

## OPTISWIRL 2100 Technical Datasheet

### Vortex flowmeter

- Economical Vortex flowmeter for standard applications
- Easy to use and reliable
- Stable measurements even under demanding process conditions with advanced technology for signal filtering (AVFD)

## 1.1 The economical solution

Vortex flowmeters are suitable for a wide range of media. This also applies to the OPTISWIRL 2100.

The OPTISWIRL 2100 uses the same durable sensor technology as the OPTISWIRL 4200. Due to the widely installed base of the OPTISWIRL 4200, the long-term reliability of the flow sensor has been proven.

With the innovative AVFD (Advanced Vortex Frequency Detection) the OPTISWIRL 2100 is fitted with an up-to-date signal filter. It analyses the measured signal and eliminates interferences and perturbations. Thereby, stable measurements can even be realised under demanding process conditions.

Figure 1-1: Device versions

- ① Compact flange version
- ② Compact sandwich version
- ③ Remote signal converter
- ④ Remote flow sensor

## Highlights

- Advanced technology for signal filtering - AVFD (Advanced Vortex Frequency Detection)
- Remote version with field housing converter with cable length up to 50 m / 164 ft
- Integrated reduction of nominal size
- Measurement of conductive and non-conductive liquids, gases and steam

## Industries

- Chemicals
- Oil & Gas
- Food & Beverage
- Pharmaceuticals
- Iron, Steel and Metals
- Pulp & Paper
- Water

## Applications

- Measurement of saturated steam and superheated steam
- Measurement of consumption of industrial gases
- Measurement of consumption in compressed air systems
- SIP and CIP processes in the food, beverage and pharmaceutical industries

## 1.2 Options and variants

### 1. The economical device for standard applications

The **OPTISWIRL 2100 C** as compact flowmeter in a flange version is suitable for universal use in measuring liquids, gases and vapours.

### 2. The easy to install sandwich version with optimised centering rings

The **OPTISWIRL 2100 C** as a compact flowmeter in a sandwich version is suitable for universal use in the measurement of liquids, gases and vapours.

The flowmeter is provided with additional optimised centering rings. The vortex flowmeter can be aligned centrically by turning the centering rings, eliminating any offset between the flowmeter and the pipeline.

### 3. The OPTISWIRL 2100 F as remote version

The **OPTISWIRL 2100** is also available as a remote version with field housing converter.

This feature allows separating the signal converter from the flow sensor up to a distance of 50 m / 164 ft, in case the flow sensor is mounted in inaccessible areas.

The remote mounted signal converter allows easy operation and reading of values at eye level.

#### 4. OPTISWIRL 2100 F1R / F2R with integrated nominal diameter reduction

The **OPTISWIRL 2100 F1R / F2R** with integrated nominal diameter reduction up to two nominal diameter sizes assures best results in accuracy and optimal measuring ranges even in pipelines with large diameters, which have been designed for a low pressure loss.

By forgoing complex pipeline reduction installations, space and cost saving installations can be realized. At the same time the number of potential leakages is reduced to a minimum.

#### 1.3 Devices with integrated nominal diameter reduction

The device versions F1R and F2R offer an integrated nominal diameter reduction up to two nominal diameter sizes to assure best results in accuracy and optimum measuring ranges; even in pipelines with large diameters, which have been designed for a low pressure loss.

Nominal diameter of flow sensor	Nominal size of process connections										
	DN15	DN25	DN40	DN50	DN80	DN100	DN150	DN200	DN250	DN300

① Standard version

## 1.4 Functional principle

Vortex flowmeters are used to measure the flow of gases, vapours and liquids at completely filled pipes.

The measuring principle is based on the Karman vortex street. The measuring tube contains a bluff body at which vortex shedding occurs and which is detected by a sensor unit located behind. The frequency  $f$  of the vortex shedding is proportional to the flow velocity  $v$ . The non-dimensional Stouhal number  $S$  describes the relationship between vortex frequency  $f$ , width  $b$  of the bluff body and the average flow velocity  $v$ :

$$f = \frac{S \cdot v}{b}$$

The vortex frequency is recorded at the flow sensor and evaluated at the signal converter.

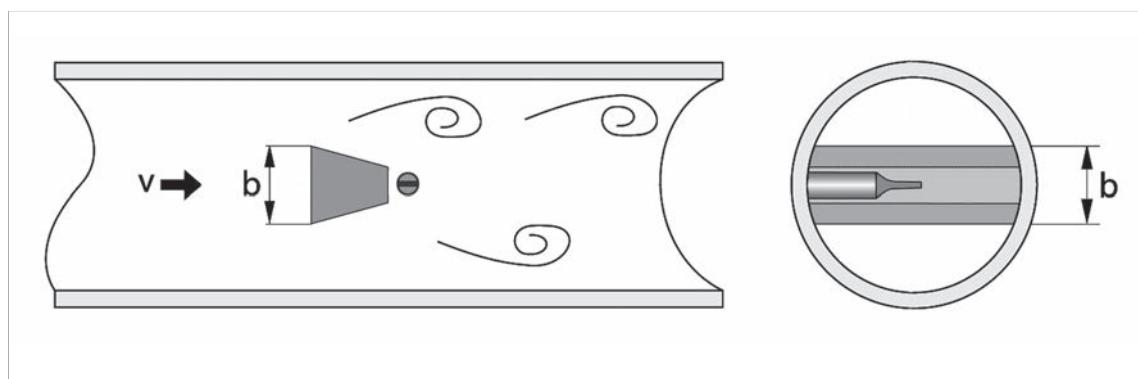

Figure 1-2: Functional principle

## 2.1 Technical data

- *The following data is provided for general applications. If you require data that is more relevant to your specific application, please contact us or your local sales office.*
- *Additional information (certificates, special tools, software,...) and complete product documentation can be downloaded free of charge from the website (Downloadcenter).*

### Measuring system

Application range	Flow measurement of liquids, gases and vapours
Function / Measuring principle	Karman vortex street

### Measurement

Primary measured value	Number of separated vortices
Secondary measured value	Operating and standard volume flow and mass flow

### Signal converter

Versions	Compact version
	Remote version

### Flow sensor

Standard	Flange version, flow sensor: F Sandwich version, flow sensor: S
Option	Flange version with single reduction of nominal diameter, flow sensor: F1R Flange version with double reduction of nominal diameter, flow sensor: F2R

### Display and user interface

Local display	Graphic display
Interface and display languages	German, English, French, Italian, Spanish, Russian, Chinese, Swedish, Danish, Czech, Polish, Turkish, Slovenian; 13 further languages (in preparation)
Communication interfaces	HART®

## Measuring accuracy

<b>Reference condition</b>	
Reference conditions	Water at +20°C / +68°F
	Air at +20°C / +68°F and 1.013 bara / 14.7 psia
<b>Maximum measuring error</b>	
Flow rate (liquid)	±1% of measured value ( $Re \geq 20000$ ) with calibration
	±5% of measured value ( $Re \geq 20000$ ) without calibration
	±3% of measured value ( $10000 < Re < 20000$ ) with calibration
	±7% of measured value ( $10000 < Re < 20000$ ) without calibration
Flow rate (gases and steam)	±2% of measured value ( $Re \geq 20000$ ) with calibration
	±5% of measured value ( $Re \geq 20000$ ) without calibration
	±3% of measured value ( $10000 < Re < 20000$ ) with calibration
	±7% of measured value ( $10000 < Re < 20000$ ) without calibration
Repeatability (volume flow)	±0.1% of measured value

## Operating conditions

<b>Temperature</b>	
Medium temperature	-40...+240°C / -40...+465°F
Ambient temperature ②	Non-Ex: -40...+85°C / -40...+185°F
	Ex: -40...+65°C / -40...+140°F
Storage temperature	-40...+85°C / -40...+185°F
② Decreasing display contrast outside of the temperature range of 0...+60°C / +32...+140°F.	
<b>Pressure</b>	
Medium pressure	Max. 100 bar / 1450 psi
Ambient pressure	Atmosphere
<b>Media properties</b>	
Density	Taken into consideration when sizing.
Viscosity	< 10 cP
Reynold's number	> 10000

<b>Recommended flow velocities</b>	
Liquids ③	0.3...7 m/s / 0.98...23 ft/s (optional up to 10 m/s / 32.8 ft/s taking cavitation into account)
Gases and steam ③	2.0...80 m/s / 6.6...262.5 ft/s DN15: 3.0...45 m/s / 9.8...148 ft/s; DN25: 2.0...70 m/s / 6.6...230 ft/s
③ These values represent the absolute limits of flow velocities. For more detailed information for your specific application refer to <i>Intended use</i> on page 23.	
<b>Other conditions</b>	
Ingress protection	Compact version: IP66/67 Remote version: signal converter housing: IP66/67; flow sensor housing: IP66/67

### Installation conditions

Inlet section	≥ 15 DN without disturbing flow ≥ 20 DN after a pipe diameter reduction ≥ 20 DN after a single bend 90° ≥ 30 DN after a double bend 2x90° ≥ 40 DN after a double three-dimensional bend 2x90° ≥ 50 DN after a control valve ≥ 2 DN before a flow straightener; ≥ 8 DN after a flow straightener
Outlet section	≥ 5 x DN

### Materials

Flanges and process connections	Steel A105
Flow sensor body	Die-cast stainless steel 1.4408/CF8M
Electronics housing	Die-cast aluminium, two-layer coating (epoxy/polyester)
Measuring tube (Pick-up gasket)	Stainless steel 1.4435 / 316L

### Process connections

<b>Flange version</b>	
DIN EN 1092-1	DN15...100, PN16...100 DN150...300, PN16...40
ASME B16.5	1/2...4", 150...600 lb 6...12", 150...300 lb
JIS B2220	DN15...300, 10...20 K
For detailed information on combination flange/pressure rating, refer to section "Dimensions and weights".	
<b>Sandwich version</b>	
DIN	DN15...100, PN100
ASME	1/2...4", 600 lb
JIS	DN15...100, 10...20 K

## Electrical connections

Power supply (current output version)	The power supply has to be able to supply a minimum of 22 mA.
	Non-Ex: 12...36 VDC
	Ex i: 12...30 VDC
	Ex d: 12...32 VDC
Cable entries	Standard: M20.5
	Option: 1/2 NPT and G1/2 adapters
Connecting cable	Only for remote versions.
	Cable length: ≤ 50 m / 164 ft

## Outputs

General	All inputs and outputs are electrically isolated from each other and from all other circuits.
Time constant	The time constant corresponds to 63% of the elapsed time of a processor procedure. 0...100 seconds (rounded up to 0.1 seconds)
<b>Current output</b>	
Type	4...20 mA HART® (passive)
Output data	Volume flow, mass flow, norm. volume flow, vortex frequency, flow velocity
Resolution	5 µA
Linearity / accuracy	0.1% (of read value)
Temperature coefficient	50 ppm/K (typically), 100 ppm/K (max.)
Error signal	According to NE 43
Description of abbreviations	$U_{ext}$ = external voltage; $R_L$ = load + resistance
Load	Minimum 0 Ω; maximum $R_L = \{[U_{ext} - 12 \text{ VDC}] / 22 \text{ mA}\}$
<b>HART®</b>	
General	HART® protocol via passive current output
HART® revision	HART® 7
	Burst mode
System requirements	Load min. 250 Ω
Multidrop operation	4 mA

<b>Pulse output</b>	
Type	Passive Proximity sensor according to DIN EN 60947-5-6 (NAMUR sensor)
Temperature coefficient	50 ppm/K
Residual current	< 0.2 mA at 32 V ( $R_i = 180 \text{ k}\Omega$ )
Pulse width	0.5...2000 ms
Output data	Volume, mass, norm. volume
Pulse rate	Max. 1000 pulses/s
Power supply	Non-Ex: 24 VDC as NAMUR or open < 1 mA, maximum 36 V, closed 120 mA, U < 2 V Ex: 24 VDC as NAMUR or open < 1 mA, maximum 30 V, closed 120 mA, U < 2 V

### Approvals and certificates

CE	This device fulfils the statutory requirements of the relevant EU directives. The manufacturer certifies successful testing of the product by applying the CE mark.  For full information of the EU directives & standards and the approved certifications, please refer to the EU declaration or the manufacturer website.

Table 2-14: Measuring range for saturated steam: 150...300 psig

### 3.1 Intended use

*Responsibility for the use of the measuring devices with regard to suitability, intended use and corrosion resistance of the used materials against the measured fluid lies solely with the operator.*

*This device is a Group 1, Class A device as specified within CISPR11. It is intended for use in industrial environment. There may be potential difficulties in ensuring electromagnetic compatibility in other environments, due to conducted as well as radiated disturbances.*

*The manufacturer is not liable for any damage resulting from improper use or use for other than the intended purpose.*

The vortex flowmeters are used for flow measurement of gases, vapours and liquids.

**The devices are particularly suitable for the measurement of:**

- Clean liquids with low viscosity (< 10 cP)
- Hydrocarbons with low viscosity (< 10 cP)
- Water
- Chemicals with low corrosiveness
- Saturated steam
- Superheated steam, including CIP (Cleaning in Place) and SIP (Sterilising in Place) applications in the food industry

**Note the following:**

- In your project planning, please observe the data given in the corrosion tables.
- The pressure-bearing parts have been designed and rated for stationary operation taking into account the maximum pressure and temperature.
- Observe the data indicated on the nameplate for PS (stated pressures), TS (stated temperatures) and PT (test pressure).
- External forces and moments, caused e.g. by pipe stresses, have not been taken into account.

Primarily, volumetric flow is measured. A fixed density can be programmed to the measuring device. From this parameter the measuring device calculates the mass flow or standard volumetric flow using pre-programmed density data and then exports the measured values via various communication interfaces.

The devices are rated for the following flow velocities:

Liquids: DN15...DN300		$V_{\min}$ : 0.3 m/s	0.98 ft/s	$V_{\min} [\text{m/s}] = 0.5 \times \sqrt{\frac{998}{\rho}} \quad \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	①
		$V_{\max}$ : 10 m/s	32 ft/s	$V_{\max} [\text{m/s}] = 7 \times \left( \frac{998}{\rho} \right)^{0.47} \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	②
Gases and steam:	DN15	$V_{\min}$ : 3 m/s	10 ft/s	$V_{\min} [\text{m/s}] = 6 \times \sqrt{\frac{1.204}{\rho}} \quad \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	①
		$V_{\max}$ : 45 m/s	147 ft/s	$V_{\max} [\text{m/s}] = 7 \times \left( \frac{998}{\rho} \right)^{0.47} \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	②
	DN15C	$V_{\min}$ : 3 m/s	10 ft/s	$V_{\min} [\text{m/s}] = 12 \times \sqrt{\frac{1.204}{\rho}} \quad \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	①
		$V_{\max}$ : 55 m/s	180 ft/s	$V_{\max} [\text{m/s}] = 7 \times \left( \frac{998}{\rho} \right)^{0.47} \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	②
	DN25	$V_{\min}$ : 2 m/s	6.6 ft/s	$V_{\min} [\text{m/s}] = 6 \times \sqrt{\frac{1.204}{\rho}} \quad \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	①
		$V_{\max}$ : 70 m/s	229 ft/s	$V_{\max} [\text{m/s}] = 7 \times \left( \frac{998}{\rho} \right)^{0.47} \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	②
DN25C	DN25C	$V_{\min}$ : 2 m/s	6.6 ft/s	$V_{\min} [\text{m/s}] = 12 \times \sqrt{\frac{1.204}{\rho}} \quad \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	①
		$V_{\max}$ : 80 m/s	262 ft/s	$V_{\max} [\text{m/s}] = 7 \times \left( \frac{998}{\rho} \right)^{0.47} \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	②
	DN40... DN300	$V_{\min}$ : 2 m/s	6.6 ft/s	$V_{\min} [\text{m/s}] = 6 \times \sqrt{\frac{1.204}{\rho}} \quad \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	①
		$V_{\max}$ : 80 m/s	262 ft/s	$V_{\max} [\text{m/s}] = 7 \times \left( \frac{998}{\rho} \right)^{0.47} \rho \left[ \frac{\text{kg}}{\text{m}^3} \right]$	②

Table 3-1: Flow velocities

① Use the larger value, according to the amount.

② Use the smaller value, according to the amount.

*DN15C and DN25C have a robust flow sensor (signal pick-up) for harsh measuring conditions and higher maximum velocity compared to the standard version.*

## 3.2 Installation conditions

*For accurate volumetric flow measurement the measuring device needs a completely filled pipe and a fully developed flow profile.*

*Any vibrations may distort the measuring result. That is why any vibrations in the pipeline must be prevented through suitable measures.*

**Procedures to carry out before installing the device:**

- Nominal diameter of connection pipe flange = nominal flange diameter of pipe!
- Use flanges with smooth holes, e.g. welding neck flanges.
- Align carefully the holes of the connecting flange and the flowmeter flange.
- Check the compatibility of the gasket material with the process product.
- Make sure that the gaskets are arranged concentrically. The flange gaskets must not project into the pipe cross-section.
- The flanges have to be concentric.
- There must not be any pipe bends, valves, flaps or other internals in the immediate inlet run.
- Devices in sandwich version may only be installed using centering rings.
- Never install the device directly behind piston compressors or rotary piston meters.
- The device must not be heated by radiated heat (e.g. exposure to the sun) to an electronics housing surface temperature above the maximum permissible ambient temperature. If it is necessary to prevent damage from heat sources, a heat protection (e.g. sun shade) has to be installed.
- Do not lay signal cables directly next to cables for the power supply.
- At product temperatures or ambient temperatures >+65°C / +149°F, a connection cable and cable glands with a minimum service temperature of +80°C / +176°F must be used.

*If there is a risk of water hammers in steam networks, appropriate condensate separators must be installed. Suitable measures must be taken to avoid water cavitation if it is a possible risk.*

### 3.2.1 Installation when measuring liquids

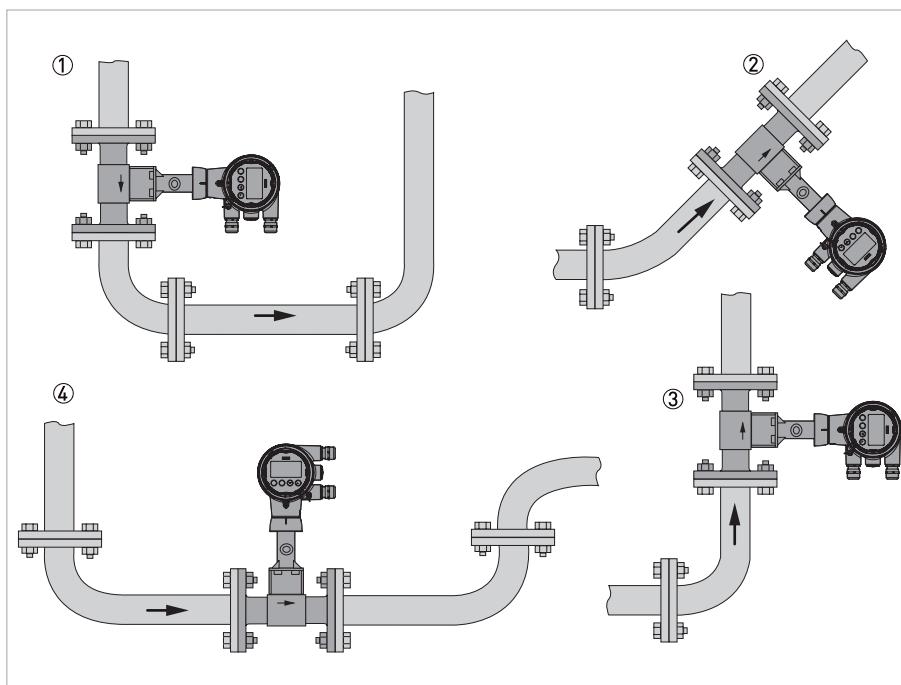

Figure 3-1: Recommended installation

- ① If the device is installed in a downpipe, a standpipe must be installed immediately after it
- ② Installing the device in an inclined standpipe
- ③ Installing the device in a vertical standpipe
- ④ Installing the device in the lower pipe bend

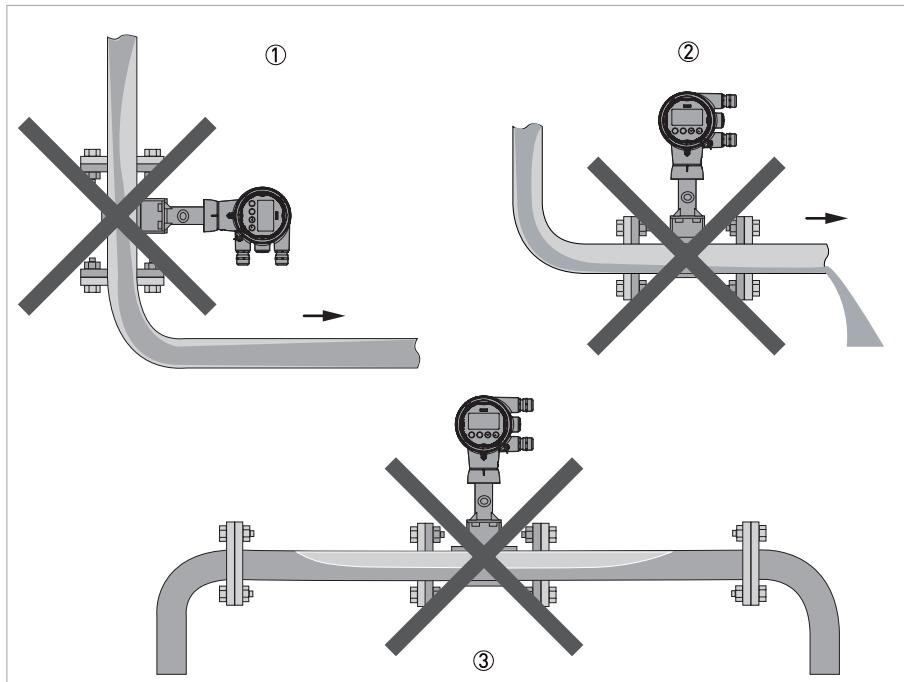

Figure 3-2: Not recommended installation

- ① Installing the device in a downstream pipe ① or upstream pipe of an outlet ②, there is a risk of partially filled pipes leading to inaccurate measurements.
- ② Installing the device in front of an outlet
- ③ Installing the device in an upper pipe bend ③, there is a risk of gas bubbles forming. Gas bubbles can lead to pressure surges and inaccurate measurement.

- *Installing the device in a downstream pipe ① or upstream pipe of an outlet ②, there is a risk of partially filled pipes leading to inaccurate measurements.*
- *Installing the device in an upper pipe bend ③, there is a risk of gas bubbles forming. Gas bubbles can lead to pressure surges and inaccurate measurement.*

### 3.2.2 Installation when measuring steam and gases

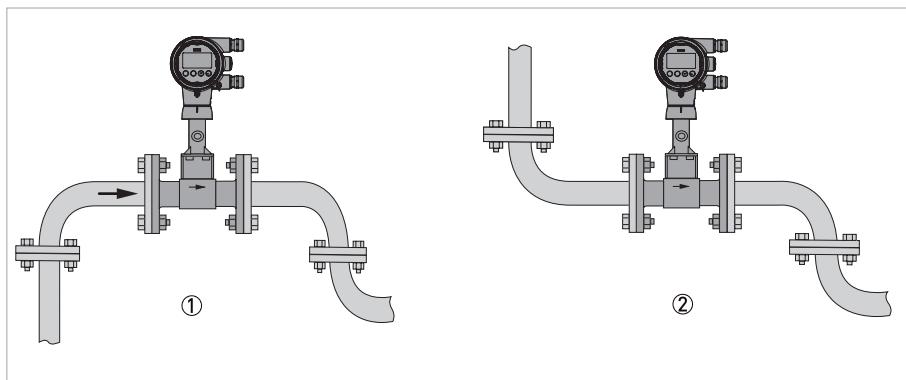

Figure 3-3: Recommended installation

- ① Installing the device in an upper pipe bend
- ② If the device is installed in a downpipe, a downpipe must be installed immediately after it

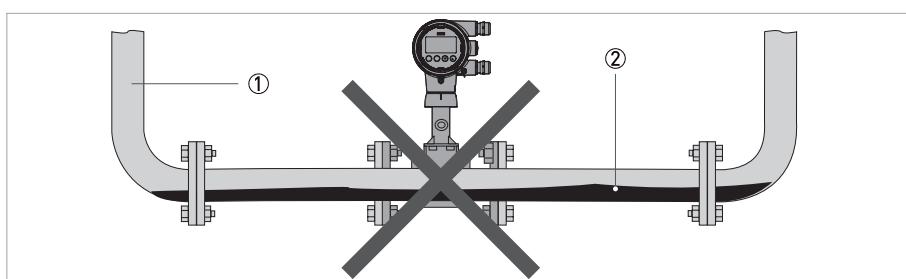

Figure 3-4: Not recommended installation

- ① Lower pipe bends
- ② Condensate

*Installing the device in a lower pipe bend: there is a risk of condensate forming. Condensate can lead to cavitation and inaccurate measurement. Under certain circumstances the device can be destroyed and the measured medium can leak.*

### 3.2.3 Pipelines with control valve

To ensure smooth and correct measurement, the manufacturer recommends not installing the measuring device downstream from a control valve. This would run the risk of vortex formation, which would distort the measuring result.

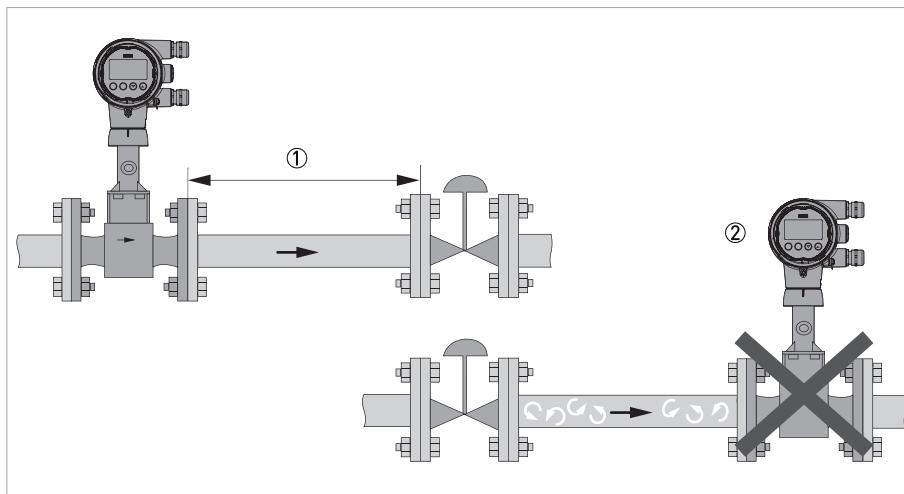

Figure 3-5: Pipelines with control valve

- ① Recommended: installing the device before the control valve at a distance of  $\geq 5 \text{ DN}$
- ② Not recommended: installing the device directly downstream of control valves, due to vortex formation

### 3.2.4 Preferred mounting position

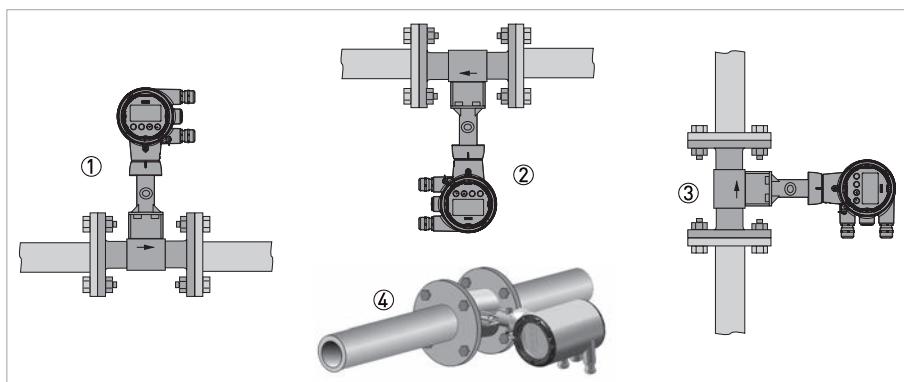

Figure 3-6: Preferred mounting position

- ① Above a horizontal pipe
- ② Underneath a horizontal pipe (not permitted with lines at risk of condensate forming)
- ③ On a vertical pipe
- ④ Horizontal pipeline with signal converter orientation of 90° to the side

Depending on the installation position, you may have to rotate the display and/or the connection housing.

### 3.3 Minimum inlet sections

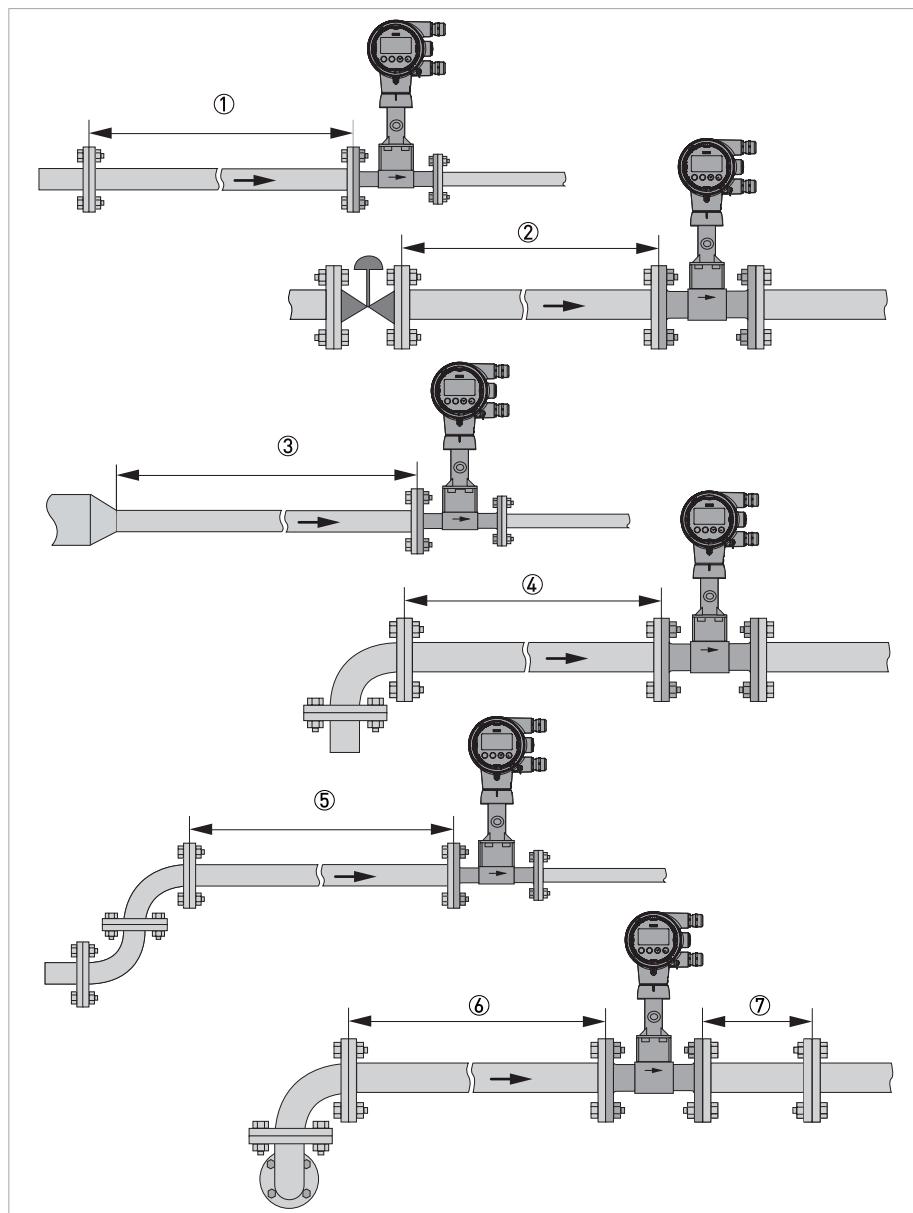

Figure 3-7: Minimum inlet sections

- ① General inlet section without disturbing flow  $\geq 15$  DN
- ② After a control valve  $\geq 50$  DN
- ③ After a pipe diameter reduction  $\geq 20$  DN
- ④ After a single bend  $90^\circ \geq 20$  DN
- ⑤ After a double bend  $2 \times 90^\circ \geq 30$  DN
- ⑥ After a double three-dimensional bend  $2 \times 90^\circ \geq 40$  DN
- ⑦ Outlet section  $> 5$  DN

*The nominal diameter of the flange is significant for the determination of the minimum inlet and outlet sections for the nominal diameter reduced versions of vortex flowmeter versions F1R and F2R.*

### 3.4 Minimum outlet sections

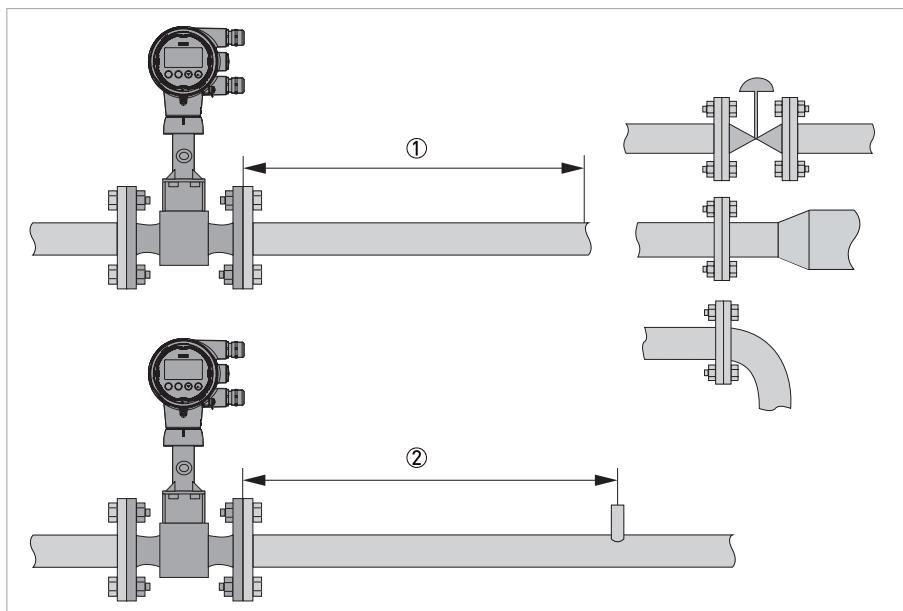

Figure 3-8: Minimum outlet sections

- ① Upstream of pipe expanders, pipe bends, control valves, etc.  $\geq 5$  DN
- ② Upstream of measuring points  $\geq 5$  DN

*The interior of the pipe at the metering points must be free of burrs and other flow impediments. The distance from external temperature measuring points must be  $\geq 5$  DN. Use flow sensors that are as short as possible to avoid disturbances of the flow profile.*

### 3.5 Flow straightener

If, due to the type of installation, the required inlet sections are not available, the manufacturer recommends using flow straighteners. Flow straighteners are installed between two flanges upstream of the device and shorten the required inlet section.

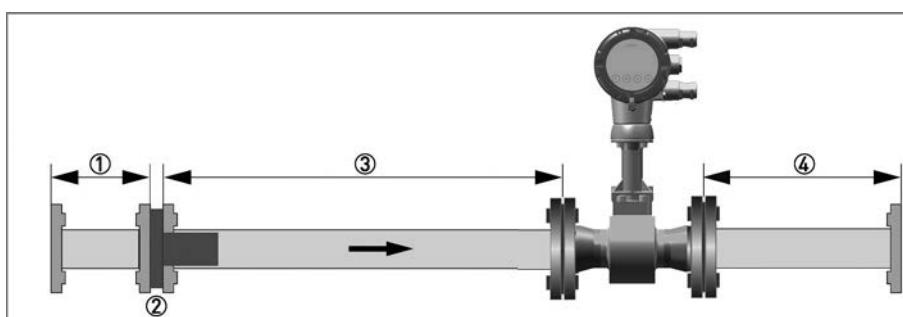

Figure 3-9: Flow straightener

- ① Straight inlet section upstream of straightener  $\geq 2$  DN
- ② Flow straightener
- ③ Straight pipe run between flow straightener and device  $\geq 8$  DN
- ④ Minimum straight outlet section  $\geq 5$  DN

### 3.6 Heat insulation

For applications with medium temperatures above +160°C / +320°F an insulation of the pipeline in accordance to the insulation guideline is suggested. Avoid higher electronic temperatures than +80°C / +176°F.

The area above the signal converter support must not be heat-insulated.

The heat insulation ② may only extend to the maximum height ① shown below.

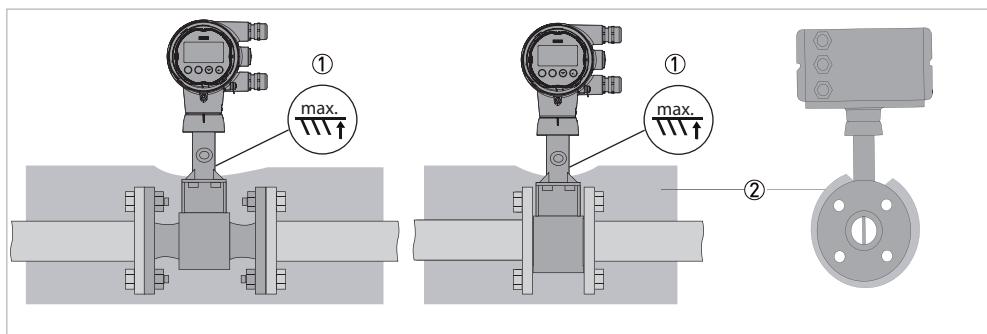

Figure 3-10: Mounting of the heat insulation

- ① Max. height of the insulation up to the marking on the neck of the flow sensor
- ② Insulation

## 4.1 Connecting the signal converter

*All work on the electrical connections may only be carried out with the power disconnected.  
Take note of the voltage data on the nameplate!*

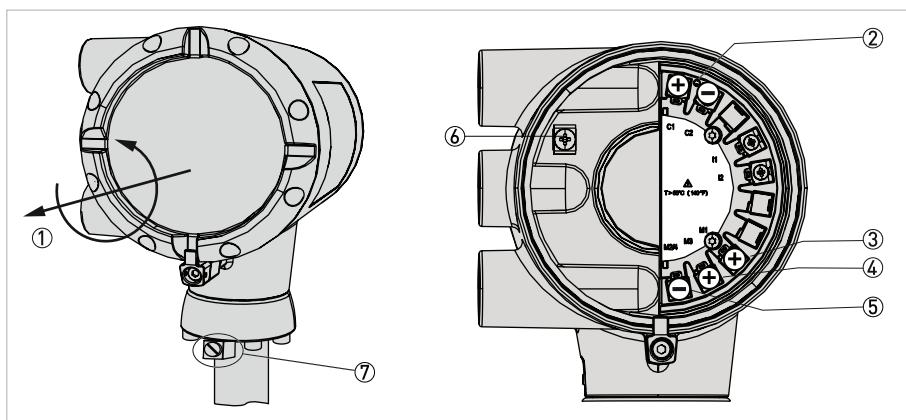

Figure 4-1: Connecting the signal converter

- ① Open the housing cover of the electrical terminal compartment using the key
- ② Signal converter supply and 4...20 mA loop
- ③ Terminal M1 pulse (high current)
- ④ Terminal M3 pulse (NAMUR)
- ⑤ Terminal M2/4 pulse, common minus connection
- ⑥ Ground terminal in housing
- ⑦ Ground terminal on connection piece between flow sensor and signal converter

*Both grounding terminals ⑥ and ⑦ are equally effective from a technical point of view.*

### Steps for connecting the signal converter:

- Unscrew the housing cover ① of the electrical terminal compartment.
- Feed the connection cable through the cable entry in the housing.
- Connect the cable according to the terminal diagrams below.
- Connect the grounding to the terminal ⑥. Alternatively use the ground terminal ⑦ on the connection piece between the flow sensor and the signal converter.
- Tighten the cable glands.
- Turn the housing cover and gasket back onto the housing and tighten it by hand.

*Ensure that the housing gasket is properly fitted, clean and undamaged.*

## 4.2 Electrical connections

The signal converter is a 2-wire device with 4...20 mA as output signal. All other outputs are passive and always require an additional power supply.

## 4.3 Connection of remote version

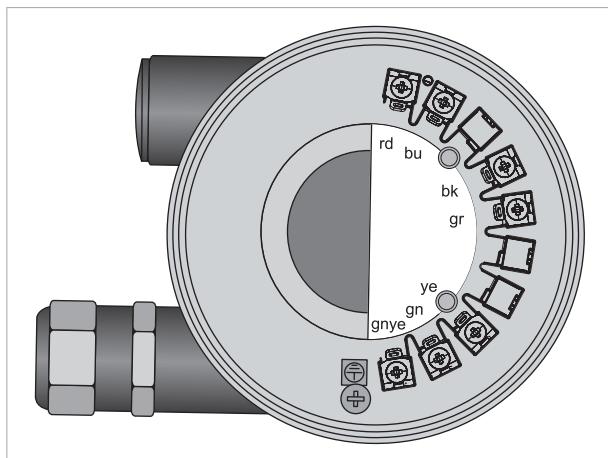

Figure 4-2: Connection terminals of remote version

The connection terminals in the connection box of the flow sensor and the wall bracket are identical in construction.

Terminals	Strand colour
rd	red
bu	blue
bk	black
gr	grey
ye	yellow
gn	green
gnye	Shielding

Table 4-1: Connection cable strand colour

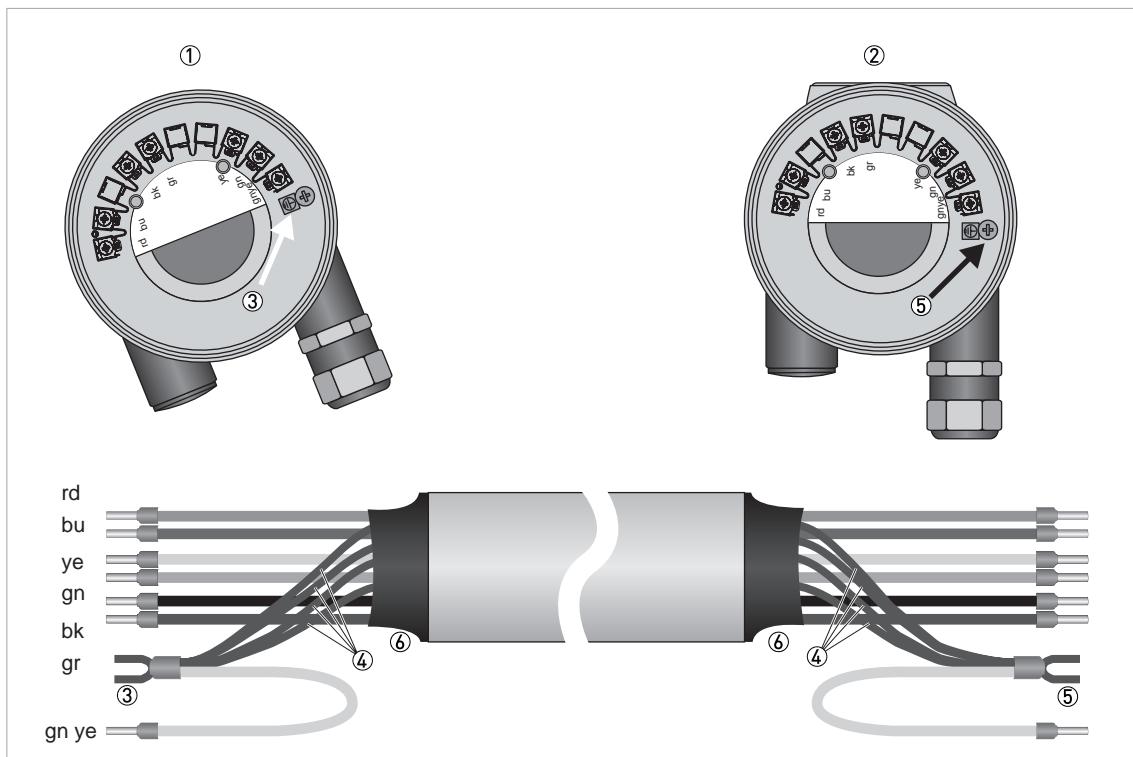

Figure 4-3: Connection of remote version

- ① Connection terminal flow sensor
- ② Connection terminal signal converter
- ③ Connection shielding flow sensor
- ④ Shielding (drain wire and overall shield)
- ⑤ Connection shielding signal converter
- ⑥ Heat shrink tubing

The maximum cable length is 50 m / 164 ft.

The cable can be shortened easily. All wires must be connected afterwards.

*Please ensure that the shielding ④ has been properly connected to both terminals ③ and ⑤.*

Please provide us with the missing information so that we can be of help to you as quickly as possible.

Then please send this page to the appropriate sales associate. We will then contact you as soon as possible.
