2</sup>	JOG operation (JOG)
WS9 <sup>*2</sup>	Selection of automatic restart after instantaneous power failure (CS)
WS10 <sup>*2</sup>	Start self-holding selection (STOP)
WS11 <sup>*2</sup>	Reset (RES)

\*1 The parameters may be changed for the inverter.

To use the devices, check the parameters and set the parameters as required.

⇒Manual of the inverter used

\*2 Write a value to parameter Pr.185, Pr.186, Pr.188, or Pr.189 that corresponds to a signal within parentheses.

Doing so issues the corresponding run command (WS8 to WS11).

For the details of the inverter parameters, refer to the following.

⇒Manual of the inverter used

### (c) Alarm definition

Virtual device name <sup>*1</sup>	Description
A0	Second alarm in past
A1	Latest alarm
A2	Fourth alarm in past
A3	Third alarm in past
A4	Sixth alarm in past

Virtual device name *1	Description
A5	Fifth alarm in past
A6	Eighth alarm in past
A7	Seventh alarm in past

\*1 Only reading is possible for A0 to A7.

These devices cannot be used for a write object (numerical input and others.).

#### (d) Parameters

The numbers of virtual devices for inverter (parameter (Pr)), used by GOT, correspond to the inverter parameter numbers. For the inverter parameters, refer to the following.

→ Manual of the inverter used

#### Point

##### (1) When setting [8888] or [9999] to inverter parameter (Pr)

Values 8888 and 9999 are used for particular purposes.

To set these values to inverter parameters using the virtual devices, specify the following values for the virtual devices.

Setting at inverter	Value to be set at GOT
8888	65520
9999	65535

##### (2) Precautions for specifying Pr900 to Pr933 (Calibration parameter), or Pr934 and Pr935 (PID display)

If you specify Pr900 to Pr933 (Calibration parameter), or Pr934 and Pr935 (PID display), whether the value below must be written to SP108 (Second parameter changing) depends on the specified device number and inverter model.

Value to be written to SP108	Description
H00	Offset/gain
H01	Analog
H02	Analog value at terminal

#### (e) Program operation

The virtual devices below correspond to the parameters (Pr.201 to Pr.230) of the FR-A500 series.

Virtual device name	Description
PG0 to PG9	Program set 1 (running frequency)
PG10 to PG19*1	Program set 1 (time)
PG20 to PG29	Program set 1 (rotation direction)
PG30 to PG39	Program set 2 (running frequency)
PG40 to PG49*1	Program set 2 (time)
PG50 to PG59	Program set 2 (rotation direction)
PG60 to PG69	Program set 3 (running frequency)
PG70 to PG79*1	Program set 3 (time)
PG80 to PG89	Program set 3 (rotation direction)

\*1 To set the start time (PG10 to PG19, PG40 to PG49, PG70 to PG79), set hour or minute in the upper 8 bits, and minute or second in the lower 8 bits.

Example) To set 13 hour 35 minute

Time to be set	13 H	35 M	Remarks
Convert hour and minute into hexadecimal.	H0D	H23	Hexadecimal (HEX)
Combine upper and lower 8-bit values.	Input H0D23 or 3363.		-

## (f) Special parameters

If the GOT reads or writes data from or to a virtual device (SP), the inverter's instruction code corresponding to the SP device is used for communication.

For instruction details, and values to be read and written, refer to the following.

⇒Manual of the inverter used

Virtual device name	Description	Instruction code	
		Read	Writing
SP108	Second parameter changing	6CH	ECH
SP109*1	Set frequency (RAM)	6DH	EDH
SP110*1	Set frequency (RAM, EEPROM)	6EH	EEH
SP111*1	Output frequency	6FH	-
SP112	Output current	70H	-
SP113	Output voltage	71H	-
SP114	Special monitor	72H	-
SP115	Special monitor selection No.	73H	F3H
SP116	Alarm definition all clear	-	F4H
	Latest alarm, second alarm in past	74H	-
SP117	Third alarm in past, fourth alarm in past	75H	-
SP118	Fifth alarm in past, sixth alarm in past	76H	-
SP119	Seventh alarm in past, eighth alarm in past	77H	-
SP121	Inverter status monitor (extended)	79H	F9H
	Run command (extend)		
SP122	Inverter status monitor	7AH	-
	Run command	-	FAH
SP123	Operation mode	7BH	FBH
SP124	All parameter clear	-	FCH
SP125	Inverter reset	-	FDH
SP127	Link parameter extended setting	7FH	FFH

\*1 GOT cannot monitor SP109 to SP111 if the conditions below are satisfied at the same time.

(Only FR-E500/S500(E)/F500J/D700/F700PJ/E700 series)

- Pr37 ≠ 0
- SP127 = 1

\*2 Only reading is possible for SP111 to SP114.

These devices cannot be used for write objects (such as numerical input).

\*3 Only writing is possible for SP124 and SP125.

These devices cannot be used for read object.

\*4 If the GOT is connected to the PU port of the FR-A500/E500/F500 (excluding the FR-F500J), the connected inverter is in the external operation mode at power-on.

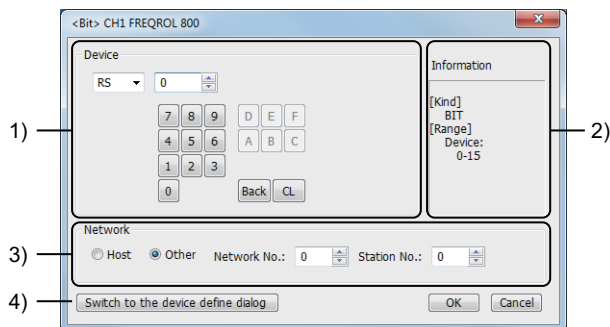

To change parameters from the GOT, change the value of SP123 to 2 (PU operation mode) in advance.

■ 21 [FREQROL 800]

- ⇒ (1) Device setting dialog
- (2) Device range

(1) Device setting dialog

1) [Device]

Set the device name, device number, and bit number.  
The bit number can be set only when a word device is specified with a bit.

2) [Information]

Displays the type and setting range of the device selected in [Device].

3) [Network]

Set the monitor target of the set device.

Item	Description
[Host]	Select this item to monitor the station connected with the GOT.
[Other]	Select this when monitoring other controller. Then, set the station number and network number of the controller to be monitored. The setting range differs depending on the connection type. For the serial communication connection • [Network No.]: Not required • [Station No.]: [0] to [31]: Monitors the inverter having the specified station number. [100] to [115]: Specifies the station number of the inverter to be monitored by the value of the GOT data register (GD). <sup>*1</sup> For the Ethernet connection • [Network No.]: [1] to [239] • [Station No.]: [1] to [120]

\*1 The following shows the relationship between the station number of the inverter and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [31] (If a value outside the range above is set, a device range error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

4) [Switch to the device definition screen] button

Displays the device definition setting dialog.  
⇒ 6.1.5 ■ 6 Device definition setting dialog

## (2) Device range

### Point

#### Inverter data

For details of parameters, refer to the following manual.

→ Manual of the inverter used

○ : Available, × : Unavailable

Virtual device name		Setting range	EG device *6	MX Component *6	Device No. representation	
Bit device	Inverter status monitor(RS) *2	0-0 RS0 to 0-31 RS15 0-100 RS0 to 0-115 RS15	×	×	Decimal number	
	Run command (WS) *3*4	0-0 WS0 to 0-31 WS15 0-100 WS0 to 0-115 WS15	×	×		
	Input (X)	0-0 X00 to 0-31 X7F 0-100 X00 to 0-115 X7F	○	○	Hexadecimal number	
	Output (Y)	0-0 Y00 to 0-31 Y7F 0-100 Y00 to 0-115 Y7F	○	○		
	Internal relay (M)	0-0 M0 to 0-31 M127 0-100 M0 to 0-115 M127	○	○	Decimal number

Special data register (SD)	0-0 SD0 to 0-31 SD2047 0-100 SD0 to 0-115 SD2047	○	○			

\*1 Only 16-bit (1-word) specification is allowed.

\*2 The GOT can only read data from the device.

\*3 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the multispeed operation (W3 to W7, SP121, SP122) cannot be used.

For using the multi-speed operation, follow either of the operations below.

- Connect the GOT to the RS-485 terminal and set the operation mode to the NET operation mode (Computer link operation mode), and then operate the inverter.
- Change the motor speed with the set frequency (SP109, SP110), and then operate the inverter with the forward or reverse rotation (WS1, WS2, SP121, SP122).

\*4 Only writing is possible for WS devices.

More than one WS cannot turn on at once. (Except the turned on WS device, the other WS devices turn off.)

The bits of SP122 (word device) are assigned to WS0 to WS7, and the bits of SP121 (word device) are assigned to WS8 to WS15.

When more than one WS turns on at once, convert the values for the bit devices that are assigned to the word device into values for the word device. Write the converted values into SP122 or SP121.

- Setting High speed operation command (WS5), Middle speed operation command (WS4), and Low speed operation command (WS3)

To set WS5, WS4, or WS3, write an appropriate value to virtual device SP122.

As shown in the figure below, operation modes are assigned to each bit of SP122.

The following shows an example for Forward rotation command (WS1) and Low speed operation command (WS3).

Write 1 to the bits of device SP122 that correspond to the Forward rotation command (WS1) and Low speed operation command (WS3).

In this example, device SP122 must store 000AH.

Convert 000AH to a decimal value (10), and then write 10 to device SP122.

- Setting the JOG operation command (WS8), Selection of automatic restart after instantaneous power failure command (WS9), Start self-holding selection command (WS10), and Reset command (WS11)

When setting the above commands, write values to device SP121 as necessary.

As shown in the figure below, each operation mode is assigned to a bit of device SP121.

The following shows an example of setting the Reset command (WS11).

Write 1 to the bit (corresponding to WS11) of SP121.

In this example, SP121 must store 0800H.

Convert 0800H to a decimal value (2048), and then write 2048 to SP121.

When using a WS device, [Alternate] of a bit switch cannot be used.

Use [Momentary], [Set], and [Reset] for bit switch actions.

\*5 The SM device cannot be specified as a word device.

For the applicable SM devices, refer to the following.

⇒ A800 PLC FUNCTION PROGRAMMING MANUAL

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*7 The word specification of bit devices is not available.

The following shows the correspondences between the virtual devices used in the GOT and the inverter data.

#### Inverter status monitor

Virtual device name	Description <sup>*1</sup>
RS0	RUN (Inverter running)
RS1	During forward rotation
RS2	During reverse rotation
RS3	SU (Up to frequency)
RS4	OL (Overload warning)
RS5	IPF (Instantaneous power failure/undervoltage)
RS6	FU (Output frequency detection)
RS7	ABC1 (Fault)
RS8	ABC2
RS9	Safety monitor output
RS15	Fault occurrence

<sup>\*1</sup> The parameters may be changed for the inverter.

To use the devices, check the parameters and set the parameters as required.

⇒ Manual of the inverter used

#### Run command

Virtual device name	Description <sup>*1</sup>
WS0	AU (Terminal 4 input selection)
WS1	Forward rotation command
WS2	Reverse rotation command
WS3	RL (Low-speed operation command)
WS4	RM (Middle-speed operation command)
WS5	RH (High-speed operation command)
WS6	RT (Second function selection)
WS7	MRS (Output stop)
WS8 <sup>*2</sup>	JOG (Jog operation selection)
WS9 <sup>*2</sup>	CS (Selection of automatic restart after instantaneous power failure , flying start)
WS10 <sup>*2</sup>	STOP (Start self-holding selection)
WS11 <sup>*2</sup>	RES (Inverter reset)

<sup>\*1</sup> The parameters may be changed for the inverter.

To use the devices, check the parameters and set the parameters as required.

⇒ Manual of the inverter used

<sup>\*2</sup> Write a value to parameter Pr.185, Pr.186, Pr.188, or Pr.189 that corresponds to a signal within parentheses.

Doing so issues the corresponding run command (WS8 to WS11).

For the details of the inverter parameters, refer to the following.

⇒ Manual of the inverter used

#### Alarm definition

Virtual device name	Description
A0 <sup>*1</sup>	Second alarm in past
A1 <sup>*1</sup>	Latest alarm
A2 <sup>*1</sup>	Fourth alarm in past
A3 <sup>*1</sup>	Third alarm in past
A4 <sup>*1</sup>	Sixth alarm in past
A5 <sup>*1</sup>	Fifth alarm in past
A6 <sup>*1</sup>	Eighth alarm in past

Virtual device name	Description
A7 *1	Seventh alarm in past

\*1 Only reading is possible.

## Parameters

The following shows the correspondences between the virtual devices used in the GOT and the servo amplifier data. For the inverter parameters, refer to the following.

→ Manual of the inverter used

### Point

#### (1) When setting [8888] or [9999] to inverter parameter (Pr)

Values 8888 and 9999 are used for particular purposes.

To set these values to inverter parameters using the virtual devices, specify the following values for the virtual devices.

Setting at inverter	Value to be set at GOT
8888	65520
9999	65535

#### (2) Precautions for specifying LPr900 to LPr933 (Calibration parameter), or LPr934 and LPr935 (PID display)

If you specify LPr900 to LPr933 (Calibration parameter), or LPr934 and LPr935 (PID display), whether the value below must be written to SP108 (Second parameter changing) depends on the specified device number and inverter model.

Value to be written to SP108	Description
H00	Offset/gain
H01	Analog
H02	Analog value at terminal

## Special parameters

If the GOT reads or writes data from or to a virtual device (SP), the inverter's instruction code corresponding to the SP device is used for communication.

For instruction details, and values to be read and written, refer to the following.

→ Manual of the inverter used

Virtual device name	Description	Instruction code	
		Read	Writing
SP108	Second parameter changing	6CH	ECH
SP109	Set frequency (RAM)	6DH	EDH
SP110	Set frequency (RAM, EEPROM)	6EH	EEH
SP111 *1	Output frequency/speed	6FH	-
SP112 *1	Output current	70H	-
SP113 *1	Output voltage	71H	-
SP114 *1	Special monitor	72H	-
SP115	Special monitor selection No.	73H	F3H
SP116	Alarm definition all clear	-	F4H
	Latest alarm, second alarm in past	74H	-
SP117 *1	Third alarm in past, fourth alarm in past	75H	-
SP118 *1	Fifth alarm in past, sixth alarm in past	76H	-
SP119 *1	Seventh alarm in past, eighth alarm in past	77H	-
SP121	Inverter status monitor (extended)	79H	F9H
	Run command (extend)		

Virtual device name	Description	Instruction code	
		Read	Writing
SP122	Inverter status monitor	7AH	-
	Run command	-	FAH
SP123	Operation mode	7BH	FBH
SP124 *2	All parameter clear	-	FCH
SP125 *2	Inverter reset	-	FDH
SP127	Link parameter extended setting	7FH	FFH

\*1 Only reading is possible.

\*2 Only writing is possible.

### Point

#### If the automatic connection fails

When [Automatic Negotiation] is set to [Yes] in the GOT communication settings, the inverter parameters are reconfigured within the user-specified negotiation time.

If the automatic connection fails, set the longer negotiation time with GT Designer3 or the utility.

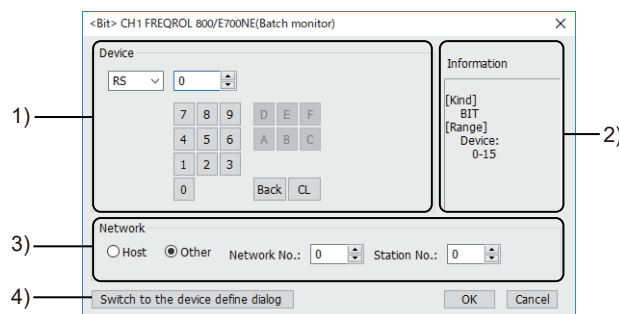

## 22 [FREQR0L 800/E700NE(Batch monitor)]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog  
(2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

[Setting items (for calibration parameters)] is settable only when a parameter (32-bit) in the range of LPr900 to LPr935 is specified.

The following shows selectable items.

- [Bias/gain value]
- [Analog input value]

When LPr900 or LPr901 (Calibration parameter) is specified, selecting [Bias/gain value] or [Analog input value] does not affect the display on the object.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[Host]	Monitors the controller set as the host station.

Item	Description
[Other]	<p>Monitors the controller set as a different station.            Select this item, and specify the station number and network number of a controller to be monitored.            The following shows the setting ranges.</p> <ul style="list-style-type: none"> <li>• [Network No.]: [1] to [239]</li> <li>• [Station No.]: [1] to [120]</li> </ul>

#### 4) [Switch to the device definition screen] button

Displays the device definition setting dialog.

→6.1.5 ■ 6 Device definition setting dialog

## (2) Device range

### Inverter data

For details of parameters, refer to the following manual.

→Manual of the inverter used

○ : Available, ×: Unavailable

Virtual device name	Setting range	EG device *6	MX Component *6	Device No. representation	
Bit device	Inverter status monitor(RS) *2*9	0-0 RS0 to 0-31 RS15 0-100 RS0 to 0-115 RS15	×	×	Decimal number

	Timer current value (TN)	0-0 TN0 to 0-31 TN15 0-100 TN0 to 0-115 TN15	○	○	
	Counter current value (CN)	0-0 CN0 to 0-31 CN15 0-100 CN0 to 0-115 CN15	○	○	
	Retentive timer current value (SN)	0-0 SN0 to 0-31 SN15 0-100 SN0 to 0-115 SN15	○	○	
	Data register (D)	0-0 D0 to 0-31 D255 0-100 D0 to 0-115 D255	○	○	
	Special data register (SD)	0-0 SD0 to 0-31 SD2047 0-100 SD0 to 0-115 SD2047	○	○	
Double-word device	Faults history (AL) *2	AL0 to AL899	×	×	
	Parameters (32-bit) (LPr)	LPr0 to LPr1500	×	×	
	Operation parameters (OP) *10*11	OP0 to OP4	×	×	
	Current value monitor (PV) *2	PV1 to PV143	×	×	

\*1 Only 16-bit (1-word) specification is allowed.

\*2 The GOT can only read data from the device.

\*3 When the GOT is connected to the PU connector and the operation mode is set to the PU operation mode, the multispeed operation (W3 to W7, SP121, SP122) cannot be used.

To use multi-speed operation, change the speed with SP109 or SP110 (Set frequency), and specify the rotation direction of the relevant motor with WS1, WS2, SP121, or SP122.

\*4 Only writing is possible for WS devices.

More than one WS cannot turn on at once. (Except the turned on WS device, the other WS devices turn off.)

The bits of SP122 (word device) are assigned to WS0 to WS7, and the bits of SP121 (word device) are assigned to WS8 to WS15.

When more than one WS turns on at once, convert the values for the bit devices that are assigned to the word device into values for the word device. Write the converted values into SP122 or SP121.

- Setting High speed operation command (WS5), Middle speed operation command (WS4), and Low speed operation command (WS3)

To set WS5, WS4, or WS3, write an appropriate value to virtual device SP122.

As shown in the figure below, operation modes are assigned to each bit of SP122.

The following shows an example for Forward rotation command (WS1) and Low speed operation command (WS3).

Write 1 to the bits (corresponding to WS1 and WS3) of SP122.

In this example, SP122 must store 000AH.

Convert 000AH to a decimal value (10), and then write 10 to SP122.

- Setting the JOG operation command (WS8), Selection of automatic restart after instantaneous power failure command (WS9), Start self-holding selection command (WS10), and Reset command (WS11)

To set WS8, WS9, WS10, or WS11, write an appropriate value to virtual device SP121.

As shown in the figure below, operation modes are assigned to each bit of SP121.

The following shows an example of setting the Reset command (WS11).

- Write 1 to the bit (corresponding to WS11) of SP121.  
 In this example, SP121 must store 0800H.  
 Convert 0800H to a decimal value (2048), and then write 2048 to SP121.  
 When using a WS device, [Alternate] of a bit switch cannot be used.  
 Use [Momentary], [Set], and [Reset] for bit switch actions.
- \*5 Virtual devices (SM) cannot be specified as a word device.  
 For usable SM devices, refer to the following.  
 → A800 PLC FUNCTION PROGRAMMING MANUAL
  - \*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 → 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)
  - \*7 The word specification of bit devices is not available.
  - \*8 Only writing is possible.
  - \*9 The virtual device is also usable for the controller whose type is [FREQROL 500/700/800, SENSORLESS SERVO] or [FREQROL 800].  
 Use the device to maintain compatibility when you change the controller type in a project from any of the above ones to [FREQROL 800(Batch monitor)].  
 When you create a project, use the following virtual devices.
    - I/O terminal monitor (IOST)
    - Operation command (CMD)
    - Faults history (AL)
    - Parameters (32-bit) (LPr)
    - Operation parameters (OP)
    - Current value monitor (PV)
  - \*10 The following devices are initially invalid because the GOT cannot control the devices via a network: CMD8 (Jog operation selection), CMD9 (Selection of automatic restart after instantaneous power failure, flying start), CMD11 (Start self-holding selection), and CMD12 (Inverter reset).  
 Write values to parameters Pr.185, Pr.186, Pr.188, and Pr.189 that correspond to the above virtual devices.  
 Doing so controls CMD8, CMD9, CMD11, and CMD12.
  - \*11 To set CMD8, CMD9, CMD11, or CMD12, write an appropriate value to OP4.  
 As shown in the figure below, operation modes are assigned to each bit of OP4.  
 The following shows an example of setting CMD12 (Inverter reset).

Write 1 to the bit (corresponding to CMD12) of OP4.  
 In this example, OP4 must store 0200H.  
 Convert 0200H to a decimal value (512), and then write 512 to OP4.

The following shows the correspondences between the virtual devices used in the GOT and the inverter data.  
 The settable devices vary by inverter model.

#### Inverter status monitor

Virtual device name	Description *1	
	FR-A800, FR-A800-E, FR-A800-GF, FR-F800, FR-F800-E	FR-E700-NE
RS0	RUN (Inverter running)	
RS1	During forward rotation	
RS2	During reverse rotation	
RS3	SU (Up to frequency)	
RS4	OL (Overload warning)	OL (overload)
RS5	IPF (Instantaneous power failure/undervoltage)	-
RS6	FU (Output frequency detection)	FU (frequency detection)
RS7	ABC1 (Fault)	ABC (fault)
RS8	ABC2	-
RS9	Safety monitor output	-
RS15	Fault occurrence	

\*1 The parameters may be changed for the inverter.  
 To use the devices, check the parameters and set the parameters as required.  
 ⇒ Manual of the inverter used

#### Run command

Virtual device name	Description *1	
	FR-A800, FR-A800-E, FR-A800-GF, FR-F800, FR-F800-E	FR-E700-NE
WS0	AU (Terminal 4 input selection)	AU (current input selection)
WS1	Forward rotation command	
WS2	Reverse rotation command	
WS3	RL (Low-speed operation command)	RL (low speed operation command)
WS4	RM (Middle-speed operation command)	RM (middle speed operation command)
WS5	RH (High-speed operation command)	RH (high speed operation command)

Virtual device name	Description *1	
	FR-A800, FR-A800-E, FR-A800-GF, FR-F800, FR-F800-E	FR-E700-NE
WS6	RT (Second function selection)	
WS7	MRS (Output stop)	
WS8 *2	JOG (Jog operation selection)	-
WS9 *2	CS (Selection of automatic restart after instantaneous power failure , flying start)	-
WS10 *2	STOP (Start self-holding selection)	-
WS11 *2	RES (Inverter reset)	RES (reset)

\*1 The parameters may be changed for the inverter.

To use the devices, check the parameters and set the parameters as required.

⇒Manual of the inverter used

\*2 Write a value to parameter Pr.185, Pr.186, Pr.188, or Pr.189 that corresponds to a signal within parentheses.

Doing so issues the corresponding run command (WS8 to WS11).

For the details of the inverter parameters, refer to the following.

⇒Manual of the inverter used

### Alarm definition

Virtual device name	Description *1	
	FR-A800, FR-A800-E, FR-A800-GF, FR-F800, FR-F800-E	FR-E700-NE
A0 *1	Second alarm in past	First fault in past
A1 *1	Latest alarm	
A2 *1	Fourth alarm in past	Third alarm in past
A3 *1	Third alarm in past	Second alarm in past
A4 *1	Sixth alarm in past	Fifth alarm in past
A5 *1	Fifth alarm in past	Fourth alarm in past
A6 *1	Eighth alarm in past	Seventh alarm in past
A7 *1	Seventh alarm in past	Sixth alarm in past

\*1 Only reading is possible.

### Parameters

The virtual device numbers used in the GOT correspond to the inverter parameter numbers.

For the inverter parameters, refer to the following.

⇒Manual of the inverter used

### Point

#### (1) When setting 8888 or 9999 to a parameter (Pr) or parameter (32-bit) (LPr) of an inverter

Values 8888 and 9999 are used for particular purposes.

To set these values to inverter parameters using the virtual devices, specify the following values for the virtual devices.

Setting at inverter	Setting on the GOT side	
	Virtual device name	Value to be set on the GOT
8888	Pr	65520
	LPr *1	8888
9999	Pr	65535
	LPr *1	9999

\*1 You are recommended to set the data type to [Real] for a parameter that can accept a value with a fractional part.

#### (2) Precautions for specifying a device (Calibration parameter or PID display)

If you specify Pr900 to Pr933 and LPr900 to LPr933 (Calibration parameter), or Pr934, Pr935, LPr934 and LPr935 (PID display), whether the value below must be written to SP108 (Second parameter

changing) depends on the specified device number and inverter model.

Value to be written to SP108	Description
H00	Offset/gain
H01	Analog
H02	Analog value at terminal

### Special parameters

Virtual device name	Description	
	FR-A800, FR-A800-E, FR-A800-GF, FR-F800, FR-F800-E	FR-E700-NE
SP108	Second parameter changing	
SP109	Set frequency (RAM)	
SP110	Set frequency (RAM, EEPROM)	
SP111 *1	Output frequency/speed	Output frequency/speed
SP112 *1	Output current	
SP113 *1	Output voltage	
SP114 *1	Special monitor	
SP115	Special monitor selection No.	
SP116	Alarm definition all clear	Faults history batch clear
	Latest alarm, second alarm in past	Latest fault, First fault in past
SP117 *1	Third alarm in past, fourth alarm in past	Second fault in past, Third fault in past
SP118 *1	Fifth alarm in past, sixth alarm in past	Fourth fault in past, Fifth fault in past
SP119 *1	Seventh alarm in past, eighth alarm in past	Sixth fault in past, Seventh fault in past
SP121	Inverter status monitor (extended) / Operation command (extended)	
SP122	Inverter status monitor / Operation command	
SP123	Operation mode	
SP124 *2	All parameter clear	
SP125 *2	Inverter reset	
SP127	Link parameter extended setting	

\*1 Only reading is possible.

\*2 Only writing is possible.

I/O terminal monitor

PV98	Control circuit temperature	○	○	×

**Point**

**If the automatic connection fails**

When [Automatic Negotiation] is set to [Yes] in the GOT communication settings, the inverter parameters are reconfigured within the user-specified negotiation time.

If the automatic connection fails, set the longer negotiation time with GT Designer3 or the utility.

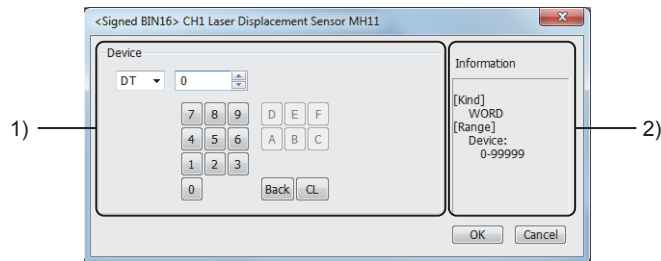

**23 [Laser Displacement Sensor MH11]**

Only available to GT2104-PMBDS2.

- (1) Device setting dialog
- (2) Device range

**(1) Device setting dialog**

**1) [Device]**

Set the device name, device number, and bit number.

The bit number can be set when a word device is specified with a bit.

**2) [Information]**

Displays the type and setting range of the device selected in [Device].

**(2) Device range**

○ : Available, ×: Unavailable

Device name		Setting range	EG device*1	MX Component*1	Device No. representation
Bit device	Internal relay (R)	R0000 to R999F	○	○	Decimal + Hexadecimal
Word device	Data (DT)	DT0 to DT99999	○	○	Decimal number
	Internal relay (WR)	WR000 to WR999	○	○	

\*1 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

For the internal relay (R), set the device number by specifying a word address (decimal) and a bit address (hexadecimal).

## 12.2.3 IAI equipment

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ➔ ■ 1 [IAI ROBO CYLINDER]
- 2 [IAI X-SEL Controller]

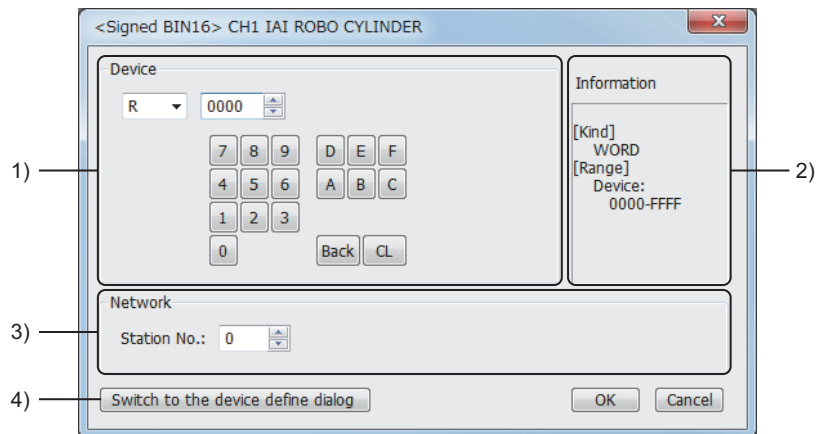

### ■ 1 [IAI ROBO CYLINDER]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ➔ (1) Device setting dialog
- (2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the station No. of the destination controller for monitoring.

Item	Description
[Station No.]	<p>The GOT monitors the robo cylinder with the specified station No. The following shows the setting range.</p> <ul style="list-style-type: none"> <li>• [0] to [15]: Specify the station No. of the robo cylinder to be monitored.</li> <li>• [100] to [115]: With the value of the GOT data register (GD), specify the station No. of the robo cylinder to be monitored.*1</li> </ul>

\*1 The following shows the relationship between the station No. of the robo cylinder and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [15] (If a value out of the range above is set, a timeout error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

#### 4) [Switch to the device definition screen] button

Displays the device definition setting dialog.

- ➔ 6.1.5 ■ 6 Device definition setting dialog

## (2) Device range

○ : Available, ×: Unavailable

Device name		Setting range	EG device <sup>*1</sup>	MX Component <sup>*1</sup>	Device No. representation
Bit device	Status (S)	S0000 to SFFFF	○	○ <sup>*2</sup>	Hexadecimal number
	Bit-specified word device	Setting range of each word device	Refer to each word device.		-
Word device	Registers (R)	R0000 to RFFFF	○	○	Hexadecimal number

\*1 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 → 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*2 The word specification of bit devices is not available.

### (a) Status (S)

The following shows the status settings and the definitions.

Status	Definition	Symbol
0000 to 00FF	- (Reserved for the system)	-
0100	EMG status	EMGS
0101	Safety speed enabled status	SFTY
0102	Controller ready status	PWR
0103	Servo ON status	SV
0104	Missed work in push-motion operation	PSFL
0105	Major failure status	ALMH
0106	Minor failure status	ALML
0107	Absolute error status	ABER
0108	Brake forced-release status	BKRL
0109	Use prohibited	-
010A	Pause status	STP
010B	Home return status	HEND
010C	Positioning completion status	PEND
010D to 010F	Use prohibited	-
0110	Use prohibited	-
0111	Use prohibited	-
0112	Load output judgment status	LOAD
0113	Torque level status	TRQS
0114	Teaching mode status	MODS
0115	Position-data load command status	TEAC
0116	Jog + status	JOG+
0117	Jog - status	JOG-
0118	Completed position 7	PE7
0119	Completed position 6	PE6
011A	Completed position 5	PE5
011B	Completed position 4	PE4
011C	Completed position 3	PE3
011D	Completed position 2	PE2
011E	Completed position 1	PE1
011F	Completed position 0	PE0
0120	Emergency stop status	EMGP

Status	Definition	Symbol
0121	Motor voltage low status	MPUV
0122	Operation mode status	RMDS
0123	Use prohibited	-
0124	Home returning status	GHMS
0125	Push-motion operation in progress	PUSH
0126	Excitation detection status	PSNS
0127	PIO/Modbus switching status	PMSS
0128	Use prohibited	-
0129	Use prohibited	-
012A	Moving signal	MOVE
012B to 012F	Use prohibited	-
0130 to 0136	Use prohibited	-
0137	Completed position number status bit 256	PM256
0138	Completed position number status bit 128	PM128
0139	Completed position number status bit 64	PM64
013A	Completed position number status bit 32	PM32
013B	Completed position number status bit 16	PM16
013C	Completed position number status bit 8	PM8
013D	Completed position number status bit 4	PM4
013E	Completed position number status bit 2	PM2
013F	Completed position number status bit 1	PM1
0140	Use prohibited	-
0141	Limit sensor output monitor 2	LS2
0142	Limit sensor output monitor 1	LS1
0143	Limit sensor output monitor 0	LS0
0144 to 0146	Use prohibited	-
0147	Position zone output monitor	ZP
0148 to 014D	Use prohibited	-
014E	Zone output monitor 2	Z2
014F	Zone output monitor 1	Z1
0150 to 015F	PIO connector pin number 20A(IN15) to PIO connector pin number 5A(IN0)	-
0160 to 016F	PIO connector pin number 16B(OUT15) to PIO connector pin number 1B(OUT0)	-
0170	Use prohibited	-
0171	Command pulse NP signal status	NP
0172	Use prohibited	-
0173	Command pulse PP signal status	PP
0174 to 0175	Use prohibited	-
0176	Use prohibited	-
0177	Mode switch status	MDSW
0178	Use prohibited	-
0179 to 017B	Use prohibited	-
017C	Home-check sensor monitor	HMCK
017D	Overtravel sensor	OT
017E	Creep sensor	CREP
017F	Limit sensor	LS
0180 to 03FF	- (Reserved for the system)	-

Status	Definition	Symbol

043A	Position command bit 32	PC32
043B	Position command bit 16	PC16
043C	Position command bit 8	PC8
043D	Position command bit 4	PC4
043E	Position command bit 2	PC2
043F	Position command bit 1	PC1
0440 to FFFF	-(Reserved for the system)	-

**(b) Registers (R)**

The following shows the register settings and the definitions.

Registers	Definition	Symbol
0000 to 0CFF	- (Reserved for the system)	-
0D00	Device control register 1	DRG1
0D01	Device control register 2	DRG2
0D03	Position number specification register	POSR
0D04 to 0FFF	- (Reserved for the system)	-
1000 to 3FFF	Target position	PCMD
	Positioning band	INP
	Speed command	VCMD
	Individual zone boundary +	ZNMP
	Individual zone boundary -	ZNLP
	Acceleration command	ACMD
	Deceleration command	DCMD
	Push-current limiting value	PPOW
	Load current threshold	LPOW
	Control flag specification	CTLF
4000 to 8FFF	- (Reserved for the system)	-
9000	Current position monitor	PNOW
9002	Present alarm code query	ALMC
9003	Input port query	DIPM
9004	Output port monitor query	DOPM
9005	Device status 1 query	DSS1
9006	Device status 2 query	DSS2
9007	Expanded device status query	DSSE
9008	System status query	STAT
900A	Current speed monitor	VNOW
900C	Current ampere monitor	CNOW
900E	Deviation monitor	DEVI
9010	System timer query	STIM
9012	Special input port query	SIPM
9013	Zone status query	ZONS
9014	Position complete number status query	POSS
9015 to 97FF	- (Reserved for the system)	-
9800	Position movement command register	POSR
9801 to 98FF	- (Reserved for the system)	-
9900	Target position coordinate specification register	PCMD
9902	Positioning band specification register	INP
9904	Speed specification register	VCMD
9906	Acceleration speed specification register	ACMD
9907	Push-current limiting value	PPOW
9908	Control flag specification register	CTLF
9909 to FFFF	- (Reserved for the system)	-

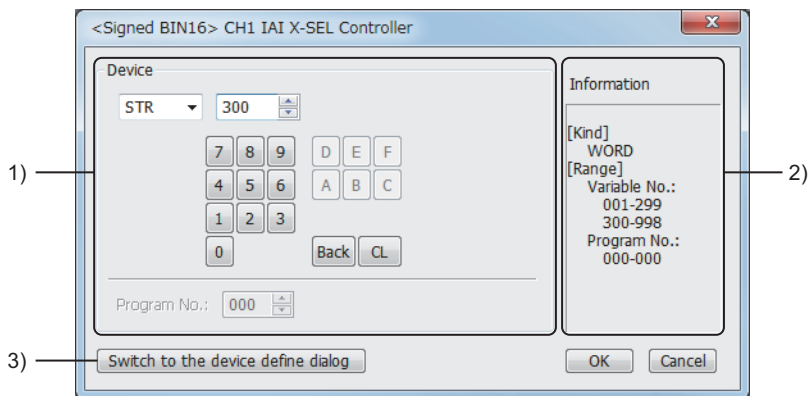

## ■ 2 [IAI X-SEL Controller]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog
- (2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.  
The bit number can be set only when a word device is specified with a bit.

Item	Description
[Program No.]	Set the number of the program for which the device is used.
[Device No.]	Set the number of the program for which the unit is used.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Switch to the device define dialog] button

Displays the device definition setting dialog.  
→ 6.1.5 ■ 6 Device definition setting dialog

### (a) Flag device setting

### (b) String device setting

### (c) Version device setting

VR 0 0: 0

0

Obtained data:  
 0: Model code           5: Time (day)  
 1: Unit code           6: Time (hour)  
 2: Version number       7: Time (min)  
 3: Time (year)         8: Time (sec)  
 4: Time (month)       9 to F: Reserved for system use

Device No.: 0

Device number (0 to F)

VR0

Unit type (0 to 3)  
 0= Main CPU application / 1 = Main CPU core  
 2= Driver CPU / 3 = Mount SIO

### (d) Axis Status device setting

AXST00

00

Obtained data:  
 AXST00 to AXST05: Single-axis status

00: Axis status  
 Bit 7 (Reserved for system use)  
 Bit 6 (Reserved for system use)  
 Bit 5 (Push error detection): 0 = Not detected / 1 = Detected  
 Bit 4 (Operation command successful completion)  
     0 = Not yet complete / 1 = Completed successfully  
 \* Can be used only for completion check after an operation command.  
 Bit 3 (Servo): 0 = OFF / 1 = ON  
 Bit 1-2 (Origin return): 0 = Not yet performed / 1 = Returning to origin / 2 = Completed  
 Bit 0 (Servo axis in use)  
     0 = Not in use / 1 = In use (moving and others)  
 \* "Servo axis in use" indicates that a given task has the right to use the applicable axis.  
 Therefore, this bit will turn on in the following conditions.  
 - When an operation command involving axis movement is in progress (including when an axis is moving)  
 - Servo is starting up from an OFF state  
 - Servo is shutting down from an ON state (excluding emergency stop)  
 - Operation axis is paused

01: Axis sensor input status  
 Bit 3 (Reserved for system use)  
 Bit 2 (Origin sensor): 0 = OFF / 1 = ON  
 Bit 1 (Overrun sensor): 0 = OFF / 1 = ON  
 Bit 0 (Creep sensor): 0 = OFF / 1 = ON

02: Axis error code  
 03: Encoder status  
 Bit 7 (Battery alarm (BA))  
 Bit 6 (Battery error (BE))  
 Bit 5 (Multi-rotation error (ME))  
 Bit 4 (Reserved for system use)  
 Bit 3 (Counter overflow (OF))  
 Bit 2 (Count error (CE))  
 Bit 1 (Full absolute status (FS))  
 Bit 0 (Overspeed (OS))

04: Current position (L) unit (0.001mm)  
 Indicates the lower 16 bits of the current position in Hex.  
 05: Current position (H) unit (0.001mm)  
 Indicates the upper 16 bits of the current position in Hex.  
 AXST06 to AXST0B: Double axes status  
 AXST2A to AXST2F: Eight axes status

**(e) Scara Axis Status device setting**

SAXS 0 00

Obtained data:

00: Work coordinate system selection number  
 01: Tool coordinate system selection number

02: Common axis status  
 Bit 7 (Reserved for system use)  
 Bit 6 (Reserved for system use)  
 Bit 5 (Reserved for system use)  
 Bit 4 (Reserved for system use)  
 Bit 2-3 (Scara axis current position coordinate system type):  
 0 = Base coordinate system / 1 = Selected work coordinate system  
 2 = Reserved for system use / 3 = Each axis system  
 Bit 0-1: (Scara axis current arm system):  
 0 = Right arm system / 1 = Left arm system  
 2 = Indeterminable / 3 = Reserved for system use

03: Axis pattern

04 to 09: Single-axis status

04: Axis status  
 Bit 7 (Reserved for system use)  
 Bit 6 (Reserved for system use)  
 Bit 5 (Push error detection): 0 = Not detected / 1 = Detected  
 Bit 4 (Operation command successful completion):  
 0 = Not yet complete / 1 = Completed successfully

\* Can be used only for completion check after an operation command.  
 (For positioning that includes any of the X, Y and R axes, be sure to check completion for all of the X, Y and R axes.)

Bit 3 (Servo): 0 = OFF / 1 = ON  
 Bit 1-2 (Origin return): 0 = Not yet performed / 1 = Returning to origin / 2 = Completed  
 Bit 0 (Servo axis in use):  
 0 = Not in use / 1 = In use (moving and others)

"Servo axis in use" indicates that a given task has the right to use the applicable axis.

Therefore, this bit will turn ON in the following conditions.

- When an operation command involving axis movement is in progress (including when an axis is moving)
- Servo is starting up from an OFF state
- Servo is shutting down from an ON state (excluding emergency stop)
- Operation axis is paused

05: Axis sensor input status

Bit 3 (Reserved for system use)  
 Bit 2 (Origin sensor): 0 = OFF / 1 = ON  
 Bit 1 (Overrun sensor): 0 = OFF / 1 = ON  
 Bit 0 (Creep sensor): 0 = OFF / 1 = ON

06: Axis error code

07: Encoder status  
 Bit 7 (Battery alarm (BA))  
 Bit 6 (Battery error (BE))  
 Bit 5 (Multi-rotation error (ME))  
 Bit 4 (Reserved for system use)  
 Bit 3 (Counter overflow (OF))  
 Bit 2 (Count error (CE))  
 Bit 1 (Full absolute status (FS))  
 Bit 0 (Overspeed (OS))

08: Current position (L) unit (0.001mm or 0.001deg)  
 Indicates the lower 16 bits of the current position in Hex.

09: Current position (H) unit (0.001mm or 0.001deg)  
 Indicates the upper 16 bits of the current position in Hex.

0A to 0E: Double axes status

:  
 2E to 33: Eight axes status  
 34 to FF: Reserved for system use

SAXS0

Unit type (0 to F)

Bit 3 (Reserved for system use) Fixed to 0  
 Bit 2 (Reserved for system use) Fixed to 0  
 Bit 0-1 (Scara axis current position type):  
 0 = Base coordinate system / 1 = Selected work coordinate system  
 2 = Reserved for system use / 3 = Each axis system

**(f) Program Status device setting**

PGST 000

Obtained data:

000 to 003: Program number 1 status

000: Status  
 Bit 3 (Reserved for system use)  
 Bit 2 (Reserved for system use)  
 Bit 1 (Reserved for system use)  
 Bit 0 (Start): 0 = Not started / 1 = Started

001: Execution program step number

002: Program-dependent error code

003: Error occurrence step number

004 to 007: Program number 2 status

:  
 508 to 511: Program number 128 status

### (g) System Status device setting

SYST 0

Obtained data:

- 0: System mode  
0 = Indeterminable / 1 = AUTO mode / 2 = MANUAL mode  
3 = Slave update mode / 4 = Core update mode
- 1 Critical level system error number
- 2: Latest system error number
- 3: System status byte 1  
Bit 7 (Reserved for system use)
- Bit 6 (Battery voltage error status):  
0 = No error / 1 = Error
- Bit 5 (Battery voltage low warning status):  
0 = No low / 1 = Low
- Bit 4 (Power error status): 0 = Normal / 1 = Error
- Bit 3 (Emergency stop switch status):  
0 = No emergency stop / 1 = Emergency stop
- Bit 2 (Safety gate status):  
0 = CLOSE / 1 = OPEN
- \* X-SEL (P / Q Series) (Multi axes/Scara) / SSEL / ASEL / PSEL:  
Enable switch (Deadman switch / Enable switch) status is indicated.
- Bit 1 (TP enable switch status): 0 = ON / 1 = OFF
- \* X-SEL (P/Q Series) (Multi axes/Scara)/SSEL/ASEL/PSEL:  
This bit is disabled (fixed to 0).
- Bit 0 (Operation mode switch status): 0 = AUTO / 1 = MANUAL

- 4: System status byte 2  
Bit 7 (Reserved for system use)
- Bit 6 (Reserved for system use)
- Bit 5 (Program run status): 0 = Not run / 1 = Running
- Bit 4 (Restart wait status): 0 = Not waiting / 1 = Waiting
- Bit 3 (I/O interlock status):  
0 = No interlock / 1 = Interlock
- Bit 2 (Servo interlock status):  
0 = No interlock / 1 = Interlock
- Bit 1 (Slave parameter writing status):  
0 = Not writing / 1 = Writing
- Bit 0 (Application data flash ROM write status):  
0 = Not writing/erasing / 1 = Writing/erasing
- \* When the core program is in operation (Application update mode), only Bit 0 is enabled.
- Data for System mode, Critical level system error number, Latest system error number, System status byte 1, System status byte 3 and System status byte 4 is disabled.
- 5: System status byte 3  
Bit 7 (Reserved for system use)
- Bit 6 (Reserved for system use)
- Bit 5 (Reserved for system use)
- Bit 4 (Operation mode): 0 = Program mode / 1 = Position mode
- Bit 3 (Reserved for system use)
- Bit 2 (System ready status): 0 = Not ready / 1 = Ready
- Bit 1 (System operation status):  
0 = Not operating in AUTO mode / 1 = Operating in AUTO mode
- Bit 0 (Drive-source cutoff status):  
0 = Not cut off / 1 = Cut off
- 6: System status byte 4  
Reserved for system use

### (h) Coordinate Affiliate Data device setting

CD 0.00: 0

Definition Data No.:

Coordinate system definition data number (00 to FF)  
Work / tool coordinate system definition data number (0 to)

Type 1 (0 to 1)

0 = Work coordinate system definition data/ 1 = Tool coordinate system definition data

- Obtained data:
- 0: X axis coordinate offset      3: R axis coordinate offset
  - 1: Y axis coordinate offset    4 to F: Reserved for system use
  - 2: Z axis coordinate offset

### (i) Servo device setting

SV 0

Obtained data:

- 0: Command trigger  
1 = Write / 4 = Clear
- 1: Axis pattern
- 2: Operation type
- Bit 3 (Reserved for system use) Fixed to 0
- Bit 2 (Reserved for system use) Fixed to 0
- Bit 1 (Reserved for system use) Fixed to 0
- Bit 0 (Servo ON/OFF): 0 = OFF / 1 = ON

### (j) Write to Flash ROM device setting

FRW 0

Obtained data

- 0: Command trigger
- 1 = Write

\*1 The GOT can only read data from the device.

\*2 The GOT can only write data to the device.

\*3 The following restrictions are applied depending on the program number.

- When the program number is 000, the variable number can be only even numbers.
- When the program number is 001 to 128, the variable number can be only odd numbers.

\*4 For the program control device, the command to be sent differs depending on the write data.

Write data other than the followings are processed as an internal error of GOT.

- Write data 0: Program Exit Command (0x254)
- Write data 1: Program Execution Command (0x253)
- Write data 2: Program Pause Command(0x255)
- Write data 3: Program 1 Step Execution Command (0x256)
- Write data 4: Program Restart Command (0x257)

\*5 When software reset is performed, a no response error is displayed after a non-communicating period of ten and several seconds, and then the communication is resumed.

\*6 For the word address, the value is specified only when the last digit is 1.

\*7 For the device whose obtained data No.0 is a command trigger, a request is sent to the controller when the Write or Read is input to the command trigger.

It is not sent when the Clear is input.

\*8 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

- 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*9 The bit specification of word devices is not available.

## 12.2.4 AZBIL equipment

- ■ 1 [Azbil SDC/DMC]
- 2 [Azbil DMC50]

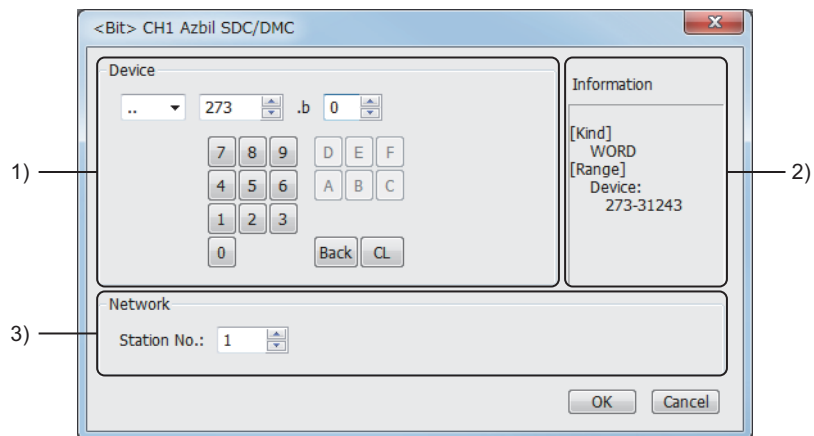

### ■ 1 [Azbil SDC/DMC]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

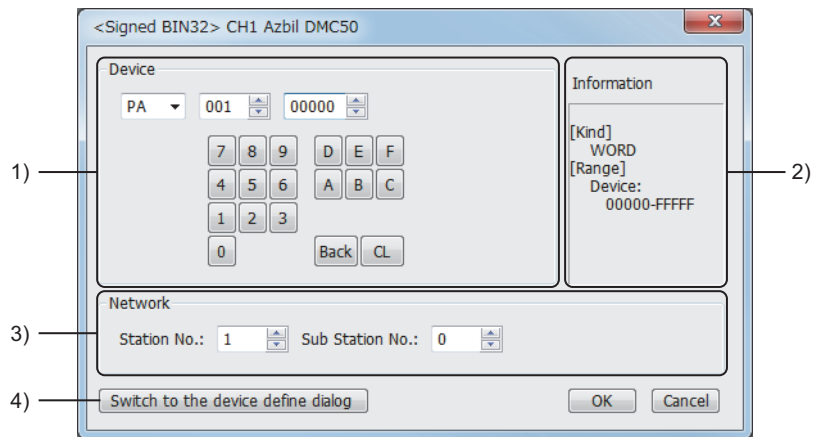

- (1) Device setting dialog
- (2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

[Azbil SDC / DMC]

[Azbil DMC50]

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[Station No.]	<p>The GOT monitors the control equipment with the specified station No. Azbil SDC/DMC</p> <p>The following shows the setting range.</p> <ul style="list-style-type: none"> <li>• [0] to [127]: The GOT monitors the control equipment with the specified station No.</li> <li>• [200] to [215]: With the value of the GOT data register (GD), specify the station No. of the control equipment to be monitored.*1 For Azbil DMC50 or AHC2001</li> </ul> <p>The following shows the setting range.</p> <ul style="list-style-type: none"> <li>• [1] to [15]: Specify the station No. of the COM module or the control equipment to be monitored.</li> <li>• [100] to [115]: With the value of the GOT data register (GD), specify the station No. of the COM module or the control equipment to be monitored, and specify the sub station No. of the control equipment. In the value of GD10 to 25, the upper 8 bits are set for the station No., and the lower 8 bits are set for the sub station No. The setting of [SubStation] is disabled.*2</li> </ul>
[SubStation]	<p>Specify the sub station No. of the control equipment connected to the COM module specified in [Station].</p> <p>The setting range is [0] to [15].</p> <p>When [SubStation] is specified to 0, the GOT monitors the COM module or the control equipment specified in [Station].</p> <p>For AHC2001, the sub station number is ignored.</p>

\*1 The following shows the relationship between the station No. of the control equipment and the GOT data register.

Station No.	GOT data register (GD)	Setting range
200	GD10	[0] to [127]: (If a value outside the range above is set, a device range error occurs.)
201	GD11	
:	:	
214	GD24	
215	GD25	

\*2 The following shows the relationship between the station No. of the control equipment and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	0x0000 to 0xFFFF
101	GD11	
:	:	
114	GD24	
115	GD25	

Example)

When [Station] is set to 100

The value of GD10 determines the control equipment to be monitored.

GD10 = 0 × 010A

(Upper 8bit) 0 × 01 → Station No.: 1

(Lower 8 bits) 0 × 0A → Sub station No.: 10

#### 4) [Switch to the device definition screen] button

Displays the device definition setting dialog.

→6.1.5 ■ 6 Device definition setting dialog

### Point

#### (1) Station No. and sub station No. of AZBIL DMC50

The station No. and the sub station No. set for the AZBIL DMC50 are equivalent to the network No. and the station No. set for the MITSUBISHI PLC, respectively.

To set the control equipment to be monitored, set both the station No. and the sub station No.

#### (2) Restrictions for the faulty station information, the control equipment, and servo amplifier monitor station disconnection

When the DMC50 is used, the GOT only monitors some stations.

For the details of the station numbers of the DMC50 to be monitored, refer to the following.

(2) Device range

○ : Available, × : Unavailable

Device name		Setting range	EG device <sup>*2</sup>	MX Component <sup>*2</sup>	Device No. representation

- (2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.  
The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the station No. of the destination controller for monitoring.

Item	Description
[Host]	Select this when monitoring the host controller.
[Other]	Select this when monitoring other controller. Then, set the station number and network number of the controller to be monitored. • [Network No.]: Set the network No. • [Station No.]: Set the station number.

#### • Device setting for OMRON SYSMAC

Set I/O relay/internal auxiliary relay (..), Data link relay (LR), Auxiliary memory relay (AR), Holding relay (HR), or Internal auxiliary relay/Work relay (WR) as follows.

## (2) Device range

○ : Available, ×: Unavailable

Device name		Setting range	EG device <sup>*4</sup>	MX Component <sup>*4</sup>	Device No. representation
Bit device	I/O relay/internal auxiliary relay	000000 to ..614315	○	○	Decimal + Hexadecimal
	Data link relay (LR)	LR00000 to LR19915	○	○	
	Auxiliary memory relay (AR)	AR0000000 to AR1153515	○	○	
	Holding relay (HR)	HR00000 to HR51115	○	○	
	Internal auxiliary relay, Work relay (WR)	WR00000 to WR51115	○	○	Decimal number
	Timer contact (TIM)	TIM0000 to TIM4095	○	○	
	Counter contact (CNT)	CNT0000 to CNT4095	○	○	
	Bit-specified word device <sup>*1</sup> (except data link relay, auxiliary memory relay, holding relay and internal auxiliary relay.)	Setting range of each word device	Refer to each word device.		
Word device	I/O relay/internal auxiliary relay	..0000 to ..6143	○	○	Decimal number
	Data link relay (LR)	LR000 to LR199	○	○	
	Auxiliary memory relay (AR)	AR00000 to AR11535	○	○	
	Holding relay (HR)	HR000 to HR511	○	○	
	Internal auxiliary relay, Work relay (WR)	WR000 to WR511	○	○	
	Data memory (DM)	DM00000 to DM32767	○	○	
	Timer (current value) (TIM) <sup>*3</sup>	TIM0000 to TIM4095	○	○	
	Counter (current value) (CNT) <sup>*3</sup>	CNT0000 to CNT4095	○	○	
	Extension data memory (EM current bank) <sup>*2</sup>	EM00000 to EM32767	○	○	
Extension data memory (E0 to EC: 13 banks) <sup>*2</sup>	E000000 to E032767 : EC00000 to EC32767	○	○		

\*1 When executing the touch switch function that has been set during the bit specification of the word device, do not write any data to the word device through the sequence program.

\*2 Writing or reading the extension data memory using multiple banks is not allowed.

\*3 Timer (current value) and counter (current value) are valid within the range of 0 to 9999.  
(This applies to the 16 bit/32 bit device data.)

\*4 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

Word device

\*1 Read-only device for KOSTAC SU series

\*2 The GOT cannot write data to R7377 for SU-5M, SU-6M, and SU-6H.

\*3 For Direct Logic 05 series and Direct Logic 06 series, devices from R1200 to R1377 are used as V-memory 1.

\*4 The GOT cannot write data to devices from R7766 to R7774 (calendar area).

\*5 The device names differ according to the series.

The following shows the device names for each series.

KOSTAC SU series, PZ series	Direct Logic 05 series, Direct Logic 06 series	Direct Logic 205 series
Input	Input relay	Input
Output	Output relay	Output
Preparatory register	V-memory 1	Data word 1
Special register 1	System parameter 1	System parameter 1
Data register 1	V-memory 2	Data word 2
Special register 2	System parameter 2	System parameter 2
Data register 2	V-memory 3	Data word 3
Special register 3	System parameter 4	System parameter 4

\*6 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 ⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*7 The word specification of bit devices is not available.

\*8 The bit specification of word devices is not available.

## 12.2.8 JTEKT equipment

GT27 GT25 GT23 GT21 SoftGOT2000 GS

→ ■ 1 [JTEKT TOYOPUC-PC]

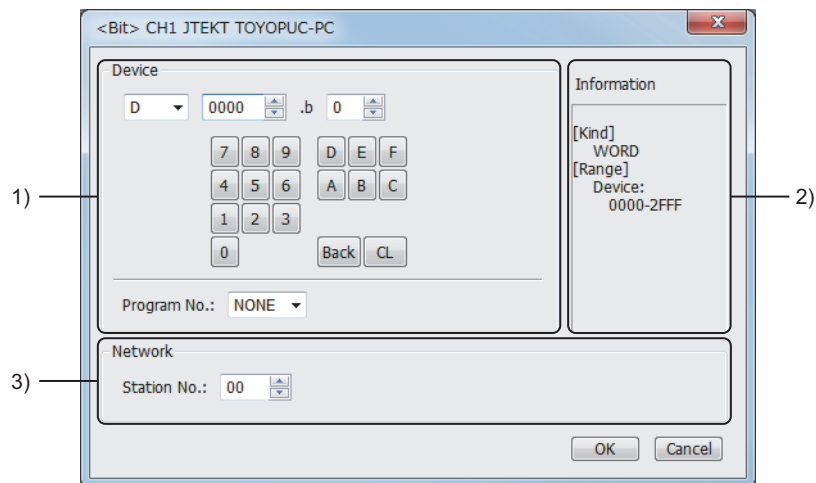

### ■ 1 [JTEKT TOYOPUC-PC]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

→ (1) Device setting dialog  
(2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

Item	Description
[Program No.]	Sets the number of the program for which the device is set.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[Station No.]	Select the station No. when monitoring the PLC of the specified station No. (octal)

#### (a) Program number setting (when PC3JG or PC3J is used)

Setting of a program number is allowed for the following devices.

Internal relay (M), keep relay (K), link relay (L), special relay (V), edge detection (P), timer (T), counter (C), data register (D), link register (R), special register (S), current value register (N)

## (2) Device range

○ : Available, × : Unavailable

Device name		Setting range	EG device <sup>*4</sup>	MX Component <sup>*4</sup>	Device No. representation	
Bit device	Input (X) <sup>*1</sup>	X000 to X7FF	○	×	Hexadecimal number	
	Output (Y) <sup>*1</sup>	Y000 to Y7FF	○	×		
	Link relay (L)	L000 to L7FF	○	×		
Bit device	Internal relay (M)	M000 to M7FF	○	×	Hexadecimal number	
	Keep relay (K)	K000 to K2FF	○	×		
	Edge detection (P)	P000 to P1FF	○	×		
	Timer (T) <sup>*1</sup>	T000 to T1FF	○	×		
	Counter (C) <sup>*1</sup>	C000 to C1FF	○	×		
	Special relay (V)	V000 to V0FF	○	×		
	Extended input (EX) <sup>*1</sup>	EX000 to EX7FF	○	×		
	Extended output (EY) <sup>*1</sup>	EY000 to EY7FF	○	×		
	Extended internal relay (EM)	EM0000 to EM1FFF	○	×		
	Extended keep-relay (EK)	EK000 to EKFFF	○	×		
	Extended special relay (EV)	EV000 to EVFFF	○	×		
	Extended timer (ET) <sup>*1</sup>	ET000 to ET7FF	○	×		
	Extended counter (EC) <sup>*1</sup>	EC000 to EC7FF	○	×		
	Extended link relay (EL)	EL0000 to EL1FFF	○	×		
	Extended edge detection (EP)	EP000 to EPFFF	○	×		
	Extended input 2 (GX) <sup>*1*3</sup>	GX0000 to GXFFFF	○	×		
	Extended output 2 (GY) <sup>*1*3</sup>	GY0000 to GYFFFF	○	×		
	Extended internal relay 2 (GM) <sup>*3</sup>	GM0000 to GMFFFF	○	×		
	Bit-specified word device (Except the extended buffer register and setup value register)	Setting range of each word device	Refer to each word device.			-
	Word device	Data register (D)	D0000 to D2FFF	○		×
Link register (R)		R0000 to R07FF	○	×		
Current value register (N)		N0000 to N01FF	○	×		
Special register (S)		S0000 to S03FF	○	×		
File register (B)		B0000 to B1FFF	○	×		
Extended present value register (EN)		EN0000 to EN07FF	○	×		
Extended setup value register (H)		H0000 to H07FF	○	×		
Extended special register (ES)		ES0000 to ES07FF	○	×		
Extended data register (U)		U0000 to U7FFF	○	×		
Extended buffer register (EB) <sup>*3</sup>		EB00000 to EB1FFFF	○	×		
Setup value register (TCS) <sup>*2</sup>		TCS0000 to TCS01FF	○	×		
Word-specified bit devices		Setting range of each bit device	Refer to each bit device.		-	

\*1 Overlapped device specification of an input (X, EX, GX) and an output (Y, EY, GY), or a timer (T, ET) and a counter (C, EC) is not allowed.

(Example: X0000 and Y0000, EX0000 and EY0000)

\*2 To store a setting value of T (timer) or C (counter), use TCS.

Setting value of a timer and a counter is stored in TCS. (TCS cannot be used if a timer or a counter is not in a program.)

\*3 GX, GY, GM and EB can be used only in the PC3JG separate mode.

Access to GX, GY, GM and EB through a link module is not possible.

\*4 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 ⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

## 12.2.9 SHARP equipment

GT27 GT25 GT23 GT21 SoftGOT2000 GS

→ ■ 1 [SHARP JW]

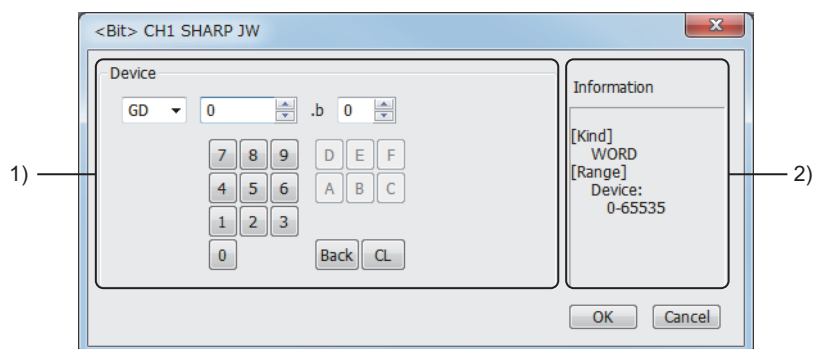

### ■ 1 [SHARP JW]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

→ (1) Device setting dialog  
(2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### (a) Device setting when setting a register as a bit device

##### • Registers

Set the type (first 2 digits) and the address.

##### • File register

Set the file number and the address.

#### (b) Device setting when setting a register or memory as a word device

##### • I/O relay

Set a combination of the device address (multiple of 16) + bit address format (fixed to 0).

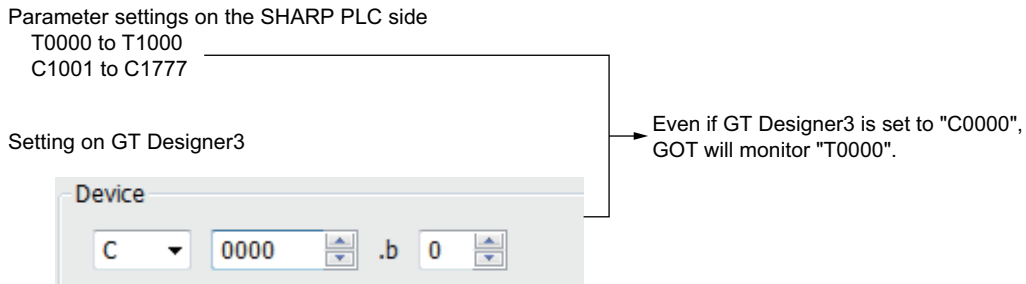

- Registers and file register  
Set the device address (multiple of 16).

### (c) Monitoring the timer (T) and the counter (C)

- Address setting  
Make sure not to set the same address range for the timer (T) and the counter (C).  
Even if the address ranges overlap one another, the GOT displays no error.  
The GOT monitors the timer and counter devices according to their address range instead of their device name.  
Accordingly, if a device invalid as a SHARP PLC parameter is specified on GT Designer3, the GOT monitors a different device that covers the address range of the specified device.  
Example)

- Contact writing into timer (T) and counter (C)  
Writing the contact for the timer (T) and counter (C) can only be done while the CPU is in RUN (while the timer and counter is in operation).

## (2) Device range

○ : Available, ×: Unavailable

Device name		Setting range	EG device*1	MX Component*1	Device No. representation

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

Item	Description
[Memory No.]	Set the memory number of the device to be monitored. The setting range is [0] to [7].*1

The device name is displayed as follows when the memory number ([0] to [7]) is set.

Memory No.	Displayed device name
None	Device No.
0	M0/Device Number
1	M1/Device Number
2	M2/Device Number
3	M3/Device Number
4	M4/Device Number
5	M5/Device Number
6	M6/Device Number
7	M7/Device Number

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[All]	Select this item when writing data to all the indicating controllers connected. During a monitoring, the indicating controller set for [Host Address] of the communication detail setting is monitored. (When inputting data with the numerical input function, the data is written to all the connected indicating controllers during input; the indicating controller that is set for [Host Address] is monitored during other than input (displaying).)
[Selection]	Select this item when monitoring the indicating controller of the station No. specified. After selecting, set the station No. of the indicating controller in the following range. The following shows the setting range. <ul style="list-style-type: none"> <li>• [0] to [94]: The indicating controller of the station No. specified is monitored.</li> <li>• [95]: Same as the setting of [All]</li> <li>• [100] to [115]: Specify the station No. of the indicating controller to be monitored with the GOT data register (GD).<sup>*1</sup></li> </ul>

\*1 The following shows the relationship between the station No. of the indicating controller and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [94] (If setting a value outside the range above, a device range error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

## (2) Device range

○ : Available, × : Unavailable

Device name		Setting range	EG device <sup>*2</sup>	MX Component <sup>*2</sup>	Device No. representation
Bit device	Bit-specified word device <sup>*1</sup>	Setting range of each word device	Refer to each word device.		-
Word device	Data item (..)	..0001 to ..7901	○	×	Hexadecimal number

\*1 As bit specification of a word device is performed after the GOT reads the value, do not change the value with the indicating controller during this period.

\*2 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

## 12.2.11 CHINO equipment

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[All]	Select this item when data are written in all the connected controllers. The controller set for [Host Address] of the communication detail settings is monitored. (When inputting data with the numerical input function, data is written to all the connected controllers during input. The controller set for [Host Address] is monitored during other than input (displaying).)
[Selection]	Select this item when the controller with the specified station No. is monitored. Select the item, and then set the station No. for the controller in the following range. • [1] to [99]: The controller with the specified station No. is monitored. • [100] to [115]: Specify the station No. for the controller to be monitored with a GOT data register (GD). *1

\*1 The following shows the relationship between the station No. of controller and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [99] (If setting a value outside the range above, a device range error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

### (a) Device setting

Devices are set with reference numbers.

For parameters corresponding to each reference number, refer to the manual of the controller to be used.

### (2) Device range

○ : Available, ×: Unavailable

Device name		Setting range	EG device <sup>*2</sup>	MX Component <sup>*2</sup>	Device No. representation
Bit device	Digital parameter (0)	00001 to 09999	○	○	Decimal number
	Digital input data (1) <sup>*1</sup>	10001 to 19999	○	○	
Word device	Analog input data (3) <sup>*1</sup>	30001 to 39999	○	○	Decimal number
	Analog parameter (4)	40001 to 49999	○	○	

\*1 Only reading is possible.

\*2 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the station number of the controller to be monitored.

Item	Description
[Host]	Select this item to monitor the station connected with the GOT.
[Other]	Select this when monitoring other controller. Then, set the station number and network number of the controller to be monitored. <ul style="list-style-type: none"> <li>• [Network No.]: Set the network No.</li> <li>• [Station No.]: Set the station number.</li> </ul>

**(a) Device setting when setting a relay as a bit device**

Set the device using the format of word address (DEC) + bit address (HEX).

**(b) Device setting when setting a relay as a word device**

Set the device using the format of word address (Decimal).

For the device name, set the bit device name with W.

**(c) Notation of device address (when using PROSEC V series)**

The notation of device address setting is different between the TOSHIBA PLC peripheral software and GOT. Refer to the following for details.

⇒(2) Device range

**(2) Device range**

○ : Available, ×: Unavailable

Device name		Setting range	EG device*1	MX Component*1	Device No. representation
Bit device	External input (X)	X0000 to X511F	○	○	Decimal + Hexadecimal
	External output (Y)	Y0000 to Y511F	○	○	
	Internal relay (R) <sup>*9</sup>	R00000 to R4095F	○	○	
	Special relay (S) <sup>*9</sup>	S0000 to S511F	○	○	
	Link register (Z)	Z0000 to Z999F	○	○ <sup>*2</sup>	
	Link relay (L)	L0000 to L255F	○	○	Decimal number
	Timer (contact) (T) <sup>*3</sup>	T0 to T999	○	○ <sup>*2</sup>	
	Counter (contact) (C) <sup>*3</sup>	C0 to C511	○	○ <sup>*2</sup>	
Bit-specified word device <sup>*4*7*9</sup> (except external input, external output, internal relay, special relay, link relay, timer and counter)		Setting range of each word device	Refer to each word device.		-
Word device	External input (XW)	XW0 to XW511	○	○	Decimal number
	External output (YW)	YW0 to YW511	○	○	
	Internal relay (RW) <sup>*8*10</sup>	RW0 to RW4095	○	○	
	Special relay (SW) <sup>*10</sup>	SW0 to SW511	○	○	
	Link relay (LW)	LW0 to LW255	○	○	
	Timer (current value) (T) <sup>*3</sup>	T0 to T999	○	○	
	Counter (current value) (C) <sup>*3</sup>	C0 to C511	○	○	
	Data register (D) <sup>*5*8*10</sup>	D0 to D8191	○	○	
	Link register (W)	W0 to W2047	○	○	
File register (R) <sup>*6</sup>	F0 to F32767	○	○		

\*1 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 ⇒10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs

(Server/Client Functions)

\*2 The word specification of bit devices is not available.

(PROSEC T series)

\*3 Write of the timer (contact) / (current value), counter (contact) / (current value) is executed after having been read by GOT. Therefore, do not edit it in the sequence program during this period.

\*4 As bit specification of a word device is performed after the GOT reads the value, do not change the value in the sequence program during this period.

\*5 When the mode switch on the CPU module has been set to P-RUN, writing to D0000 through D4095 is disabled.

\*6 Extension file register is not supported.

(PROSEC V series)

\*7 As bit specification of a word device is performed after the GOT reads the value, do not change the value in the sequence program during this period.

\*8 RW0000 and D0000 indicate the same data register in the same region although they are shown in different notations.

\*9 For bit data, the conversion from the address notation for the TOSHIBA PLC to that for the GOT is shown as follows.

Address notation for TOSHIBA PLC ÷ 16 = Word address (Quotient)...Bit address (Remainder)

Address notation for TOSHIBA PLC	Address notation for GOT	Conversion
S8191	S511 F (Decimal) (Hexadecimal)	8191 ÷ 16 = 511...15
R65535	R4095 F (Decimal) (Hexadecimal)	65535 ÷ 16 = 4095...15

\*10 For word data, the conversion from the address notation for the TOSHIBA PLC to that for the GOT is shown as follows.

Data type		Address notation for TOSHIBA PLC	Address notation for GOT
16 bit data		DW10	D10
32 bit data	(Integer)	DD10 (Calculate the device No. in 32-bit unit)	D20
	(Real number)	DF10 (Calculate the device No. in 32-bit unit)	D20

- (2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.

The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) Network setting

Set the monitor target of the set device.

Item	Description
Station No.	Monitors the temperature controller of the specified station No. The following shows the setting range. <ul style="list-style-type: none"> <li>• [1] to [199], [216] to [255]: Monitors the temperature controller of the specified station No.</li> <li>• [200] to [215]: Specifies the station No. of the temperature controller to be monitored by the value of GOT data register (GD).<sup>*1</sup></li> </ul>

\*1 The following shows the relationship between the station No. of controller and the GOT data register.

Station No.	GOT data register (GD)	Setting range
200	GD10	[1] to [119], [216] to [255] (If setting a value outside the range above, a device range error occurs.)
201	GD11	
:	:	
214	GD24	
215	GD25	

**(a) Device setting**

Devices are set with the coil and register numbers of the temperature controller.

For the relation between the numbers, parameters, and others. (such as an address map of coil/register number and a parameter), refer to the manual of the temperature controller to be used.

**(2) Device range**

The device ranges vary by model.

Set the coil device (MB) as follows.

- When setting a link and coil as a bit device  
Set the device using the format of word address (DEC) + bit address (HEX).

- When setting a register as a word device  
Set the device using the format of word address (DEC).

#### (2) Device range

○ : Available, ×: Unavailable

Device name		Setting range	EG device <sup>*8</sup>	MX Component <sup>*8</sup>	Device No. representation
Bit device	Coil (O) <sup>*5</sup>	O1 to O63424	○	○	Decimal number
	Input relay (I) <sup>*6*7</sup>	I1 to I63424	○	○	
	Link coil (D)	D1 to D2048 D10001 to D12048 D20001 to D22048	○	○	
	Bit-specified word device	Setting range of each word device	Refer to each word device.		-
Word device	Input register (Z) <sup>*1*7</sup>	Z1 to Z31840	○	○	Decimal number
	Holding register (W, SW) <sup>*2*4</sup>	W1 to W28291	○	○	
		SW1 to SW28291	○	○	
	Link register (R, SR) <sup>*4</sup>	R1 to R2048	○	○	
		R10001 to R12048 R20001 to R22048	○	○	
		SR1 to SR2048	○	○	
	SR10001 to SR12048 SR20001 to SR22048	○	○		
Constant register (K) <sup>*3</sup>	K1 to K4096	○	○		
Word-specified bit devices (Except Coil and Input relay)	Setting range of each bit device	Refer to each bit device.		-	

\*1 Change the input register 30001 to 30512 to Z1 to Z512 for setting. (When set in default)

\*2 Change the holding register 40001 to 49999 to W1 to W9999 for setting. (When set in default)

\*3 Change the constant register 31001 to 35096 to K1 to K4096 for setting. (When set in default)

\*4 SR and SW indicate registers (virtual register) compatible to the data format where internal data of PLC is displayed using R or W.

The following shows the difference between the display values of SR, SW and those of R, W corresponding to the values of PLC internal data.

PLC internal data (16 bits)	SR,SW	R,W
9999	9999	9999
1001	1001	1001
1000	1000	1000
999	999	999
0	0	0
-1	-1	32769
-999	-999	33767
-1000	-1000	33768
-1001	-1001	33769
-9999	-9999	42767

\*5 The internal coil N1 to N1536 can be set as O513 to O2048.

However, setting must not exceed O1 to O512 and O513 to O2048.

\*6 Change the input relay 10001 to 14096 to I1 to I4096 for setting. (When set in default)

\*7 Only reading is possible.

\*8 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

→10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

## 12.2.22 YOKOGAWA equipment

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 [YOKOGAWA STARDOM/FA500/FA-M3]
- 2 [YOKOGAWA GREEN/UT100/UT2000/UTAdvanced]

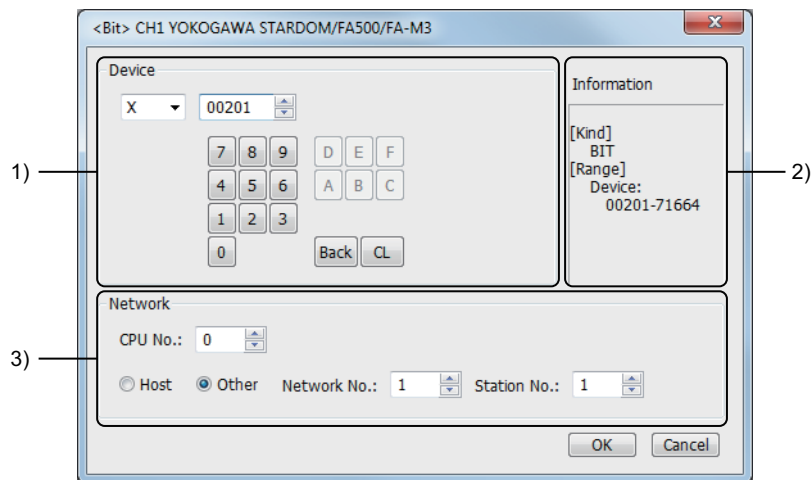

### ■ 1 [YOKOGAWA STARDOM/FA500/FA-M3]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog
- (2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.  
The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the station No. of the destination controller for monitoring.

Item	Description
[CPU No.]	Set the CPU No. of the controller to be monitored.
[Host]	Select this when monitoring the host controller.
[Other]	Select this when monitoring other controller. After selecting the item, set the station No. of the controller to be monitored. • [Network No.]: Set the network No. • [Station No.]: Set the station number.

#### (a) Setting CPU No.

- When monitoring a single CPU system  
Set the CPU No. to [0].
- When monitoring a multiple CPU system  
Set the CPU No. to any of [0] to [4].  
When [0] is set, the GOT monitors CPU No. 1.

## (2) Device range

If a device outside the setting range is set for an object, the value display at the object is indefinite. (No error is displayed for system alarm.)

A device to be set for an object must be in the device range of YOKOGAWA PLC.

For the device range of YOKOGAWA PLC, refer to the manual below.

⇒Manual of YOKOGAWA PLC

○ : Available, ×: Unavailable

Device name		Setting range	EG device <sup>*6</sup>	MX Component <sup>*6</sup>	Device No. representation

- (2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, and bit number.  
The bit number can be set only when a word device is specified with a bit.

Item	Description
[CPU No.]	Set the CPU No. (1, 2) of the device to be monitored. When device B is selected, the CPU No. is fixed to 1. When there is no setting for the CPU No. in the communication settings on the temperature controller side, set the CPU No. on the GOT side to 1 (default).

#### 2) [Information]

Displays the setting range available for the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[All]	Select this item when writing data to all the temperature controllers connected. When bit specification of word device is preformed, data are written to the indicating controller of the station No. set for the host address of the communication detail settings. Monitoring and writing with bit specification of word device are performed only for the station No. set for the host address. (When inputting data with the numerical input function, the data is written to all the connected temperature controller that is set for the host address is monitored during other than input (displaying).)
[Selection]	Select this when monitoring the temperature controller of the specified station No. After selecting this item, set the station No. in the range indicated below. • [0] to [99]: Monitors the temperature controller of the specified station No. • [100] to [115]: Specifies the station No. of the temperature controller to be monitored by the value of GOT data register (GD). <sup>*1</sup>

\*1 The following shows the relationship between the station No. of temperature controller and the GOT data register.

Station No.	GOT data register (GD)	Setting range
100	GD10	[0] to [99] (If setting a value outside the range above, a device range error occurs.)
101	GD11	
:	:	
114	GD24	
115	GD25	

## (2) Device range

	Counter (set value) (C) <sup>*1*3</sup>	C3:0.1 (PRE) to C3:255.1 (PRE) : C255:0.1(PRE) to C255:255.1(PRE)	○	×	
	Counter (current value) (C) <sup>*1*3</sup>	C3:0.2 (ACC) to C3:255.2 (ACC) : C255:0.2(ACC) to C255:255.2(ACC)	○	×	
	Integer (N)	N3:0 to N3:255 : N255:0 to N255:255	○	○	
	Status (S)	S2:0 to S2:163	○	○	
Double-word device	32bit integer (L) <sup>*2</sup>	L3:0 to L3:255 : L255:0 to L255:255	×	×	
	32bit float (F) <sup>*2</sup>	F3:0 to F3:255 : F255:0 to F255:255	×	×	

\*1 Writing on the device is not allowed for 32-bit data.

\*2 Writing on the device is not allowed for 16-bit data.

\*3 Monitoring or writing is not possible in the continuous device designation mode.

\*4 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.  
 ⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

\*5 Up to eight consecutive devices can be specified.

\*6 The GOT reads the value from a device and then write a value to the device.

Do not change the device value with a sequence program until the GOT completes writing a value to the device.

## ■ 2 [SIEMENS S7-300/400]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- (1) Device setting dialog
- (2) Device range

### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Device]

Set the device name, device number, bit number, and data block number.  
The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[Host]	Select this item to monitor the controller specified as the host station in the GOT utility (setup).
[Other]	Select this item to monitor a controller other than the one specified as the host station. Set the MPI address of the controller monitored.

### (a) Device setting when setting a bit memory as a bit device

Set the device using the format of byte address (DEC) + bit address (0 to 7)

### (b) Device setting when setting a bit memory as a word device

Set the device number.

For the device name, set the bit memory device name with W.

**(c) Device setting when setting a data register**

Set the device using the format of data block (DB) + data word (DW).

**(d) Precautions for setting device**

- Notation system of bit memory

The difference in bit memory notation between GOT and PLC is as follows.

Notation of GOT	Notation of PLC
Q0007	Q0.7

- Preparation for setting data register

It is necessary to define the data block using a peripheral software and sequence program, before using a data register.

Setting more than one data block cannot be done for the data register.

- Object to which timer (current value) (T) cannot be set

For the timer (current value) (T), only one device can be set for the write target.

Therefore, multiple devices, such as using the recipe function, cannot be used.

- Notation method of the data registers with the bit specification

The notation of the data registers with the bit specification differs between the GOT and the PLC.

The following shows the correspondence table.

Notation in GOT	Notation in PLC
DB1.DBW0.b0	DB1.DBX1.0
DB1.DBW0.b1	DB1.DBX1.1
:	:
DB1.DBW0.b7	DB1.DBX1.7
DB1.DBW0.b8	DB1.DBX0.0
:	:
DB1.DBW0.b15	DB1.DBX0.7
DB1.DBW2.b0	DB1.DBX3.0
:	:
DB1.DBW2.b7	DB1.DBX3.7
DB1.DBW2.b8	DB1.DBX2.0
:	:
DB1.DBW2.b15	DB1.DBX2.7
:	:

\*1 Monitoring or writing is not possible in the continuous device designation mode.

\*2 For the devices assigned to EG devices (gateway devices) and the functions used in MX Component, refer to the following.

⇒ 10.13 Monitoring the Controller Device, Which the GOT is Monitoring, by Using Other Personal Computers or the GOTs (Server/Client Functions)

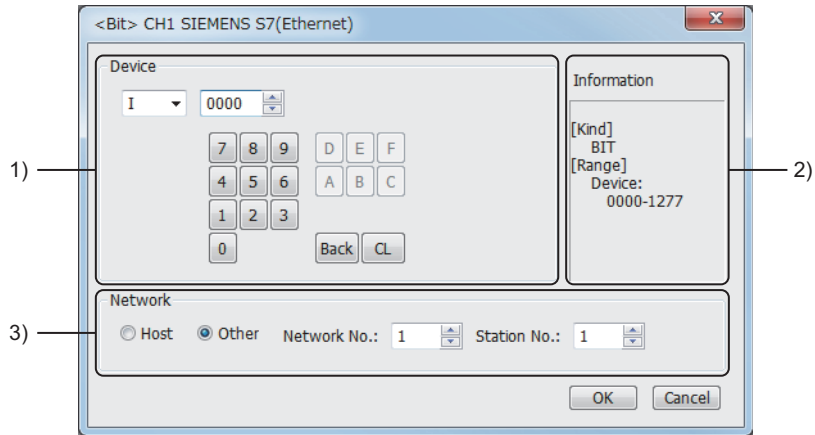

### ■ 3 [SIEMENS S7(Ethernet)]

GT27 GT25 GT23 GT21 SoftGOT2000 GS

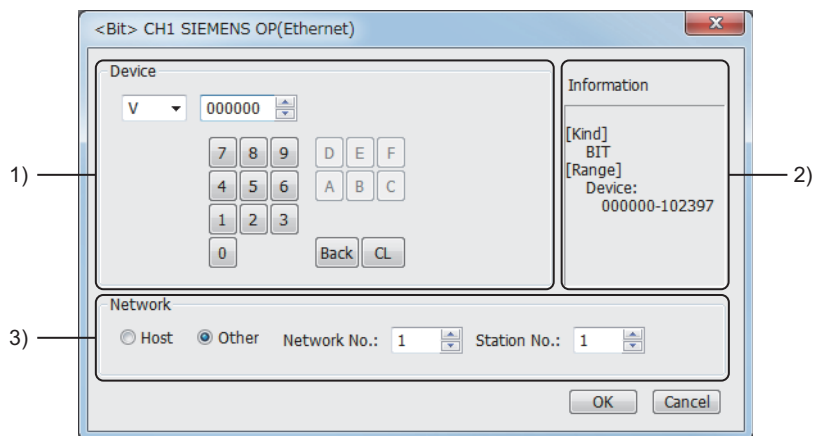

- (1) Device setting dialog
- (2) Device range

#### (1) Device setting dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

[SIEMENS S7 (Ethernet)]

[SIEMENS OP (Ethernet)]

#### 1) [Device]

Set the device name, device number, bit number, and data block number.  
The bit number can be set only when a word device is specified with a bit.

#### 2) [Information]

Displays the type and setting range of the device selected in [Device].

#### 3) [Network]

Set the monitor target of the set device.

Item	Description
[Host]	Select this item to monitor the controller specified as the host station in the GOT utility (setup).
[Other]	Select this item to monitor a controller other than the one specified as the host station. Then, set the station number and network number of the controller to be monitored.

#### (a) Device setting when setting a bit memory as a bit device

Set the device using the format of byte address (DEC) + bit address (0 to 7)

**(b) Device setting when setting a bit memory as a word device**

Set the device number.

For the device name, set the bit memory device name with W.

**(c) Device setting when setting a data register**

Set the device using the format of data block (DB) + data word (DW).

**(d) Precautions for setting device**

- Notation system of bit memory

The difference in bit memory notation between GOT and PLC is as follows.

Notation of GOT	Notation of PLC
Q0007	Q0.7

- Preparation for setting data register

It is necessary to define the data block using a peripheral software and sequence program, before using a data register.

Setting more than one data block cannot be done for the data register.

- Object to which timer (current value) (T) cannot be set

For the timer (current value) (T), only one device can be set for the write target.

Therefore, multiple devices, such as using the recipe function, cannot be used.

- Notation method of the data registers with the bit specification

The notation of the data registers with the bit specification differs between the GOT and the PLC.

The following shows the correspondence table.

Notation in GOT	Notation in PLC
DB1.DBW0.b0	DB1.DBX1.0
DB1.DBW0.b1	DB1.DBX1.1
:	:
DB1.DBW0.b7	DB1.DBX1.7
DB1.DBW0.b8	DB1.DBX0.0
:	:
DB1.DBW0.b15	DB1.DBX0.7
DB1.DBW2.b0	DB1.DBX3.0
:	:

Notation in GOT	Notation in PLC
DB1.DBW2.b7	DB1.DBX3.7
DB1.DBW2.b8	DB1.DBX2.0
:	:
DB1.DBW2.b15	DB1.DBX2.7
:	:

## 12.4 Restrictions for Folder Names and File Names used in GOT

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### ■1 Characters which can be used in folder names and file names

- One-byte alphanumeric characters
  - Symbols other than the followings  
"/:<>?|\
- (A one-byte space cannot be used.)

### ■2 Character strings which cannot be used in folder names and file names

The following character strings (case-insensitive) cannot be used.

- COM1 to COM9
- LPT1 to LPT9
- AUX
- CON
- NUL
- PRN
- CLOCK\$

The use of the following folder and file names is prohibited.

- Folder names starting with G2 (Except for file operation functions of script function used as arguments)
- Folder and file names starting with . (period) or \
- Folder and file names ending with . (period) or \
- Folder and file named as only . (one period) or .. (two periods)

### ■3 Number of characters for folder names and file names

GOTs recognize the location of a file with the following path.

Set a folder name and file name so that the total number of characters used for the path is 78 or less.

Only the folder name and file name in the path can be set by the user.

(Other part of the path is automatically specified.)

Example) File path stored by GT27 in the data storage (for CSV files)

When setting the folder name, enter \ between folder names.

(\ is counted as one character.)

Up to 20 hierarchy levels can be created.

## 12.5 Precautions for Using Unicode Text File

GT27 GT25 GT23 GT21 SoftGOT2000 GS

This section explains for using a Unicode text file imported/exported by GT Designer3.

### ■1 How to save Unicode text files

To edit and use a Unicode text file exported by GT Designer3, save the file in the Unicode text file format (\*.txt).  
The character code applicable to Unicode text files is Unicode (file format: UTF16 LittleEndian).

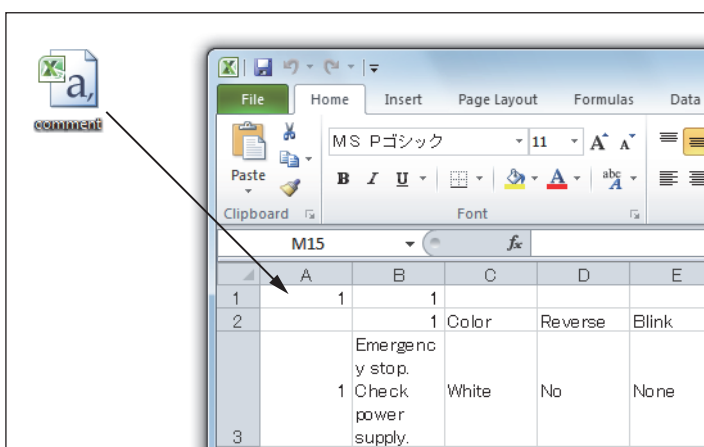

### ■2 Displaying Unicode text files

To display Unicode text files on a personal computer and others, use software compatible to the Unicode.  
Software that is not compatible with the Unicode cannot display Unicode text files properly.

### ■3 Displaying Unicode text files by Microsoft Excel

To open a Unicode text file that contains a comment of multiple lines by Microsoft Excel, drag the Unicode text file to the Microsoft Excel.

Methods other than above cannot display Unicode text files by Microsoft Excel properly.

## 12.6 Data Transferred to the GOT and Storage Destination

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Transfer the created project to the GOT with system application in units of the package data.

The GOT operates after expanding the data stored in the memory for storage to the memory for operation (RAM).

Some data is stored in the memory for storage with being compressed. When the data is expanded to the memory for operation (RAM), the data capacity increases.

The capacity of the package data to be transferred must be less than or equal to the available space of the memory for storage (ROM) and the memory for operation (RAM) at the destination.

Example) For GT27

The following shows the data transferred to the GOT and destination drive.

Data type		Storage destination (ROM)	Expansion destination (RAM)
BootOS		Stored in the built-in flash memory (system area). The data capacity to be stored in the system area is unnecessary to be considered.	Stored in the memory for operation (RAM) (system area). The data capacity to be stored in the system area is unnecessary to be considered.
Package data	Project Data	Stored in either of the following. • Drive A • Drive B <sup>*1</sup> • Drive C • Drive E <sup>*3</sup> • Drive F <sup>*1</sup> • Drive G <sup>*1</sup>  ⇒ ■ 2 Capacity of each drive of the GOT	Memory for operation (RAM) (user area) ⇒ ■ 2 Capacity of each drive of the GOT Some data points are expanded to the memory for operation (RAM) (system area). ⇒ 12.6.1 ■ 1 (2) Capacity of the package data expanded to the memory for operation (RAM)
	System Application		
	Special Data <sup>*1*2</sup>		

\*1 Not available to GT21.

\*2 Not available to GT23.

\*3 Not available to GT2105-Q, GT2104-R, GT2104-P, and GT2103-P.

⇒ 12.6.1 Data transferred to the GOT and capacity of the destination drive

## 12.6.1 Data transferred to the GOT and capacity of the destination drive

### 1 Capacity of package data

For how to check the capacity of the package data, refer to the following.

⇒ 12.6.1 ■ 3 (1) Checking the capacity of the package data

#### (1) Capacity of the package data transferred to the memory for storage (ROM)

The total capacity of the project data, system application, and the special data must be less than or equal to the available space of the memory for storage (ROM).

- GT27,GT25,GT23

\*1 Not available to GT23.

- GT21

For the available drives by GOT model, refer to the following.

⇒ 1.2.7 Drive configuration of the target GOT for data transfer

**(2) Capacity of the package data expanded to the memory for operation (RAM)**

The total capacity of the project data, system application, and the special data must be less than or equal to the available space of the memory for operation (RAM).

- GT27,GT25

- GT23, GT21

The following data points of the system application are expanded to the system area of the memory for operation (RAM). Considering the data capacity is unnecessary.

Data type		Data stored in the memory for operation (RAM) (system area)
System Application	Standard Function	Standard System Application
		Standard Font
	Extended Function	GOT Platform Library
		GOT Function Expansion Library

**■2 Capacity of each drive of the GOT**

**(1) GT27**

Drive	Name	Capacity
Storage memory (ROM)	Drive A	Standard SD card
	Drive B	USB Drive
	Drive C	Built-in flash memory (user area)
	Drive E	USB Drive
	Drive F	USB Drive
	Drive G	USB Drive
	Drive X	Current drive
	Operation memory (RAM)	-

## (2) GT25

	Drive	Name	Capacity
Storage memory (ROM)	Drive A	Standard SD card	Depends on the data storage used.
	Drive B	USB Drive	Depends on the data storage used. The following models do not have drive B. • GT2505-V • GT25HS-V
	Drive C	Built-in flash memory (user area)	32 MB
	Drive E	USB Drive	Depends on the data storage used. The following models do not have drive E. • GT2512F-STNA • GT2512F-STND • GT2510-VTWA • GT2510-VTWD • GT2510F-VTNA • GT2510F-VTND • GT2508-VTWA • GT2508-VTWD • GT2508F-VTNA • GT2508F-VTND • GT2507T-WTSD
	Drive F	USB Drive	Depends on the data storage used.
	Drive G	USB Drive	Depends on the data storage used.
	Drive X	Current drive	Depends on the data storage used.
	Operation memory (RAM)	-	Memory for operation (RAM) (user area)

## (3) GT23

	Drive	Name	Capacity
Storage memory (ROM)	Drive A	Standard SD card	Depends on the data storage used.
	Drive B	USB Drive	Depends on the data storage used.
	Drive C	Built-in flash memory (user area)	9 MB
	Drive E	USB Drive	Depends on the data storage used.
	Drive F	USB Drive	Depends on the data storage used.
	Drive G	USB Drive	Depends on the data storage used.
	Drive X	Current drive	Depends on the data storage used.
Operation memory (RAM)	-	Memory for operation (RAM) (user area)	9 MB

## (4) GT21

	Drive	Name	Capacity
Storage memory (ROM)	Drive A <sup>*1</sup>	Standard SD card	Depends on the data storage used.
	Drive C	Built-in flash memory (user area)	• GT2107-W:15MB • GT2105-Q:9MB • GT2104-R:9MB • GT2104-P:6MB • GT2103-P:3MB
	Drive E	USB Drive	Depends on the data storage used. The following models do not have drive E. • GT2105-Q • GT2104-R • GT2104-P • GT2103-P
	Drive X	Current drive	Depends on the data storage used.

Drive	Name	Capacity
Operation memory (RAM)	Memory for operation (RAM) (user area)	<ul style="list-style-type: none"> <li>• GT2107-W:15MB</li> <li>• GT2105-Q:9MB</li> <li>• GT2104-R:9MB</li> <li>• GT2104-P:6MB</li> <li>• GT2103-P:3MB</li> </ul>
	Memory for operation (RAM) (buffering area)	1 MB

\*1 To use an SD card on GT2103-P, mount the SD card unit (GT21-03SDCD) on the GOT.

### ■3 Checking the capacity of the package data and available space of the destination drive

#### (1) Checking the capacity of the package data

- Checking in the [Data Size (Project)] dialog
  - ⇒11.11.2 Checking data size of project
- Checking in the [Write Option] dialog
  - ⇒4.8.3 [Write Option] dialog (for writing data to one GOT)

#### (2) Checking the available space of the destination drive

- Checking [Communicate with GOT] dialog ([GOT Write] tab) or the [GOT Information - Detail] dialog
  - ⇒4.8.2 [Communicate with GOT] dialog

### ■4 Reducing the capacity of the package data

Reduce the capacity of the package data by the following methods when the capacity of the package data exceeds the capacity of the memory for storage (ROM) and the memory for operation (RAM).

#### (1) Using a set overlay screen

- When you placing the same object on multiple screens, reduce the capacity of the data by using the set overlay screen.
  - ⇒8.29 Placing Another Screen on a Screen

#### (2) Reducing the number of figures and objects

- Reduce the number of figures and objects placed on the screen.

#### (3) Reducing the number of the project settings

- Delete unnecessary settings.

#### (4) Reducing the number of system applications transferred to the GOT

- In the [Application Selection] dialog, deselect unnecessary system applications (extended functions) and special data.
  - ⇒4.2 Setting a System Application to be Written to the GOT
- For the size of the system applications (extended functions) and the special data, refer to the following.
  - ⇒12.6.2 Transferred data size list

## 12.6.2 Transferred data size list

The following shows the data size of the system applications and special data used in the GOT.

- ➔ ■ 1 Data size of system applications
- 2 Data size of special data

### ■ 1 Data size of system applications

- ➔ (1) Communication driver (GT27)
- (2) Communication driver (GT25)
- (3) Communication driver (GT23)
- (4) Communication driver (GT21)
- (5) Extended function (GT27)
- (6) Extended function (GT25)
- (7) Extended function (GT23)
- (8) Extended function (GT21)

## ■2 Data size of special data

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The data size in the user area varies with the selection for [Language] in the [Application Selection] dialog.

- (1) [Japanese]
- (2) [English]

### (1) [Japanese]

Special Data	Data size in the user area	
	Built-in flash memory (ROM)	User memory (RAM)
[Intelligent module monitor data]	13294KB	13294KB
[R motion monitor data]	292KB	292KB
[Q motion monitor data]	606KB	606KB
[Servo amplifier monitor data]	273KB	273KB

### (2) [English]

Special Data	Data size in the user area	
	Built-in flash memory (ROM)	User memory (RAM)
[Intelligent module monitor data]	13761KB	10067KB
[R motion monitor data]	321KB	98KB
[Q motion monitor data]	639KB	552KB
[Servo amplifier monitor data]	273KB	196KB

## 12.7 Resource Data Size

---

Some functions of the GOT store the resource data into a data storage.

The following shows the expressions for calculating the size of the resource data to be stored into a data storage by each function.

The sizes determined by the expressions are approximate.

A determined size may be different from the actual size of the resource data.

- ⇒ ■ 1 User alarm observation
- 2 System Alarm Observation
- 3 Logging
- 4 Recipe
- 5 Operation Log
- 6 Hard copy
- 7 MES interface function
- 8 Label name resolution information

### ■ 1 User alarm observation

#### (1) Binary file (\*.G2A)

##### (a) Historical mode

$144 + (A \times 2) + (18 \times B) + (20 \times C)$  bytes

- A: Number of characters of the alarm name
- B: Number of alarms
- C: Number of stored events

##### (b) Cumulative mode (when [Display the same alarm occurring multiple times as another item] is deselected)

$144 + (A \times 2) + (48 \times B)$  bytes

- A: Number of characters of the alarm name
- B: Number of alarms

##### (c) Cumulative mode (when [Display the same alarm occurring multiple times as another item] is selected)

$144 + (A \times 2) + (26 \times B) + (32 \times C)$  bytes

- A: Number of characters of the alarm name
- B: Number of alarms
- C: Number of stored events

#### (2) CSV file

##### (a) Historical mode

$422 + A + (14 + B + C + D + E + (F \times 3) + G + H) \times I$  bytes

- A: Number of characters of the alarm name
- B: Number of digits of the upper comment No.
- C: Number of digits of the middle comment No.
- D: Number of digits of the basic alarm comment No.
- E: Average number of characters of comments
- F: Length of the date and time string
- G: Number of digits of the level
- H: Number of digits of the group
- I: Number of alarms

##### (b) Cumulative mode

$457 + A + (39 + B + C + D + E + (F \times 3) + G + H + I) \times J$  bytes

- A: Number of characters of the alarm name
- B: Number of digits of the upper comment No.
- C: Number of digits of the middle comment No.
- D: Number of digits of the basic alarm comment No.
- E: Average number of characters of comments
- F: Length of the date and time string
- G: Number of digits of the level

- H: Number of digits of the group
- I: Number of digits of the frequency of alarm occurrences
- J: Number of alarms

### (3) Unicode text file

Size of the CSV file × 2 bytes

## ■2 System Alarm Observation

### (1) Binary file (\*.G2A)

#### (a) When [Get detailed alarm information] is deselected

128 + (24 × A) bytes

- A: Number of stored events

#### (b) When [Get detailed alarm information] is selected

128 + (52 × A) bytes

- A: Number of stored events

### (2) CSV file

$447 + (20 + A + B + (C \times 3) + D + E + F + G + H + I + J + K) \times L$  bytes

- A: Average number of digits of alarm numbers
- B: Average number of characters of comments
- C: Length of the data and time string
- D: Number of digits of the channel No.
- E: Number of characters of the network No., station No., and module No.
- F: Number of characters of the device name
- G: Number of digits of the screen No.
- H: Number of digits of the definition screen No.
- I: Number of digits of the object ID
- J: Number of characters of the function name
- K: Number of characters of the drive name
- L: Number of alarms

When counting characters, count a one-byte character as 0.5 character and a two-byte character as 1 character.

### (3) Unicode text file

Size of the CSV file × 2 bytes

## ■3 Logging

### (1) Binary file (\*.G2L)

$156 + (A \times 2) + (8 \times B) + (F \times 2) + (16 \times G) + (H \times I)$  bytes

- A: Number of characters of the logging name
- B: Total number of blocks (total number of devices = C + D + E)
- C: Total number of blocks (with the device type [BIT])
- D: Total number of blocks (with the device types [Signed BIN16], [Unsigned BIN16], and [BCD16])
- E: Total number of blocks (with the device types [Signed BIN32], [Unsigned BIN32], [BCD32], and [Real])
- F: Total number of characters of all the device comments (without distinction between two-byte and one-byte characters)
- G: Number of blocks
- H:  $8 + ((C + D + (E \times 2)) \times (9/4))$
- I: For the file save mode: Number of logs per file  
For the buffer historical mode: Number of stored logs

### (2) CSV file

$215 + A + D \times F$  bytes

- A:  $(B + 17) \times C$
- B: Average number of characters of device comments
- C: Total number of the devices set to the block
- D:  $(20 + (E + 1) \times C)$
- E: Number of displayed digits (When the digits are displayed in real type, add 5 to this number.)
- F: Number of logs in the file

### (3) Unicode text file

Size of the CSV file × 2 bytes

## ■4 Recipe

### (1) Binary file (\*.G2P)

$160 + (16 \times A) + (8 \times B) + (C \times 2) + (D \times I)$  bytes

- A: Number of blocks
- B: Total number of blocks (when the device type is [Text]: the number of blocks = 1)
- C: When [Include device comments in conversion target] is deselected: Total number of characters of all the device comments (without distinction between two-byte and one-byte characters)  
When [Include device comments in conversion target] is selected: B + [Maximum number of characters]
- D:  $80 + ((E + F + G + (H \times 2)) \times 2)$
- E: Total number of blocks (with the device type [BIT])
- F: Total number of blocks (with the device types [Signed BIN16], [Unsigned BIN16], and [BCD16])
- G: Total number of blocks (with the device type [Text])
- H: Total number of blocks (with the device types [Signed BIN32], [Unsigned BIN32], [BCD32], and [Real])
- I: Number of records

### (2) CSV file

$240 + A + B + H$  bytes

- A: Number of characters of the record name
- B:  $(C + D + E + F) \times (18 + G)$
- C: Number of bit devices
- D: Number of word devices
- E: Number of double-word devices
- F: Number of blocks with the device type [Text]
- G: Number of characters of the device comment
- H:  $I \times (25 + C \times 2 + D \times 7 + E \times 12 + F \times 2)$
- I: Number of records  
(when the recipe file format is CSV or Unicode text, regardless of the recipe settings: the number of records = 1)
- F: Total number of words in devices (with the device type [Text])

### (3) Unicode text file

Size of the CSV file × 2 bytes

## ■5 Operation Log

### (1) Binary file (\*.G2O)

$64 + (N1 + N2 + \dots + Nm)$  bytes

"N1 + N2 + ... + Nm" indicates the total size of each log.

The following table shows the size per log for each log type.

Log type	Size (byte)	Log type	Size (byte)
GOT startup	Max. 88	GOT termination	12
GOT restart	12	GOT restart by reset	12
GOT offline mode transition	12	GOT background processing stop	12
GOT background processing restart	12	Application switching	16
Application startup, exit	20	Clock setting (External device to GOT)	16
Clock setting (SNTP)	16	Clock setting (GS)	16
Time zone change	24	System language switching (Device)	Max. 48
Screen switching	Max. 84	Station No. Switching	16
Language Switching	16	Security level change (Device value change)	16
SoftGOT-GOT link connection	16	SoftGOT-GOT link disconnection	16
SoftGOT-GOT link authorization transfer	20	VNC server connection	16
VNC server disconnection	16	VNC server authorization transfer	20
System language switching	Max. 72	Security level change (Password entry)	Max. 40
Clock function (changed in the utility)	Max. 40	Time zone change (in the utility)	Max. 48

Log type	Size (byte)	Log type	Size (byte)
GOT No. switching	Max. 40	Touch switch: Bit set	Max. 140
Touch switch: Bit reset	Max. 140	Touch switch: Bit alternate	Max. 140
Touch switch: Bit momentary	Max. 140	Touch switch: Word set	Max. 140
Touch switch: Application switching	Max. 120	Touch switch: Screen switching	Max. 124
Touch switch: Station No. switching	Max. 124	Touch switch: Auto repeat start	Max. 120
Touch switch: Auto repeat end	Max. 124	Numerical input: Base device	Max. 312
Numerical input: Option write device	Max. 140	Numerical input: Option write completion device	Max. 140
Text input	Max. 900	Alarm display: User alarm deletion	Max. 120
Alarm display: Deletion of all the user alarms	Max. 120	Alarm Display: System alarm deletion	Max. 120
Alarm Display: Deletion of all the system alarms	Max. 120	Alarm display: User alarm reset	Max. 124
Alarm Display: System alarm reset	Max. 120	Object script (trigger type [Key Code Input])	Max. 140
Operator authentication: Login successful	Max. 36	Operator authentication: Login failed, re-login failed	Max. 36
Operator authentication: Logout	Max. 36	Operator authentication: Automatic logout	Max. 36
Operator authentication: Forced logout	Max. 36	Operator authentication: Operator switching successful	Max. 36
Operator authentication: Operator switching failed	Max. 36	Functional operation security	Max. 44

## (2) CSV file

248 + (N1 + N2 + ... + Nm) bytes

"N1 + N2 + ... + Nm" indicates the total size of each log.

The following table shows the size per log for each log type.

Log type	Size (byte)	Log type	Size (byte)
GOT startup	154	GOT termination	93
GOT restart	103	GOT restart by reset	108
GOT offline mode transition	113	GOT background processing stop	116
GOT background processing restart	118	Application switching	139
Application startup	128	Application termination	126
Clock setting (External device to GOT)	182	Clock setting (SNTP)	179
Clock setting (GS)	176	Time zone change	125
System language switching (Device)	115	Screen switching	193
Station No. Switching	129	Language Switching	103
Security level change (Device value change)	111	SoftGOT-GOT link connection	125
VNC server connection	114	System language switching	171
Security level change (Password entry)	167	Clock function (changed in the utility)	224
GOT No. switching	169	Touch switch: Bit set	205
Touch switch: Bit reset	205	Touch switch: Bit alternate	205
Touch switch: Bit momentary	205	Touch switch: Word set	247
Touch switch: Application switching	171	Touch switch: Screen switching	195
Touch switch: Station No. switching	193	Touch switch: Auto repeat start	193
Touch switch: Auto repeat end	198	Numerical input: Base device	228
Numerical input: Option write device	221	Numerical input: Option write completion device	227
Text input	588	Alarm display: User alarm deletion	174
Alarm display: Deletion of all the user alarms	176	Alarm Display: System alarm deletion	174
Alarm Display: Deletion of all the system alarms	176	Alarm display: User alarm reset	195
Alarm Display: System alarm reset	195	Object script	218
Operator authentication: Login successful	119	Operator authentication: Login failed, re-login failed	123
Operator authentication: Logout	119	Operator authentication: Automatic logout	128
Operator authentication: Forced logout	128	Operator authentication: Operator switching successful	125

Log type	Size (byte)	Log type	Size (byte)
Operator authentication: Operator switching failed	127	Functional operation security	182

### (3) Unicode text file

Size of the CSV file × 2 bytes

## ■6 Hard copy

### (1) BMP file

The file size depends on the resolution of the GOT.

GOT resolution	Size (byte)
WXGA (1280×800)	3072054
XGA (1024 × 768)	2359350
SVGA (800 × 600)	1440054
WVGA (800×480)	1152054
VGA (640 × 480)	921654
QVGA (320 × 240)	230454
480 × 272 dots	391734
384 × 128 dots	147510
320 × 128 dots	122934

### (2) JPEG file

The file size depends on the contents displayed on the GOT screen.

## ■7 MES interface function

File	Size
Execution log file	Max. 512 K bytes per file
Event log file of the job execution	Max. 1 M byte per file

## ■8 Label name resolution information

The following shows the size of the label name resolution file by channel.

$56 + (A \times 52) + (B \times 98) + (C \times 2)$  bytes

- A: Number of the monitored controllers per CPU No. by channel
- B: Total number of the labels by channel used on the GOT
- C: Total number of characters of the labels by channel used on the GOT

## 12.8 Size of Data Stored in the SRAM User Area

GT27 GT25 GT23 GT21 SoftGOT2000 GS

Some functions of the GOT use the SRAM user area.

The following shows the expressions for calculating the size of the SRAM user area used by each function.

- ■ 1 User alarm observation
  - 2 System Alarm Observation
  - 3 Logging
  - 4 Recipe

The expressions only determine the approximate sizes.

The actual sizes may differ.

Check the actual sizes in the following setting dialogs.

- 9.1.2 ■ 7 [User Alarm Observation] dialog
- 9.1.3 ■ 5 [System Alarm Observation] dialog
- 9.2.7 [Logging] dialog (traditional display)
- 9.3.7 [Recipe] dialog

### ■ 1 User alarm observation

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### (1) Current alarm only

$256 + (16 \times A)$  bytes

- A: Number of alarms

#### (2) Historical mode

$256 + (2 \times A) + (20 \times B)$  bytes

- A: Number of alarms
- B: Number of stored events

#### (3) Cumulative mode (when [Display the same alarm occurring multiple times as another item] is deselected)

$256 + (32 \times A)$  bytes

- A: Number of alarms

#### (4) Cumulative mode (when [Display the same alarm occurring multiple times as another item] is selected)

$256 + (12 \times A) + (32 \times B)$  bytes

- A: Number of alarms
- B: Number of stored events

### ■ 2 System Alarm Observation

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### (1) Current alarm only (when [Get detailed alarm information] is deselected)

$256 + (20 \times A)$  bytes

- A: Number of stored events

#### (2) Current alarm only (when [Get detailed alarm information] is selected)

$256 + (48 \times A)$  bytes

- A: Number of stored events

#### (3) Historical mode (when [Get detailed alarm information] is deselected)

$256 + (24 \times A)$  bytes

- A: Number of stored events

#### (4) Historical mode (when [Get detailed alarm information] is selected)

$256 + (52 \times A)$  bytes

- A: Number of stored events

### ■ 3 Logging

GT27 GT25 GT23 GT21 SoftGOT2000 GS

$192 + (4 \times A) + (B \times E)$  bytes

- A: Number of blocks
- B:  $10 + ((C + (D \times 2)) \times (9/4))$
- C: Total number of blocks (with the device types [Bit], [Signed BIN16], [Unsigned BIN16], [BCD16] and [String])
- D: Total number of blocks (with the device types [Signed BIN32], [Unsigned BIN32], [BCD32], and [Real])
- E: Number of stored logs

### ■ 4 Recipe

GT27 GT25 GT23 GT21 SoftGOT2000 GS

$256 + (16 \times A) + (B \times E)$  bytes

- A: Number of blocks
- B:  $80 + ((C + D \times 2) \times 2)$
- C: Total number of blocks (with the device types [Bit], [Signed BIN16], [Unsigned BIN16], [BCD16] and [String])
- D: Total number of blocks (with the device types [Signed BIN32], [Unsigned BIN32], [BCD32], and [Real])
- E: Number of records

## 12.9 Compatibility with Conventional Products

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 12.9.1 Compatibility of projects
- 12.9.2 Specifications of the project conversion from GOT1000 to GOT2000
- 12.9.3 Specifications of the project conversion from GOT2000 to GOT2000
- 12.9.4 Data copy between drawing software

### 12.9.1 Compatibility of projects

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- ■ 1 Project that can be handled with GT Designer3
- 2 Converting a project by changing the GOT type

#### ■ 1 Project that can be handled with GT Designer3

The following shows each project format and the compatibility with GT Designer3.

Project format		Operation				
		Open	Save		Utilize other projects	
			GT Designer3 (GOT2000)	GT Designer3 (GOT1000)	GT Designer3 (GOT2000)	GT Designer3 (GOT1000)
GOT2000 project	Workspace format	○	○	×	○	×
	*.GTX	○	○	×	○	×
	*.GTXS	○	○	×	○	×
	*.G2	○	○*1	×	×	×
	*.GTCNV	○	×	×	×	×
GOT1000 project	Workspace format	○*2	×	○	×	○
	*.GTW	○*2	×	○	×	○
	*.G1 (Created with GT Designer3)	○*2	×	○*1	×	×
	*.GTE	○*2	×	×	×	○
	*.G1 (Created with GT Designer2)	○*2	×	×	×	×
GOT900 project	*.GTD	○*3	×	×	×	×

\*1 This format is a project format for writing to the data storage.  
This format cannot be saved with the [Project] menu.

\*2 There are two alternatives: convert a project into the GOT2000 equivalent, or start GT Designer3 (GOT1000) to edit the project with keeping a GOT1000 project.

\*3 Open the project after converting into the GOT1000 equivalent by using GT Designer3 (GOT1000).  
To edit the project as a GOT900 project, use GT Designer2 Classic.

To convert the project into the GOT2000 equivalent, convert the project into the GOT1000 equivalent in advance.

#### ■ 2 Converting a project by changing the GOT type

You can change the opened project to another GOT project by changing the GOT type.

- 5.1 Changing the GOT Type of the Project ([GOT Type Setting])

GT Designer3 is compatible with the following project conversion.

Project before conversion	Project after conversion	
	GOT2000 project	GOT1000 project
GOT2000 project	The project can be converted.	The project cannot be converted.
GOT1000 project	The project can be converted.	The project can be converted.

## 12.9.2 Specifications of the project conversion from GOT1000 to GOT2000

The following shows the project settings after the GOT1000 project is converted into the GOT2000 project.

- Settings configured for both GOT1000 and GOT2000  
The settings are held.
- Settings configured only for GOT2000  
Default values are set.  
(For some settings, default values are not set.)
- Settings configured only for GOT1000  
The settings are deleted.
- Settings configured for both GOT1000 and GOT2000, but have difference  
The settings are changed according to the setting specifications of GOT2000.

Device settings are changed as follows.

- Device settings for devices within the device range that is compatible with the GOT model after the conversion are held.  
[??] is displayed for devices outside the device range for the GOT model after the conversion.
- When no network setting is configured for the GOT model after the conversion, the NW No. setting and the PLC station No. settings are deleted.
- All devices of all channels are converted as the devices of a controller set for CH1 after the conversion.

### ■ 1 Whole project

#### (1) Font

Before conversion (setting for GOT1000)	After conversion (setting for GOT2000)	Specifications of the conversion
[Font]	[Font]	<ul style="list-style-type: none"> <li>• For converting the GOT type to GT27, GT25, GT23, or GT SoftGOT2000 [Stroke] is converted into [Outline Gothic].</li> <li>• For converting the GOT type to GT2107-W [Stroke] is converted into [Outline Gothic].</li> <li>• For converting the GOT type to GT2105-Q, GT2104-R, GT2104-P, or GT2103-P [Stroke] is converted into [16dot Standard].</li> </ul>

#### (2) Drive name

Before conversion (setting for GOT1000)	After conversion (setting for GOT2000)	Specifications of the conversion
[Drive Name]	[Drive Name]	<p>The drive name is converted as below.</p> <ul style="list-style-type: none"> <li>• [A:Standard Memory Card] is converted into [A:Standard SD Card].</li> <li>• [B:Extended Memory Card] is converted into [B:USB Drive].</li> <li>• [C:Built-in Flash Memory] is held.</li> <li>• [D:Built-in SRAM] is converted into [X:Current Drive].</li> </ul> <p>For converting the GOT type to GT2107-W, GT2105-Q, GT2104-R, or GT2104-P, the setting is held.</p> <ul style="list-style-type: none"> <li>• [E:USB Memory] is converted into [E:USB Drive].</li> </ul>

#### (3) Report screen

All the settings for the report screens are held.

## ■2 Screen

### (1) Property of screens

Before conversion (setting for GOT1000)	After conversion (setting for GOT2000)	Specifications of the conversion
[Screen No.]	[Screen No.]	If [Display the screen of value stored in screen switching device +1] is enabled in [GOT Environmental Setting] ([Screen Switching/Windows]), all the screen numbers decrease by one after conversion. If the item is disabled, the setting is held after conversion.
[Front Layer Transparent]	[Front Layer Transparent Color]	The settings are held. For GT21, the setting is deleted after conversion.
[Popup the display of advanced alarm]	[Display alarms as popups]	The settings are held.
[Specify the touch area]	-	The settings are deleted.
[Display alarm flow]	[Display alarms as popups]	The settings are held.
[Backlight]	[Backlight]	<ul style="list-style-type: none"> <li>For converting GT1020 or GT1030 to GT21-P The conversion result depends on the backlight color selected in [Type Setting]. When [Green/Red/Orange] is selected, [Green/White] is changed to [Green], and [Orange/Pink] is changed to [Orange]. When [White/Red/Pink] is selected, [Green/White] is changed to [White], and [Orange/Pink] is changed to [Pink]. Regardless of the selection, [Red] is held.</li> <li>For converting any other than GT1020 and GT1030 to GT21-P The setting is changed to [White].</li> <li>For converting GOT1000 series to any other than GT21-P The settings are deleted.</li> </ul>
[Blink Backlight]	[Blink Backlight]	<ul style="list-style-type: none"> <li>For converting GT1020 or GT1030 to GT21-P The settings are held.</li> <li>For converting any other than GT1020 and GT1030 to GT21-P The setting is changed to [None].</li> <li>For converting GOT1000 series to any other than GT21-P The settings are deleted.</li> </ul>
[Option Selection]	[Option Selection]	The settings are held. For GT23 and GT21, the setting is deleted after conversion.

### (2) Report setting

Before conversion (setting for GOT1000)	After conversion (setting for GOT2000)	Specifications of the conversion
-	[Printer Language]	[Japanese] is set.

## ■3 Common setting

### (1) Script

Before conversion (setting for GOT1000)	After conversion (setting for GOT2000)	Specifications of the conversion
[Trigger Type]	[Trigger Type]	<ul style="list-style-type: none"> <li>[Ordinary] is converted into [Sampling] (Cycle time: [1] x 100 ms).</li> <li>[ON] is converted into [ON Sampling] (Cycle time: [1] x 100 ms).</li> <li>[OFF] is converted into [OFF Sampling] (Cycle time: [1] x 100 ms).</li> </ul>

## ■4 Precautions

### (1) HQ font setting for the comment display

When a GOT1000 project created with GT Designer2 is converted into a GOT2000 project, the HQ font setting may not be migrated.

For the details, refer to the following Technical News.

⇒Precautions when Replacing GOT1000 Series with GOT2000 Series(GOT-A-0061)

### 12.9.3 Specifications of the project conversion from GOT2000 to GOT2000

---

The following shows the project settings after the GOT2000 project is converted into another GOT2000 project.

- Settings configured for both the GOT model before the conversion and the one after the conversion  
The settings are held.
- Settings configured only for the GOT model after the conversion  
Default values are set.
- Settings configured only for the GOT model before the conversion  
The settings are deleted.
- Settings configured for both the GOT models before the conversion and after the conversion, but have difference  
The settings are changed according to the setting specifications of the GOT model after the conversion.

For the GOT models compatible with each function, refer to the following.

⇒ 1.1.3 List of the supported models for each function

### 12.9.4 Data copy between drawing software

---

You can edit data among the drawing software, such as copying and pasting, by using multiple drawing software.

#### ■ 1 When using GT Designer3 (GOT2000)

Copying and pasting data among other GT Designer3 (GOT2000)s are available.

Copying and pasting data between GT Designer3 (GOT2000) and GT Designer3 (GOT1000) are unavailable.

#### ■ 2 When using GT Designer3 (GOT1000)

Copying and pasting data among other GT Designer3 (GOT1000)s are available.

Copying and pasting data between GT Designer3 (GOT1000) and GT Designer3 (GOT2000) are unavailable.

## 12.10 Data Compatibility between the Graphics Modes

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 12.10.1 Project conversion specifications when the graphics mode is changed to GOT Graphic Ver.2
- 12.10.2 Project conversion specifications when the graphics mode is changed to GOT Graphic Ver.1

### 12.10.1 Project conversion specifications when the graphics mode is changed to GOT Graphic Ver.2

GT27 GT25 GT23 GT21 SoftGOT2000 GS

The following shows the current settings to be changed or deleted after the setting of [Graphics Setting] is changed to [GOT Graphic Ver.2] in the [Type Setting] dialog.

The items available only in the new graphics mode are set to their default.

The screen design will be the basic black after the graphic mode change.

To change the screen design, select your preference in the [Screen Design] dialog.

- 2.4.3 [Screen Design] dialog

#### ■1 Screen

##### (1) Screen properties (Base screen, window screen, and mobile screen)

Item	Specifications after the graphics mode change
[Front Layer Transparent Color] (for base screens and window screens)	The setting of this item is deleted. Setting the transparent color for the front layer is not available.
[Background Color]	The setting of each item is migrated to the [Pattern] tab of the [Fill Effects] dialog. However, the following cases exist depending on the settings made before the graphics mode change. <ul style="list-style-type: none"> <li>• If [None] has been selected for [Pattern], the settings of [Background Color], [Pattern], and [Pattern Color] are deleted.</li> <li>• If [8] has been selected for [Pattern], the settings of [Background Color] and [Pattern] are deleted and the setting of [Pattern Color] is migrated to [Background Color].</li> <li>• If [37] has been selected for [Pattern], the settings of [Pattern] and [Pattern Color] are deleted and the setting of [Background Color] is migrated to [Background Color].</li> </ul>
[Pattern]	
[Pattern color]	

#### ■2 Common settings

##### (1) Type Setting

Item	Specifications after the graphics mode change
[Enable the graphics accelerator to smooth the screen gesture and document display operations]	The setting of this item is deleted. The graphics accelerator is not available.
[Enable the antialiasing to smooth jagged text edges]	This item is nonexistent. Antialiasing is always enabled.
[Adjust object display order in GOT to the one in GT Designer3]	This item is nonexistent. The object stacking order adjustment is always enabled.

##### (2) Peripheral setting

Item	Specifications after the graphics mode change
[PC Remote Operation]	Although the setting of [Use PC Remote Operation (Ethernet)] is migrated, the remote personal computer operation (Ethernet) function is inoperable.

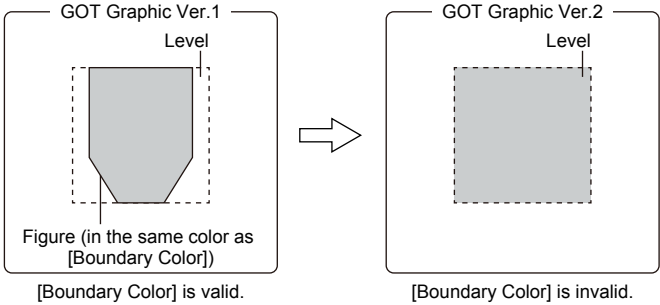

##### (3) Parts Setting

Item	Specifications after the graphics mode change
[Show overlapping areas of shapes in XOR when Display Mode of Parts Display is XOR]	The setting of this item is deleted. The XOR synthesis is not available.

#### ■3 Figure

Item	Specifications after the graphics mode change
Paint	The setting of this item is deleted. The paint is not available.

## 4 Object

Item	Specifications after the graphics mode change
Touch Switch	<p>The setting of [Reverse Switch Area] is deleted.            Inverting the colors in the touch switch area is not available.            For a special function switch, if [Switch Action] is set to [PC Remote Operation (Ethernet)], the setting is migrated but the switch is inoperable.</p>
Lamp Area	<p>The setting of this item is deleted.            The lamp area is not available.</p>
Numerical display	[Display Mode] is nonexistent.
Numerical input	The [Transparent] mode is applied.
Comment display (bit)	[Display Mode] is nonexistent.
Comment display (word)	The [Transparent] mode is applied.
Bit Parts Display	[Display Mode] is nonexistent.
Word Parts Display	The [Replace] mode is applied.
Fixed Parts Display	
Parts movement (bit)	[Display Mode] is nonexistent.
Parts movement (word)	The [Movement] mode is applied.
Parts movement (fixed)	
Alarm Display (User)	[Text color on cursor display] is nonexistent.
Alarm Display (System)	The [Reverse] mode is applied.
Level object	<p>The setting of [Boundary Color] is deleted.            As the boundary color setting is invalid, the level display does not appear in the figure accordingly.</p> <div style="text-align: center;">  </div> <p>To appropriately display the level object in GOT Graphic Ver.2, place a parts display on the level object.            For the setting, refer to the following.            →8.23.2 How to use the level object (GOT Graphic Ver.2)</p>

## 12.10.2 Project conversion specifications when the graphics mode is changed to GOT Graphic Ver.1

The following shows the current settings to be changed or deleted after the setting of [Graphics Setting] is changed to [GOT Graphic Ver.1] in the [Type Setting] dialog.

The items available only in the new graphics mode are set to their default.

### ■1 Screen

#### (1) Screen design

Item	Specifications after the graphics mode change
Design	If the selected design is available in GOT Graphic Ver.1, the design setting is migrated as-is. If the selected design is not available in GOT Graphic Ver.1, the design is changed to an available design.

#### (2) Screen properties (Base screen, window screen, and mobile screen)

Item	Specifications after the graphics mode change
When a solid color background is set	[Pattern] is set to [8]. The background color setting is migrated to [Background Color] and [Pattern Color].
When a gradient background is set	[Pattern] is set to [8]. The setting of [Color 1] is migrated to [Pattern Color]. The setting of [Color 2] is migrated to [Background Color]. The setting of [Variation] is deleted.
When a pattern background is set	The setting is migrated to the [Basic] tab of the [Screen Property] dialog.
[Transparency] (for window screens only)	The setting of this item is deleted.
[Screen Contour] (for window screens only)	The setting of this item is deleted.
[Radius] (for window screens only)	The setting of this item is deleted.

### ■2 Common settings

#### (1) Type Setting

Item	Specifications after the graphics mode change
[Adjust object display order in GOT to the one in GT Designer3]	This item is deselected.

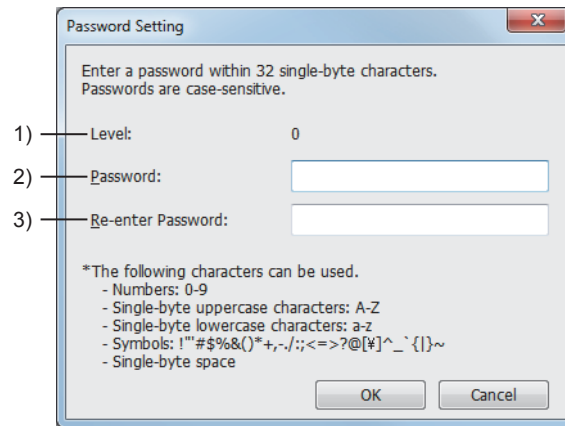

## 12.11 Common Dialog

---

### 12.11.1 [Password Setting] dialog

---

GT27 GT25 GT23 GT21 SoftGOT2000 GS

#### 1) [Level]

Displays the security level for the password.

Displayed when a password is edited in the [Screen Security] tab.

#### 2) [Password]

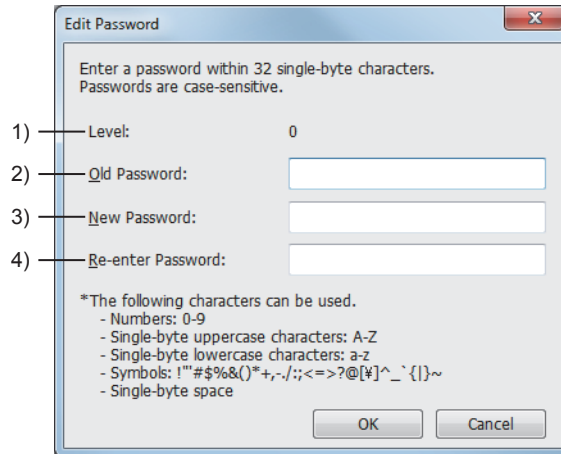

Set a password.

#### 3) [Re-enter Password]

Input the password set in [Password] for the confirmation.

## 12.11.2 [Edit Password] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 1) **[Level]**  
Displays the security level for the password.  
Displayed when a password is edited in the [Screen Security] tab.
- 2) **[Old Password]**  
Set the password currently set for the project.
- 3) **[New Password]**  
Set a new password.
- 4) **[Re-enter Password]**  
Input the password set in [New Password] for the confirmation.

## 12.11.3 [Delete Password] dialog

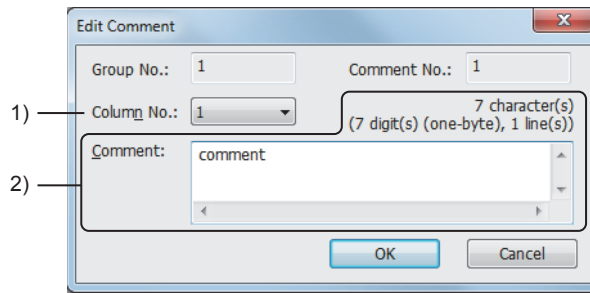

GT27 GT25 GT23 GT21 SoftGOT2000 GS

- 1) **[Password]**  
Set the password currently set for the project.

## 12.11.4 [Edit Comment] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

### 1) [Column No.]

Select the column No. of the comment to be edited.

### 2) [Comment]

Edit the comment in the comment group.

If an unregistered comment group No. or comment No. is displayed, create a new comment.

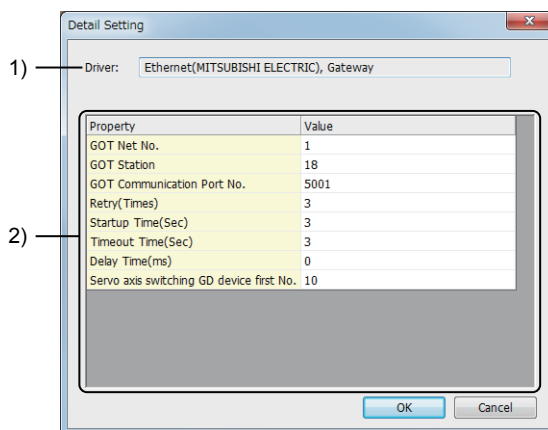

Up to 1024 characters can be set for the comment.

The number of characters, digits, and rows of the input comment are displayed on the upper right of the comment input field.

- Number of characters:  
A character is counted as one character.  
The line feed is counted as two characters.
- Number of digits:  
The number of digits of the row with the largest number of digits is displayed.
- Number of rows:  
The number of rows of the comment is displayed.  
Even though a line feed is inserted without characters, the line feed is counted as one row.

## 12.11.5 [Detail Setting] dialog

GT27 GT25 GT23 GT21 SoftGOT2000 GS

When the driver is set to [Ethernet(MITSUBISHI ELECTRIC), Gateway]

### 1) [Driver]

Displays the driver that is currently set.

### 2) Detail Setting

Setting items and setting ranges to be displayed vary depending on the driver to be used.

Item	Description
[Transmission Speed(BPS)]	Select the transmission speed.
[Data Bit]	Select the data length.
[Stop Bit]	Select the stop bit length.
[Parity]	Select the type for a parity check.
[Sum Check]	Select whether to perform a sum check.
[Sum Check Type]	Select the type for a sum check.
[Retry(Times)]	Set the number of retries to be performed when a communication error occurs. When no response is received after the retries, the communication times out.
[Startup Time(Sec)]	Set the time period from the GOT startup to the beginning of the communication with the PLC CPU.
[Timeout Time(Sec)]	Set the interval for communication to time out.
[Adapter Address]	Set the adapter address in the connected network.
[Host]	Set the host address in the connected network.
[Delay Time(ms)]	Set the send delay time to lower the load of the network and the connected PLC CPUs.
[GOT Station]	Set a station number of the host in the system configuration.
[Format]	Select the communication format.
[Interrupt Data Byte]	Select the number of bytes of the interrupt data.
[Station No. Selection]	Select whether to use a station number at the communication or not.
[Special Interrupt Code]	Select whether to have the special interrupt code output or not.
[Control method]	Set this item when XON or XOFF control is used.
[Message Format]	Select a message format.
[Communication data code]	Select a communication data code.
[32bit Storage]	Select an order for storing two words (32-bit data).
[Monitor Speed]	Set the monitor speed of the GOT.
[Negotiation Time(Sec)]	Set the time period that the GOT side communication setting is sent to the inverter.
[Initialization Wait Time(Sec)]	Set the wait time from when the communication setting is changed until when the communication starts.
[Automatic Negotiation]	Select whether to use the automatic negotiation.
[Function Code[0F]]	Select whether to use the function code [0F] or not.
[Function Code[10]]	Select whether to use the function code [10] or not.
[Read coil points]	Set the maximum number of read coils.
[Read input relay points]	Set the maximum number of read input relays.
[Read holding register points]	Set the maximum number of read holding registers.
[Read input register points]	Set the maximum number of read input registers.
[Write coil points]	Set the maximum number of write multiple coils.
[Write holding register points]	Set the maximum number of write multiple holding registers.
[Device read points(Points)]	Set the number of consecutive devices from which data is read in one communication.
[Device write points(Points)]	Set the number of consecutive devices to which data is written in one communication.
[Device read random points(Points)]	Set the number of separate devices from which data is read in one communication.
[Device write random points(Points)]	Set the number of separate devices to which data is written in one communication.
[Stage No.]	Set the number of extension base units.
[Slot No.]	Set the slot No.
[GOT Net No.]	Set the network No. of the GOT.
[GOT Station]	Set the GOT's station number.
[GOT Communication Port No.]	Set the port No. used by the GOT for the connection with the Ethernet module.
[Protocol]	Select a communication protocol.
[Interrupt Data Length]	Set the number of bytes of the interrupt data.

Item	Description
[Existence Confirmation]	Select whether to perform an existence confirmation.
[Existence Confirmation Cycle(Sec)]	Set the cycle to perform an existence confirmation.
[Network Type]	Select a network type.
[Network No.]	Set the network No.
[Station No.]	Set the GOT's station number.
[Group No.]	Group No.
[Mode]	Set a mode.
[Transmission Speed(Mbps)]	Select a transmission speed.
[Refresh Interval(Times)]	Set how many times is the block data assurance per station (refresh) performed for the send data and the receive data.
[Transmission Speed(Gbps)]	Select a transmission speed.
[Refresh Interval(ms)]	Set the interval for performing the block data assurance per station (refresh) for the send data and the receive data.
[Input for Error Station]	Select whether to clear or hold the error at an error occurrence.
[Transmission Rate]	Set the transmission speed and a mode of the GOT.
[Expanded Cyclic]	Select the cyclic counts expansion.
[Occupied Station]	Select the number of stations occupied by the GOT.
[Video Input Signal]	Select the video input signal
[Video Resolution]	Select the video resolution.
[IP Address]	Set the IP address of the multimedia unit.
[Subnet Mask]	Set the subnet mask.
[Default Gateway]	Set the default gateway.
[Connection CH No.]	Set the channel number used for the connection to the GOT (Extended computer).
[Transmission method]	Set the CC-Link transmission method.
[Servo axis switching GD device first No.]	Set the start device number of the GOT data registers (GD) to specify an axis number.
[Output HOLD/CLEAR Setting]	Select whether the GOT (slave station) holds the device values received from and sent to the master station when the master station stops running.
[Destination module I/O number]	Specify a destination module I/O number to be returned from the GOT to the host station.

For the detail settings of peripheral devices including barcodes and RFIDs, refer to the following.

- ⇒ 10.1.5 [Bar Code] dialog
- ⇒ 10.2.5 [RFID] dialog
- ⇒ 10.6.5 [Video/RGB Input] dialog
- ⇒ 10.8.6 [Multimedia] dialog
- ⇒ 10.11.8 [Printer] dialog

## 12.12 Upgraded Additional Function List

- ⇒ 12.12.1 Supported hardware
- 12.12.2 Supported controller
- 12.12.3 Functions of GT Designer3
- 12.12.4 Drawing Setting
- 12.12.5 GOT functions

This section explains functions added by upgraded GT Designer (GOT2000).

The following shows the version of the system application that GT Designer 3 of each version supplies.

GT Designer3 version	System application version	BootOS version	CoreOS version	Version and issue date of this manual	
1.100E	01.00.***	A	-	SH-081220ENG-A	September 2013

## 12.12.1 Supported hardware

Product name	Model	Applicable GT Designer3 version
GT27	GT2715-XTBA, GT2715-XTBD	1.112S
	GT2712-STBA, GT2712-STBD, GT2712-STWA, GT2712-STWD	1.100E
	GT2710-STBA, GT2710-STBD, GT2710-VTBA, GT2710-VTBD, GT2710-VTWA, GT2710-VTWD	1.100E
	GT2708-STBA, GT2708-STBD, GT2708-VTBA, GT2708-VTBD	1.100E
	GT2705-VTBD	1.130L
GT25	GT2512-STBA, GT2512-STBD	1.122C
	GT2512F-STNA, GT2512F-STND	1.150G
	GT2510-WXTBD, GT2510-WXTSD	1.175H
	GT2510-VTBA, GT2510-VTBD, GT2510-VTWA, GT2510-VTWD	1.112S
	GT2510F-VTNA, GT2510F-VTND	1.150G
	GT2508-VTBA, GT2508-VTBD, GT2508-VTWA, GT2508-VTWD	1.112S
	GT2508F-VTNA, GT2508F-VTND	1.150G
	GT2507-WTBD, GT2507-WTSD	1.175H
	GT2507T-WTSD	1.195D
	GT2505-VTBD	1.180N
	GT2506HS-VTBD	1.170C
GT2505HS-VTBD	1.195D	
GT23	GT2310-VNBA, GT2310-VNBD	1.100E
	GT2308-VNBA, GT2308-VNBD	1.100E
GT21	GT2107-WTBD, GT2107-WTSD	1.170C
	GT2105-QTBDS, GT2105-QMBDS	1.144A
	GT2104-RTBD	1.122C
	GT2104-PMBD, GT2104-PMBDS	1.131M
	GT2104-PMBDS2, GT2104-PMBLS	1.137T
	GT2103-PMBD, GT2103-PMBDS	1.112S
	GT2103-PMBDS2, GT2103-PMBLS	1.119Z
GT SoftGOT2000	GT SoftGOT2000	1.100E
Bus connection unit	GT15-QBUS, GT15-QBUS2, GT15-75QBUSL, GT15-75QBUS2L	1.100E
Serial communication unit	GT15-RS2-9P, GT15-RS4-9S, GT15-RS4-TE	1.100E
MELSECNET/H communication unit	GT15-J71LP23-25, GT15-J71BR13	1.100E
CC-Link IE Controller Network communication unit	GT15-J71GP23-SX	1.100E
CC-Link IE Field Network communication unit	GT15-J71GF13-T2	1.100E
CC-Link communication unit	GT16-J61BT13	1.100E
Wireless LAN communication unit	GT25-WLAN	1.108N BootOS: C
Serial multi-drop connection unit	GT01-RS4-M	1.100E
Field network adapter unit	GT25-FNADP	1.130L BootOS: N
Ethernet communication unit	GT25-J71E71-100	1.160S BootOS: Z
Connection conversion adapter	GT10-9PT5S	1.180N
RS-232/485 signal conversion adapter	GT14-9RS2T4-9P	1.180N

Product name	Model	Applicable GT Designer3 version
Printer unit	GT15-PRN	1.104J
Video/RGB input unit	GT27-V4R1-Z	1.100E
Video input unit	GT27-V4-Z	1.100E
RGB input unit	GT27-R2	1.130L BootOS: N
	GT27-R2-Z	1.100E
RGB output unit	GT27-ROUT	1.130L BootOS: N
	GT27-ROUT-Z	1.100E
Multimedia unit	GT27-MMR-Z	1.100E
Digital video output unit	GT27-VHOUT	1.205P BootOS: AK
Sound output unit	GT15-SOUT	1.100E
External I/O unit	GT15-DIO, GT15-DIOR	1.100E
SD card unit	GT21-03SDCD	1.112S
Connector conversion box	GT16H-CNB-42S	1.170C
	GT16H-CNB-37S, GT11H-CNB-37S	1.195D

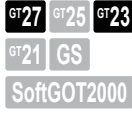

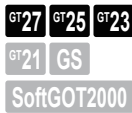

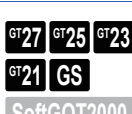

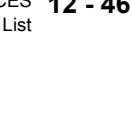

## 12.12.2 Supported controller

For the controller supported by each communication driver, refer to the following.

→12.2.1 Correspondence between the setting of [Controller Type] and the controller used

### ■1 Mitsubishi equipment

Communication driver	Version of communication driver	Added and edited function	Supported models <sup>1</sup>
Serial(MELSEC) (formerly Q/L/QnA/A CPU, QJ71C24, LJ71C24)	01.00.***	- (first edition)	
	01.03.***	The connection to Q24DHCCPU-VG is supported.	
	01.04.***	<ul style="list-style-type: none"> <li>The driver name has been changed. (Unified with MELSEC-Q/L/QnA.)</li> <li>The connection to RCPUR is supported.</li> <li>The global label is supported.</li> </ul>	
	01.08.***	<ul style="list-style-type: none"> <li>The connection to MELSEC iQ-F is supported.</li> <li>The connection to the motion controller CPU (MELSEC iQ-R series) is supported.</li> </ul>	
	01.10.***	<ul style="list-style-type: none"> <li>The connection to RnPCPU is supported.</li> <li>The connection to the C Controller module (MELSEC iQ-R series) is supported.</li> </ul>	
	01.12.***	The connection to RnENCPU is supported.	
	Models other than GT21: 01.14.*** GT21: 01.15.***	<ul style="list-style-type: none"> <li>The connection to RnSF CPU is supported.</li> <li>The connection to R64MTCPU is supported.</li> <li>The connection to MR-J4(W)-*B(-RJ) or MR-JE-*B through a motion controller or a simple motion module is supported.</li> </ul>	
	Models other than GT21: 01.15.*** GT21: 01.16.***	The connection to Q26DHCCPU-LS is supported.	
	Models other than GT21: 01.16.*** GT21: 01.18.***	The connection to CNC C80 is supported.	
	Models other than GT21: 01.17.*** GT21: 01.19.***	The redundant system using RCPUR is supported.	
	Models other than GT21: 01.19.*** GT21: 01.21.***	The connection to MR-J4-GF(-RJ) through a motion controller or a simple motion module is supported.	
	Models other than GT21: 01.20.*** GT21: 01.22.***	The connection to MR-JE-*BF through a motion controller or a simple motion module is supported.	
	Models other than GT21: 01.21.*** GT21: 01.23.***	The connection to CR800-R is supported.	
	Models other than GT21: 01.24.*** GT21: 01.26.***	The connection to R00CPU, R01CPU, or R02CPU is supported.	
	Models other than GT21: 01.25.*** GT21: 01.27.***	The connection to FR-A800, FR-A800-E, FR-F800, FR-F800-E, or FR-A800-GF through a PLC CPU is supported.	
	Models other than GT21: 01.26.*** GT21: 01.28.***	<ul style="list-style-type: none"> <li>The connection to SIL2 Process CPU is supported.</li> <li>The connection to FR-E700-NE through a PLC CPU is supported.</li> <li>Automatically switching the monitoring target while the GOT is monitoring the equipment on a different network through the Redundant CPU on a relay station is supported.</li> </ul>	
	Models other than GT21: 01.27.*** GT21: 01.29.***	The connection to CR800-Q is supported.	

Communication driver	Version of communication driver	Added and edited function	Supported models <sup>*1</sup>

## 12.12.3 Functions of GT Designer3

### ■1 Functions for the project

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
Help on MELSOFT Navigator	1.104J
Project format "*.GTCNV" has been added.	1.108N
Registering device comments or device definitions as a comment group is supported.	1.117X
Importing global labels is supported.	1.118Y
Importing AB native tags is supported.	1.122C
Verifying the items set in each screen (screen property, object, or others) is supported.	1.123D
Labels (GT Designer3) are supported.	1.126G
Assigning a security key is supported.	1.144A
Global labels created with MT Developer2 is supported.	1.155M
The system label Ver.2 is supported.	1.170C
Printing label group data is supported.	1.175H
String-type system labels are supported.	1.185T
Importing labels created on GX Works3, GX Works2, or MT Developer2 as labels (GT Designer3) is supported.	1.195D
Array-type labels (GT Designer3) are supported.	
Copying data from a cell in the [Label Group] window to one in Excel (and vice versa) is supported.	
Outputting the MELSOFT iQ AppPortal information file is supported.	
The bit specification of word devices for system labels or labels (GT Designer3) is supported.	
System labels Ver.1 and Ver.2 of the Unicode string type are supported.	
Global labels of the string type or Unicode string type are supported.	
String-type AB native tags are supported.	
Importing OMRON NJ tags is supported.	
Applying the offset setting to OMRON NJ tags is supported.	
Importing global labels from a GX Works3 project is supported.	
Registering the labels (GT Designer3) created from profile (CSP+) data is supported.	

### ■2 Functions for editing the screen, figure, and object

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
<ul style="list-style-type: none"> <li>The objects support registering the characters (text type [Text]) for a comment group and making the registered comment be automatically referred.</li> <li>For the following figures, the setting items have been divided into tabs. Line, freeform line, rectangle, polygon, circle, and piping</li> </ul>	1.112S
The copy direction setting is supported for the consecutive copy.	1.130L
Reading 24-bit PNG files is supported.	1.155M
Anchoring a figure or object to align figures and objects is supported.	1.170C
Editing objects with fixed shape frame widths is supported.	1.175H

### ■3 Functions for the search and replacement

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
<ul style="list-style-type: none"> <li>Device list, text list Report screens have been added as a search target.</li> <li>Batch edit Report screens have been added as a batch edit target.</li> </ul>	1.104J

Added and edited function	Version corresponding with GT Designer3
Importing and exporting the device batch edit data are supported.	1.108N
Setting the display type in the device batch edit is supported.	1.126G
Displaying the data browser from the [Search/Replace] menu is supported.	1.130L
Listing the OMRON NJ tags in the device list is supported.	1.175H
OMRON NJ tags have been added as a batch edit target.	
The unit numbers and axis numbers have been targeted for the batch edit.	1.185T
Searching the whole project at a batch edit is supported.	
Searching the specified scripts at a batch edit of channel numbers is supported.	
Searching the scripts of a script parts object at a batch edit is supported.	1.195D
The device search is supported.	1.205P

#### ■ 4 Functions for the display

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
Switching the states of the object displayed on the screen editor is supported.	1.108N
The [Verify Result] window is supported.	1.118Y
The display language switching is supported.	1.122C
The buttons to expand and collapse all attribute items have been added to the property sheet.	1.134Q
Displaying guidelines for a table figure is supported.	1.144A
Displaying guidelines for enlarging or reducing an object is supported.	
[25%] and [Whole Screen] have been added to specify the zoom magnification.	1.165X

#### ■ 5 Functions for communication with GOT

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
The communication between the GOT and a personal computer by the wireless LAN function is supported.	1.108N
Installing CoreOS with a data storage is supported.	
The communication between the GOT and a personal computer via an RCPUC is supported.	1.118Y
Writing resource data is supported.	1.165X
The [CSP+ for iQSS Data Write] command has been moved from the [Tools] menu.	
Writing, reading, and verifying data through the Ethernet extended port or Ethernet standard port 2 of the GOT are supported.	1.175H
Writing package data to multiple GOTs in one go is supported.	1.185T

#### ■ 6 Functions for the window display

Added and edited function	Version corresponding with GT Designer3
Displaying errors recorded in the GOT and their causes and corrective actions is supported.	1.130L
The GOT internal device monitor is supported.	1.175H

#### ■ 7 Tools and option

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
The simulation function supports MT Simulator2.	1.108N
Restructuring the project data when saving the project is supported.	1.112S
Writing iQSS profile data is supported.	1.126G
The simulation function supports GT2705-V.	1.130L
The simulation function supports referring to resource data.	
The simulation function supports GT2104-P.	1.131M

Added and edited function	Version corresponding with GT Designer3
The simulation function supports GT2105-Q.	1.144A
Simulating the connection to RnSFCPU is supported.	
Simulating the connection to R64MTCPU is supported.	
The [iQSS Profile Data Write] command in the menu is renamed with [CSP+ for iQSS Data Write].	1.150G
The [CSP+ for iQSS Data Write] command has been moved to the [Communication] menu.	1.165X
Disabling IME to specify a device is supported.	
The simulation function supports GT2107-W.	1.170C
The simulation function supports using a keyboard in the simulation of GT21.	
The simulation function supports importing or exporting a free registration list of the device monitor function.	
The simulation function supports GT25-W.	1.175H
The simulation function supports global labels when GX Simulator3 is connected.	1.190H

## ■ 8 Functions for the window display

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E

## ■ 9 Help

Added and edited function	Version corresponding with GT Designer3
- (first edition)	1.100E
Displaying Help with e-Manual Viewer is supported.	1.155M

## ■ 10 Others

Added and edited function	Version corresponding with GT Designer3
GT Designer3 is compatible with Windows8.1.	1.108N
The input assist supports the system label.	
The input assist supports the device definitions for FR-A800, FR-A700, FR-F700, FR-F700P, FR-F700PJ, FR-E700, and sensorless servo.	1.112S
The input assist supports the global label.	1.117X
The input assist supports the device definitions for FR-F800.	
The input assist supports the AB native tag.	1.118Y
The input assist supports the label (GT Designer3).	1.122C
Support for GT Designer3 running on Windows XP Service Pack2 and Windows 2000 has ended.	
Narrowing the search scope of the sample projects by category is supported when a screen is created by utilizing existing data.	1.130L
GT Designer3 is compatible with Windows 10.	1.155M
GT Designer3 is compatible with the Italian version of Windows OSs.	1.165X
The input assist supports the bit specification of word devices for system labels or labels (GT Designer3).	1.170C
The GOT Ethernet setting has been added to the new project wizard.	
The input assist supports the OMRON NJ tag.	1.175H
Editing a sound file by using speech synthesis is supported.	
The graphics setting has been added to the new project wizard.	1.185T
The usability of the screen utilization has been improved.	
Utilizing an add-on project is supported.	1.205P

## 12.12.4 Drawing Setting

### ■ 1 Functions for the edit and settings of the screen

Added and edited function	Version of application/BootOS	Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.*** 1.100E
Report function • Settings for the report screen are added.	• Standard system application • Report • Printer (PictBridge) • Printer (Serial)	01.01.*** 1.104J
GOT type setting • GT27**-X, GT25**-V, and GT2103-P have been added as a GOT type. • The setup direction setting has been added. • The backlight color setting for GT21 has been added. • The graphics accelerator setting has been added.	Standard system application • Standard system application • Graphic Acceleration Driver (only for using the graphics accelerator) CoreOS (only for using the graphics accelerator)	01.03.*** E 1.112S
Base screen and window screen • The setting range of the screen number has been changed. (0 to 32767)	Standard system application	01.03.*** 1.112S
GOT type setting • The vertical installation setting for GT27, GT25, and GT23 is supported.	Standard system application	01.04.*** 1.117X
GOT type setting • GT25**-S and GT2104-R have been added as a GOT type.	Standard system application	01.06.*** 1.122C
Report function • The maximum number of settable report screens has been changed to 32. • The maximum number of settable data collection times has been changed to 1000. • The maximum number of settable repeat times has been changed to 999. • The footer is supported. (Not applicable to GT21) • The alarm print is supported. (Not applicable to GT21) • The text print is supported. (Not applicable to GT21)	• Standard system application • Report	01.10.*** 1.130L
GOT type setting • GT2705-V has been added as a GOT type. • Switching between the Simplified Chinese character codes used for the outline font is supported. • A setting to use the easily-distinguishable font for the numeral zero and the capital letter I is supported.	• Standard system application • Standard Font • Outline Font (Gothic) (Chinese(Simplified)) • Outline Font (Kaisho) (Chinese(Simplified))	01.10.*** 1.130L
GOT type setting • GT2104-P has been added as a GOT type.	Standard system application	01.11.*** 1.131M
Report function • GT21 supports the footer. • GT21 supports the alarm print. • GT21 supports the text print.	• Standard system application • Report	01.12.*** 1.134Q
Superimpose window • A setting to close a target window upon switching base screens has been added.	Standard system application	01.12.*** 1.134Q
GOT type setting • GT2105-Q has been added as a GOT type.	Standard system application	01.14.*** 1.144A
GOT Mobile function • The mobile screen setting has been added.	• Standard system application • GOT Mobile Setting CoreOS	01.14.*** L 1.144A
GOT type setting • GT2107-W has been added as a GOT type. • Selecting a typeface for the outline font is supported. (Only available to GT2107-W)	Standard system application	01.19.*** 1.170C
GOT type setting • GT25**-WX and GT25**-W have been added as a GOT type.	Standard system application	01.20.*** 1.175H

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
GOT type setting • The graphics setting has been added.	Standard system application	01.23.***	1.185T
The screen design setting has been added.	Standard system application	01.23.***	1.185T
Report function • The report screen setting dialog has been revamped. • The operation log has been added as an output target. • The file output settings are supported. • The page header and page footer settings are supported.	• Standard system application • Report	01.26.***	1.200J
GOT Mobile function • The setting range of the mobile screen size has been extended.	• Standard system application • GOT Mobile Setting	01.26.***	1.200J
Report function • Saving report files into the network drive is supported.	• Standard system application • Report	01.27.***	1.205P

## ■2 Functions for the common setting

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.***	1.100E
Hard copy • Settings for the printer output (PictBridge and serial) are added.	• Standard system application • Printer (PictBridge) • Printer (Serial)	01.01.***	1.104J
KANA-KANJI Conversion • Settings for the GOT environmental settings are added to the GOT environmental settings.	• Standard system application • KANA-KANJI Conversion	01.01.***	1.104J
Wireless LAN function • The wireless LAN setting is added to the GOT setup. • Settings for the wireless LAN are added to the I/F communication setting. • Settings for the wireless LAN are added to the gateway function connection setting. • Settings for the wireless LAN are added to the GOT setting list.	• Standard system application • Wireless LAN • Gateway (server and client) • Gateway (mail) • Gateway (FTP server) • Gateway (FTP client)	01.02.***	1.108N
	BootOS	D	
Comment group • Switching the comment number notations (between decimal and hexadecimal) is supported.	Standard system application	01.02.***	1.108N
User alarm observation • The setting range for the alarm observation cycle has been changed to 0.1 second to 3600 seconds. (GT27 and GT SoftGOT2000)	Standard system application	01.02.***	1.108N
MES interface function • The MES interface function settings have been added.	• Standard system application • MES Interface	01.02.***	1.108N
	BootOS	D	
Screen switching/windows (GOT environmental setting) • The setting to specify the screen number of the window screen to be hidden has been added. • The setting to enable screen switching by device while the screen is being touched has been added.	Standard system application	01.03.***	1.112S
System information (GOT environmental setting) • The backlight color selection for 3-color control has been added.	Standard system application	01.03.***	1.112S
Brightness adjustment mode • The brightness adjustment mode setting has been added to the GOT setup.	Standard system application	01.03.***	1.112S
	BootOS	E	
POWER LED shutoff • The POWER LED setting has been added to the GOT setup.	Standard system application	01.03.***	1.112S
System alarm observation • Recording global label names is supported.	Standard system application	01.04.***	1.117X

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Script • The global label is supported.	Standard system application	01.04.***	1.117X
Backup/restoration • GT21 supports this function.	• Standard system application • Backup/restoration	01.05.***	1.118Y
System alarm observation • Recording AB native tag names is supported.	Standard system application	01.05.***	1.118Y
Script • The AB native tag is supported.	Standard system application	01.05.***	1.118Y
Script • Labels (GT Designer3) are supported.	Standard system application	01.06.***	1.122C
Controller setting • The buffer memory unit No. switching is supported.	Standard system application	01.06.***	1.122C
IP filter function • The IP filter settings have been added to the controller setting. • The IP filter settings have been added to the connection settings for the gateway function.	Standard system application	01.06.***	1.122C
	CoreOS	H	
System launcher • The system launcher setting has been added to the GOT setup.	• Standard system application • System launcher	01.08.***	1.126G
iQSS utility • The iQSS utility setting has been added to the GOT setup.	• Standard system application • iQSS utility	01.08.***	1.126G
User alarm observation • Unicode has been added as a character code.	Standard system application	01.08.***	1.126G
Logging • Unicode has been added as a character code.	Standard system application	01.08.***	1.126G
Recipe • Unicode has been added as a character code.	Standard system application	01.08.***	1.126G
Script • The following file operation functions are supported. file_getfolderlist, file_uniliread, #pragma use_character_code unicode • The following string operation functions are supported. str_uniscanf, str_uniprintf, str_unistrlen, str_unistrmid, str_lc2uni, str_uni2lc	Standard system application	01.08.***	1.126G
I/F communication setting • Assigning a channel number ranging from 5 to 8 to the standard I/F-1 is supported.	Standard system application	01.08.***	1.126G
Video/RGB input • A setting to use GT27-R2 is supported.	• Standard system application • Video/RGB (Object)	01.10.***	1.130L
	BootOS	N	
User alarm observation • Printing alarm details is supported. (Not applicable to GT21)	Standard system application	01.10.***	1.130L
Operation log (GOT environmental setting) • A setting to log the previous device value with each touch switch operation has been added.	Standard system application	01.12.***	1.134Q
Comment group • Collectively copying, cutting, and pasting multiple cells are supported.	Standard system application	01.12.***	1.134Q
Script • Setting the execution cycle time in units of 100 ms is supported.	Standard system application	01.12.***	1.134Q
Operation log (GOT environmental setting) • The GOT network interaction function and the GOT Mobile function have been added as the operation log target. • A setting to log operations performed on a GOT Mobile function client has been added.	Standard system application	01.14.***	1.144A

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Wireless LAN function • The access point mode has been added as an operation mode.	• Standard system application • Wireless LAN	01.14.***	1.144A
	BootOS	D	
System alarm observation • A setting to monitor errors of a GOT Mobile function client has been added.	Standard system application	01.14.***	1.144A
Controller setting • The setting range of the port number has been changed in the Ethernet setting for the MODBUS/TCP connection (1 to 65535).	Standard system application	01.14.***	1.144A
GOT network interaction function • The GOT network interaction function setting has been added.	• Standard system application • GOT Network Interaction	01.14.***	1.144A
GOT Mobile function • The GOT Mobile function setting has been added.	• Standard system application • GOT Mobile Setting	01.14.***	1.144A
	CoreOS		
Logging • The setting dialog has been revamped.	Standard system application	01.15.***	1.150G
Screen switching/windows (GOT environmental setting) • The setting to specify the stacking order of overlap windows has been added. • The setting to disable the touch operation on the window screen that is behind an overlap window has been added.	Standard system application	01.16.***	1.155M
Controller setting • The menu name [Q Redundant] has been changed to [MELSEC Redundant].	Standard system application	01.17.***	1.160S
GOT Mobile function • The ANDON setting has been added.	Standard system application	01.17.***	1.160S
Comment group • Setting Windows fonts is supported.	Standard system application	01.18.***	1.165X
GOT Mobile function • The historical data list display, statistics bar graph, statistics pie graph, scatter graph, and graphical meter are supported.	• Standard system application • GOT Mobile Setting	01.18.***	1.165X
User alarm observation • Setting the device to change the status of an alarm to "Checked" is supported. • Setting the device to notify that the status of an alarm has been changed to "Checked" is supported.	Standard system application	01.19.***	1.170C
Operation log (GOT environmental setting) • The setting to log operations performed on a numerical input or a text input has been added.	Standard system application	01.20.***	1.175H
GOT internal device monitor of the GOT diagnostics function (GOT setup) • The setting to enable the GOT internal device monitor has been added.	Standard system application	01.20.***	1.175H
VNC server (GOT setup) • This function is supported by GT2107-W.	• Standard system application • VNC server	01.20.***	1.175H
System launcher (GOT setup) • The setting to display the servo network configuration has been added.	• Standard system application • System Launcher (Basic) • System Launcher (Servo Network)	01.20.***	1.175H
Ethernet interface setting (GOT Ethernet setting) • The IP address settings have been moved to the [GOT IP Address Setting] tab. • The default gateway and other common settings have been moved to the [GOT Ethernet Common Setting] tab. • The IP filter settings have been moved to the [IP Filter Setting] tab.	Standard system application	01.20.***	1.175H
Controller setting • The IP filter settings have been moved to the [GOT Ethernet Setting] window.	Standard system application	01.20.***	1.175H

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Barcode (Peripheral setting) • The USB barcode settings have been added.	• Standard system application • Bar Code (USB)	01.20.***	1.175H
I/F communication setting • The Ethernet interface settings have been moved to the [GOT Ethernet Setting] window.	Standard system application	01.20.***	1.175H
Trigger action • Selecting the sound output in the action setting is supported. • Playing the sound files specified in the playlist is supported.	Standard system application	01.20.***	1.175H
Time action • The setting range of the sound file number has been changed to 1 to 500.	Standard system application	01.20.***	1.175H
Hard copy • The setting to use the image file output and the printer output is supported.	Standard system application	01.20.***	1.175H
Script • The OMRON NJ tag is supported.	Standard system application	01.20.***	1.175H
GOT Mobile function • The setting to clear the values of the GOT Mobile devices (VGD and VGB) for the target client upon connection is supported.	• Standard system application • GOT Mobile Setting	01.20.***	1.175H
Sound output function • The maximum number of sound files has been expanded to 500 files. • Settings to play, stop, and mute the sound are supported. • [Message], [Sound Effect], and [Melody] have been added as a sound type.	• Standard system application • Sound Output	01.20.***	1.175H
Sound output function • The WAV file format conversion is supported. • Setting [File No.] in the [Create New Sound File] or [Edit Sound File] dialog is supported.	• Standard system application • Sound Output	01.22.***	1.180N
Operation log (GOT environmental setting) • The operator management has been added as the operation log target.	Standard system application	01.23.***	1.185T
Script • The project script has been added as the screen-related setting to be utilized automatically at the screen utilization.	Standard system application	01.23.***	1.185T
GOT Mobile function • The hard copy function is supported.	• Standard system application • GOT Mobile Setting	01.23.***	1.185T
Recipe • Saving recipe data to the SRAM user area is supported. • The date format setting has been moved to the [Basic] tab.	• Standard system application	01.24.***	1.190Y
Logging • Enabling the SRAM power-failure backup function for a maximum of 20 logging settings is supported.	• Standard system application	01.24.***	1.190Y
IP filter function • GT21 supports this function.	Standard system application	01.25.***	1.195D
Comment group • Displaying comments from a comment text file is supported.	Standard system application	01.25.***	1.195D
GOT Mobile function • File manipulations are supported.	• Standard system application • GOT Mobile Setting	01.25.***	1.195D
Controller setting • The channel setting window has been revamped.	Standard system application	01.26.***	1.200J
Operation log (GOT environmental setting) • The file print has been added as an operation log target. • The object operation name settings are supported. • Setting an item to be output using the report function is supported.	Standard system application	01.26.***	1.200J

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Barcode (Peripheral setting) • Specifying values as the header or terminator is supported.	• Standard system application • Bar Code (Serial)	01.26.***	1.200J
RFID (Peripheral setting) • Specifying values as the header or terminator is supported.	• Standard system application • RFID	01.26.***	1.200J
Printer (Peripheral setting) • The Ethernet printer setting is supported.	• Standard system application • Printer (ESC/P-R)	01.26.***	1.200J
	BootOS	AJ	
Hard copy • The Ethernet printer setting is supported.	Standard system application	01.26.***	1.200J
	BootOS	AJ	
Network drive • The network drive settings have been added to the GOT setup.	• Standard system application • Network Drive	01.27.***	1.205P
	CoreOS	L	
	BootOS	AK	
Logging • Saving logging files into the network drive is supported.	Standard system application	01.27.***	1.205P
Hard copy • Saving image files into the network drive is supported.	Standard system application	01.27.***	1.205P

### ■3 Functions for the edit and settings of the figure

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.***	1.100E
Line, freeform line, rectangle, polygon, circle, and piping • The setting items have been divided into tabs.	Standard system application	01.03.***	1.112S
Text • Registering text to a comment group and converting the text figure to a simple comment display object are supported.	Standard system application	01.04.***	1.117X
Figure • Changing the coordinates of a grouping of figures on the property sheet or toolbar is supported.	Standard system application	01.12.***	1.134Q
Figure • Independently editing each figure of a grouping is supported.	Standard system application	01.14.***	1.144A
Table • The table setting has been added.	Standard system application	01.14.***	1.144A
Figure • The maximum number of characters for a figure name has been changed to 100.	Standard system application	01.23.***	1.185T

### ■4 Functions for the edit and settings of the object

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.***	1.100E
Text input • Settings for the KANA-KANJI conversion are added.	• Standard system application • KANA-KANJI Conversion	01.01.***	1.104J
Print object • Settings for the numerical print, bit comment print, and word comment print are added.	• Standard system application • Report	01.01.***	1.104J
Object • Selecting the ON display or OFF display is available for displaying and hiding the object.	Standard system application	01.02.***	1.108N

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Key code switch • The setting not to specify the character code is supported.	Standard system application	01.02.***	1.108N
Slider • The slider settings have been added.	Standard system application	01.02.***	1.108N
Special function switch • The R motion monitor is supported. • The CNC monitor is supported. • The CNC data I/O is supported. • The CNC machining program edit is supported. • The recipe operation is supported.	Standard system application	01.04.***	1.117X
Key code switch • The key code (FFBFh) for displaying the first alarm is supported.	Standard system application	01.04.***	1.117X
Alarm display (user), Alarm display (system) • Indirectly specifying the display start row is supported. • The setting ranges for the numbers of the displayed rows and digits have been expanded. • Setting items of [Flow all] and [Flow the selected row] have been added. • Externally outputting the alarm status and the number of displayed alarms is supported.	Standard system application	01.04.***	1.117X
Special function switch • The recipe operation is supported.	Standard system application	01.04.***	1.117X
Logging • The string has been added as a device type.	Standard system application	01.06.***	1.122C
Historical data list • The string has been added as a device type.	Standard system application	01.06.***	1.122C
Panelmeter • The beginning angle and end angle settings have been added. • The triangle and the inverted triangle have been added as a needle shape. • Specifying the distance from the meter center to the drawing start position of the needle is supported.	Standard system application	01.06.***	1.122C
Special function switch • The system launcher is supported. • The iQSS utility is supported.	Standard system application	01.08.***	1.126G
Key code switch • Unicode has been added as a character code.	Standard system application	01.08.***	1.126G
Text display, text input • Unicode has been added as a character code.	Standard system application	01.08.***	1.126G
Slider • GT21 supports this function.	Standard system application	01.08.***	1.126G
Document display • The setting range of the document ID has been expanded. (1 to 32767) • Specifying the document ID by setting a device is supported.	Standard system application	01.08.***	1.126G
Key code switch • The key code (FFBAh) for starting the sequence program monitor (R ladder) from the alarm display (user) is supported.	Standard system application	01.09.***	1.127H
Special function switch • The motion program editor is supported. • The motion program I/O is supported.	Standard system application	01.10.***	1.130L
Print object • Settings for the text print have been added. (Not applicable to GT21)	• Standard system application • Report	01.10.***	1.130L
Video/RGB display object • Settings for the video/RGB display object have been added.	• Standard system application • Video/RGB (Object)	01.10.***	1.130L
	BootOS	N	

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Object • Changing the coordinates of a grouping of objects on the property sheet or toolbar is supported.	Standard system application	01.12.***	1.134Q
Object • Independently editing each object of a grouping is supported.	Standard system application	01.14.***	1.144A
Hyperlink • The hyperlink setting has been added.	Standard system application	01.14.***	1.144A
Special function switch • The file management function is supported.	Standard system application	01.15.***	1.150G
Text display, text input • HQ fonts have been added.	Standard system application	01.15.***	1.150G
Special function switch • The CNC monitor 2 is supported. • The drive recorder is supported. • The recipe file operation is supported.	Standard system application	01.16.***	1.155M
Recipe Display (Record List) • The settings for the recipe display (record list) have been added.	Standard system application	01.16.***	1.155M
Graphical Meter • The graphical meter settings have been added.	Standard system application	01.16.***	1.155M
Special function switch • The CC-Link IE Field Network diagnostics is supported.	Standard system application	01.18.***	1.165X
Switch • Setting the offset device for the lamp function is supported.	Standard system application	01.19.***	1.170C
Bit Switch • Setting the offset device for the lamp function is supported.	Standard system application	01.19.***	1.170C
Word Switch • Setting the offset device for the lamp function is supported.	Standard system application	01.19.***	1.170C
Go To Screen Switch • Setting the offset device for the lamp function is supported.	Standard system application	01.19.***	1.170C
Change Station No. Switch • Setting the offset device for the lamp function is supported.	Standard system application	01.19.***	1.170C
Key window display switch • Setting the offset device for the lamp function is supported.	Standard system application	01.19.***	1.170C
Switch • The sound output has been added to the switch action setting.	Standard system application	01.20.***	1.175H
Special function switch • The output destination setting for the hard copy is supported.	Standard system application	01.20.***	1.175H
Text input • The write completion device setting is supported.	Standard system application	01.20.***	1.175H
Document display • The setting to display a PDF file as-is is supported.	• Standard system application • Document Display (PDF)	01.20.***	1.175H
Object • The maximum number of characters for an object name has been changed to 100.	Standard system application	01.23.***	1.185T
Numerical display, numerical input • Indirect specification of the number of decimal places is supported.	Standard system application	01.23.***	1.185T
Document display • The search and bookmark functions for PDF files are supported.	• Standard system application • PDF Search/bookmark Function	01.23.***	1.185T

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Special function switch • The servo amplifier graph is supported.	Standard system application	01.25.***	1.195D
Script parts • The script parts object settings have been added.	Standard system application	01.25.***	1.195D
Recipe Display (Record List) • GT21 supports this function.	Standard system application	01.25.***	1.195D
Special function switch • The file print is supported.	Standard system application	01.26.***	1.200J
Alarm display (user) • Placing key code switches together with this object is supported.	Standard system application	01.27.***	1.205P
Alarm display (system) • Placing key code switches together with this object is supported.	Standard system application	01.27.***	1.205P

## 12.12.5 GOT functions

### ■1 Basic functions

#### (1) Utility function

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.***	1.100E
The wireless LAN setting is added.	• Standard system application • Wireless LAN	01.02.***	1.108N
	BootOS	D	
The license management for the MES interface function is supported.	BootOS	D	1.108N
The brightness adjustment mode setting has been added.	Standard system application	01.03.***	1.112S
	BootOS	E	
The POWER LED setting has been added.	Standard system application	01.03.***	1.112S
• The operation button has been added to the operation log list screen. • Displaying the operation log screen in a reduced size is supported.	Standard system application	01.03.***	1.112S
The R motion monitor is supported.	• Standard system application • R motion monitor	01.04.***	1.117X
The CNC monitor is supported.	• Standard system application • CNC Monitor	01.04.***	1.117X
The CNC data I/O is supported.	• Standard system application • CNC Data I/O	01.04.***	1.117X
The CNC machining program edit is supported.	• Standard system application • CNC Manufacturing Program Editor	01.04.***	1.117X
The recipe operation is supported.	Standard system application	01.04.***	1.117X
Deleting the label name resolution file is supported.	Standard system application	01.04.***	1.117X
GT21 supports the backup/restoration.	• Standard system application • Backup/restoration	01.05.***	1.118Y
The IP filter setting is supported.	Standard system application	01.06.***	1.122C
	CoreOS	H	
The system launcher setting is supported.	• Standard system application • System launcher	01.08.***	1.126G
The iQSS utility setting is supported.	• Standard system application • iQSS utility	01.08.***	1.126G
The motion program editor is supported.	• Standard system application • Motion Program Editor	01.10.***	1.130L
The motion program I/O is supported.	• Standard system application • Motion Program Input/Output	01.10.***	1.130L
Displaying information on the station connected to the GOT (wireless LAN access point) is supported.	• Standard system application • Wireless LAN	01.14.***	1.144A
	BootOS	D	
The license management for the GOT Mobile function is supported.	• Standard system application • GOT Mobile Setting	01.14.***	1.144A
	CoreOS	L	
The GOT Mobile information is supported.	Standard system application	01.15.***	1.150G
The file manager is supported.	• Standard system application • File Manager	01.15.***	1.150G
The CNC monitor 2 is supported.	• Standard system application • CNC Monitor 2	01.16.***	1.155M
The drive recorder is supported.	• Standard system application • Drive Recorder	01.16.***	1.155M

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
The ANDON connection is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>GOT Mobile Setting</li> </ul>	01.17.***	1.160S
The CC-Link IE Field Network diagnostics is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>CC-Link IE Field Network diagnostics</li> </ul>	01.18.***	1.165X
The system launcher (servo network) is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>System Launcher (Basic)</li> <li>System Launcher (Servo Network)</li> </ul>	01.20.***	1.175H
The GOT Mobile function supports the file manager.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>GOT Mobile Setting</li> </ul>	01.20.***	1.175H
The SRAM management function supports recipe data.	<ul style="list-style-type: none"> <li>Standard system application</li> </ul>	01.24.***	1.190Y
The servo amplifier graph is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Servo amplifier graph</li> </ul>	01.25.***	1.195D
GT21 supports the IP filter settings.	Standard system application	01.25.***	1.195D
The GOT Mobile function supports file manipulations.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>GOT Mobile Setting</li> </ul>	01.25.***	1.195D
The GOT Mobile function supports disconnecting the clients by operating the GOT.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>GOT Mobile Setting</li> </ul>	01.26.***	1.200J
The file print is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>File Print</li> </ul>	01.26.***	1.200J
The network drive settings are supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Network Drive</li> </ul>	01.27.***	1.205P
	CoreOS	L	
	BootOS	AK	
File print <ul style="list-style-type: none"> <li>Printing a report file in the network drive is supported.</li> </ul>	<ul style="list-style-type: none"> <li>Standard system application</li> <li>File Print</li> </ul>	01.27.***	1.205P
File manager <ul style="list-style-type: none"> <li>Manipulating the folders and files in the network drive is supported.</li> </ul>	<ul style="list-style-type: none"> <li>Standard system application</li> <li>File Manager</li> </ul>	01.27.***	1.205P

## (2) Project function

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.***	1.100E
The screen gesture function supports the key code (FF91h) for performing the full scale display (100%).	Standard system application	01.01.***	1.104J
The screen gesture function supports the graphics accelerator.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Graphic Acceleration Driver</li> </ul>	01.03.***	1.112S
	CoreOS	E	
Screen switching while the screen is being touched is supported.	Standard system application	01.03.***	1.112S
Automatically creating a recipe file (*.G2P) by converting an advanced recipe file (*.G1P) is supported.	Standard system application	01.03.***	1.112S
Assigning a security key is supported.	Standard system application	01.06.***	1.122C
	BootOS	AJ	
Specifying the unit of the drive free space is supported.	Standard system application	01.17.***	1.160S
The recipe special control is supported.	Standard system application	01.17.***	1.160S
The comment group supports Windows fonts.	Standard system application	01.18.***	1.165S
The operator authentication supports the following settings. <ul style="list-style-type: none"> <li>Password requirements</li> <li>Password expiration prenotification</li> <li>Password change notification at the next login</li> <li>Enabling or disabling an operator account</li> </ul>	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Operator Authentication</li> </ul>	01.20.***	1.175H

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
The operator authentication supports the sub administrator setting.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Operator Authentication</li> </ul>	01.23.***	1.185T
A setting to display or hide the title bar of a user-created key window is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Key Window Design Information</li> </ul>	01.23.***	1.185T
The operation log function supports recording file print operations.	<ul style="list-style-type: none"> <li>Standard system application</li> </ul>	01.26.***	1.200J
The hard copy function supports Ethernet printers.	<ul style="list-style-type: none"> <li>Standard system application</li> </ul>	01.26.***	1.200J
	BootOS	AJ	
Operator authentication <ul style="list-style-type: none"> <li>The operator authentication with a USB device is supported.</li> </ul>	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Operator Authentication</li> </ul>	01.27.***	1.205P

### (3) Figures and objects

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard system application	01.00.***	1.100E
The KANA-KANJI conversion for the text input is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>KANA-KANJI Conversion</li> </ul>	01.01.***	1.104J
Printing reports is supported.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Report</li> </ul>	01.01.***	1.104J
The slider is supported.	Standard system application	01.02.***	1.108N
Line, freeform line, rectangle, polygon, circle, and piping support the display/hide control.	Standard system application	01.03.***	1.112S
The objects on the key window support the following fonts. <ul style="list-style-type: none"> <li>[6x8dot]</li> <li>[12dot Standard]</li> <li>[Outline Kaisho]</li> <li>[Outline Gothic]</li> </ul>	Standard system application	01.03.***	1.112S
The document display function supports the graphics accelerator.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Graphic Acceleration Driver</li> </ul>	01.03.***	1.112S
	CoreOS	E	
GT21 supports the slider.	Standard system application	01.08.***	1.126G
The text print is supported. (Not applicable to GT21)	Standard system application	01.10.***	1.130L
GT21 supports the text print.	Standard system application	01.12.***	1.134Q
The table is supported.	Standard system application	01.14.***	1.144A
The hyperlink is supported.	Standard system application	01.14.***	1.144A
GT21 supports the graphical meter.	Standard system application	01.18.***	1.165X
The document display supports the display of a PDF file without conversion to JPEG format.	<ul style="list-style-type: none"> <li>Standard system application</li> <li>Document Display (PDF)</li> </ul>	01.20.***	1.175H
Making the background of a logo text transparent is supported.	Standard system application	01.25.***	1.195D

### (4) Standard font

Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
- (first edition)	Standard font <ul style="list-style-type: none"> <li>Japanese</li> <li>Chinese (Simplified)</li> <li>Chinese (Traditional)</li> </ul>	01.00.***	1.100E
- (first edition)	True Type numerical font	01.00.***	1.100E
The easily-distinguishable font for the numeral zero and the capital letter I is supported.	Standard font <ul style="list-style-type: none"> <li>Japanese</li> <li>Chinese (Simplified)</li> <li>Chinese (Traditional)</li> </ul>	01.10.***	1.130L

## ■2 Extended function

Item	Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Graphics accelerator	The function to smooth the operations of the screen gesture function and the document display function is supported.	Graphic Acceleration Driver	01.03.***	1.112S
		CoreOS	E	
Standard font	- (first edition)	Standard font • Japanese • Chinese (Simplified) • Chinese (Traditional)	01.00.***	1.100E
Outline font (Gothic)	- (first edition)	Gothic • Alphanumeric characters /KANA • Japanese (Kanji) • Chinese (Simplified) • Chinese (Traditional) • Hangul	01.00.***	1.100E
	Character code GBK for Simplified Chinese is supported.	Gothic • Chinese (Simplified)	01.10.***	1.130L
Outline font (Square style)	- (first edition)	Square style • Alphanumeric characters /KANA • Japanese (Kanji) • Chinese (Simplified) • Chinese (Traditional) • Hangul	01.00.***	1.100E
	Character code GBK for Simplified Chinese is supported.	Gothic • Chinese (Simplified)	01.10.***	1.130L
SoftGOT-GOT Link Function	- (first edition)	SoftGOT-GOT Link Function	01.00.***	1.100E
	Under the authorization control of the GOT network interaction function, connecting multiple GT SoftGOT2000 modules to one GOT is supported.	SoftGOT-GOT Link Function	01.14.***	1.144A
System launcher	The system launcher is supported.	System Launcher	01.08.***	1.126G
	Starting the drive recorder is supported.	System Launcher	01.16.***	1.155M
	Starting the sequence program monitor (R ladder), the R motion monitor, and the CNC monitor 2 is supported.	System Launcher	01.19.***	1.170C
	Starting the system launcher (servo network) is supported.	System Launcher	01.20.***	1.175H
	CR800-R(R16RTCPU) is supported.	System Launcher	01.21.***	1.178L
	Starting the servo amplifier graph is supported.	System Launcher	01.25.***	1.195D
	• CR800-Q(Q172DSRCPU) is supported. • Displaying the product information list and outputting product information to files are supported.	System Launcher	01.27.***	1.205P
iQSS utility	The iQSS utility is supported.	iQSS Utility	01.08.***	1.126G
	RCPU is supported.	iQSS Utility	01.20.***	1.175H
KANA-KANJI conversion function	KANA-KANJI conversion function is supported.	KANA-KANJI Conversion	01.01.***	1.104J
Wireless LAN function	Wireless LAN function is supported.	Wireless LAN	01.02.***	1.108N
		BootOS	D	
	The operation mode to make the GOT operate as a wireless LAN access point is supported.	Wireless LAN	01.14.***	1.144A
		BootOS	D	

Item	Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Sequence program monitor (ladder)	- (first edition)	Sequence Program Monitor • Sequence program monitor (Common)	01.00.***	1.100E
		GOT Platform Library	01.00.***	1.100E
		GOT Function Expansion Library	01.00.***	1.100E
Sequence Program Monitor(iQ-R Ladder) (formerly sequence program monitor (R ladder))	The sequence program monitor (R ladder) is supported.	Sequence Program Monitor • Sequence Program Monitor(R Ladder)	01.09.***	1.127H
		GOT Platform Library	01.09.***	1.127H
		GOT Function Expansion Library	01.09.***	1.127H
		GOT Function Expansion Library (Additional/MELSEC iQ-R)	01.09.***	1.127H
	Editing programs with the sequence program monitor (R ladder) is supported.	Sequence Program Monitor • Sequence Program Monitor(R Ladder)	01.18.***	1.165X
		GOT Platform Library	01.18.***	1.165X
		GOT Function Expansion Library	01.18.***	1.165X
	The function name has been changed to the sequence program monitor (iQ-R ladder).	GOT Function Expansion Library (Additional/MELSEC iQ-R)	01.18.***	1.165X
		Sequence Program Monitor • Sequence Program Monitor(iQ-R Ladder)	01.23.***	1.185T
		GOT Platform Library	01.23.***	1.185T
Sequence program monitor (SFC)	- (first edition)	Sequence Program Monitor • Sequence program monitor (SFC)	01.00.***	1.100E
		GOT Platform Library	01.00.***	1.100E
		GOT Function Expansion Library	01.00.***	1.100E
FX Ladder Monitor Function	- (first edition)	FX Ladder Monitor Function	01.00.***	1.100E
Backup/restoration	- (first edition)	Backup/Restoration	01.00.***	1.100E
	The backup/restoration for RCPUCPU and CNC C70 is supported.	Backup/Restoration	01.04.***	1.117X
	• The backup/restoration for the motion controller CPU (MELSEC iQ-R series) is supported. • GT21 supports the backup/restoration.	Backup/Restoration	01.05.***	1.118Y
	Retaining the file registers of a PLC at restoration is supported.	Backup/Restoration	01.08.***	1.126G
	The backup/restoration for R64MTCPU is supported.	Backup/Restoration	01.20.***	1.175H
	The backup/restoration for CR800-R(R16RTCPU) and CR800-D is supported.	Backup/Restoration	01.21.***	1.178L
	The backup/restoration for MELSEC iQ-F is supported.	Backup/Restoration	01.23.***	1.185T
	• CR800-Q(Q172DSRCPU) is supported. • The connection to an inverter or servo amplifier through a QCPU or LCPU is supported.	Backup/Restoration	01.27.***	1.205P
Gateway (Server and client function)	- (first edition)	Gateway • Gateway (Server, Client)	01.00.***	1.100E

Item	Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Gateway (Mail send function)	- (first edition)	Gateway • Getaway Server (Mail)	01.00.***	1.100E
	The SMTP server authentication is supported.	Gateway • Getaway Server (Mail)	01.18.***	1.165X
	The SMTP server authentication through a password of 129 or more characters is supported.	Gateway • Getaway Server (Mail) BootOS	01.18.*** AA	
FTP server function(Gateway)	- (first edition)	Gateway • Gateway (FTP Server)	01.00.***	1.100E
	GT21 supports this function.	-	01.14.***	1.144A
	The number of connectable FTP clients has been changed to 4.	Gateway • Gateway (FTP Server)	01.25.***	1.195D
Gateway (File Transfer (FTP Client)function)	- (first edition)	Gateway • Gateway (FTP Client)	01.00.***	1.100E
	Access to the FTP server function of a MITSUBISHI PLC is supported.	Gateway • Gateway (FTP Client)	01.08.***	1.126G
	GT21 supports this function.	-	01.14.***	1.144A
	The function name has been changed to the file transfer function (FTP transfer).	File Transfer	01.16.***	1.155M
	The maximum number of connectable FTP servers has been changed to 64.	File Transfer	01.23.***	1.185T
Barcode	- (first edition)	Barcode	01.00.***	1.100E
	Connection via the standard RS422/485 interface is supported.	Barcode	01.08.***	1.126G
	The system application name has been changed.	Bar Code (Serial) (formerly Barcode)	01.20.***	1.175H
	The barcode function supports data entry from a USB barcode reader.	Bar Code (USB)	01.20.***	1.175H
	Specifying values as the header or terminator is supported.	Bar Code (Serial)	01.26.***	1.200J
RFID	- (first edition)	RFID	01.00.***	1.100E
	Connection via the standard RS422/485 interface is supported.	RFID	01.08.***	1.126G
	Specifying values as the header or terminator is supported.	RFID	01.26.***	1.200J
PC Remote Operation function (Serial)	- (first edition)	PC Remote Operation (Serial)	01.00.***	1.100E
	Remote Personal Computer Operation Driver (TSC-DD) is supported.	PC Remote Operation (Serial)	01.02.***	1.108N
	The video/RGB display object is supported.	PC Remote Operation (Serial) BootOS	01.10.*** N	1.130L
	Remote Personal Computer Operation Driver (DMT-DD) is supported.	PC Remote Operation (Serial)	01.26.***	1.200J
PC Remote Operation function (Ethernet)	- (first edition)	PC Remote Operation (Ethernet)	01.00.***	1.100E
VNC Server function	- (first edition)	VNC server	01.00.***	1.100E
	The authorization control of the GOT network interaction function is supported.	VNC server	01.14.***	1.144A
	The VNC server function is supported by GT2107-W.	VNC server	01.20.***	1.175H
Video Display function	- (first edition)	Video/Multimedia • Video/RGB	01.00.***	1.100E
RGB Display function	- (first edition)	Video/Multimedia • Video/RGB	01.00.***	1.100E

Item	Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
Multimedia function	- (first edition)	Multimedia • Multimedia	01.00.***	1.100E
External I/O function / Operation Panel function	- (first edition)	External I/O	01.00.***	1.100E
	The operation panel function is supported.	External I/O / Operation Panel	01.02.***	1.108N
Report function	• The file output is supported. • Outputting the operation log is supported.	Report function	01.26.***	1.200J
	Ethernet printers are supported.	Report function BootOS	01.26.*** AJ	
Sound Output function	- (first edition)	Sound Output.	01.00.***	1.100E
GOT network interaction function	The GOT network interaction function is supported.	GOT Network Interaction	01.14.***	1.144A
	Obtaining the authorization of the GOT network interaction function together with that of the VNC server function is supported.	GOT Network Interaction	01.19.***	1.170C
GOT Mobile function	The GOT Mobile function is supported.	GOT Mobile Setting	01.14.***	1.144A
		CoreOS	L	
Device Data Transfer	- (first edition)	Device Data Transfer	01.00.***	1.100E
Device monitor	- (first edition)	Device monitor	01.00.***	1.100E
		GOT Platform Library	01.00.***	1.100E
	RCPU is supported.	Device monitor	01.12.***	1.134Q

	RnSFCPU is supported.	Device monitor	01.14.***	1.144A
		GOT Platform Library	01.14.***	1.144A
CR800-R(R16RTCPU) and CR800-D are supported.	Device monitor	01.21.***	1.178L	
	GOT Platform Library	01.21.***	1.178L	
Network monitor	- (first edition)	Network monitor	01.00.***	1.100E
	RCPU is supported.	Network monitor	01.04.***	1.117X
Log Viewer	- (first edition)	Log Viewer	01.00.***	1.100E
	BOX data logger is supported.	Log Viewer	01.01.***	1.104J
	RCPU is supported.	Log Viewer	01.04.***	1.117X
	CNC C70 is supported.	Log Viewer	01.12.***	1.134Q
	MELSEC iQ-F is supported.	Log Viewer	01.23.***	1.185T
Intelligent module monitor	- (first edition)	Intelligent module monitor	01.00.***	1.100E
	RCPU is supported.	Intelligent module monitor	01.04.***	1.117X
	Q26DHCCPU-LS is supported.	Intelligent module monitor	01.15.***	1.150G
	RJ72GF15-T2, RD77GF, and RD77MS are supported.	Intelligent module monitor	01.17.***	1.160S
	CR800-R(R16RTCPU) is supported.	Intelligent module monitor	01.21.***	1.178L
Servo amplifier monitor	- (first edition)	Servo amplifier monitor	01.00.***	1.100E
R motion monitor	- (first edition)	R motion monitor	01.04.***	1.117X
	Transition to the system launcher is supported.	R motion monitor	01.19.***	1.170C
Q motion monitor	- (first edition)	Q motion monitor	01.00.***	1.100E
	Q26DHCCPU-LS is supported.	Q motion monitor	01.15.***	1.150G
CNC monitor	The CNC monitor is supported.	CNC Monitor	01.04.***	1.117X
CNC data I/O	The CNC data I/O is supported.	CNC Data I/O	01.04.***	1.117X
		GOT Platform Library	01.04.***	1.117X

Item	Added and edited function	Version of application/BootOS		Version corresponding with GT Designer3
CNC machining program edit	The CNC machining program edit is supported.	CNC Manufacturing Program Editor	01.04.***	1.117X
		GOT Platform Library	01.04.***	1.117X
Motion program editor	The motion program editor is supported.	Motion Program Editor	01.10.***	1.130L
	RnMTCPU is supported.	Motion Program Editor	01.23.***	1.185T
Motion program I/O	The motion program I/O is supported.	Motion Program Input/Output	01.10.***	1.130L
	RnMTCPU is supported.	Motion Program Input/Output	01.23.***	1.185T
FX list editor	- (first edition)	List editor for FX	01.00.***	1.100E
File manager	The file manager is supported.	File Manager	01.15.***	1.150G
File print	The file print is supported.	File print	01.26.***	1.200J
Document Display	- (first edition)	Document Display	01.00.***	1.100E
	The system application name has been changed.	Document Display (Document Converter) (formerly Document Display)	01.20.***	1.175H
	Displaying a PDF file as-is is supported.	Document Display (PDF)	01.20.***	1.175H
	The search and bookmark functions for PDF files are supported.	PDF Search/bookmark Function	01.23.***	1.185T
Video/RGB display object	The video/RGB display object is supported.	Video/RGB (Object)	01.10.***	1.130L
		BootOS	N	
File transfer function (GOT internal transfer)	The file transfer function (GOT internal transfer) is supported.	File Manager	01.16.***	1.155M
Drive recorder	The drive recorder is supported.	Drive Recorder	01.16.***	1.155M
	MELSERVO-JE-*B is supported.	Drive Recorder	01.17.***	1.160S
	MR-J4-GF(-RJ) is supported.	Drive Recorder	01.23.***	1.185T
CNC monitor 2	The CNC monitor 2 is supported.	CNC Monitor 2	01.16.***	1.155M
	GT27-V and GT25-V support the CNC monitor 2.	CNC Monitor 2	01.18.***	1.165X
	<ul style="list-style-type: none"> <li>• GT2505-V and GT2505HS-V support the CNC monitor 2.</li> <li>• GT27-X supports QWERTY keyboards.</li> </ul>	CNC Monitor 2	01.27.***	1.205P
Recipe display (record list)	The recipe display (record list) is supported.	Recipe Display (Record List)	01.16.***	1.155M
CC-Link IE Field Network diagnostics	The CC-Link IE Field Network diagnostics is supported.	CC-Link IE Field Network diagnostics	01.18.***	1.165X
Servo amplifier graph	The servo amplifier graph is supported.	Servo amplifier graph	01.25.***	1.195D

# Warranty

---

Please check the following product warranty details before using this product.

## ■1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company. However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion.

Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

### (1) Gratis Warranty Term

The gratis warranty term of the product shall be for thirty-six (36) months after the date of purchase or delivery to a designated place.

Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be forty-two (42) months.

The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

### (2) Gratis Warranty Range

- (a) The customer shall be responsible for the primary failure diagnosis unless otherwise specified. If requested by the customer, Mitsubishi Electric Corporation or its representative firm may carry out the primary failure diagnosis at the customer's expense. The primary failure diagnosis will, however, be free of charge should the cause of failure be attributable to Mitsubishi Electric Corporation.
- (b) The range shall be limited to normal use within the usage state, usage methods, and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (c) Even within the gratis warranty term, repairs shall be charged in the following cases.
  - Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
  - Failure caused by unapproved modifications, etc., to the product by the user.
  - When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
  - Failure that could have been avoided if consumable parts designated in the instruction manual had been correctly serviced or replaced.
  - Replacing consumable parts such as a battery, backlight, and fuse.
  - Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
  - Failure caused by reasons that could not be predicted by scientific technology standards at the time of shipment from Mitsubishi.
  - Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

## ■2. Onerous repair term after discontinuation of production

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Mitsubishi shall not accept a request for product supply (including spare parts) after production is discontinued.

## ■3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center.

Note that the repair conditions at each FA Center may differ.

## ■4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

## ■5. Changes in product specifications

The specifications given in the catalogs, manuals, or technical documents are subject to change without prior notice.

## ■6. Product application

- (1) In using the Mitsubishi graphic operation terminal, the usage conditions shall be that the application will not lead to a major accident even if any problem or fault should occur in the graphic operation terminal device, and that backup and fail-safe functions are systematically provided outside of the device for any problem or fault.
- (2) The Mitsubishi graphic operation terminal has been designed and manufactured for applications in general industries, etc. Thus, applications in which the public could be affected such as in nuclear power plants and other power plants operated by respective power companies, and applications in which a special quality assurance system is required, such as for Railway companies or Public service shall be excluded from the graphic operation terminal applications. In addition, applications in which human life or property could be greatly affected, such as in aircraft, medical, railway applications, incineration and fuel devices, manned transportation equipment, recreation and amusement devices, safety devices, shall also be excluded from the graphic operation terminal. Even for the above applications, however, Mitsubishi Electric Corporation may consider the possibility of an application, provided that the customer notifies Mitsubishi Electric Corporation of the intention, the application is clearly defined and any special quality is not required, after the user consults the local Mitsubishi representative.

## Trademarks
