

# Inclination and Acceleration Sensors **Highly Resistant in Any Environment**

Whether for leveling cranes, for acceleration control in elevators or for monitoring the condition of large plants, inclination and acceleration sensors from Pepperl+Fuchs always guarantee precise measurements—even in harsh outdoor conditions.

## **Unique Concept for Optimal Protection and Easy Installation**

Based on a two-part mounting concept, the inclination and acceleration sensors always consist of the sensor module and a particularly robust metal retaining bracket. This combination brings many advantages: The metal retaining bracket offers optimal impact protection and simple installation thanks to the integrated hexagon head screw. This makes the entire system even more resistant to mechanical force. It can also be replaced quickly and easily if required. It is not necessary to re-adjust or calibrate.

## **The Right Sensor Version for Every Requirement**

Each application has different requirements for the sensor technology. The portfolio of inclination and acceleration sensors from Pepperl+Fuchs therefore consists of different variants which can be selected depending on the application requirement.

In addition to sensors for inclination and acceleration detection, the F99 Fusion inertial measurement units are also available. Specifically designed for use in dynamic applications, they provide precise inclination and acceleration data in 360° at any time thanks to their compensation for external acceleration.

# Inclination and Acceleration Sensors

## Highly Precise Even with Dynamic Motion

The F99 Fusion inertial measurement unit guarantees error-free inclination detection in dynamic applications. The intelligent combination of the acceleration sensor and gyroscope compensates for external accelerations. This increases efficiency and opens up completely new opportunities.

Inclination sensor

Acceleration sensor

### Typical Applications

#### Inclination sensors:

- Leveling of working platforms
- Ensuring optimal alignment of solar systems

#### Acceleration sensors:

- Monitoring of upper vibration limits in wind energy plants
- Monitoring acceleration in elevators

#### F99 Fusion inertial measurement unit:

- Steering angle limitation in an inclined position on construction machines or material handling equipment
- On-board weighing systems in port crane facilities

### Your Benefits at a Glance

- Precise inclination measurement, even in motion, thanks to compensation for dynamic acceleration without loss of time (F99 Fusion)
- Variable output values and parameterizable filters for optimum adjustment to suit the application (F99 Fusion)
- Simplified installation: 360° inclination and acceleration sensors in three axes in one device. Mounting is independent of the orientation (F99 Fusion)
- Sophisticated mounting concept as well as IP68/IP69K degree of protection for incredible robustness, even when used outdoors
- Wide range of applications: E1 and GL approvals enable use on public roads as well as on the high seas

F99 Fusion inertial measurement unit

### Technical Features

- Optimal sealing due to degree of protection IP68/IP69K
- Increased EMC immunity: Tested according to ISO 7637 and ISO 11452
- Increased shock and vibration resistance of up to 100 g

F99 Fusion inertial measurement unit:  
Intelligent combination of  
acceleration sensor and gyroscopes for  
maximum precision in dynamic motion

## Highlights

- Variable output values and parameterizable filters for optimum adjustment to suit the application for products with CAN or J1939 interface
- Simplified installation: 360° inclination sensors in three axes in one device. Mounting is independent of the orientation
- Sophisticated mounting concept as well as IP68/69 degree of protection for maximum robustness, even when used outdoors
- Wide range of applications: E1 and GL approvals enable use on public roads as well as on the high seas

## Brief Description

Based on a two-part mounting concept, F99 series inclination and acceleration sensors are always equipped with a sensor module and an especially robust metal retaining bracket. This combination brings many advantages: The metal retaining bracket offers optimal impact protection and simple installation thanks to the integrated hexagon head screw. This makes the entire system even more resistant to mechanical force.

## Brief Description

Acceleration sensors from Pepperl+Fuchs offer the option of selectively adapting the sensing range to any application. Specific software filters and the angle range to be monitored can be set quickly and easily. The sensor captures the specific data required in the application. Each application has different requirements for the sensor technology. The portfolio of inclination and acceleration sensors from Pepperl+Fuchs therefore consists of different variants which can be selected depending on the application requirement.

IMU360D-F99-B20-V15

## Highlights

- Inclination, acceleration and yaw rate measurement in three axes
- Compensation of dynamic faults
- F99 Fusion technology
- CAN bus with SAE J1939 protocol
- Increased EMC resistance

## Brief Description

Conventional inclination sensors are based on the principle of acceleration measurement and provide reliable information about the current orientation of the sensor. However, this measuring principle reaches its limits when other forces as well as gravity—such as those caused by acceleration, braking, or cornering—affect the sensor. This results in measurement errors, which in the worst case can cause damage, but certainly result in efficiency losses. The F99 Fusion was therefore specially developed to compensate for this external acceleration and to ensure precise inclination data even with dynamic movement.
